OR AN
UNIVERSAL DICTIONARY

CONTAINING
AN EXPLANATION OF THE TERMS AND AN ACCOUNT OF
THE THINGS SIGNIFIED THEREBY

IN
THE
FIGURES, KINDS, PROPERTIES, PREPARATIONS, AND USES OF THINGS
NATURAL AND ARTIFICIAL

THE RARE, THE STRANGE, THE UNKNOWN

With the Several Systems, Definitions, Opinions, &c.

PHILOSOPHERS
DIVINES
ARTIFICERS
PHYSICIANS
MATHEMATICIANS
CRITICS &c.

Extracted from the best Authors, Dictionaries, Journals, Memoirs, &c.
Epitomes, &c. in several Languages

Printed at the Press of J. B. ROBERTSON, in London.

THE SIXTH EDITION
CORRECTED AND AMENDED

VOL. I.

Printed for J. B. ROBERTSON, 2, St. Paul's Church-yard, London.
R. HARRIS, J. HODGKIN, J. SHERRIN, A. MILLER,
J. RIVINGTON, W. and M. GIBBS, and the Executors of J. B. ROBERTSON.

CYCLOPÆDIA:
OR, AN
UNIVERSAL DICTIONARY
OF
ARTS AND SCIENCES;

CONTAINING
AN EXPLICATION OF THE TERMS, AND AN ACCOUNT OF
THE THINGS SIGNIFIED THEREBY,
IN THE
SEVERAL ARTS, BOTH LIBERAL AND MECHANICAL;
AND THE
SEVERAL SCIENCES, HUMAN AND DIVINE:
The Figures, Kinds, Properties, Productions, Preparations, and Uses of Things
NATURAL AND ARTIFICIAL:

The Rise, Progress, and State of Things
ECCLESIASTICAL, CIVIL, MILITARY, AND COMMERCIAL:
With the several Systems, Sects, Opinions, &c. among

PHILOSOPHERS,		PHYSICIANS,
DIVINES,		ANTIQUARIES,
MATHEMATICIANS,		CRITICS, &c.

The whole intended as a Course of antient and modern Learning.

Extracted from the best Authors, Dictionaries, Journals, Memoirs, Transactions,
Ephemerides, &c. in several Languages.

By E. CHAMBERS, F.R.S.

THE ARTS AND SCIENCES, human and divine, are the two great pillars of human knowledge. The arts are the practical part, and the sciences are the theoretical part. The arts are the means by which we improve our condition in this world, and the sciences are the means by which we improve our understanding of the universe. The arts are the foundation of human progress, and the sciences are the foundation of human wisdom. The arts are the means by which we create a better world for ourselves, and the sciences are the means by which we create a better world for all.

THE PROTECTION OF ARTS HAS EVER BEEN EFFECTED THE PROPER PROVINCE OF THE GREAT. It is a plain truth, that the arts are the foundation of human progress, and the sciences are the foundation of human wisdom. The arts are the means by which we improve our condition in this world, and the sciences are the means by which we improve our understanding of the universe. The arts are the foundation of human progress, and the sciences are the foundation of human wisdom. The arts are the means by which we create a better world for ourselves, and the sciences are the means by which we create a better world for all.

SOMETHING extraordinary is intended by providence, in placing such a Prince at the head of such a people: a Prince inspired with a generous passion to devote his ears to the welfare of mankind; and a people conspiring with unexampled ardor and unanimity to all his glorious views. Some of our best Princes have had their hands tied down; checked by jealousy, which spoiled every noble design. Your Majesty, however, is distinguished by a more liberal and generous spirit. You have no such checks, and you are free to pursue every noble design. You have no such checks, and you are free to pursue every noble design. You have no such checks, and you are free to pursue every noble design.

T O T H E

K I N G.

S I R,

THE ARTS and SCIENCES humbly crave audience of Your Majesty. The near connexion they have with the happiness of a people, promises them a favourable reception from a Prince who makes his peoples happiness the basis of his own. 'Tis by them the parsimony of nature is supplied, and life rendered easy and agreeable under its numerous infirmities. By them the mind is reclaimed from its native wildness, and enriched with sentiments which lead to virtue and glory. 'Tis they, in fine, that make the difference between Your Majesty's subjects, and the savages of Canada, or the Cape of Good Hope.

THE protection of ARTS has ever been esteemed the proper province of the Great. 'Tis a branch of the regal office, which a Prince equal to the whole charge of a Crown, will not suffer to be alienated into other hands. From this, do the first and most distinguished names in history derive a large share of their glory: and if there be any age or nation conspicuous above the rest, and which is looked on with envy by our own; it is that wherein the Sovereigns have signalized themselves most in this quality.---But, the time is now at hand, when we are no longer to envy Rome her AUGUSTUS and AUGUSTAN AGE; but Rome, in her turn, shall envy ours.

SOMETHING extraordinary seems intended by providence, in placing such a Prince at the head of such a people: a Prince inspired with a generous passion to devote his cares to the welfare of mankind; and a people conspiring with unexampled ardor and unanimity to all his glorious views. Some of our best Princes have had their hands tied down; check'd by reluctant factions, which opposed every nobler design: Your Majesty has found the happy secret, to make even contention do You homage; and turn opposition itself into approbation and applause.

T H E R E

D E D I C A T I O N.

THERE is a time reserved in fate for every nation to arrive at its height; and the uppermost place on the terrestrial ball is held successively by several states. May not the numerous presages which usher in Your Majesty's reign, give us room to expect that our turn is next; and that what Greece was under ALEXANDER, and Rome under AUGUSTUS Cæsar, Britain shall be under Your Majesty's government and protection.

BUT even this were to under-rate our hopes, which are raised by Your Majesty to something still more truly glorious. Greatness, so fondly coveted, has already cost the world very dear; and though still pursued by unthinking men under almost every shape, is only desirable in a few. Of itself it is rather an object of terror and alarm, than delight; and at best only pleases, when joined with something naturally amiable. From the practice of Your Majesty, men may correct their sentiments, and learn, that greatness has no charm except when founded in goodness. To be Great and a King, is but a small matter with Your Majesty; 'tis a quality many others enjoy in common with You, and to which some have even been doomed to their infamy: 'tis what Herod was, what Nebuchadnezzar was; and what Nero, and Domitian were. But, while some Princes chuse to be great in what is destructive, and others in things wholly indifferent; 'tis Your Majesty's praise to be great in what is the perfection of our nature, and that whereby we approach nearest the Deity. Happy choice! to use power only as the means of rendering your beneficence more diffusive; and thus to make Royalty minister to the happiness of mankind, which it has been used to invade.

YOUR Majesty commands a people capable of every thing. Not more fitted to shine in arms, or maintain an extended commerce; than to succeed in the stiller pursuits of philosophy, and literature. And it will be Your Majesty's glory, not to let any of their talents lie unemploy'd. If Your Majesty gives the word, while some of them are busied in avenging Your cause, by humbling some turbulent monarch; some in extending your dominions by new settlements, and some in increasing your peoples wealth, by new trades: others will be employ'd in enlarging our knowledge by new discoveries in nature, or new contrivances of art; others in refining our language; others in improving our morals; and others in recording the glories of Your reign in immortal song.

THE Work I here presume to lay at Your Majesty's feet, is an attempt towards a survey of the republic of learning, as it stands in Your Majesty's most auspicious reign. We have here somewhat of the boundary that circumscribes our present prospect; and separates the known, from the unknown parts of the intelligible world. Under Your Majesty's princely influence and encouragement, we promise ourselves this boundary will be removed, and the prospect extended far into the other hemisphere.—Methinks I see trophies erecting to Your Majesty in the yet undiscover'd regions of Science; and Your Majesty's Name inscribed to inventions at present held impossible!

I am, with all sincerity and devotion,

May it please Your MAJESTY,

*Your Majesty's most dutiful,
and obedient Subject,
and Servant,*

Ephraim Chambers.

ADVERTISEMENT

Concerning the SECOND EDITION.

WHAT advantages the present Edition has above the former, I had rather the Reader should find in the perusal, than be taught by a formal recital of them: the rather, as an author's second cares, whatever credit they may do his perseverance, do none to his circumspection; his utmost praise, in such case, being to have done that at a second attempt, which he ought to have done at the first.

THUS much, however, it may be necessary to say, in justice to the Bookellers concerned, That the work is now considerably more correct than at its first appearance; as having been re-touched, and amended in a thousand places. Some advantage it likewise has, in being rendered more uniform, its parts in many places better disposed, as well as more conformable to each other, and the References reformed throughout. Some Additions, likewise, the Reader will meet withal; particularly, the articles BOOK, PAPER, BRIDGE, DEGREE, DYING, SATYR, BOG, and a few others of lesser consequence. — Some other articles, as GYMNASIUM, GYMNASTICS, LUSTRATION, LUXATION, LYRIC, SPINOZISM, PLANETARY, &c. have also been enlarged, for reasons chiefly typographical, and not very necessary to be recited here; the less, as all additions are beyond the main design, which was, to have reserved the additional matters entire for a supplemental work.

SOME persons, perhaps, instead of a new edition, may have expected a new work, agreeable to the plan published some time ago in my paper of Considerations, &c. To obviate any complaints from this quarter, it may be proper to add, that nothing has been wanting on the author's part, to have satisfied their expectations. A considerable part of the copy was prepared, and upwards of twenty sheets actually printed in that method, with a design to have published a volume last winter; and to have gone on publishing a volume yearly, till the whole had been finished. But while things were in this train, the Bookellers were alarmed with a bill in parliament, containing a clause to oblige the publishers of all improved editions of books, to print their improvements separately: which, in the method we were proceeding in, could not have been done without great loss. The bill, indeed, after having passed the commons, failed (when it was least expected) in the house of lords: but as there were apprehensions of its being revived in some subsequent session, when it might have born still harder on the undertakers of this work, they thought best to retreat, before they were further involved.

'TIS possible, the loss, from this alteration of measures, may be the greatest to themselves; and that the public may even be gainers by it: as, by this means, they now have the former book considerably improved, without either its bulk, or its price being sensibly augmented.

T H E P R E F A C E.

IT is not without some concern, that I put this work in the reader's hands; a work so seemingly disproportionate to any single person's experience, and which might have employed an academy. What adds to my apprehensions, is the scanty measure of time that could be employed in a performance, which a man's whole life scarce appears equal to. The Vocabulary of the academy *della Crusca* was above forty years in compiling, and the Dictionary of the French academy much longer; and yet the present work will be found more extensive than either of them in its subject and design, as much as it falls short of them in respect of years, or of hands employed in it.

HERE, the reader might be led to suspect something of dissingenuity; and think I first offer him a book, and then give him reasons why I should not have done it. — But his suspicions will abate, when he is apprized of some advantages under which I engaged; which are superior to what had been known in any former work of the kind: since all that had been done in them, accrued, of course, to the benefit of this. I come, like an heir, to a large patrimony, gradually raised by the industry and endeavours of a long race of ancestors. What the French and Italian academists, the abbe Furetiere, the editors of *Trevoux*, Savary, Chauvin, Harris, Wolfius, Daviler, and others have done, has been subservient to my purpose. To say nothing of an interior class of books of this kind, which contributed their share; dictionaries on almost every subject, from medicine and law, down to heraldry and the manage.

YET this is but a part: I am far from having contented myself to take what was ready collected; but have augmented it with a large accession from other quarters. Few parts of the commonwealth of learning, but have been trafficked to on this occasion. Recourse has been frequently had to the originals themselves on the several arts; and, not to mention what small matters could be furnished from my own stock, the reader will here have extracts and accounts from a great number of books of all kinds, either overlooked by former lexicographers, or not then extant; and a multitude of improvements in the several parts, especially of natural knowledge, made in these last years. If instances hereof were required, I hope there are few pages which will not afford several.

SUCH are the sources from whence the materials of the present work were derived; which, it must be allowed, were more than sufficiently ample: So that the difficulty lay in the form, and oeconomy of it; so to dispose such a multitude of materials, as not to make a confused heap of incoherent parts, but one consistent Whole. — And here it must be confessed there was little assistance to be had. — Former lexicographers have scarce attempted any thing like structure in their works; nor seem to have been aware, that a dictionary was, in some measure, capable of the advantages of a continued discourse. Hence it is that we see nothing like a whole in what they have done: and, for this reason, such materials as they did afford for the present work, generally needed farther preparation, ere they became fit for our purpose; which was as different from most of theirs, as a system from a cento.

OUR view was, to consider the several matters, not only in themselves, but relatively, or as they respect each other: both to treat them as so many wholes, and as so many parts of some greater whole; their connexion with which to be pointed out by a reference. So that by a course of references, from generals to particulars; from premises, to conclusions; from cause, to effect, and vice versa, *i. e.* from more, to less complex, and from less, to more; a communication might be opened between the several parts of the work; and the several articles be, in some measure, replaced in their natural order of science, out of which the alphabetical order had removed them.

FOR an instance. — The article ANATOMY, is not only to be considered as a whole, *i. e.* as a particular system, or branch of knowledge; and accordingly divided into its parts, *human*, and *comparative*; and human, again, subdivided into the *analysis of solids*, and *fluids*, (to be referred to in their several places in the book, where they themselves being treated of, refer to others still lower, and so on) but also as a part of MEDICINE; which, accordingly, it refers to; and which, itself, refers to another higher, &c. — By such means, a chain may be carried on from one end of an art to the other, *i. e.* from the first or simplest complication of ideas, appropriated to the art, which we call the *elements*, or principles thereof, to the most complex, or general one, the name or term that represents the whole.

NOR is the pursuit to be dropped here: but as the elements or data, in one art, are ordinarily quæsitæ in some other subordinate one, and are furnished thereby; (as here, for instance, the elements of anatomy are furnished by *natural history*, *physics*, and *mechanics*; and anatomy itself may be considered as a datum furnished to *medicine*;) we may carry on the view farther, and refer out of one art or province into the adjoining ones; and thus lay, as it were, the whole land of knowledge open. — It may appear, indeed, with the face of a wilderness; but it should be a wilderness through which a reader might find his way as securely, though not so expeditiously and easily, as through a regular parterre.

IT may be even said, that if the System be an improvement upon the Dictionary; the Dictionary is some advantage to the System; and that this is, perhaps, the only way wherein the whole circle, or body of knowledge, with all its parts and dependencies, can well be delivered. In any other form, many thousand lesser things must needs be concealed: all the pins, the joints, the binding of the fabric, must be invisible of course; all the lesser parts, one might say, all the parts whatsoever, must be, in some measure, swallowed up in the whole. The imagination, stretched and amplified to take in so large a structure, can have but a very general, indistinct perception of any of the component parts. — Whereas the parts are not less matter of knowledge when exsist one, it may seem more natural to consider knowledge in its parts, *i. e.* as divided into separate articles, denoted by so many different terms; than to consider the whole assemblage in its utmost composition; which is a thing merely artificial, and the work of imagination.

AND yet the latter way must be allowed to have many and real advantages over the former; which, in truth, is only of use and significance, as it partakes of it. — Whence it should follow, that the most advantageous way, is to make use of both: to consider every point, both as a part, to help the imagination to the whole; and

THE PREFACE.

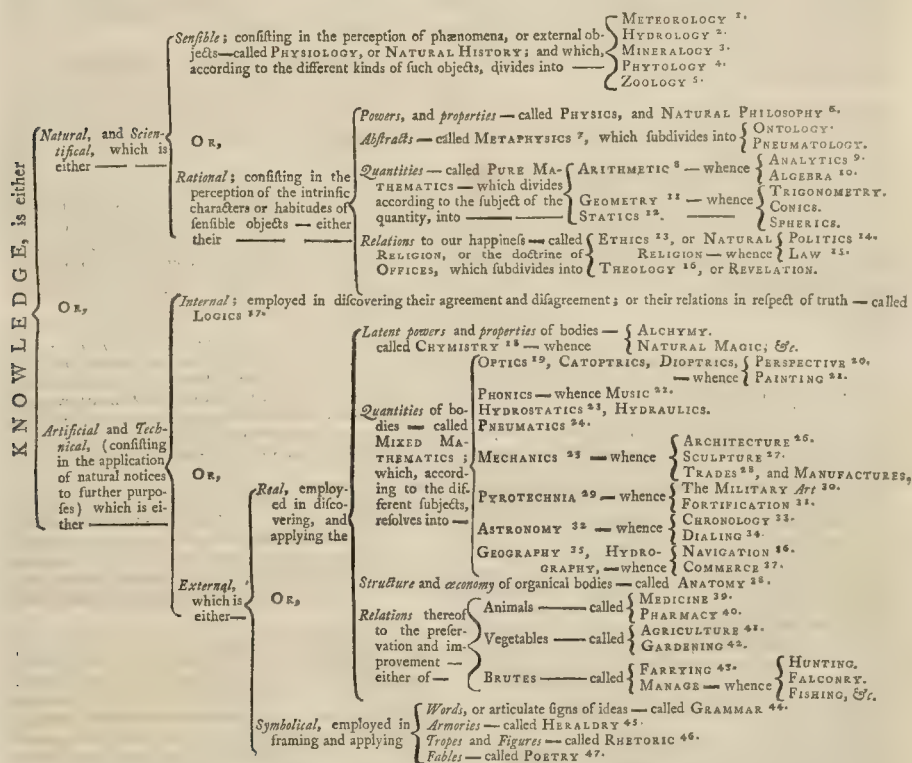

iii

and as a whole, to help the understanding to each part. — Which is the view in the present work. — So far, we mean, as the many and great difficulties we had to labour under, would allow us to pursue it.

IN this view we have endeavoured to give the substance of what has been hitherto discovered in the several branches of knowledge, both natural and artificial: that is, in the knowledge of *nature*, first, as she appears to our senses, either spontaneously, as in *natural history*; or with the assistance of art, as in *anatomy*, *chemistry*, *medicine*, *agriculture*, &c. Secondly, to our imagination; as in *grammar*, *rhetoric*, *poetry*, &c. Thirdly, to our reason; as in *physics*, *metaphysics*, *logics*, and *mathematics*: with the several subordinate arts arising from each, as *agriculture*, *painting*, *sculpture*, *trade*, *manufactures*, *policy*, *law*, &c. and numerous remote particulars, not immediately reducible to any of these heads; as *heraldry*, *philology*, *antiquities*, *customs*, &c.

THE plan of the work, then, I hope, may be allowed to be good; whatever exceptions be taken to the execution of it. It would look extravagant to say, that half the men of letters of an age might be employed in it to advantage; and yet it will appear, that a work accomplished as it ought to be, on the footing of this, would answer most of the purposes of a library, except parade; and contribute more to the propagating of useful knowledge through the body of a people, than half the books extant. — After this, let the reader judge how far I may deserve censure for engaging in it, even under some disadvantages; and whether to have failed in such a design, may not be some degree of praise.

BUT it will be here necessary to carry on the division of knowledge, just laid down, a little farther; and make a more precise partition of the body thereof, in the formal way of an analysis: the rather, as an analysis, by shewing the origin and derivation of the several parts, and the relation in which they stand to their common stock, and to each other; will assist, both in reinstating the scattered articles in the book, and in connecting them together.

THIS is a view of knowledge, as it were in *flamine*; exhibiting only the grand, constituent parts thereof: it would be needless to pursue it into all its members and ramifications; which is the proper business of the book itself. It might here, therefore, seem sufficient to refer, from the several branches thus deduced, to the same in the course of the work; where their division is carried on. And yet this would sometimes prove inconvenient for the reader; who, to find some particular matter, would go a long circuit, and be referred backwards and forwards, from one end of the book to another: to say nothing of the interruptions which may frequently happen in the series of references. — To obviate this, we have taken a middle course, and carried on the distribution further, in the way of *notes* at the bottom of the pages; but this in a looser manner, to prevent the embarrass of a strict analysis, so complex and diffusive as this must otherwise prove. Some

* METEOROLOGY, or the history of *AIR* and the *ATMOSPHERE*: including, 1°. That of its contents, *ETHER*, *FIRE*, *VAPOUR*, *EXHALATION*, &c. 2°. METEORS formed therein; as *CLOUD*, *RAIN*, *SHOWER*, *DROP*, *SNOW*, *HAIL*, *DEW*, *DAMP*, &c. *RAINBOW*, *PARHELION*, *HALO*, *THUNDER*, *WATER-SPOUT*, &c. *WINDS*, *MONSOON*, *HURRICANE*, and the like.

* HYDROLOGY, or the history of *WATER*; including that of *SPRINGS*, *RIVERS*, *ACIDULE*, *BATHS*, &c. of *LAKE*, *SEA*, *OCEAN*, &c. of *TIDES*, *DELUGE*, and the like.

* MINERALOGY, or the history of *EARTH*; 1°. Its parts; as *MOUNTAIN*, *MINE*, *MOSS*, *BOG*, *GROTTO*; and their phenomena, as *EARTHQUAKE*, *VOLCANO*, *CONFLAGRATION*, &c. 2°. Its STRATA, as *CLAY*, *BOLE*, *SAND*, &c. 3°. FOSSILS or MINERALS, as *METALS*, *GOLD*, *SILVER*, *MERCURY*, &c. with operations relating to them; as *FUSION*, *REFINING*, *PURIFYING*, *PARTING*, *ESSAYING*, &c. *LITHARGE*, *LAVATORY*, &c. *SALTS*, as *NITRE*, *NATRON*, *GEMMA*, *ALLUM*, *ARMONIAK*, *BORAX*, &c. *SULPHURS*, as *ARSENIC*, *AMBER*, *AMBERGREASE*, *COAL*, *BITUMEN*, *NAPHTHA*, *PETROL*, &c. *SEMI-METALS*, as *ANTIMONY*, *CINNABAR*, *MARCASTE*,

of the principal articles, in each branch of science, are hereby brought to light, and such as will naturally suggest, and lead to the rest; so that this may afford the reader a sort of *summary* of the whole; and, at the same time, dispense a kind of auxiliary, or succedaneous order throughout the whole; the articles omitted, all naturally enough ranging themselves in their proper places among these. A detail of this kind is of the more consequence,

MARCASITE, MAGNET, BISMUTH, CALAMINE, COBALT, &c. STONES, as MARBLE, PORPHYRY, SLATE, ASBESTOS, &c. GEMS, as DIAMOND, RUBY, EMERALD, OPAL, TURCOISE, &c. EMBERY, LAPIS LAZULI, whence ULTRAMARINE, AZURE, &c. PETRIFICATIONS, as CRYSTAL, SPAR, STALACTITES, TROCHITES, CORNU AMMONIS, and the like.

* PHYTOLOGY, or the history of *PLANTS*; their origin in the SEED, FRUIT, &c. Their kinds; as TREE, HERB, &c. Extraordinary species; as TEA, COFFEE, PARAGUAY, VINE, GINSENG, COTTON, TOBACCO, &c. CORAL, MUSHROOM, TRUFFLE, PARASITES, MISTLETOE, MOSS, &c. Parts; as ROOT, STONE, FLOWER; WOOD; as GUAIACUM, SASSAFRAS, EBONY, ALOES, &c. LEAVES, FOLIATION, ROLL, &c. BARK; as QUINQUINA, &c. also PISTIL, FARINA, STAMINA, &c. Operations thereof; as VEGETATION, GERMINATION, CIRCULATION, &c. Circumstances; as PERPENDICULARITY, PARALLELISM, FECUNDITY, &c. Productions; as HONEY, WAX, BALSAM, SUGAR, MANNA, &c. GUM, RESIN, CAMPHOR, &c. INDIGO, OPIUM, GALLS, and the like.

* ZOOLOGY, or the history of *ANIMALS*; their origin in EGG, EMBRYO, FOETUS, GENERATION, CONCEPTION, GESTATION, HATCHING, MIGRATION, &c. Their kinds; as QUADRUPED, BIRD, FISH, INSECT, REPTILE, RUMINANT, CARNIVOROUS, &c. Extraordinary species; as UNICORN, TORPEDO, TARANTULA, TORTOISE, CAMELEON, SALAMANDER, BARNACLE, ANCHOVY, DEATH-WATCH, &c. MONSTERS; as DOUBLE ANIMALS, HERMAPHRODITE, MULE, PIGMY, GIANT, &c. Metamorphoses; as AURELIA, METEMPSYCHOSIS, &c. Parts; as HEAD, HAND, FOOT, FINGER, TAIL, FIN, WING, GILLS, &c. Covering; as HAIR, WOOL, SILK, FEATHERS, &c. Armature; as NAIL, STING, HORN, TOOTH, SHELL, PROBOSCIS, WEB, &c. Productions; as PEARL, BEZOARD, CASTOREUM, CIVIT, MUMMY, USNEA, KERMES, COCHINEAL, &c. Motion; as FLYING, SWIMMING, and the like.

* PHYSICS, or the doctrine of *CAUSES*; as NATURE, LAW, &c. Occasions or means; as PRINCIPLE, MATTER, FORM, &c. Their composition, or constitution, in ELEMENT, ATOM, PARTICLE, BODY, CHAOS, WORLD, UNIVERSE, SPACE, VACUUM, &c. Properties of body; as EXTENSION, SOLIDITY, FIGURE, DIVISIBILITY, &c. Powers thereof; as ATTRACTION, COHESION, GRAVITATION, REPULSION, ELASTICITY, ELECTRICITY, MAGNETISM, &c. QUALITIES; as FLUIDITY, FIRMNESS, DUCTILITY, HARDNESS, VOLATILITY, DENSITY, POLARITY, LIGHT, HEAT, COLD, &c. Operations or effects thereof; as MOTION, RAREFACTION, DILATATION, CONDENSATION, DISSOLUTION, EBULLITION, FREEZING, EVAPORATION, FERMENTATION, DIGESTION, EFFERVESCENCE, &c. VISION, SEEING, HEARING, FEELING, SMELLING, &c. Modifications or changes; as ALTERATION, CORRUPTION, PUTREFACTION, GENERATION, DEGENERATION, TRANSMUTATION, &c. Systems or hypotheses thereof; CORPUSCULAR, EPICUREAN, ARISTOTELIAN, PERIPATETIC, CARTESIAN, NEWTONIAN, &c.—Occult and fictitious qualities, powers, and operations; ANTIPERISTASIS, SYMPATHY, ANTIPATHY, ARCHEUS, &c. MAGIC, WITCHCRAFT, FASCINATION, VIRGULA DIVINA, LIGATURE, TALISMAN, CABBALA, &c. DRUID, BARD, BRACHMAN, GYMNOSEPHIST, MAGI, ROSICRUCIAN, and the like.

* METAPHYSICS, or the doctrine of *ENS*; ESSENCE, EXISTENCE, POWER, ACT, UNDERSTANDING, &c.—The *MIND*, its FACULTIES; APPREHENSION, JUDGMENT, IMAGINATION, REASON, WIT, &c. Its OPERATIONS; RETENTION, REFLECTION, ASSOCIATION, ABSTRACTION, &c. Its PERCEPTIONS; as SUBSTANCE, ACCIDENT, MODE, &c. RELATIONS; as UNITY, MULTIPLITUDE, INFINITY, UNIVERSAL, &c. QUANTITY, QUALITY, WHOLE, PART, &c. GENUS, SPECIES, DIFFERENCE, &c. PROPER, OPPOSITE, CIRCUMSTANCE, EXTERNAL, &c. Effects hereof; KNOWLEDGE, SCIENCE, ART, EXPERIENCE, &c. Conditions; PROBABILITY, CERTAINTY, FALLACY, &c. Systems hereof; NOMINALS, SCOTISTS, &c.

* ARITHMETIC, including the doctrine of *DISCRETE* or DISCONTINUOUS QUANTITY, viz. NUM-

BER, RATIO, PROPOSITION, &c. Kinds; as INTEGER, FRACTION, DECIMAL, SURD, &c. Relations; as ROOT, POWER, SQUARE, CUBE, &c. RULES or operations thereof; as NOTATION, NUMERATION, ADDITION, SUBTRACTION, &c. REDUCTION, PRACTICE, POSITION, &c. EXTRACTION, APPROXIMATION, &c. Instruments subservient thereto; as LOGARITHMS, NEPER'S BONES, &c.

* ANALYTICS, or the resolution of *PROBLEMS* by SPECIES, or symbolical expressions: RULES or operations hereof; as ADDITION, SUBTRACTION, MULTIPLICATION, &c. Application thereof, in COMBINATION, PERMUTATIONS, MAGIC SQUARES, CHANCES, GAMING, &c. SERIES, PROGRESSIONS, &c. METHODS of MAXIMIS, FLUXIONS, EXPONENTIALS, TANGENTS, &c.

* ALGEBRA, or the doctrine of *EQUATIONS*; SIMPLE, QUADRATIC, CUBIC, &c. Operations thereof; as REDUCTION, CONSTRUCTION. Objects thereof; PROBLEMS, RESOLUTION, &c.

* GEOMETRY, or the doctrine of *EXTENDED* or CONTINUOUS QUANTITY, viz. 1^o. LINES; RIGHT, PERPENDICULAR, PARALLEL, OBLIQUE, &c. ANGLES; ACUTE, SCALENOUS, VERTICAL, OPPOSITE, &c. 2^o. FIGURES, or SURFACES; TRIANGLE, SQUARE, PARALLELOGRAM, POLYGON, &c. Circumstances hereof; as PERIMETER, AREA, &c. Operations relating thereto; as BISECTING, DIVIDING, MULTIPLYING, MEASURING, &c. Instruments used therein; as COMPASSES, RULER, SQUARE, PARALLELISM, SCALE, &c. CURVES; as CIRCLE, CYCLOID, CIRCLOID, CATENARIA, CAUSTIC, EVOLUTE, QUADRATRIX, &c. Circumstances thereof; as AXIS, DIAMETER, RADIUS, CENTER, CIRCUMFERENCE, ABSCISS, ORDINATE, &c. ARCH, CHORD, SINUS, TANGENT, SECANT, &c. Instruments used herein; as artificial LINES, CANONS, &c. Operations arising herefrom; as SURVEYING, taking ANGLES or BEARINGS, &c. with QUADRANT, PLAIN-TABLE, SEMICIRCLE, CIRCUMFERENTOR, &c. taking DISTANCES, with CHAIN, PERAMBULATOR, &c. PLOTTING into DRAUGHT, MAP, &c. with PROTRACTOR, &c. 3^o. SOLIDS, or bodies; as CUBE; PARALLELEPIPED, PRISM, PYRAMID, CYLINDER, POLYHEDRON, &c. Their SUPERFICIES, SOLIDITY, &c. Operations relating thereto; as CUBATURE, measuring of TIMBER, GAUGING, &c. Instruments used herein; as CARPENTERS RULE, SECTOR, SLIDING RULE, GAUGING ROD, &c.—The SPHERE; its doctrine, PROJECTION, &c. Application thereof; in PLANISPHERE, ANALEMMA, &c.—The CONE; its SECTIONS, ELLIPSIS, PARABOLA, HYPERBOLA, &c. with its ASYMPTOTES, FOCI, &c. Their CONSTRUCTION; QUADRATURE, RECTIFICATION, &c.

* STATICS, or the doctrine of *MOTION*: its laws; VELOCITY, MOMENTUM, &c. Causes; as GRAVITY, PERCUSSION, COMMUNICATION, &c. Modifications; as COMPOSITION, ACCELERATION, RETARDATION, REFLECTION, REFRACTION, &c. Kinds; as ASCENT, DESCENT, CENTRAL, CENTRIPETAL, &c. OSCILLATION, UNDULATION, PROJECTION, &c. POWERS, or applications thereof; in LEVER, SCREW, &c. PENDULUM, PROJECTILE, &c. Operations directed hereby; as GUNNERY, the MECHANICAL ARTS, &c. enumerated hereafter.

* ETHICS, or the consideration of *NATURAL INCLINATIONS*, PASSIONS, TASTES, &c. Objects thereof; as GOOD, EVIL, VIRTUE, VICE, BEAUTY, DEFORMITY, &c. PLEASURE, PAIN, &c. RECTITUDE, EQUITY, CONSCIENCE, &c. LAW, OBLIGATION, &c. WILL, LIBERTY, ACTION, ASSENT, &c. NECESSITY, PROMOTION, PROVIDENCE, &c. Systems hereof; STOICS, PLATONISM, ACADEMY, CYNIC, and the like.

* POLICY, or the consideration of *SOCIETY* and *GOVERNMENT*: its origin; in CONTRACT, &c. Constitutions and forms thereof; as, 1^o. MONARCHY, DESPOTISM, &c. Powers thereof; KING, QUEEN, PRINCE, DUKE, EMPEROR, SULTAN, SOPHY, CALIPH, CÆSAR, CZAR, YNCA, ETHNARCH, TETRARCH, DESPOT, and the like. Their TITLES and QUALITIES; MAJESTY, HIGHNESS, GRACE, EXCELLENCE, and the like. Their REGALIA; CROWN, SCEPTRE, TIARA, FASCES, &c. 2^o. ARISTOCRACY, its powers; as ARCHON, DICTATOR, DOGE, SENATE, COUNCIL, &c. 3^o. DEMOCRACY; STATES-GENERAL, STADTHOLDER, PROTECTOR, &c. Their

THE PREFACE.

V

consequence, as it may not only supply the office of a *table of contents*, by presenting the dispersed materials of the book in one view; but also that of a rubric, or directory, by indicating the order they are most advantageously read in.—Note, then, that the initial words of the *notes*, correspond to the final ones of the *analysis*; and that the several members, or items of both, make so many heads or articles in the book.

I

Their Succession, Elective, Hereditary, by Primogeniture, &c. Their transactions; as Peace, War, Treaty, Union, Croisade, &c. By Armies, Fleets, Embassies, Secretary, Plenipotentiary, Envoy, Legate, Nuntio, &c. Their Territories, Empire, Signory, &c. Their Estates, Nobles, Commons, Clergy. Census, Enumeration, Tribe, Quarter, &c. Province, Circle, County, City, Town, &c. Magistrature, Chancellor, Judge, Sheriff, Justice, Mayor, Alderman, Bailiff, Constable. Interrex, Consul, Pretor, Censor, Visier. Tribune, Triumvir, Provost, Ephori, Edile, Prefect, Questor, Proconsul. Vice-roy, Lieutenant, Steward, Warden, Keeper. Juriconsultus, Procurator, Advocate, Barrister, Prothonotary, Custos, Philazer, Chirographer, Usher, Clerk, &c. Their jurisdiction; Courts; as Areopagus, Comitia, &c. Parliament, Diet, Divan. Chamber, Assize, Privy-Council, &c. Chancery, King's-Bench, Exchequer, Admiralty, Verge, Sessions, Turn, County Court, Leet, Eyre, &c. Terms, Circuits, Commissions, Oyer. Convocation, Arches, Prerogative, Faculties, Delegates. Rota, Inquisition, &c. Their Revenues, Treasury, Fisc, Exchequer, Tally, Political Arithmetic. Duties, Customs, Gabel, Excise, &c. Coinage, Money, Interest, Usury, &c. Their Household, Chamber, Green-Cloth, Ward-robe, &c. Under Steward, Chamberlain, Comptroller, Coffeer, Aga, Oda, &c. Guards, Ordinance, &c. directed by Captain, Master, Querry, &c. Militia, Navy, Post, Timariot, Arriere-band, &c. Dignities; Dauphin, Elector, Palatine, Grave, Palsgrave, Thane, Earl, Count, Knight, Garter, Baronet, Bath, Teutonic, Malta, Elephant, &c. Gentleman, Yeoman, &c. Their Names, Surnames, Titles, Precedence, &c. Factions, Patrician, Guelph, Tory, &c. Corporations, or lesser Communities, University, Academy, College, Society, Chapter, School, Hospital; Inn. Public Buildings; Hall, Basilica, Guildhall, Prison, Tower, Arsenal, Library, Museum, Circus, &c. Solemn Ceremonies; as Triumph, Tournament, Carrousal, Quadril. Donative, Medal, Trophy, Monument, Funeral, Tomb, Catacomb, &c.

²⁵ LAW, or the rules and measures of SOCIETY; published in Act, Statute, Charter, Rescript, Constitution, Decretal, Senatus-consultum, Pragmatic Sanction, &c. Recorded in Institutes, Code, Novel, Register, Pandect, Corpus, Domesday, &c. Kinds; Civil, Canon, Sumptuary, &c. respecting, 1^o. Persons; as the King; his Prerogative, Royalties, &c. viz. Granting Dispensation, Pardon, Commendam, Exemption. Dignities, Franchises, Forest, Park, Purview, Vert, Chase, Imposit, Subsidy, Toll, Tax, Aid, Hidage, Scutage, Prisaige. Waife, Estray, Escheat, Treasure Trove, &c. Officers, and Magistrates; created by Writ, Warrant, Commission, &c. Their Oath, Test, Declaration. Visitation, Procuration, &c. Corporations; Regular, Secular, &c. made by Charter, Patent, &c. dissolved by Quo Warranto, Mandamus, &c. Subjects; as Denizen, Alien, Naturalization, Husband, Wife, Marriage, Concubine, Separation, Alimony, Dower, Affinity, Bastard, Adoption, Emancipation. Lord, Tenant, Villain, Vassal. Client, Patron. Servant, Slave, Retainer. Manumission, Enfranchising, &c. Tenure, Service, Homage, Fealty, Sergeanty, Escuage, Relief, Guardian, Wardship, Socage. Heir, Intestate, Ancestor, &c.—2^o. Estates, or things; either real, as Tenements, Hereditaments, Freehold, Fee, Customary, Tail, Gavelkind, Courtsey, &c. In Reversion, Mortgage, Hypotheca, &c. Manor, Demesne, Honours, Common, Glebe, Advowson, &c. Acquired by Occupancy, Prescription, Descent, Conveyance, Feoffment, Fine, Recovery. Deffizance, Lease, Devis, Attournment, Investiture, Livery, &c. Lost by Alienation, Mortmain, Disseisin, Abatement. Surrender, Discontinuance, Disclaimer, Forfeiture, Resignation, Deprivation, Lapse, &c. Of personal; as Goods, Chattels, Emblements, Annuity, Debts, Specialty, Recognizance, &c. Acquired by Succession, Heiriot, Mortuary, Heir-loom, Testament, Executor, Administrator, Ordinary. Judgment, Fieri Facias, &c.—3^o. Wrongs or Injuries; either to persons; as Crimes, Treason, Par-

Vol. I.

ricide, Murder, Felony, Assault, Rape, Assassin. Adultery, Fornication, Defloration, Polygamy, Heresy, &c. Prosecuted by Indictment, Accusation, Actions of Conspiracy, and upon the Case, Habeas Corpus, &c. Punished with Hanging, Crucifixion, Wheel, Furca, Scala, Pillory, Transportation, Divorce, Scaphism, &c. Or Civil, and to things; as Trespass, Nuisance, Deformement, &c. Remedied by Writs of Quare Impedit, Darrein Presentment, Appeal, Atteint, Error, Right, Disceit, Superseas, Audita Querela, &c.—SUIT, or course of proceedings, whereby redress is procured; including, 1^o. Process; either by Bill, Summons, Subpoena, Attachment, Capias, Exigent, &c. to which belong Appearance, Attorney, Bail, Escon, Default, Nonsuit, Arraignment, &c.—2^o. Pleading; whence Count, Declaration, Aid Prier, Voucher, Age Prier, Bar, Abate, Release, Replication, Outlawry, Sequestration, &c.—3^o. Issue; whence Demurrer.—4^o. Trial; whence Proof, Evidence, Presumption, Oath, Affidavit, Affirmation, Jury, Challenge, Array, Verdict, Battel, Duel, Champion, Purgation, Ordeal &c. Paine fort et dure, Rack, Torture, &c.—5^o. Judgment; whence Arrest, &c.—6^o. Execution; whence Scire Facias, Reprieve, &c.

²⁶ THEOLOGY, or the confederation of GOD; his nature and Attributes; as Eternity, Ubiquity, &c. His Unity, Trinity, &c. Persons, Hypostasis, &c. Our duty to him, discovered by Inspiration, Revelation, Prophecy, &c. by the Messiah, Evangelists, Apostles, &c. In the Bible; Pentateuch, Hagiographa, Psalter, Gospel, Apocalypse, &c. Canon, Deuterocanonical, Apocrypha, &c. Circumstances thereof; Style, Allegory, Type, Parable, Mystical, &c. Text, Version, Septuagint, Vulgate, &c. Paraphrase, Targum, &c. Points, Quotations, &c. Matter thereof; Declarations, of Incarnation, Passion, Crucifixion, Miracles, &c. Injunctions; as Worship, Prayer, Sacrifice, &c. Sacraments; as Eucharist, Baptism, &c. Promises; as Grace, Justification, &c. Degrees; as Predestination, Election, Reprobation, &c. Breaches on our part; Sin, Fall, Imputation, &c. Remedies thereof, by Penitence, Confession, &c. Rewards and punishments allotted thereto; Heaven, Hell, Resurrection, Immortality, &c. His Ministers; Angels, Devil, &c. His Church; either Triumphant; as Saints, Martyrs, Confessors, Fathers, Doctors, &c. or Militant, &c. Its Offices; Creed, Liturgy, Decalogue, Doxology, Trisagion, &c. Discipline, and rites; as Absolution, Anathema, Excommunication, &c. Catechumen, Confirmation, Genuflexion, &c. Its Hierarchy; as Bishop, Priest, Deacon, &c. Patriarch, Archbishop, Primate, Dean, Canon, Prebend, Archdeacon, Chantor, &c. Their enigns; Mitre, Crosier, Pallium, &c. Their Ordination, Consecration, Collation, Imposition, &c. Benefices, Revenues, Tithes, &c. Places set apart; as Churches, Chapel, Oratory, &c. Cathedral, Parochial, Cardinal, &c. Choir, Nave, Altar, Font, &c. Diocese, Province, &c. Assemblies; as Synod, Council, Convocation, Consistory, Chapter, Presbyter, &c. Feasts, Fast, Lent, Vigils, &c. Easter, Epiphany, Pentecost, Annunciation, Purification, Presentation, &c.—Particular Systems, or professions thereof; viz. Reformed, or Protestant; as the Church of England, Lutheranism, Calvinism, &c. Romish, or Latin; its Mass, Breviary, Legend, &c. Transubstantiation, Extreme unction, Supererogation, Penance, &c. Hierarchy; Pope, Cardinal, &c. Secular, Regular, Monk, Religious, Abbot, Prior, &c. Order, Congregation, Monastery, General, &c. Jesuit, Carthusian, Carmelite, Augustin, Dominican, &c. Third order; Coenobite, Anachoret, Hermit, Recluse, Monastery, Cell, Rule, Vow, Reform, Noviciate, &c. Image, Relics, Saint, Virgin, Rosary, &c. Canonization, Beatification, &c. Indulgence, Jubilee, Exorcism, &c.—Greek; its Anthologion, Prothesis, Particles, &c. Maronite, Jacobite, Thomæan, &c. Armenian, Copti, Solitary, &c.—Sects, and Heresies; as Manichees, Gnostics, Arians, &c. Ebionites, Nestorians, Milennaries, Quartodecimans, &c. Montanists, Socinians, Arminians, &c. Presbyterians, Anabaptists, Independants, Quakers, &c. Quietists, Servetists, Pre-adamites, &c. Deist, Atheist, Spinozism, &c.—
Jewish;

I might here have ended my preface; and perhaps the reader would be willing enough to be thus dismissed: But something has been already started, which will require further disquisition.—The distribution we have made of knowledge is founded on this; that the several branches thereof commence either Art or Science, according to the agency, or non-agency of the human mind, in respect thereof.—It remains to take the matter up a little higher, and explain the reason and manner of this operation: to consider knowledge in its principles, antecedent to

Jewish; its TALMUD, TRADITION, &c. TEMPLE, TABERNACLE, SANCTUARY, ARK, &c. PONTIFF, LEVITE, TRIBE, &c. EPHOD, THERAPHIM, CIRCUMCISION, SABBATH, SANHEDRIN, &c. RABBIN, DOCTOR, CABBALA, MASSORA, &c. PHARISEE, SADDUCEE, ESSEAN, CARAITE, &c. NAZARITE, THERAPEUTA, &c. SAMARITAN, DOSITHEAN, HELLENIST, &c. PASSOVER, SCENOPEGIA, GEHENNA, &c.—MAHOMETAN; their ALCORAN, MUFTI, DERVIS, MOSQUE, MUSSULMAN, &c.—Heathen; their IDOLATRY, THEOGONY, &c. their GODS; PENATES, LARES, LEMURES, &c. SATYRS, SYLVANS, NYMPHS, TRITONS, &c. DEMI-GOD, HERO, FORTUNE, DESTINY; DEMON, GENIUS, &c. APOTHEOSIS, SACRIFICE, &c. FEAST, LUSTRATION, &c. as ELEUSINIA, SATURNALIA, CERERIALIA, &c. Ministers thereof; REX, PONTIFEX, FLAMEN, VESTAL, CORYBANTES, &c. GAMES; OLYMPIC, ITHMIA, &c. DIVINATION, ORACLE, PYTHIAN, SIBYL, &c. AUGUR, AUSPEX, &c. TEMPLE, FANE, PAGOD, &c. SECTS; as BANIAN, BRACHMAN, SABBÆAN, &c.

" LOGICS, or the consideration of *IDEAS* or *NOTIONS*: their kinds; SIMPLE, COMPLEX, ADEQUATE, &c. Disposition into classes or CATEGORIES, PREDICAMENTS, PREDICATES, &c. Their composition, or association into AXIOMS, PROPOSITIONS, PROBLEMS, THEOREMS, THESES, HYPOTHESES. ARGUMENTS; as SYLLOGISM, ENTHYME, SORITES, SOPHISM, DILEMMA, CROCODYLUS, &c. Their RESOLUTION; DEFINITION, DIVISION, &c. into PREMISES, CONSEQUENCES, TERMS, &c. Their TRUTH, FALSHOOD, EVIDENCE, DEMONSTRATION, &c. Operations therewith; as ARGUMENTATION, INDUCTION, DISCOURING, PHILOSOPHISING, &c. DISPUTATION, DISTINCTION, CONTRADICTION, REDUCTIO AD ABSURDUM, &c.

" CHYMISTRY, including the use of *FIRE*, WATER, BATHS, FERMENTS, MENSTRUUMS, FURNACES, RETORTS, and other instruments; to change ANIMAL, VEGETABLE, and FOSSILE bodies, by inducing FUSION, PUTREFACTION, FERMENTATION, DISSOLUTION, EXHALATION, &c. and hereby procuring SPIRITS, SALTS, OILS, ACID, ALKALINE, AROMATIC, URINOUS. WINES, VINEGARS, FLOWERS, CALCES, CRYSTALS, SOAPS, TARTARS. REGULUS, MAGISTERY, EXTRACT, ELIXIR. CERUSS, MINIMUM, LITHARGE, QUINTESSENCE, PHOSPHORUS, ALCAHEST, PHILOSOPHER'S STONE, and the like; by the operations of DISTILLATION, EXPRESSION, COHOBATION, SUBLIMATION, RECTIFICATION, CRYSTALLIZATION, CALCINATION, AMALGAMATION, DIGESTION, PRECIPITATION, VITRIFICATION, FIXATION, TRANSMUTATION, and the like.—ARBOR DIANÆ, AURUM FULMINANS, artificial EARTHQUAKE, MAGIC, DIVINATION, &c.

" OPTICS, including the laws and consideration of *VISION*, and *VISIBLE* Objects; effected by means of LIGHT: its RAYS; their REFRACTIBILITY, REFLEXIBILITY, &c. FOCUS, TRANSPARENCY, OPACITY, SHADOW, &c.—REFLECTION thereof, in MIRROR, LOOKING-GLASS, CATOPTRIC, CISTULA, &c.—REFRACTION, in LENS, PRISM, GLASS, &c. Application, in TELESCOPE, MICROSCOPE, MAGIC LANTERN, &c. SPECTACLE, POLYMOSCOPE, POLYHEDRON, CAMERA OBSCURA, &c.

" PERSPECTIVE, or the projection of POINTS, LINES, PLANES, &c. in SCENOGRAPHY, ORTHOGRAPHY, ICNOGRAPHY, ANAMORPHOSIS, &c.

" PAINTING, or the *DESIGNING* of objects in CLAIR-OBSCURE, PROPORTION, &c. with ORDONNANCE, EXPRESSION, &c. Circumstances thereof; ATTITUDE, CONTRAST, GROUP, &c. Kinds; LIMNING, MINIATURE, CAMIEUX, FRESCO, &c. ENAMELLING, MOSAIC, &c.

" PHONICS, or the doctrine of *SOUNDS*, VOICE, &c. Their modifications, in ECHO, RESONANCE, WHISPERING-PLACE, SPEAKING-TRUMPET, &c.—Their TUNE; GRAVITY, INTERVAL, &c. TIME, TRIPLE, &c. c. pelled by NOTE, CHORD, &c. Comparisons thereof; CONCORD, as UNISON, OCTAVE, THIRD, FOURTH, DISCORD, &c. COMPOSITION; as MELODY, HARMONY, COUNTER-POINT. SYMPHONY, SYNAULIA, CHIME, SONG, RHYTHMUS, &c. Kinds; GENUS, MODE, &c. Circum-

stances; KEY, CLEFF, SIGNATURE, TRANSPOSITION, &c. STAFF, SCALE, GAMMUT, SOLFAING, MODULATION, &c. Instruments; ORGAN, BELL, TRUMPET, LYRE, CYMBAL, VIOLIN, HARPSICORD, &c.

" HYDROSTATICS, or the consideration of *FLUIDS*; their SPECIFIC GRAVITY, DENSITY, EQUILIBRIUM, &c. Instruments to measure the same; as ARMOMETER, HYDROSTATICAL BALANCE, &c. SIPHON, TORRICELLIAN, &c.—Motion thereof, in PUMP, FOUNTAIN, SPIRAL SCREW, HYDROCANISTERIUM, HYDROMANTIC, &c.

" PNEUMATICS, or the consideration of the *AIR*; its WEIGHT, DENSITY, PRESSURE, ELASTICITY, &c. CONDENSATION, RAREFACTION, MOTION, WIND, &c. in AIR-PUMP, SUCTION, VACUUM, &c. Measured by BAROMETER, THERMOMETER, HYGROMETER, MANOMETER, &c. ANEMOMETER, WINDMILL, &c.

" MECHANICS, including the structure and contrivance of *MACHINES*; as BALLANCE, STEELYARD, PULLEY, POLYSPAST, &c. WHEEL, CLOCK, WATCH, PENDULUM, SPRING, FUSEE, &c. CLEPSYDRA, COACH, ROTA ARISTOTELICA, PERPETUAL MOTION, &c. MILL, PRESS, VICE, LATH, LOOM, WINDLASS, &c. Operations of SWIMMING, DIVING, FLYING, &c.

" ARCHITECTURE, including the construction of *BUILDINGS*; as HOUSE, TEMPLE, CHURCH, HALL, PALACE, THEATRE, &c. SHIP, GALLY, GALLEON, ARK, BUCENTAURO, BOAT, &c. PYRAMID, MAUSOLEUM, PANTHEON, &c. CAPITOL, SERAGLIO, ESCURIAL, &c. ARCH, VAULT, BRIDGE, MONUMENT, TOMB, &c. Forms thereof; ROTUNDO, PLATFORM, PINNACLE, &c. PLANS, DESIGN, ICNOGRAPHY, PROFILE, &c. Parts; as FOUNDATION, WALL, ROOF, &c. DOOR, WINDOW, STAIRS, CHIMNEY, &c. ORDERS; as TUSCAN, DORIC, CORINTHIAN, &c. CARYATIDES, RUSTIC, GOTHIC, &c. COLUMN; PILASTER, ATTIC, &c. Parts thereof; ENTABLATURE, CAPITAL, PEDESTAL, &c. CORNICE, FREEZE, BASE, &c. VOLUTE, PEDIMENT, MODILLION, CONSOLE, &c. MOULDINGS; OGEE, TORE, ASTRAGAL, SCOTIA, ABACUS, OVULO, &c. Materials; as BRICK, STONE, TYLE, SLATE, SHINGLE, &c. TIMBER, WAINSCOT, GLASS, LEAD, PLASTER, &c. BEAM, RAFTER, MORTAR, NAIL, HINGE, KEY, LOCK, &c. QUARRY, MASONRY, &c.

" SCULPTURE, or the framing of STATUE, FIGURE, ORNAMENT, &c. in RELIEVO, CREUX, &c. as CARVING, POTTERY, PORCELAIN, &c. ENGRAVING; SEAL, DYE, &c. ETCHING, CUTTING, MEZZO-TINTO, &c. FOUNDRY; of BELL, LETTER, ORDINANCE, &c. COINING; MONEY, MEDAL, MEDALLION, &c. PILE, LEGEND, &c. LAPIDARY, TURNING, INLAYING, VANNERING, DAMASQUEENING, ENCHASING, &c.

" TRADES AND MANUFACTURES; as PRINTING, PAPER-MAKING, BOOK-BINDING, &c. GILDING, JAPANNING, GLASS-MAKING, GRINDING, &c. PLUMBERY, FORGING, HAMMERING, &c. WEAVING, BLEACHING, WHITENING, &c. FULLING, DYING, PRESSING, SHEERING, CALENDRING, TABBYING, FREEZING, &c. WOOLLEN, SILK, LINUM INCOMBUSTIBLE, &c. CLOTH, SERGE, TAFFETY, STOCKING, &c. VELVET, TAPESTRY, HAT, &c. TANNING, CURRYING, TAWING, &c. SHAMPOING, SHAGREEN, MOROCCO, &c. Making PARCHMENT, GLUE, GUN-POWDER, SMALT, SOAP, STARCH, &c. CANDLE, TAPER, TORCH, &c. STEEL, BUTTON, PIN, NEEDLE, PIPE, FAN, PERUKE, &c.

" PYROTECHNY, or ARTIFICIAL FIRE-works; including the consideration and use of GUN-POWDER, MATCH, FUSEE, &c. Of ORDINANCE, CANNON, GUN, MORTAR, &c. CARRIAGE, CHARGE, PROJECTION, RANGE, POINT-BLANK, RECOIL, &c. PETARD, CARCASS, SHOT, BOMB, GRANADO, &c. ROCKET, STAR, &c.

" MILITARY ARTS, including the consideration of *ARMIES*, FLEETS, CAVALRY, INFANTRY, &c. consisting of REGIMENTS, TROOPS, COMPANIES, PHALANX, LEGION, &c. SOLDIERS; DRAGOON, GRENADIER, FUSEEER, CUIRASSIER, ARCHER, JANISARY, SPAHI, VELITES, ARGYRASPIDES,

to such intervention of ours; and even pursue it up to its cause, and shew how it exists there: and trace the progress of the mind through the whole, and the order of the modifications induced by it.—This is a desideratum which we could not here decline entering upon, on account of its immediate relation to the present design. It is the basis of all learning in general; the great, but obscure hinge, on which the whole encyclopædia turns.

T O

GYRASPIDES, GEND'ARMERY, &c. Divided into SQUADRON, BATTALION; BRIGADE, &c. commanded by GENERAL, MARSHAL, BASHAW, ADMIRAL, &c. LIEUTENANT, BRIGADIER, COLONEL, CAPTAIN, SERJEANT, MAJOR, ADJUTANT, ENSIGN, QUARTER-MASTER, TRIBUNE, CENTURION, PRIMIPILUS, &c. in BATTLE, SIEGE, MARCH, CAMP, &c. Ranged in LINE, COLUMN, &c. Motions; ATTACK, RETREAT, HALT, &c. EVOLUTIONS; WHEELING, COUNTER-WHEELING, &c. SIGNALS; WORD, DRUM, CHAMADE, &c. GUARDS; GARRISON, PIQUET, PATROOL, ROUND, QUARTER, PLACE OF ARMS, &c. STANDARD, BANNER, EAGLE, LABARUM, &c. Their ARMS; ARTILLERY, CARABINE, MUSQUET, &c. HELMET, BUCKLER, PELTA, COURASS, &c. ARIES, BALISTA, CATAPULTA, SLING, &c.

¹¹ FORTIFICATION, or the construction of *FORTRESSES*; as CITADEL, CASTLE, TOWER, &c. FORT, STAR, REDOUT, &c. WORKS, or parts thereof; RAMPART, BASTION, DITCH, COUNTERSCARP, CURTIN, &c. RAVELING, HORN-WORK, CROWN-WORK, &c. APPROACHES; TRENCH, SAP, MINE, &c. LINE, PARALLEL, CIRCUMVALLATION, &c. BATTERY, ATTACK, &c.

¹² ASTRONOMY, or the doctrine of the *HEAVENS*; their CIRCLES, ECLIPTIC, ZODIAC, MERIDIAN, EQUATOR, VERTICAL, AZIMUTH. GALAXY, &c. POINTS; as POLE, ZENITH, NADIR, &c. Celestial bodies, viz. STARS, SUN, &c. Affemblage thereof; into SIGN, CONSTELLATION, &c. Their PRECESSION, CULMINATION, REFRACTION, DECLINATION, ASCENSION, LONGITUDE, LATITUDE, ALTITUDE, AMPLITUDE, AZIMUTH. PLANETS; as SATURN, VENUS, EARTH, MOON, SATELLITE, COMET, &c. Their PLACES, ASPECTS, SYZYGIES, CONJUNCTION, QUADRATURE, DIAMETER, DISTANCE, PERIOD, REVOLUTION, ORBIT, NODE, &c. Their STATION, RETROGRADATION, EQUATION, &c. Their PHASES, ECLIPSE, PENUMBRA, OCCULTATION, PARALLAX, CREPUSCULUM, MACULÆ, &c. Observations thereof; taken with the QUADRANT, GNOMON, MICROMETER, RETICULA, &c. Collected in CATALOGUE, TABLES, &c. HYPOTHESES, or SYSTEMS thereof; COPERNICAN, TYCHONIC, PTOLEMAIC, &c. Exhibited in SPHERE, GLOBE, &c.

¹³ CHRONOLOGY, or the doctrine of *TIME*; measured by YEAR, MONTH, WEEK, DAY, HOUR, AGE, PERIOD, CYCLE, &c. Commencing from EPOCH, INCARNATION, HEGIRA, &c. Laid down in FASTI, ALMANACK, CALENDAR, JULIAN, GREGORIAN, &c. Accommodated to FEASTS, FESTES, EASTER, &c. by means of EPACT, GOLDEN NUMBER, DOMINICAL, &c.

¹⁴ DIALING, including the FURNITURE, and projection of *DIALS*; HORIZONTAL, DECLINING, RECLINING, DEINCLINING, &c. MOON-DIAL, RING-DIAL, HORODICTICAL, &c. Instruments; as DECLINATOR, ANALEMMA, SCALES, &c.

¹⁵ GEOGRAPHY, including the doctrine of the *EARTH*, or *GLOBE*: its CIRCLES; PARALLEL, TROPIC, HORIZON, AXIS, POLES, &c. Its ZONES, CLIMATES, &c. Its PLACES; their LONGITUDE, LATITUDE, DISTANCE, ELEVATION, &c. Inhabitants; ANTIPODES, ABORIGINES, TROGLODYTES, ASCITI, PERSITI, &c. Instruments relating thereto; GLOBE, MAP, &c.

¹⁶ NAVIGATION, or the consideration of *SAILING*; in SHIP, FRIGATE, BARK, &c. Parts thereof; MAST, ANCHOR, SAILS, YARDS, CORDAGE, CAPSTAN, RUDDER, DECK, &c. Their COURSE, RHUMB, &c. shown by COMPASS, NEEDLE, VARIATION, &c. Directed by STEERING, CURRENT, &c. Distance, or RECKONING, by LOG, OBSERVATION, LONGITUDE, LATITUDE, &c. Taken by FORE-STAFF, BACK-STAFF, ASTROLABE, NOCTURNAL, SINICAL QUADRANT, &c. Wrought by GUNTER, CHART, MERCATOR, TRAVERSE, &c. The operations of SOUNDING, WEIGHING, CAREENING. SIGNALS; BUOY, &c.

¹⁷ COMMERCE, or the affairs of *MERCHANTILE*; including MONEY, COIN, SPECIES, &c. as POUND, CROWN, SHILLING, PENNY, STERLING, DUCAT, DOLLAR, PIECE of eight, TALENT, SESTERCE, SHEKEL, and the like. WEIGHTS; LIBRA, OUNCE, &c. MEASURES; FOOT, YARD, STANDARD, &c. Given in EX-

CHANGE, TRUCK, PERMUTATION, COMMUTATION, &c. for MANUFACTURE, SPICE, DRUG, WOOLEN, SLAVE, NEGRO, &c. IMPORTED, EXPORTED, TRANSPORTED, CONVOY, FLOTA, &c. Conditions thereof; TARIFF, CONTRABAND, CHARTER-PARTY, FREIGHT, AVERAGE, &c. CUSTOMS, DUTY, TUNNAGE, POUNDAGE, &c. BOTTOMRY, ASSURANCE, PIKE, &c. Transacted by COMPANY; as HANS, STEEL-YARD, EAST-INDIA, TURKEY, HAMBURGH, MISSISSIPPI, SOUTH SEA, ASSIENTO, REGISTER, COLONY, FISHERY, FACTORY, &c. At STAPLE, FAIR, MARKET, BANK, EXCHANGE, &c. By COMMISSION, FACTOR, BROKER, &c. WEIGHING, paying by BILL; at USANCE, ACCEPTANCE, PAR. PROTEST, DISCOUNT, RECHANGE, &c. ACTION, SUBSCRIPTION. BOOK-KEEPING, &c.

¹⁸ ANATOMY, or the ANALYSIS of *ANIMAL BODIES*, and their PARTS, viz. BONES; as CRANIUM, RIB, VERTEBRA, RADIUS, FEMUR, TIBIA. SACRUM, PUBIS, PATELLA, &c. Their ARTICULATION, APOPHYSES, &c. MUSCLES; ABDUCTOR, ADDUCTOR, ERECTOR, DEPRESSOR, DELTOIDES, SARTORIUS, CUCULLARIS, ORBICULARIS, SPHINCTER, &c. Their TENDONS, FIBRES, &c. VESSELS; as ARTERY, AORTA, ASPERA, TRACHEA, PULMONARY, &c. VEINS; as CAVA, PORTA, JUGULAR, CAROTID, &c. GLANDS; as PANCREAS, PAROTIDES, PROSTATES, &c. NERVES; OPTIC, OLFACTORY, AUDITORY, &c. LYMPHATIC, LACTEAL, MESARAIIC, MUCILAGINOUS, &c. Their VALVES, TUNICS, ANASTOMASES, &c. Their HUMOURS; as CHYLE, BLOOD, SPIRIT, SEED, GALL, URINE, MILK, SWEAT, MARROW, &c. MEMBRANES; PANNICLE, CUTIS, CUTICULA, PAPILLA, &c. VENTERS, HEAD, MENINGES, BRAIN, &c. EYE, EAR, PUPIL, TYMPANUM. TONGUE, TOOTH, PALATE, LARYNX, GLOTTIS, OESOPHAGUS, &c. VISCERA, STOMACH, LUNGS, HEART, &c. LIVER, SPLEEN, KIDNEY, INTESTINES, BLADDER, &c. FUNCTIONS or operations thereof; RESPIRATION, DEGLUTITION, DIGESTION, CHYLIFICATION, SANGUIFICATION, CIRCULATION, SYSTOLE, NUTRITION, SECRETION, EXCRETION, PERSPIRATION, VOMITING, &c. GENITALS; PENIS, TESTICLES, CLITORIS, MATRIX, NYMPHA, HYMEN. EMBRYO, ZOOPHYTE, MOLE, &c. ERECTION, GENERATION, CONCEPTION, GESTATION, DELIVERY, LOCHIA, MENSES, &c.

¹⁹ MEDICINE, including the consideration of *LIFE* and *HEALTH*: conditions thereof; LONGEVITY, STRENGTH, TEMPERAMENT, &c. Means; as FOOD, DRINK, EXERCISE, &c. Opposites; as DEATH, DISEASE, &c. Kinds thereof; CHRONIC, EPIDEMIC, CONTAGIOUS, &c. as PLAGUE, FEVER, GOUT, APOPLEXY, EPILEPSY, PALSY, POX, POLYPUS, PALPITATION, MANIA, HYDROPHOBIA, SPASM, HYPOCHONDRIC, PHTHISIS, SCORBUTUS, DROPSY, TYMPANITES. LEPRO, ITCH, PLICA, OPHTHALMIA, GUTTA, CATARACT, and the like. WOUND, ULCER, CANCER, FRACTURE, FISSURE, CARIES, and the like. SYMPTOMS; SIGN, DIAGNOSTIC, PULSE, URINE, &c. PRESCRIPTION, CRISIS, CURE, &c. REGIMEN, DIET, MEDICINE, &c. Kinds thereof; SPECIFIC, PURGATIVE, EMETIC, DIAPHORETIC, DIURETIC, ALTERNATIVE, STYPTIC, ASTRINGENT, EMOLIENT, OPIATE, ABSORBENT, CAUSTIC, ANODYNE, SYMPATHETIC. CARDIAC, CEPHALIC, FERRIFUGE. ANTIMONIAL, CHALYBEAT, MERCURIAL, and the like. OPERATIONS; as EVACUATION, PHLEBOTOMY, SUTURE, LITHOTOMY, AMPUTATION, INOCULATION. SALIVATION, COUCHING, CUPPING, TREPPANNING. TOUCHING, PARACETISIS, STROAKING, TRANSFUSION, CASTRATION, CIRCUMCISION, and the like.

²⁰ PHARMACY, or the PREPARATION and COMPOSITION of *REMEDIES*; as MITHRIDATE, TREACLE, HIERA PICRA, LAUDANUM, DIASENNA, TURBITH, CALOMEL, &c. in the form of ELECTUARY, CONFECTION, EXTRACT, TINCTURE, SYRUP, TROCHE, PILL, POWDER, LOHOC, POTION, APOZEM, DROPS, medicated ALES, WINES, WATERS, UNGUENT, EMPLASTER, PURGE, CLYSTER, SUPPOSITORY, PESSARY, COLLYRIUM, &c. From DRUGS, or SIMPLES; as GUALACUM, SASSAFRAS, COLOCYNTHIS, CROCUS, RHUBARB, CASSIA, SENNA, CORTEX, STYRAX, JALAP, SCAMMONY, OPIUM, &c. FATS, CLAWS, HORNS, &c. of VIPER, CRAB, ELK, &c. CANTHARIDES, MILLEPEDES, MUMMY, USNEA, ICHTHYOCOLLA, &c. ANTIMONY, ORPIMENT, ASPHALTUS, BISMUTH, MARCASITE, BOLE, CINNABAR, MARS, VENUS, &c.

TO be more explicit. Words are the immediate matter of knowledge; I mean, of knowledge considered as communicable, or capable of being transmitted from one to another. We should have known many things without language; but it would only have been such as we had seen or perceived ourselves. The observations of others, could no way have been added to our own; but every individual must have gone through a course for himself, without any assistance either from predecessors, or contemporaries.—It is evident, that in this case, nothing like an art or science could ever have arose: the little system of things, which come immediately in one man's way, would but have afforded a slender stock of knowledge; especially to a being whose views were all to terminate in himself. Add, that as the chief occasions of his observation would have been of the same kind with those of other animals; it is probable his knowledge would not have been very different, whether we consider its quantity or quality. It is confessed, that all our knowledge, in its origin, is no other than sense; whence it should follow, that one being has no natural advantage over another, in its dispositions for knowledge, other than what it has in the superior number, extent, or acuteness of its senses.

IT is, then, to language that we are chiefly indebted for what we call *science*. By means of language our ideas and notices, though things in their own nature merely personal, and adapted only to private use, are extended to others, to improve their stock. And thus, by a kind of second sense, a man gets perceptions of the objects that are perceived by all mankind; and is present, as it were by proxy, to things at all distances from him: we hear sounds made a thousand years ago, and see things that pass a thousand miles off. If the eagle really sees, the raven smells, and the hare hears, farther and better than man; their sense, at best, is but narrow, in comparison of ours; which is extended, by the artifice of language, over the whole globe. They see with their own eyes only; we with those of a whole species.—In effect, by language, we are upon much the same footing, in respect of knowledge, as if each individual had the natural sense of a thousand: an accession, which, alone, must have set us far above any other animals. But at the same time, this very accession of a multitude of ideas, more than naturally belonged to us, must have been, in great measure, useless, without certain other faculties of ordering and arranging them; of abstracting, or making one a representative of many; of comparing them together, in order to learn their relations; and of combining them, &c. The effect thereof, is what we call *discourſing*, and *philosophizing*; whence arise *doctrines, theories, &c.*

EVERY word is supposed to stand for some point, article, or relation of knowledge. From which it follows, that the vocabulary of any language, is representative of the several notices of the people, among whom it obtains: I mean of the primary, or absolute notices; for by the construction of these words with one another, a new set of secondary, or relative notices are expressed.—To enter better into this, it may be observed, that the several objects of our senses, with that other set of things analogous hereto, the proper objects of the imagination, are represented by fixed names*; denoting some of them, individuals†; others kinds‡, &c. Now these, which make the first, or fundamental part of a language, it is obvious, are no other than a representation of the works of nature and art, as they exist in a kind of still life, or in a state of inaction, and independency one upon another. But, in regard we do not find the Creation thus quiescent, but observe a great number of mutations arise in the things we are conversant among; we are hence put under a necessity of framing another set of words, to express these variations, and the actions to which they are owing, with the several circumstances and modifications thereof§. By this means, nature is removed, as it were, out of her dormant constitution, and shewn in action; and thus may occasional descriptions be framed, accommodate to the present state of things.

* AGRICULTURE, or the TILLAGE and improvement of SOILS, CLAY, SAND, EARTH, &c. by the operations of PLOUGHING, FALLOWING, BURNING, SEMBRADORE, SEMINATION, MANURING, &c. To produce CORN, HEMP, FLAX, LIQUORICE, SAFFRON, &c. For MALT, FARINA, &c. GRANARY, THRESHING, &c. The culture of TREES, TIMBER, &c. by PLANTING, SHROWDING, BARKING, &c. For COPPICE, PARK, PADDOCK, HEDGE, PASTURE, &c.

† GARDENING, including the culture of HERBS, FLOWERS, FRUITS, &c. as DWARF, STANDARD, WALL, ESPALIER, SALET, &c. The operations of PLANTING, TRANSPLANTING, REPLANTING, WATERING, ENGRAFTING, INOCULATING, PRUNING, PINCHING, VARIEGATING, &c. Preventing DISEASES, BLIGHTS, GUM, &c. The Use and ordering of a HOT-BED, GREENHOUSE, NURSERY, GARDEN, VINEYARD, &c. Their EXPOSURE, WALLS, HORIZONTAL SHELTER, &c. WALKS, GRASS-PLOT, TERRACE, QUINCUNX, PAR-TERRE, &c.

‡ MANAGE, including the consideration of HORSES; their AGE, COLOUR, TOOTH, HOOF, STAR, &c. PACES; as AMBLE, GALLOP, &c. AIRS; as VOLTE, DEMIVOLTE, CURVET, CAPRIOLE, &c. AID, CORRECTION, HAND, BIT, &c. SADDLE, SHOE, BRIDLE, &c. DISEASES; as HALTING, FARCY, STAGGERS, SCRATCHES, YELLOWS, &c. Operations; as ROWELLING, CURTAILING, GELDING, &c.—HAWK, HAWKING, HOOD, &c. RECLAIMING, CASTING, &c. PIP, FILANDERS, &c.—HOUND, HUNTING, &c. RUT, STALKING, BIRDLIME, TRAMMEL-NET, BAT-FOWLING, &c.—FISH, FISHING, FISHERY, &c. ANGLING, HOOK, ROD, FLOAT, &c. BAIT, FLYING, HUMING, &c.

§ GRAMMAR, or the consideration of LANGUAGE; as ENGLISH, LATIN, GREEK, HEBREW, FRENCH, &c. Their DIALECT, IDIOM, PATAVINITY, &c. Matter thereof; LETTER, VOWEL, CONSONANT, DIPHTHONG, ASPIRATE, CHARACTER, SYMBOL, HIEROGLYPHIC, &c. SYLLABLE, PARTICLE, &c. WORD; kinds hereof; NOUN, PRONOUN, VERB, &c. SUBSTANTIVE, ADJECTIVE, &c. Their CONSTRUCTION, CONCORD, REGI-

MEN, &c. IN CASE; NOMINATIVE, GENITIVE, &c. GENDER; MASCULINE, &c. NUMBER, PERSON, MOOD, TENSE, &c. INTO SENTENCE, PHRASE, PERIOD, &c. Distinguished by POINT, ACCENT, COMMA, &c. Delivered by PRONUNCIATION, WRITING, ORTHOGRAPHY, &c.

§ HERALDRY, or the consideration of COATS; consisting of FIELD, CHARGE, FIGURE, &c. as CROSS, CHEVRON, BEND, PALE, &c. with ABATEMENT, DIFFERENCE, QUARTERING, &c. Composed of COLOUR, METALS, POINTS, &c. Born on ESCUTCHEON, SHIELD, &c. Accompanied with SUPPORTERS, HELMET, CREST, MANTLING, MOTTO, &c. DEVISE, EMBLEM, REBUS, ENIGMA, &c. And described by BLAZON.

§ RHETORIC, or the means of PERSUASION; as INVENTION, AMPLIFICATION, TOPIC, PLACE, ARGUMENT, PASSIONS, MANNERS, &c. DISPOSITION, EXORDIUM, NARRATION, CONFIRMATION, PERORATION, &c. ELOCUTION, SUBLIME, STYLE, NUMBERS, &c. FIGURES; as EXCLAMATION, PLEONASM, EPIPHONEMA, APOSTROPHE, PROSOPOEIA, ANTI-THESIS, &c. TROPES; as METAPHOR, ALLEGORY, SYNECDOCHÉ, SARCASTIC, HYPERBOLE, CATACHRISIS, &c. ACTION, GESTURE, MONOTONIA, &c. COMPOSITIONS; as ORATION, DECLAMATION, PANEGYRIC, &c. PARABLE, ESSAY, DIALOGUE, HISTORY, &c.

§ POETRY, including the consideration of VERSE; its MEASURE, FEET, QUANTITY, &c. as HEXAMETER, ALEXANDRINE, SPONDEE, IAMBIC, &c. RHYME, STANZA, &c. COMPOSITIONS; as EPIGRAM, ELEGY, SONO, MADRIGAL, HYMN, ODE, PINDARIC, &c. ECGLOGUE, SATYR, GEORGIC, &c. ANAGRAM, ACROSTIC, BURLESQUE, MACARONIC. LEONINE, TROUBADOUR, &c. DRAMATIC; as TRAGEDY, COMEDY, HILARIO-TRAGEDIA, FARCE, &c. Parts thereof; ACT, SCENE, PROTASIS, EPITASIS, CATASTROPHE, &c. Circumstances; PROLOGUE, EPILOGUE, SOLILOQUY, CHORUS, &c. LAWS, UNITY, ACTION, &c. EPIC; its FABLE, HERO, MACHINES, &c. CHARACTERS, MANNERS, SENTIMENTS, &c. PERSONIFICATION, PROPOSITION, INVOCATION, EPISODE, &c. ILIAD, ODYSSEE, RHAPSODY, &c.

* Nouns.

† Proper Names.

‡ Appellatives.

§ Verbs, Particles, Adverbs, &c.

HENCE arise two kinds of knowledge; the one absolute, including the standing phenomena; the other relative, or occasional, including what is done, or passes with regard to them. The former is, in some sense, permanent; the latter is merely transient, or historical. The first is held forth, as already observed, in the vocabulary: the second is vague, and uncircumscribed by any bounds; being what fills all the other books. In effect, this last, being in some measure casual, may be said to be infinite: for that every new case, *i. e.* every new application and combination of the former, furnishes something new.

IN the wide field of intelligibles, appear some parts which have been more cultivated than the rest; chiefly on account of the richness of the soil, and its easy tillage; but partly too, by reason of the skilful and industrious hands under which it has fallen. These spots, regularly laid out, and conveniently circumscribed, and fenced round, make what we call the *Arts and Sciences*: and to these have the labours and endeavours of the men of curiosity and learning, in all ages, been chiefly confined. Their bounds have been enlarged from time to time, and new acquisitions made from the adjoining waste; but still the space of ground they possess is but narrow; and there is room either to extend them vastly, or to lay out new ones.

THEY were divided, by their first discoverers, into a number of subordinate provinces, under distinct names; and have thus remained for time immemorial, with little alteration. And yet this distribution of the land of science, like that of the face of the earth and heavens, is wholly arbitrary; and might be altered, perhaps not without advantage. Had not Alexander, Cæsar, and Gengiskan lived, the division of the terraqueous globe had, doubtless, been very different from what we now find it: and the case would have been the same with the world of learning, had no such person been born as Aristotle. The first divisions of knowledge, were as scanty and ill concerted, as those of the first geographers; and for the like reason: and though future Bacons, Cartes's, and Newtons, by opening new tracks, have carried our knowledge a great way further; yet the regard we bear to the antient adventurers, and the established division, has made us take up with it, under all its inconveniences, and strain and stretch things, to make our later discoveries quadrate thereto. I do not know whether it might not be more for the general interest of learning, to have the partitions thrown down, and the whole laid in common again, under one undistinguished name. Our inquirers, in such case, would not be confined to so narrow bounds; but we should be led to explore many a rich track, now doomed to lie neglected because without the pale.

ART, and SCIENCE, are, indeed, words of familiar use, and great significance, but, I doubt, little understood: philosophers have long laboured to explain and ascertain their notion and difference; but all their explanation amounts to little more, than the substituting one obscure notion for another. Their attempts have usually terminated in some abstracted definition, which rather casts obscurity, than light on the subject; and expresses very little of the essence, and obvious phenomena thereof.—To come at which, we must be at the pains of a new investigation.

TO SCIENCE, then, seem to belong such things as men may discover by the use of sense and reasoning: whatever the mind descries in virtue of that faculty whereby we perceive things and their relations, is matter of science: such are the laws of nature, the affections of bodies, the rules and criterions of right and wrong, truth and error, the properties of lines and numbers, &c. Science, in effect, is the result of reason and sense, in their general or natural state, as imparted to all men, and not modified, or circumstantiated by any thing peculiar in the make of a man's mind, the objects he has been conversant among, or the ideas he has present to him. In fine, science is no other than a series of deductions, or conclusions, which every person, endued with those faculties, may with a proper degree of attention, see, and draw: and a science, *i. e.* a formed science, is no more than a system of such conclusions, relating to some one subject, orderly and artfully laid down in words. Thus a person who has all the ideas expressed in Euclid's *Definitions*, and sees the immediate connection of those in his *Axioms*; which no man, acquainted with his language, can be supposed without; may be said to have it in his power, with attention and industry, to form all the theorems, and problems that follow: He has nothing to do, but to range those ideas orderly in his mind, compare them together, one by one, in all their changes, and put down the immediate relations observed in the comparison, *i. e.* their parity, imparity, &c. And after the relations of each to each are thus got, which make a kind of primary propositions; to proceed to combine them, and take down the relations resulting from a comparison of the several combinations. By such means, without any other helps than penetration, and perseverance, might he make out an infinite number of propositions; possibly more than Euclid has done: there being a new relation, *i. e.* a new proposition, resulting from every new combination.

TO ART, on the other hand, belong such things as mere reason would not have attained to; things which lie out of the direct path of deduction, and which require a peculiar cast, or turn of mind, to see or arrive at. A man might call these, the results of particular, or personal reason, in opposition to the former; but that such a denomination would be thought unphilosophical. It may, perhaps, be more just to consider reason, here, as modified or tinted with something in the complexion, humor, or manner of thinking of the person; or as restrained and diverted out of its proper course, by some views or notices peculiar to him.—The difference between the two, may be illustrated by that between wit and humour; the former whereof is a general faculty of exciting agreeable and surprizing pictures in the imagination; and the latter a particular one: the former is pure and absolute in its kind; the latter tinged with something foreign and complexional.

AN art and a science, therefore, only seem to differ as less and more pure: a science is a system of deductions made by reason alone, undetermined by any thing foreign, or extrinsic to itself: an art, on the contrary, requires a number of data, and postulates, to be furnished from without; and never goes any length, without, at every turn, needing new ones. It is, in one sense, the knowledge and perception of these data that constitutes the art: the rest, that is, the doctrinal part, is of the nature of science; which attentive reason alone will descry.

AN art, in this light, appears to be a portion of science, or general knowledge, considered, not in itself, as science, but with relation to its circumstances, or appendages. In a science, the mind looks directly backwards and forwards, to the premises, and conclusions: in an art we also look laterally, to the concomitant circumstances. A science, in effect, is that to an art, which a stream running in a direct channel, with regard to any thing but its own progress, is to the same stream turned out of its proper course, and disposed into cascades, jets, cisterns, ponds, &c. In which case, the progress of the stream is not considered, with regard to itself, but only as it concerns the works; every one of which, modifies the course of the stream, and leads it out of its way. It is easy to trace the progress of the former, from its rise, to its issue; in regard it flows consequentially: but a man ever so well acquainted with this, will not be able to discover that of the latter, in regard it depends on the genius, humour, and caprice of the engineer who laid the design.

THESE are some of the different characters, or conditions of art and science; but there is a difference between them prior to any of these, and of which these are only consequences. The origin of them all lies higher, in the principle of action, or operation, above specified; namely, as the mind is either active or passive, in respect of them. With regard to this, those things may be said to belong to science, which we only

fee, or perceive; which flow from the nature and constitution of things, by the sole agency of the author thereof; subservient only to his general purposes; exclusive of any immediate agency, or intervention of ours. — And, on the contrary, those things belong to art, wherein such science or perception is further modified, and applied by us, to particular purposes and occasions of our own. — From hence arise the several differences above-mentioned: for the matters of art are only personal, as they are, according to the measure of the artist's natural faculties, in respect of quantity, and degree; and to the complexion and cast of his moral faculties, in respect of their quality. The perception, even of matters of art, is of the nature of science: so that thus far the two agree: and their differences only commence, from the superinducing a farther modification in the matter of such perception; and the giving it a new direction to some particular end. By means hereof, it becomes invested with a new set of conditions, and circumstances wholly personal; as being all framed, and adapted to the particular view and aim of the artist, and conducted according to his particular degree of knowledge and address; which is the effect of a particular set of objects, and a particular organism of body. In a word, in art there is a moral view or motive, superadded to the natural science, or perception; which motive is the proper principle, or primum mobile of art: perception is its matter; and some member of the body its organ, or instrument. And from such new principle, &c. arise a new set of secondary perceptions analogous to the natural, and primary ones. — The whole, therefore, ends in this, that science arises from a natural principle, art from a moral one; or even, as moral matters are also, in one sense, natural, science may be said to be of divine original; art of human *.

HAVING

* THIS doctrine may seem to overturn the Aristotelian definition of art: *Artis est habitus mentis cum rella ratione effectivus*, a habit of the mind operative according to right reason; which, at first sight, appears to be taken from a partial consideration of the subject. — If it be the single character or condition of art, to proceed according to right reason; the more and purer this reason, the more perfect the art. But, in some of the arts, reason appears to have little to do; and the less, as those arts are in greater purity and perfection. — Thus it is in poetry: a man that would undertake an ode, or an epic poem, on the strength of his reason, would be miserably mistaken: all his efforts would not carry him above the humble sphere of versification, where he must be contented to wait for an impulse of another kind. So far is reason from leading the way, that it can scarce follow at a distance, so as to keep in sight. The principle of motion is evidently something other than reason; otherwise, the greatest philosophers would be the best poets, and vice versa. On the contrary, most of us have known people weak enough in their rational, yet powerful in their poetical faculties. Poetry is an appendage of one kind of madnes, and accordingly passes, among physicians, for a symptom thereof. — Let not this be thought any reflection upon the poets: a spice of the *μανικος παθος*, is no unexquisite thing: a man, seated on that bench, finds himself in very good company; some of the greatest philosophers, prophets, legislators, doctors, fathers, and saints, of all ages, being confessedly his associates. It is remarkable with what respect and awe the ancients treated people suspected to be touched: the very names they called them by import a high veneration, and places them as it were, at the threshold of Jupiter †. One of their most common appellations, *numine afflatus*, is, at the same time, the most just and philosophical that can be thought of. In effect, a share of fury and enthusiasm is held, by them, a condition absolutely necessary, in order to rise above the crowd. We may add, that the poets themselves have, an hundred times, expressly attributed all their greater and happier thoughts, to enthusiasm, ecstacy, and fury; and they do it implicitly, almost in every piece they write: it being their standing practice, to take a formal leave of common sense at first setting out, and call a muse for their future guide; which, to talk out of the poetical style, is as much as to say, they resign themselves over to the conduct of genius, and imagination, which they now find strong and prevalent in them: thus inspired, a new scene of objects arises: castles on castles: and they see things invisible to other eyes. — From such prevalence of imagination, arises what we call POETRY, which is common to all men, in a greater or less degree: philosophers have a little of it, poets a great deal, and lunatics scarce any thing else.

IT may look strange to say, that the principle is precisely of the same kind in them all. We are used to consider it, in the two first, as constitution; in the latter, as disease: in the former, it is only occasional; in the latter, perpetual: in the one, it is arbitrary, and uncontrollable; in the other, limited, and restrained. The barque, in the one case, drives off necessity, as wanting cable and anchor to hold her; and in the other, sails out of choice, as finding the wind favourable, and the voyage desirable. But all this amounts to little more than a difference in degree, between the fictions of the poet, and those of the lunatic: the moving principle is the same in both, though its effects be various. If the proper balance and adjustment between the powers of reason and imagination be wanting, yet they still retain their nature: as the wind is the same, whether the pilot directs the helm or not.

THIS doctrine is plainly countenanced by the ancients; who, in some respects, seem to have had clearer and juster notions than the moderns; as being less embarrassed with the jargon and refinements of the scholastic learning. Philosophy, with them, was one degree more simple, and obvious than among us: nature was not yet covered and concealed under so much elucidation, but afforded more frequent, and nearer views of herself. — Accordingly, the divine Plato, in his *Phædrus*, asserts, “that enthusiasm and madnes, are one and the same thing;” and has a long and cogent discourse, to prove that it must be so: and among the several species of enthusiasm, he expressly ranks poetry. In effect, the *συναίσιμος*, and *μανικός*, make two of the principal branches in his division of enthusiasm, or inspiration. And Plutarch, though he divide enthusiasm somewhat differently from Plato; yet agrees with him in making poetry a species of it. Nay, the most reserved of all the ancient critics, Longinus, declares, “that the poet is possessed with a kind of enthusiasm, that he believes he really feels what he speaks; and represents it to others, that they catch the enthusiasm, and see it likewise.” Add, that speaking of the orators, he does not scruple to use *συναίσιμος* and *μανικός*, as synonymous with *μανία*.

THE principle, then, of the art of poetry, is something other than reason; and I know of no art that has more of the nature and essence of an art, than poetry: nothing that can fashion, build, and produce things so fine, and so fast: sculpture, architecture, agriculture, &c. are arts, but in an inferior degree. — And yet, turning another side of things forward, poetry will scarce appear to have any thing of an art in it, but rather to be all the work of nature; wherein human thought and study have the least hand. It is produced by a principle superior to that of reason, i. e. a more immediate action of the author of nature. — But the same may be said of most of the other arts; and when we say that art produces effects, we mean nature does so. The poet's imagination may be considered as a field, wherein the author of nature produces a set of objects, which existed not before: new images arise here, like new plants, according to the settled laws of the Creator; so fruitful is the womb of nature! New worlds, innumerable, arise out of every particle of an old one.

THE *passive* arts, as some love to call them, i. e. those from which permanent effects arise, may be considered, as so many secondary, or derivative natures, raised by engraftment, from the old stock; and spreading out, or projecting from this or that part thereof. — Here, at first sight, man appears somewhat in quality of creator; the potter's power over his clay, has been made a shadow or similitude of that of the Deity over his works: and yet the potter, at best, is only accessory, or occasional to his own productions. Nature, that is, the power or principle of action and motion, to which we owe this visible frame, and all the appearances and alterations therein, acts by fixed laws, which necessarily produce different effects, according to the different circumstances of things: thus a glass globe, being swiftly revolved about its axis, and a hand applied to its surface, grows warm, emits light, attracts bodies, &c. &c. becomes a hot, luminous, electrical body; though, before, it had none of those properties. So gunpowder, a mass of dark, inert, motionless matter, being only touched with a lighted brand, instantly blazes up, and smokes, with noise; perhaps bursts a rock, or drives a ball in a parabolical direction, and levels a tower, or other work. — Now nothing arises here, but in consequence of pre-established laws, which import, that the globe and the powder, whenever by any means they come under such circumstances, shall exhibit such appearances. There are no two bodies in nature more different from each other, than the same is from itself, under the different circumstances of contiguity, or non-contiguity with some other body, e. g. with a spark of fire. But both states are equally natural; and there must be a law of nature, to produce the appearance of one state, as well as of the other. — Now the agency of man amounts to this, that he has it in his power to put bodies in such circumstances, as are necessary to make this or that respective law take hold of them. And this we call *art*; and by this means, we can produce a number of things, or bring them into act, which otherwise would have remained in eternal non-entity. — Man may be said to create them, but no otherwise than the apothecary creates the blister, or the gardener the apple; i. e. those effects would necessarily have arisen, upon the same position of the cantharides and the cutis, and the scion and stock, if there never had been apothecary or gardener in the world.

WE may define the works or productions of art, therefore, to be all those phenomena, or effects, which would not have arisen without the agency or intervention of man. But man can only be said to act, or intervene so far, as what he does is his own principle, without being moved, or directed by any external power; i. e. so far as he is exempted from the influence of any necessary laws of nature, concurring, however remotely, to such effect. So that if, as some philosophers have maintained, man were not really and truly a free agent, there would be no such thing as art, in the sense here understood; but art would only be a name given to that system or series of effects, to which man is made by nature, and in her hands, subservient; and might, with equal reason, be attributed to such effects, as any other natural production is subservient to.

WE see then, how far man is concerned in the productions of art. Our endeavours are contrived, by nature, to be means accessory to the laws taking place, from whence the effects are to arise. We are part of the chain, whereby the effect is connected to the cause. The circumstances are in our power, on which such and such laws depend; and thus far we may be said to be active, in the case of art; supposing that there is nothing higher, or further; and that the chain ends with us: in a word, that our agency is not subordinate, but collateral to that of the Almighty. But if there be other superior laws which respect those same circumstances and which are not in our power, i. e. if the circumstances necessary to the former laws be, themselves,

† *Θορμαλίας, Εὐθεστίας, Εὐθεστικοί, Θουρηπῆτες, Εὐθεί, Καλῶχοι, Ecstatici, Phrenetici, Pythii, Sideræ, &c.*

HAVING discussed the nature and characters of *art and science*, it remains to settle the notion of a *TERM* of *art*; an expression as little understood as any thing in nominations of knowledge, under this or that habitude; and words are representatives of the several parts thereof. The whole compais of words, in all their cases, is supposed equivalent to the whole system of possible science,

themselves, supposed the effects of necessary laws, and the immediate work of nature; our agency will dwindle into nothing. The utmost that can be said of us in such case, is, that we are active in respect of the one, and passive in respect of the other; which, to most people, may appear a kind of contradiction. — The statue cannot be formed, unless our inclination concur thereto; so far its existence depends on us: but are our inclinations, with respect thereto, of our own growth; or do they arise naturally, in consequence of an apprehension of good, and advantage in the subject? That is, does any thing appear good and advantageous to us, absolutely, and of itself? or only what the Creator represents to us as so? And do we desire and pursue this seeming good, from any principle and tendency that is in us, other than what we owe to his laws? The difficulty seems to amount to this; whether between our faculties of apprehending, or willing, and their respective objects, there be any relation which he did not create? If any allege, that it is such relation constitutes the faculty; and therefore, that the question ends in this, whether our faculties are from God, or ourselves; *i. e.* whether they be the causes of themselves? I should suspect some sophism in the case, which, at present, I have not penetration enough to detect.

BUT, having traced the agency of man thus far, we must here desist; and from the passive arts, resume the consideration of the active ones; *i. e.* we must pass from what art does out of us, to what it does in us: or rather, from the arts whose source is supposed in ourselves, and which proceed outwards; to those whose source seems without us, and act inwards; that is, from those which arise from our observation and reason, directing us how to minister occasions to the laws which obtain in the external world; to those which flow into our imagination, and furnish occasions to the laws which obtain in the internal world. — An inquiry which may, perhaps, carry us where the reader little imagines; but which will afford an ample discussion of the principle above established; and a further insight into the origin and cause of science and art, and the nature and measure of our agency, and passion therein.

WE have already said some thing concerning poetry; not for its own sake, but as a proper instance to illustrate the nature of art in. It makes the lowliest article in our *Analysis*, and may be considered as the last in the scale of arts; there being a sort of progression, from the beginning of the analysis, to the end. It begins with the first matter of knowledge, the common objects of our senses; and proceeds through the various modifications they undergo by the other faculties of imagination and reason, till those sensible objects become so much our own, are so assimilated to us, and, as it were, humanized; that they are part of ourselves, and obey and take directions from our will, and minister to all our views and purposes: of which, this of producing images, and making fables, is, in one sense, the most conspicuous; inasmuch as the greatest effects here, arise from the slenderest means and endeavours. The poet stirs but little in the matter; but nature co-operates so strongly with him, that this little suffices, even to make new worlds. In effect, the poet seems, as it were, to sit nearer the spring of action than other men; and to have only to do with the general, and higher principles thereof, which command and direct a number of other subordinate ones, that he himself is not ordinarily aware of. What we shall say of poetry, therefore, will hold proportionally of all the other arts; and we have only kept to that, because the influence or inspiration is here the most apparent and palpable. — The principle or spirit of poetry, may be said to be that of art in general; and hence many authors make no scruple, to make all arts the invention of poets; thus it is that Homer is often complimented, with being the father of all arts.

THE mind is allowed to be passive, in respect of the matter of the art of poetry. We need not quote the poets to prove it: no poet ever questioned his inspiration: every body knows that their whole system is built on the supposition. And hence the stories of *Apollon* and the *Muses*, of *Helicon* and *Parnassus*; the dreams of *Pindar* and the *Aonian* maids; but the philosophers, and critics also, give them their suffrages, and attest their inspiration, in the strongest terms. Plato contends at large, that all poetry is "by immediate divine inspiration; in the proper and literal sense of the word." Aristotle confirms it; "*ἐνθουσιάζοντες*, poetry comes by divine inspiration." And Plutarch says as much of all the branches of enthusiasm, poetical, divinator, bacchical, or corymbantal, martial and erotic: to all which, he asserts, the appellation, *ἐνθουσιάζειν*, or *ἐνθουσιάζεσθαι*, equally agrees. — And not only so, but they hold the enthusiasm communicable from one to another. It arises from the poet, as its centre, and is diffused in orbem; in a less degree of intensity, the further it recedes from him. Plato asserts, that the *ἰασημένιοι*, or those who sung and rehearsed the poets works on the public theaters; nay, and the spectators themselves, were all divinely inspired, in some degree; which he illustrates in case of a needle touched by a magnet, which communicates an attractive property to another needle; that, to a third; and so on, but with a continual diminution. — Nor does the effect end here, but the professors of other arts, as sculpture, criticism, and even philosophy itself, borrow their flame and inspiration from this fire. Thus Phidias declared he was inspired to make that wonderful statue of Jupiter Olympius, by the reading of Homer: and thus Aristotle may be said to have been inspired by the same poet, to compile his immortal *Poetics*: the like one of our own poets says of Longinus; that he was inspired by the *Muses*, or with the fire of a poet.

BUT after poetry, rhetoric comes next, and shares most of the spirit thereof: accordingly Plato, in his dialogue inscribed *Meno*, allows, that "as we say pythians, prophets, and poets, are divinely agitated; so we do of orators." Elsewhere he adds, "that they are certainly inspired of God, and plainly possessed." So Dion. Hali-

"carnaeus relates, that Demosthenes did plainly *ἐνθουσιάζειν*." And adds that the distemper caught so among his audience, that "they were possessed at second hand, and brought to do many things against their own reason and judgment." And *Æschines*, his professed enemy and antagonist, allows as much. I need not say, that Plutarch relates the like of Cicero, in the instance of his oration to *Cæsar*, for Ligarius.

SOMETHING like this has been observed, even in the case of prayer to God: several heretics are on record for possessing their hearers that way. Hacket, executed for blasphemy under queen Elizabeth, is said, by the historian, "to have ravished all that heard him at his devotions, and converted many in spite of their teeth;" and *Saravivius* relates, the people were persuaded that "God directed his tongue." *S. Basil* even affirms, "that our prayers are never right or acceptable, till the fervour thereof carry us out of ourselves, so that God possesses us in some extraordinary manner." And hence the learned and pious *Casaubon* establishes a new kind of enthusiasm, which he calls *applicatio*, or *precatory*. To say no more, the author last mentioned makes no scruple, to rank even "the ordinary delights and benefits men receive from the harangues of orators, sophists, preachers, &c. among the effects of enthusiasm and inspiration; as being what could never have arisen from mere common sense." And Plutarch, and others, make that ardour which the soldier feels in battle, of the same kind with that which inspired the prophet, orator, and poet.

WE have here little less than a system, sufficient to account for most of the phenomena in the moral world, on principles of enthusiasm: and yet these are only a few, out of infinite instances, of the immediate agency and inspiration of the Deity. We find the same principle in every art, every invention, every discovery; where no natural and necessary connexion is perceived between the discovery, and something known before. What has no immediate dependence, either on what we perceive by sensation, or reflection, comes by the vehicle of inspiration, *i. e.* of imagination, for there it rises. The imagination may be called the medium of art, as sense is of science. The faculty of reason, can make no great discoveries; it can only advance from one step to another, which must be ready laid to its hand; and if these be any where interrupted or discontinued, there it is at a stand. It is, in fine, a limited principle, subject to very narrow bounds; whereas the imagination seems to be indefinite, and still kept in the Creator's hand, to be occasionally made use of for the conduct of mankind.

THE truth is, when we say, such a thing is the effect of enthusiasm, or inspiration; (speaking, I mean of profane matters, the inspiration, for instance, of scripture, being matter of a very different consideration, and quite beside our present purpose) this does not remove it out of the ordinary course of things: it does not put it on any principle different from that, whereby causes and effects succeed each other in the physical world. We can account for the phenomena of the imagination, as well as those of sensation. They have their respective laws, like other things, which they are subject to; and to which we have arts and processes appropriated. In effect, all the inspiration here spoken of, may be produced without any great conjunction. — If the reader will not take offence at this novel philosophy, he may be convinced of it. And so. In the instance of the poetical kind.

THE inspiration of poetry is of a still and pure kind; and needs little artifice and apparatus, to produce it in an imagination naturally disposed for it. The attentive consideration of some interesting object, usually suffices to set it a-going. And the gentlemen of that faculty have all nature to chuse out of: the finest seasons, the most agreeable scenes, and the most moving objects. Hence it is, that they are continually harping on "groves and shades, and gods and nymphs, and darts and flames." — How do they riot in "meadows, trim with daisies pied; shallow brooks, and rivers wide: towers and battlements they see, bosom'd high in tufted trees." Sometimes they sing of "knights and squires, and maids forlorn." Then, "tilts and tournaments, and feats of arms: pomp, and feast, and revelry; with masque and antique pageantry: stories of Thebes, or Pelop's line; or the tale of Troy divine; of Arthur and Cambuscan bold; of Cambal and of Algarine, and who took Cane to wife." If these fail, they have all that is gloomy, and solemn, and terrible in nature, at their beck; we may now expect to see "the red bolt, or forked lightning glare." Earthquakes and tempests seldom roar in vain: if by chance they do, the "ill-boding raven's croak" is ready at hand; or else "the far-off curlew founds, o'er some wide watery shore, (swinging slow with solemn roar)." And now for "baleful ebon shades, and rugged low-brow'd rocks:" next enter "horrid shapes, and shrieks, and rights unholy: Gorgons, and Hydras, and Chimera's dire." Images of things most moving to sense, readily alarm and raise a commotion in the imagination. And the new ideas thus procured, coming to be mixed, and combined in the imagination, with others there before; new effects arise from them, in consequence of the laws of the Creator: much as intelligibly as fire and flame, upon mixing spirit of nitre, and oil of cloves.

SCALIGER distinguishes two kinds of *inspiration*, or poets divinely inspired: the first, those on whom the inspiration falls, as it were, from heaven; without any thought or seeking; or, at least by means of prayer and invocation. The second, those in whom it is procured by the fumes of wine. — All required to the first, is a delicate, pregnant imagination; susceptible of any feeble impressions, that may happen to be made in the course of things; and ready to take fire at the least spark. The surfaces of the finer fluids, we find, are kept in continual motion, by the bare tremor of the atmosphere, though to us insensible: and thus the air is never so still, but that the alpin

ence, though it is only a small part thereof that is actual, *i. e.* only a few of the possible combinations are, or ever will be made.

THE business of knowledge, then, is cantoned out among the body of words: but they do not bear equal shares thereof. Being creatures of our own, we have dealt with them accordingly; and made some, others

leaf feels its impulse, and bends and trembles to it; when others require a ruder gust to move them: yet these, too, give way in a general storm; whole forests then totter indifferently: accordingly, we read, in ancient history, of whole nations being at once seized with the poetical fury; few of the cities of Greece, not even Athens itself, with all its philosophy, but has, one time or other, laboured under these epidemical enthusiasms.

WE have already observed, that invention is the principle, or source of poetry: an excellent poet of our own age adds, that it is this which furnishes art with all its materials; and that, without it, judgement itself can, at best, but steal wily. — Now this faculty of invention itself, is usually no other than a delicacy, or readiness of taking hints: but even at most, what we are said to *invent*, results or arises from something already in us. Invention produces no new simple ideas: those can only come by the way of sense and observation; all that passes in the other case, is, that from the memory of certain things, *i. e.* the comprehension of certain ideas to the mind, certain new images or pictures arise, according to the order of things. The sprightly imagination is led, on various occasions, to compound its ideas; and many of them so oddly and boldly, that we take its productions for new things; and thus think we invent them, because they did not before exist in that form: there is no more real invention in the poet, than in the tapestry or mosaic worker, who ranges and combines the various coloured materials furnished to his hand, so as to make an assemblage or picture, which before had no existence.

THE reader who has any doubt about this, need only take the first piece of poetry that comes in his way, to be convinced that all that is new, and moving in it, is no other than new composition, and combination of sensible ideas. In the *Illegre*, and *Il Penitente*, two of the most poetical pieces in our, or perhaps in any language; how easy is it to resolve all that is so magical and ravishing, to the new, uncouth, and frequently wild and romantic assemblages of imagery! Who can contain himself at — “Sport which wrinkled care” derides, and laughter holding both his sides. — Cynthia peeping “through a cloud, while rocking winds are piping loud. — To hear the lark begin her flight, and singing startle the dull night; or early cock with lively din, scatter the rear of darkness thin: or, listen how the hounds and horn, loudly rouse the slumbering morn. — or see glowing embers, through the room, teach light to counterfeit a gloom. — Or, storied windows richly dight, calling a dim religious light. — Or hear Orpheus sing such notes, as warbled to the strings, drew iron tears down Pluto’s cheek.”

PERSONIFICATION, which is of that extent and importance that it is usually held the life and essence of poetry, is a vast source of new imagery. By this, not only different objects, but different systems and worlds are combined and blended together; and what belongs to one kind of beings, man, is attributed to every other; each object, either of sense or imagination, being occasionally invested with all the characters and properties belonging to the human kind. Thus an arrow grows impatient, and thirsts to drink the blood of a foe; or lovers and lamps half way, loth to carry death, &c. So an action of the body, *laughter*, is represented, by Milton, as itself laughing, ready to burk its sides. One of the planets, the moon, is represented as tricked up, and frowned; and again as kerkchiefed, and in a decent undress, and thus going a hunting. To tell us that a fine spring morning, attended with a gentle gale of wind, is very pleasant; presently — “Zephyr with Aurora playing, as he met her once a maying, on a bed of violets blue, and fresh-blown roses dipt in dew, “filled her with a daughter fair, yclep’d in heaven Euphrosyne, and “mirth on earth.” How consistent with the nature of things, that a breath of air should lay an early hour of the day down; and that, from a green gown thus given, a passion of the mind should in time be brought forth? In effect, the inspiration of the poet frequently amounts to little more, than relating things that are naturally incongruous. He does not invent, he only transposes; nor has he the least power to move, other than what he derives from the novelty and strangeness of his combinations; to which nothing exists in the ordinary system, any way conformable. — To say no more, if invention furnish art; memory furnishes the invention; and sensation the memory, where all knowledge originally commences. And the whole process is nothing but the action or operation of the Deity, in a course of laws.

AS to the second kind of poets, in whom the inspiration is excited by means of wine; Cædemon is perfectly frightened at it, judging it the highest strain of impiety, to suppose a man may be divinely inspired by the fumes of liquor. — And yet I do not know whether his fright be not founded on a misapprehension. If Scalliger alledge, that the juice of the grape may be a means or condition, necessary to make the laws that concur to invention take place; I do not see what religion has to do here, more than in any other enthusiasm. The use of such means is no way derogatory to the power or goodness of God, who still remains the author of this, as of any other inspiration; whether it be by visions, by voices, dreams, or the like. — What matters it, whether the found of a cymbal, or the sight of an image, or the effluvia of a liquor, be the occasion? And of all the blessings this juice is made the instrument of to us; why should it be precluded from that, which even the vilest of God’s creatures occasionally minister?

THE inspiration of orators, bears a near relation to that of the poets; though being somewhat grosser, it demands more industry and art. — Quintilian tells us how a rhetor is to get inspired: “not by “suddenly lolling and gazing at the next moveable, and carelessly “turning things over in his mind; but by imagining the judge and “the audience present, and strongly representing to himself the time, “the occasion, &c.” He adds, that no body ought to pretend to be

an orator, unless he have this art of inspiration at command; so that he can raise it at pleasure.

WHAT has been said above, contains some of the general principles of enthusiasm, and their connection with other physical effects: and it would be easy to trace and pursue the same, where they appear in other cases, and with other circumstances. Thus the inspiration, excited by the orator in his audience, is resolved, by Cædemon, into the music of the speaker, *i. e.* the tone and cadence of his voice; and the *sublimis*, or order and placing of his words: in which last, how simple and trivial forever it may seem, all the great matters on the subject allow somewhat mysterious, and unaccountably forcible; and accordingly make it the principal part of rhetoric. And yet there is nothing in the whole, but what results from the powers, properties, &c. of the several letters, considered as so many sounds, artfully combined. In effect, there is some *gibberish*, or numbers, and some *pallego*, or diction, in all diction; much more in that of oratory: and music itself has no charm in it, but what it derives from those very sources.

NOR must it be omitted, that the use of metaphors contributes its share to the effect: the secret whereof consists in this, that they are, as it were, accommodated to the senses; and present such images to the imagination, as move us most, when perceived in the way of sensation.

AS to that enthusiasm felt in prayer, its cause it not far to seek. The powers of rhetoric and music, and a peculiar fervour of imagination, raised by an apprehension of the presence of God, &c. will go a great way. We may add, that the ancient heathens made use of dithyrambs in all their most solemn prayers; which, Proclus observes, are peculiarly fit to stir up enthusiastical dispositions. A man that rides Pindar’s horse cannot well fail of going at a great rate.

BUT the most extraordinary, and unaccountable kind of inspiration is still behind, *viz.* that of prophecy, divination, discovering cures by dreams, &c. which yet may all be produced by art; and accordingly, they have been taught and studied like other arts: not to say, also, practised like them for a livelihood. Schools and colleges of prophets, divines, augurs, &c. were numerous, both among Jews and Gentiles; and there was little in their discipline, but what may be resolved into what has been already said. Here, all the means abovementioned, all the springs of enthusiasm were used; and frequently all combined together, to make the more compound and extraordinary effect. The light of vast objects, as rocks and mountains, wild prospects, solitary groves, gloomy caves, furious rivers, seas, &c. which we find to work so strongly on the mind, were indulged; and frequent changes, and sudden transitions were made from one to another. Such unusual objects, necessarily suggested unusual ideas; which were heightened by proper applications to all the other senses. And when the patient was at length got out of the ordinary system of thinking, what he uttered was judged oracular. And among a large train of objects, which presented themselves to him, some could not want an analogy to things that were really to happen; at least in the opinion of a person already possessed with the notion thereof. It may be added, that the prophecies themselves, had their share in producing futurity; the events whereof partook of the predictions, some more, others less, according to the degree of possession of the parties concerned in them. In effect, the revelation still retained something of the means made use of to raise it. And hence a revelation was artificially producible of the complexion required; which was the very apex of the art. So that the divination, when most perfect, really supplied a natural knowledge of the thing demanded, and was built on it.

AS to dreams, &c. there was a formula for them; the circumstances whereof, might be appropriated to raise in the imagination an idea of the thing required. — After a number of ceremonies, the party was to sleep in the temple: and the priests had not only the placing of his body, and the stirring of his bed; but also the management of odours, sounds, &c. in the night time. So that if any natural means were known for the cure, here was room enough to suggest it to the patient’s imagination, which was made accessible to them; and, as it were, put into their hands. But if no adequate remedy were known: as, it is probable, they hardly entered so far into the part: yet, what was thus suggested, perhaps at random, how strongly must it operate, when incited by the opinion of its coming by miracle and inspiration? We see what the bare presence and assurance of a physician will frequently do; even cure disorders far above the reach of his skill: and what an improvement would it not be to the faculty, to have the further assistance of a little shew of religion, and ceremony?

I am afraid I may seem to have been too long absent from my subject; but it has been all along in my eye, and a little recapitulation will convince the reader that we have not wandered far out of the way. — We have shewn whence all our knowledge originally rises; that sensation is its only source; that what comes this way, comes by the agency of the divine being: that it is further modified in the memory or imagination, where new assemblages are frequently made, which is called *invention*; that it is continually altering, by the admission of new ideas from without; but still remains subject to the laws imposed by the Creator; so that nothing happens therein, but in consequence of such laws. — Thus far the mind appears merely passive; and thus it stands with respect to the matter of all knowledge and art. — It remains, now, to consider its *form*, or that whereby such knowledge becomes *art*, *i. e.* becomes subservient to human purposes, and under the direction of human reason.

HERE, therefore, a new state of the mind, *agency*, and a new faculty thereof, *reason*, come in play: the foundation and office whereof,

others less significant, at pleasure; some stand for large provinces, others for petty districts thereof. In effect, the order wherein we attain our knowledge, has occasioned us to make a kind of sortiment in the matter thereof. Though the mind only sees and perceives individuals, which alone are the proper objects thereof; yet it has a power of combining and complicating these together, for its own convenience: and hence its progress from particulars,

whereof, will be best ascertained, by inquiring what there is in the artist's, *e. gr.* Homer's mind, that concurred with his inspiration or invention, to the production of his poem? This will be found to resolve into, first, an inclination to produce some piece, in the way of fable, that shall strongly represent the mischiefs of discord among confederates; and secondly, a knowledge of certain means necessary to that end, or an acquaintance with certain rules and measures, which tend to produce such an effect.

THE first is a *moral view*, or *motive*, which has already been laid down as the spring or principle of all human action, and which is founded on the apprehension of good or advantage to arise from such a poem. The second, *viz.* the knowledge of the *means*, stands on the common footing of the knowledge hitherto discoursed of.

THE means and measures of an art, make a kind of preliminary doctrine, necessary or conducive thereto, called the *theory of the art*; which also, in one sense, may be considered as another art, distinct from the former: at least, to come at it, is the business of another art.—If, for instance, a certain position, or set of motions of the body, be constituted, by nature, the occasion of a poetic inspiration; and such and such images and ideas arising herefrom, be constituted the occasions of such passions in the mind of a reader, and such views consequent thereon, *viz.* an aversion to enmity, and contention; to form an art productive of these effects, we must first observe the like effects to arise from the like causes; and infer, that it is probable these motions, or these images, are the occasions thereof: and consider their order, manner, and circumstances, to form the art, or method.—So that we have here, as before, 1^o. *Matter*, or phenomena, furnished by sensation, and preserved in the memory; 2^o. *Form*, arising from the moral view, which led us to frame an art; and in order thereto, to consider and dwell on the phenomena, compare them together, and infer something from them.

IT appears, therefore, that we have two arts of poetry, very different from each other; arising from different causes, tending to different ends, and rarely found, in any great degree, in the same person. The first art Homer possessed in perfection; the second, Aristotle.

BUT for all their difference, the two will be found of the same general nature and kind; and only to differ in point of degree, and subordination; as they are nearer to, or further from the principle of all knowledge and art, sensation.—Homer, we have shewn, was inspired: he derived his art only from nature, acting on him in the ordinary course of things, and first presenting objects to his sense, then to his imagination; and others are inspired from him, *i. e.* they derive the inspiration from nature, through his means: among whom is Aristotle. Nature, as she appears to the senses, is Homer's object; as she shews herself in Homer, she is Aristotle's: by which time the inspiration is grown a degree cooler, and less forcible; and the ideas thus excited at second hand, moving the mind less, it can attend more steadily to them, and perceive their relations better.—In the first, it falls like lightning immediately from heaven; the second may be compared to the reflection of the same lightning in a mirror. The reading of Homer, *i. e.* the exciting and calling up his ideas, and images, does, as it were, impregnate Aristotle's imagination; and transplant the poet's whole stock into the philosopher's garden, to be further cultivated. Accordingly, Aristotle, applying his reason to them, and examining them closely on all sides, perceives divers relations and analogies between them, which Homer was not aware of; and which the warmth of his imagination, and the quick succession of new ideas, would not give him room to attend to. These analogies he calls *rules*, or *laws*, the assemblage or system whereof, make what we call Aristotle's *Art of Poetry*.

THE like process might be observed in the several other arts. Those we have hitherto chiefly kept to have been of the symbolical kind: We shall here give an instance in what we call the real kind, *viz.* architecture.—An Athenian sculptor, then, observing an acanthus shooting up under a basket, is pleased with the figure it presents; and, taking the hint, invents the capital of a column on the model thereof: and by a number of like steps, an entire order gradually arose; and, in time, a whole art.—Things thus advanced; and another person seeing a building framed after such manner, he attentively examines the several members, their forms, proportions, &c. and puts them down in writing: and thus does another posterior art arise. And between the two, there still remains the subordination already observed between the means, or occasions of producing them; *i. e.* the rules thus formed, being couched in words, supply the office of the external objects they were originally derived from, and prove occasions of raising ideas, or images, in the imaginations of future artists, to be imitated in the proper materials.

THE arts, then, of poetry and architecture, come first in at Homer's and Callimachus's sense, in the simple quality of natural objects; which, meeting with other ideas in the memory or imagination, and coming to be compared and combined therewith, by the agency of the moral view or principle which suggested the making of a poem, &c. as advantageous and desirable, new productions arise, *e. gr.* a poem, or a building; which, coming at length under the cognizance and consideration of reason, certain relations or analogies are discovered therein, which tend to propagate, and produce the like at any time.—Reason returns rules for matter; which, rules prove like the philosopher's stone, which tends to turn all materials it is applied to into gold; and the materials thus transmuted, like the pretended multiplicative virtue of the same stone, from every thing they are applied to, produce rules of again.—And thus we are arrived at the reason of the Aristotelian definition of art abovementioned, which we feel lies pretty deep, and costs some pains to come at; as do many other doctrines of that philosopher, which the precipitancy of moderns has rejected as false, only because they would not be at the pains to discover their truth.

Vol. I.

REASON, in effect, which is the last faculty the matter of art arrives at, is the first from which the form or rules thereof, which are to propagate it, arise. In which view, reason may be laid down as the principle of this secondary art, or theory; as imagination is of the primary one. We still see the effect of the first laws, even in the latter art; external objects strike the sense and imagination so strongly that they reach to reason; which, like an infinitely elastic substance, reflects them back again; and thus they again grow into objects of sense: and so on in a circle.

THIS seems to make the two arts differ very widely: and as reason appears our highest faculty (inasmuch as it is this alone that tends to produce and multiply, and accordingly all our knowledge appears proportionably higher and purer, as reason is more concerned therein: the rules or theory of an art, appear of infinitely nearer consequence than the matter thereof. The former is, in some sense, active, and, like the almighty mind, tends to produce new things, new worlds, new systems, without end; the latter is mere passion, and ends in bare brute perception.

YET Aristotle's rules, it must be observed, do not tend to produce poetry; I mean not the matter of poetry; but only the form. Aristotle's art is not the art of poetry, in that sense, as its rules do not tend to produce enthusiasm. They only give the human part, and relate what reason observes in the productions of the imagination, *i. e.* what there is in them, that is a proper object in this last faculty, and comes under its notice. In effect, poetry is only subject to Aristotle's rules, as there is reason, not as there is inspiration or invention in it.

THE source of poetry, we have observed, lies out of poetry, in a higher ground; and to turn the stream upon us, is the business of this other art of inspiration. The immediate inspiration, is not so immediate as we may imagine. It is not the ultimate principle of art, but it is itself subordinate to another further or purer art; so that we must not only have art and rules to produce poetry, but also to produce the principle thereof, inspiration or invention. And the same will hold of the rules of this last art, themselves, which will require others; and so on in infinitum. At least, the series will be infinite, if we only take ourselves and our own agency into the account.

TO clear up this, it may be observed, that the art, *e. gr.* of poetry is not only the result of another higher art, as above laid down; but that its matter and form, are each of them the subject of a particular art, and each of them require another higher art, to produce them.—The means, for instance, necessary for inspiration, or the invention of images, make one art; and those for their application to the present purpose, another. So that the art of poetry resolves itself into two subordinate ones; the first of which may be called the *art of invention*, the other the *art of judgement*, or criticism: each of which, has all the characters of the general art; is come at like it, produces new objects like it, and resolves into principles of the same kind with it.—Nor does the view end here: for as each of these subordinate arts, may be considered as consisting of matter and form, each of them resolves lower into two other arts: and the same may be said of each of these; and so on. So that there is really an infinite series of arts, previous to any one, and accessory thereto; all distinct from each other, though all of the same general nature, and only differing in point of order or subordination. They arise subordinately from the same cause, and tend subordinately to the same end: which difference or subordination, as already noted, arises only from their greater or less distance from the principle of all knowledge, sensation.

UPON the whole, sensible nature furnishes the matter of them all, by means of the imagination; and moral nature the form, by means of the light of reason.—The former proposition has been sufficiently discussed. It remains to enquire a little further into the latter; for, *that reason furnishes the means*, &c. must be further qualified, ere it be received.—Our reason, it is to be observed, does not perceive any necessary and immediate connexion between the means and the effect: for there really is none. Consequently, reason cannot be the author of them; in regard, the medium is wanting, whereby alone it could possibly attain them. So that they must be procured by some other canal; which will at length be found to end in sensation. In effect, ere we know that such means conduce to such end, we must first have observed, or found it so by experience. Our memory suggests to us, that such or the like causes have been followed by such or the like effects; which is the only foundation we have to expect any thing from them on the present occasion.—Thus, if Homer's reason direct him to retire into a place free of noise and disturbance, at a time when his mind is clear, and in due temper; and there to apply himself with attention and earnestness to think on his subject; in consequence of which means, new ideas and images present themselves, some more immediately relative to the present purpose, others less: whence comes all this, but that Homer remembers such or the like ideas as are now wanted, to have arisen upon the use of such or the like means? And if, among the crowd of images, he chuses only such as are most proper and immediately conducive to his end, and throws aside, or expunges the rest; whence is this, but that he remembers such, on former occasions, to have contributed more fully to ends like his own, than such other? So that the whole process appears to be little other than remembrance, which, we know, resolves into sense.

BUT, memory, it is here to be noted, deals only in past things. It informs us, that on such an occasion such means, under such circumstances, produced such effects: but its notices are merely narrative, or historical; and relate only to those numerical means, occasions, circumstances, &c. which can never happen again. So that memory speaks nothing to the present case; nor gives any directions how the particular purpose, now in view, is to be attained. Its language is only

particulars, to generals; from simple to complex.—Hence we come to have words of all orders, and degrees; from the simplicity of an atom, to the complexness of the universe. It is pleasant to trace the mind, bundling up its ideas, and giving names to the several parcels; to observe, for instance, how it proceeds from the simple idea, *thinking*, to the more comprehensive one, *knowledge*, thence to a *science*, thence forward to *scientific*, &c.

INDEED it is very few of our words that express single or simple ideas. The reason is, that, observing certain relations to obtain between the several ideas; as of cause and effect, subject and attribute, &c. we do not so much consider them absolutely, and independently, as under such circumstances and relations to each other. The great readiness and propensity of the mind to combine its ideas, and thus pay or receive them in parcels, has left us very few simple ones; I mean, very few names which denote only one idea. The words *atom*, or *mathematical point*, usually imply several ideas; in regard we are led to take the attributes and relations into the consideration of the subject: thus we consider the *atom*, as hard, heavy, and invisible; as the principle of physical magnitude; as contributing to the constitution of bodies, &c. And even the primary qualities themselves, as hardness, heaviness, and the like, simple as they are in their own nature; are so far combined with particular circumstances, *v. gr.* their cause, &c. that their names become none of the least complex.

NOW what we call a *term*, is no other than “a word which denotes an assemblage, or system of ideas, relating to some one point, which the mind has artfully complicated, or associated together, for the convenience of its own operations.” Or, it is “a word which comprehends several ideas under a certain relation to each other, whereby they represent some complex piece of knowledge to the mind, for the convenience, &c.” Or, “it is a word, which holds several different ideas combined together in a relation, such as they appeared under when the mind first considered them as a standing phenomenon, and took measures to have them fixed, or retained in that quality.”

THE effect of *term* is, that by virtue thereof, we are enabled to receive, or communicate knowledge with more ease and dispatch; so far as having proper combinations thereof always ready made, we are saved the necessity of beginning *denovo*, and detailing it in individuals: much as in arithmetic, to avoid the embarrass of a large number of units, we tell by tens, or sixties, or hundreds: with the like view, on some occasions, we make up certain sums of money in rouleau’s, or in purses; and thus pay and receive them, without the trouble of telling or enumerating the contents.

IN this sense of a *term*, we shall find little else in language:—Among nouns all are such, except proper names, which, indeed, are out of the ordinary case of language; yet even these sometimes become terms; as when any particular ideas become constantly attached to them, *e. gr.* in *Mecenas*, *Machiavel*, *Augustus*, *Atlas*, *Bucephalus*, *Argo*, &c. And, among verbs, very few but are terms, except the general ones, *to be*, *to do*, and *to suffer*. As all the others suppose these, and modify, or superadd some farther circumstances thereto; they commence terms of course: such, for instance, is the word *to moisten*; which, as it carries a farther meaning, than the bare act of applying a fluid to a dry body; and denotes, *e. gr.* the modus of action, and the alteration superinduced by it, *viz.* the softening, lubricating, &c. is a thorough term. So, *to strike*, as it not only implies a certain motion of the arm, but this motion effected by the successive contraction and dilatation of certain muscles, &c. has every thing that is essential to a term. In the same sense, a *staff*, is a term, as much as a *lever*; and a *pin*, as an *axis in peritrochio*.

THIS may look like stretching a point, especially to those who are used to consider *terms*, as things, I know not how, quaint and mysterious; and make a *term* and a hard word the same thing. But there is no remedy: complexness is the only characteristic, that will be found to hold good, of them all; and if there be any other more specific, and distinguishing properties in most of them, as we shall have occasion, hereafter, to shew there are; yet these, not being universal, cannot be made the foundation of a just philosophical definition. They may, perhaps, be introduced, to good purpose, into a popular one; as they afford a more useful and adequate knowledge of the subject, so far as they do obtain.

THUS much relates to what we may call *terms of knowledge*, which are one degree more simple than the terms of an art or science; and were, for that reason, pitched upon to exhibit the common nature, and origin of both. These latter arise out of the former, by the super-addition of some new character, or condition. They were before members of the commonwealth of knowledge; but they are now incorporated into some certain province, or city thereof; where they become of farther significance and consideration than before: that is, some new ideas and circumstances, are now taken into the combination, which before did not belong to it.—A term of art, then, “is a word that has a meaning beyond its general, or scientific one; and this meaning restrained “to some one art.” Or, “it is a word used to denote a certain combination of ideas, under some peculiar rela-

only this, “Such means did produce such and such effects.”—To make the application of past things to present, is the office of reason; which comes in where memory ends; and subjoins, that “if such means have done so, such others will now do so.” And, consequently, it is reason that, in strictness, prescribes the present measures.

OUR enquiry now draws towards an issue; and it only remains to shew, in what manner reason attains this end, *i. e.* what farther or higher means there are, to enable it to furnish measures for the present exigency, from the circumstances of past ones?—This it effects by certain perceptions of similitude and dissimilitude, parity and imparity, congruity and incongruity, between former, and present means, occasions, &c. By virtue of these, the mind infers, that, “inasmuch as such means were followed by such effects; “such others, by parity of reason, will be followed by such others.” And that, “as there are such and such differences between former “and present occasions, and circumstances; there must be such and “such other correspondent variations in the present measures, to “keep up the congruity.” All which resolves into the comprehensive word, *analogy*.—Thus it is found, that every means, every step of an art, includes what has been already shewn of the whole art; and consists of *matter*, furnished by memory, from sense and observation; and *form*, furnished by reason, from comparison and analogy.

AND thus it is reason that makes all our historical knowledge of any significance to us. It is this that makes former cases subservient to the present occasion. We may look upon this, as the instrument or faculty of transferring; whereby the effects of former times and places, are brought over to the present ones. Without this, sense would lose its chief use; and memory, with all its copia, would be no other than useless lumber.—It is this faculty alone, that arranges our sensible ideas into any thing of subordination. Memory only presents them such as they first appeared; wholly distinct all, and independent of

each other, being connected by nothing but their comference, or co-existence, in point of time and place. The establishment of all other relations is the work of reason; which, from these few sensible relations, infers numerous others, *e. gr.* from the comference of two things in respect of time, place, &c. it concludes that some new appearance, perceived in the one, was occasioned by the other; and, therefore, that there was some power in the latter, by which this was effected, &c. And thus it is we come by the relations or perceptions of cause, effect; action, passion; property, quality, &c. so that to this faculty of reason we owe the whole science of physics; which is no other than the doctrine of causes: at least the form thereof. The matter, *i. e.* the sensations themselves, being furnished by sense, constitute *natural history*, the basis of all knowledge whatever.

WE are now got to the top of all our natural faculties, *reason*; and the most refined of all our sciences, *analogy*.—It remains to observe, that with this natural reason is connected *moral inclination*. In the case, for instance, of good; to the voice of reason representing a thing as such, is connected a desire or inclination towards the same; which is the great principle of human action, or operation; and commands a number of subordinate ones; the application of all which, constitutes what we call the *pursuit* of such good.

AND thus we are got to the bottom of all our moral faculties, *desire*, or *inclination*.—Hence, as reason is the end of passion or perception; inclination is the beginning of action: the one terminating in the apprehension of good, where the other commences. And again, as the perception of analogy is the ultimate effect of science: the inclination, arising by means hereof, is the beginning of art: the two being joined, and as it were, insinuated, in some middle point. And thus external or physical things, come to influence or produce internal, or moral ones; thus the whole effect of sensible nature, is applied to moral nature. And thus do physics take hold of ethics, God

"tion, retained arbitrarily in some art, and either not used in any other art, or for a different combination, or "with other relations and circumstances."

TO make the way a little clearer to the philosophy of a term of art, it is to be observed, that from the primary, or literal sense of words, we frequently, by abstraction, form a secondary, general, or philosophical one, expressing only the quality most predominant in the former, exclusive of the particular circumstances of the concrete. Thus, the word *spirit*, literally and primarily signifying *breath*; we thence frame a more simple general meaning, and use the word for any thin, subtle matter whatsoever. — Now, terms of art are not immediately formed from the literal or grammatical, but from the general or philosophical acceptance of words; which is their proper basis, or the ground-work they are erected on. The general or abstract sense of some word already established, being found to agree to something which we have occasion to give a name to; we take the word in that sense, and superadd the other incidents and circumstances, which the present occasions furnish, thereto; which, being different, according to the different matter and subject of the art, specify the meaning of the term in this or that art. So that the word which, to raise it to a philosophical or scientific sense, was generalized; to form a technical one, is again particularized, or appropriated and invested with new accidents.

THUS, the same word *spirit*, which literally signifies breath, and philosophically any subtle substance, is technically brought to denote divers other things; as, in anatomy, a thin animal juice secreted in the brain, and detached thence through the nerves, for the uses of sensation, and muscular motion: in chymistry, the exhalations of bodies exposed to the fire: in theology, the third person of the Trinity: in metaphysics, any incorporeal agent, or intelligence, &c. In all which, we see the same substratum, *viz.* a fine subtle substance; but this modified a great diversity of ways; each of which is susceptible, by further super-additions, of infinite more. And hence we have legions of sorts of spirits, both in the human body, the chymists laboratories, the hierarchy, &c.

THE notion of a term, will receive some farther light from that of a DEFINITION; which is, as it were, the analysis thereof. — By definition we undo what was done in forming the term; that is, we resolve the complex ideas into simple ones, or restore the ideas from their new and artificial state, to their primitive and vague one. A definition, then, may be defined "An enumeration of the several simple ideas couched under any terms "in the relation wherein they stand to one another." — We have already shewn, that terms are words which have peculiar and determinate meanings, resulting from a certain combination of ideas; in which view, a term may be said to be, "a word that is capable of definition;" *i. e.* of having its sense explained and ascertained, by an enumeration of its properties and relations: by which it is distinguished from words merely grammatical, whose meanings are general and indeterminate, and may be used with equal propriety in a thousand cases. We can explain a term; a word is inexplicable: all we can do towards this, amounts not to definition, but only to substitution, or the giving a synonymon.

THUS the idea attached to the word *force*, is absolutely incommunicable by means of any language: we can only try whether the party have it not already, under another name; to which end, we may tell him it is *power*, or *energy*, or *vigor*; if he have ideas for any of these, he will take in that of *force*, by its relation thereto; if he have not, we must proceed to try him with more, and tell him it is *forza*, or *vis*, or *efficacia*, or *potentia*, &c. or it is *βία*, or *ισχυς*, or *δυναμις*, &c. If none of these will do, it remains to try, whether he may not have it without any name to it; and say, it is "that whereby one thing, coming in contact with another, moves, or shakes, or breaks it," &c. — If, by any of these means, he learns what *force* is, he does not form any new idea; he only learns a new name: and finds, that what he had known by one name, others call by another; or that what he had never taken the pains to distinguish by any name, some others have. To get the idea, he must have recourse to sensation, not to language; it being a physical *ens*, and only to be attained that way.

BUT the simple idea called *force*, being given; and coming to be afterwards modified, or circumstantiated by new accidents added thereto, and thus formed into terms, in this or that art; it is here in the power of language alone to excite them; by resolving such compound idea into its ingredient ones; which, being re-compounded, or put together again, in the manner assigned by the definition, gives the full adequate import thereof. — Thus the idea of *force* being variously modified, and combined with other ideas of *centre*, *attraction*, *repulsion*, *will*, *machine*, &c. in the words *central force*, *centripetal force*, *centrifugal force*, *necessity* or *moral force*, *mechanic force*, &c. we can, by definition, arrive at the meaning thereof; by having those circumstances specified, or superadded to the idea of *force*. — In this case, there is no coming at the idea by sensation; in regard it is a creature of our own, and does not exist any where without us, to make an object of sense.

HENCE appear all the diversity of definitions; technical ones, comporting only to terms, as to *central force*; scientific, or philosophical, to qualities, as *forcibleness*; and nominal or succedaneous, belonging to simple ideas, as *power*, or *energy*.

IT is the various assemblage of simple ideas, denoted by common words, that makes all the variety of terms; as it is of simples in an apothecary's shop, that makes the variety of his medicines. — The analogy goes farther; and it may be said terms, like medicines, only differ from each other as their ingredient ideas, and the relations thereof differ. — If these be not all rehearsed in the definition, the term or medicine is not specified, or distinguished from some other, which may have all, except that one or two omitted. Consequently, such one or two, are the characteristics of that term; which may be explained, in some sort, by only enumerating those characteristics, and couching the rest under the name of that other term. This amounts to little more than the substitution abovementioned; and yet to this is reducible all that the schoolmen teach of *genus*, *species*, and *difference*.

BESIDES simple words, which we have observed are, in their own nature, inexplicable; there are divers others that become accidentally so: and such are all the data, or preliminary principles of any art, with respect to those who confine themselves to the bounds of that art. Thus, if it be demanded of an apothecary to define one of his simples, *e. gr.* mercury; he must needs be at a stand, unless he be likewise versed in mineralogy; by reason it is putting him to explain a principle, which his art does not explain, but assume; the explication thereof lying in another province. But ask him to define calomel, and he is prepared for you; and will readily enumerate the several ingredients, and the manner of preparing it, which is the proper pharmaceutical definition of calomel.

HERE it may be observed, that the words used in the definition of a term, do many of them represent complex ideas; and, consequently, ought themselves to be first defined, if we would have the definition complete. The term has usually divers subaltern ones; all which are resolvable into it, and make part and parcel of the knowledge held forth by it. Thus, if *mercurius præcipitatus albus* be defined, "a white medicinal powder, "precipitated from a solution of crude mercury in aqua fortis, by adding thereto a lixivium of sea-salt; and "then purified by repeated ablutions in a filter," &c. The ideas, *powder*, *precipitated*, *solution*, *mercury*, *aqua fortis*, *ablution*, *filter*, &c. remain to be explained, to furnish the complete notion of white precipitate. — But as this would be endless, and would defeat the intention of a definition; the practice obtains, to suppose all other terms known, except that particular one under definition. By this means we avoid the embarrass of bringing

bringing down every word to its principles, or simple ideas; and acquit ourselves, by bringing it to the next complex ones: since the bringing an unknown term to several known ones, is a kind of indirect definition.

SUCH is the nature of a technical definition, which holds good or valid for those of that art, or craft; who are to be supposed furnished with the necessary data, or preliminary notices. But to make a scientific definition, we must go a little lower; and bring down the words, if not to their simple ideas, yet to general or common ones. For, it is to be observed, there are great numbers of complex ideas current among most people, which therefore may be considered as data, and used as simple ones, for more convenience sake. All technical apparatus, then, is to be here thrown by; and instead of giving five or six hard words for one, the general effect and meanings thereof are to be made use of. Thus, the precipitate abovementioned may be defined, "a white powder, which falls down from quicksilver dissolved in spirit of salt petre, upon casting salt therein; and afterwards washed, again and again, by passing fair water through it," &c. where, though several of the words be complex; yet most people in the ordinary course of life, have framed the complex ideas belonging to them: so that they may be considered as simple ones. — Yet the definition can scarce be said to be complete, even here: the general, or philosophical sense of words, we have observed, is formed from the grammatical one; and, consequently, the definition ought, in strictness, to extend thither: the solution, to be adequate, should go as far as the knot; the analysis, as the synthesis.

THE reader already begins to feel this preface grow tiresome; and yet several things are still behind. When so large a work was to follow, he perhaps imagines he should have been excused from a long introduction: and the like, probably, may the author say; who, after so tedious a work, could not be over-tired of any additional fatigue. But, the expediency of the case, which swayed and determined the one; may, we hope, suffice to satisfy the other. Several matters were purposely waved in the course of the Book, to be treated of in the PREFACE; which appeared the most proper place for such things as have a regard to the whole work. What has been hitherto insisted on, as well as what remains, immediately affects every article in the book; and tends, withal, to let a little needful light into certain points, hitherto involved in great obscurity. A preface may be considered as a vehicle wherewithal to convey the reader, commodiously, from the title page into the book. The preface is a kind of comment upon the title; the book a paraphrase on it: or, if you had rather, the book is the title executed, the preface the title explained.

HAVING, therefore, dispatched some of the leading words of our title, ART, SCIENCE, TERM, and DEFINITION; we proceed to consider the nature of a DICTIONARY. — It were to be wished, that the many adventurers in print, who publish their thoughts under this or that form and denomination, would frame to themselves some precise notion of the character and laws thereof. — There is something arbitrary and artificial in all writings: they are a kind of draughts, or pictures, where the aspect, attitude and light, which the objects are taken in, though merely arbitrary, yet sway and direct the whole representation. — Books are, as it were, plans or prospects of ideas artfully arranged and exhibited, not to the eye, but to the imagination; and there is a kind of analogous perspective, which obtains in them, wherein we have something not much unlike points of sight, and of distance. An author, in effect, has some particular view or design in drawing out his ideas; either nakedly, to represent something, or to distort and ridicule it, or to amplify and extenuate, or discover, or teach, or prove, &c. whence arise divers kinds of compositions, under the names of *histories, discourses, treatises, essays, enquiries, examinations, paraphrases, courses, memoirs, burlesques*, &c. in all which, though the matter or subject may be the same, the conduct or artificial part is very different; as much as a still-life from a history, or a grotesque, or a nudity, or a caricature, or a scene-work, or a miniature, or a profile, &c. each of these methods of composition has its particular characters, and laws; and, to form a judgment of the things represented, from the picture made of them, it is necessary we be able to unravel, or undo what is artificial in them, resolve them into their former state, and extricate what has been added to them in the representation: that is, we should know the manner thereof; whether, *e. gr.* they be mere nature, shewn through this or that medium, in a fore, or side-view, withinside, or without, to be viewed from above, or below; or nature raised and improved, or altered for the better, or the worse. — The case amounts to the same as the viewing of objects in a mirror; where, unless the form of the mirror be known, *viz.* whether it be plain, concave, convex, cylindric, or conic, &c. we can make no judgment of the magnitude, figure, &c. of the objects.

IT is beyond my purpose to enter into the nature of the several methods of composition abovementioned. I shall only note, by the way, that the first writers in each, marked and chalked out the measures of all that came after them. — The several manners of composing amount to so many *arts*; which we have already shewn, are things, in great measure, personal, and depend on the genius or humour of the inventors.

WERE we to enquire who first led up the way of Dictionaries, of late so much frequented; some little grammarian would, probably, be found at the head thereof: and from his particular views, designs, &c. if known, one might probably deduce, not only the general form, but even the particular circumstances of the modern productions under that name. The relation, however, extends both ways; and if we cannot deduce the nature of a Dictionary from the condition of the author, we may the condition of the author from the nature of the Dictionary. Thus much, at least, we may say, that he was an *analyst*; that his view was not to improve or advance knowledge, but to teach or convey it; and that he was hence led to untie the complexions, or bundles of ideas his predecessors had made, and to reduce them to their natural simplicity: which is all that is essential to a lexicographer. Probably this was in the early days of the Egyptian fables, when words were more complex and obscure than now; and mystic symbols and hieroglyphics obtained, so that an explication of their marks or words, might amount to a revelation of their whole inner philosophy: in which case, instead of a grammarian, we must put perhaps a priest or mystagogue at the head of Dictionaries. — Indeed, this seems the more probable, for that a grammatical Dictionary could only have place where a language was already become very copious, and many synonyms got into it; or where the people of one language were desirous to learn that of another: which we have no reason to think could be very early, or till much commerce and communication had made it necessary.

WHEN a path is once made, men are naturally disposed to follow it; even though it be not the most convenient: numbers will enlarge and widen, or even make it straighter and easier; but it is odds they do not alter its course. To deviate from it, is chiefly for the ignorant, or the irregular; persons who do not well know it, or are too licentious to keep it. And hence the alterations and improvements made in the several arts, are chiefly owing to people of those characters. There is scarce a more powerful principle in nature than that of imitation, which not only leads us to do *what* we see others do, but *as* they do it. It is true, there are exceptions from every rule: there are persons in good measure exempted from the influence of this principle; and it is happy there are; witness our Paracelsus's, Hobbes's, Leibnitz's, &c. In effect, if an art were first broached by an happy genius, it is afterwards cultivated, on his principles, to advantage; otherwise, not: and it may wait long for the anomalous hand of some reformer, to set it to rights. Some of our arts have met with such hands, others still want them.

WERE we to give an absolute and consistent definition of a Dictionary; we should say, "It is a collection of definitions of the words of a language." — Whence, according to the different kinds of words, and

and definitions above laid down, *i. e.* according to the different matter, and the different view wherein such matter is considered, will arise different sorts of Dictionaries: *grammatical*, as the common Dictionaries of languages; which, for one word, substitute another of equal import, but more obvious sense: *philosophical*, which give the general force or effect of words, or what is common to them in all the occasions where they occur: and *technical*, which give the particular sense attached to them in some one or more arts.

BUT, in truth, this is a little chimerical: though we have Dictionaries under all these titles, it would, perhaps, be hard to find any conformable to this partition; which is not so much taken from what really is, as what might, or should be. Dictionary-writers are far from considering their subject so closely, or confining themselves to so narrow, though direct a channel: they must have more room; and think themselves privileged by the general quality of lexicographers, to use all kinds of definitions promiscuously. It is no wonder they should not keep to views which they had not, and which could only arise from researches they never made. While the notions of *term* and *art* remained yet in the rubbish wherein they were left by the schoolmen, those of *definition*, and *Dictionary* must needs be vague, and arbitrary enough; and the Dictionaryists and Expositors profited by an embarrass which it was their business to have removed. They have not only built on it, but improved it, by a continual varying, and confounding of views, imperfect enumerations, &c.

IT is not to be imagined, what mischiefs and inconveniencies have arisen from this single head; what great uncertainty it has introduced into language; and what an obstacle it has been to the improvement thereof. It is certain it has, in great measure, defeated the intention of speech; and turned knowledge, which that was to be the medium of, into jargon and controversy. All the confusion of Babel is brought upon us hereby; and people of the same country, nay the same profession, no longer understand one another. — The effect is, that our knowledge is grown into little other than that of peoples misunderstandings, or misapprehensions of one another; which is the only kind of knowledge that grows; and which will for ever grow: there being the seeds already laid of such disputes, as, according to the ordinary spreading of such things, must overshadow and starve every thing else. If all men meant precisely the same thing, by the same name, there would be no room for their differing upon any point, either in philosophy, or any thing else: there is no more possibility of seeing the relations of things to each other, differently; than of altering their nature, and overturning the system. Relations of ideas are as immutable as the Creator's will. — Error, in effect, is no natural production; nor is there any direct way of coming at it: we must go about for it; and find some law of nature, to put it in our power. So that error is, in one sense, truth, ere it takes place; only it is not the truth it is taken for.

THERE are two manners of writing: in the one, which we may call *scientific*, we proceed from ideas, and things, to words; that is, we first lay down the thing, then the name it is called by. — This is the way of discovery, or invention; for that the thing ought to be first found, before it be named. In this way, we come from knowledge to ignorance; from simple and common ideas, to complex ones.

THE other is *didactic*, just the reverse of the former; in which we go from words and sounds, to ideas and things; that is, begin with the term, and end with the explanation. — This is the historical way, or the way of teaching, and narration; of resolving the extraordinary knowledge of one person, into the ordinary of another; of distributing artificial complications into their simple ideas; and thus raising, and levelling again, what art had erected.

THE Dictionary comes under the latter kind. It supposes the advances and discoveries made, and proceeds to explain or relate them. The Lexicographer, like an historian, comes after the affair; and gives a description of what passed. The several terms, are so many subjects, supposed to be known to him; and which he imparts to others, by a detail of the particulars thereof. — Indeed, the analogy between a *Dictionary* and a *history*, is closer than people at first sight may imagine: the Dictionary relates what has passed, with regard to each of our ideas, in the coalitions, or combinations that have been made thereof: its business is, to deliver the progress made in the several parts of knowledge under consideration, by an orderly retrospect, and deduction of the terms, from their present complex, to their original simple state. The Dictionary of an art, is the proper history of such art: the Dictionary of a language, the history of that language. The one relates that such an art, or such and such parts thereof, stand so and so; are managed so and so; and the result so and so: the other, that such and such a word is used as synonymous to such and such others. The Dictionary-writer is not supposed to have any hand in the things he relates, he is no more concerned to make the improvements, or establish the significations, than the historian to achieve the transaction he relates.

THE difference between what we commonly call the *history of an art*, and a *Dictionary* thereof, is only circumstantial; arising from the different views of the two sorts of authors: the one chiefly regards the time and order, when each step, each advance was first made, *i. e.* how it stood with respect to such and such æra's, or periods of time; and might more properly be called the *chronology of the art*: the other regarding chiefly the object or intention of the art, relates its present constitution, and how it proceeds to attain the end proposed. You may add, that the former primarily considers what is past, or already advanced; the other also what is present, or remains to be done; the one tells, *e. gr.* how Mercury finding a dead tortoise on the shore, took its shell, added strings to it, and made it into a lyre: the other, how a lyre is, or may be made. And if you will likewise add this, that the history intermixes divers foreign and accidental circumstances with the discovery, which the Dictionary abstracts, and sets aside, and so reduces it nearer to science, you will have the full and adequate difference between them. Thus the making of the first lyre is related with some circumstances, which have no place in the proper structure of the instrument, and are therefore to be omitted in the Dictionary, which only takes in what belongs to the art, or artists in general; not what belongs to some one of them.

THE whole, in effect, amounts to this, that the first time of doing a thing is related by the historian with the several particulars which in any wise, though occasionally only, and remotely affected it: whereas the lexicographer, coming afterwards, keeps more closely and severely to the point, and relates nothing but what is essential: *i. e.* the first time the thing is considered as now arising; a new production or phenomenon, from some analogous principle; and therefore we attend to the foreign causes that brought it forth: whereas, afterwards, we consider it as arising from a pre-existent theory, or the prescription of an artist, and thus resolve the cause into the art itself.

ANY other difference which may seem to be between the two, is only as to more or less particular; which indeed is a thing that embarrasses and amuses us on many other occasions: thus in mere civil histories, if one relate the series of a campaign, another the bombardment of a town, and a third the wounding and death of a general officer; though the latter subjects be only part of the former, yet the first will be said to have composed a piece of *history*, the second a piece of *fortification*, and the third a piece of *chirurgery*. And yet there is no other difference between them, than between the geography of a country, and the topography of a village, or a hillcock; the history of a nation, and the life of a single person.

TO say no more, the Dictionary of an art, stands in much the same relation to the history thereof, that the history of a people does to the lives of all the considerable and active persons therein. Their difference is only as to the point of sight; the eye being supposed so near in the one case, as to see the parts distinctly; and in the other so far off, as to take in the whole completely: whence the one gives you all the incidents; the other

only the greater. In effect, the one is all concerted to one point of view, most favourable to the whole, and the great parts; the other to many; the eye being shifted for each part, to furnish an adequate representation of each.

I am afraid to keep the reader any longer in this painful way of disquisition, wherein we are obliged to dig for every step we take. It would doubtless seem a more agreeable, as well as more reputable employment, to be raising things on high; than thus engaged in sinking; and working under-ground: a castle in the air, is an object of pleasure to every body, while it lasts; and withal is easily raised, and at small expence. Mines and subterranean cavities, are mere drudgery, and pioneers work; difficult to carry on, dubious of success, and over-looked when done.—Being therefore arrived near the surface, we take this opportunity to quit the course, and emerge to open air.

AFTER so severe an enquiry into the reason, nature, and perfections of a Dictionary; it may prove dangerous and impolitic, to speak any thing about the present one. From the design of a Dictionary in general, to the actual performance of any particular one, the style must be much altered. A man would make fine work, that would examine the several Dictionaries extant, by the standard here laid down: none of them could abide such a trial; even that here offered must go to wrack, like the rest.—It may be remembered, that the thing executed, is allowed to come short of the idea conceived: the former is only a copy of the latter, and liable to all the imperfections incident to other copies. A thousand things interfere; lexicography, being of the nature of an art, deviates, of course, from the standard of pure reason; and its productions come to degenerate still farther, by the accidents that attend their bringing forth. The instruments, the materials, and forty things come into the account: the former prove out of order; the latter obstinate and untractable, or perhaps not easy to be had. In effect, the author's situation, his want of leisure or perseverance, his frailties and foibles, may his very perfections and all conspire against it.

INDEED a too servile attachment to the rules and methods of an art, in many cases proves inconvenient and impertinent. We know, that the rules of an art are posterior to the art itself, and were taken from it, or adjusted to it, *ex post facto*. An author, therefore, is still in some measure left to his own conduct, and may consider himself as invested with a sort of discretionary power, whereby he can dispense with some of them, and go by others of his own suggesting, where he apprehends it for the general advantage of his work. The heights of art are never to be reached by rule, but by genius; by reason the rules were accommodated to a certain concurrence of circumstances, which rarely happens twice; so that laws should be made *de novo* for every new case. While a person considers himself as following, at second hand, the measures pointed out and prescribed by others; he will not go on with that spirit and alacrity, as when he follows his own bent. He should therefore consider himself in the place of the first inventor, or as his representative, or successor; and therefore qualified to enact with the same authority for the present occasion, as he did for another.

WHEN a law is not founded on mere reason, as we have shewn is the case in art; the observation of such law cannot be enjoined on others. It may well obtain, with respect to the person that first established it, as being accommodated to his particular genius, situation, and other circumstances; but it cannot extend to those in whom these conditions are different. Accordingly, few laws of art are universal. Small matter by what laws and precepts a people is guided, provided they be led on to happiness; or by what course a vessel steers, if she do but make a prosperous voyage.

WITH this view, in the present work, we have taken all the advantages the nature of the thing would afford us; and have frequently made ourselves delinquents against strict rule, for our reader's benefit.—A Dictionary, by our own confession, is to be a history; and yet we have not kept so close to that form, as to abandon the benefit of all others. In the business of mathematics, for instance; the regular way would be to relate or enumerate the several matters belonging thereto, without investigating or demonstrating their truth: demonstrations, strictly speaking, have nothing to do in a Dictionary, no more than authentic instruments, declarations, &c. in a history. To demonstrate the several properties and relations, *e. gr.* of *lines, angles, numbers, &c.* in a Dictionary, were an indistinction as great, as for an historian to produce certificates, and copies of parish registers, of the births, burials, marriages, &c. of the several persons whose actions he relates.—And yet, on some extraordinary occasions, we have not omitted to give demonstrations; where, for instance, there was any thing very interesting, or important in them: a practice like which historians themselves frequently give into; though it be a confessed irregularity, as it breaks in upon the unity of the narration.

BUT we are far from the views of certain Dictionary-writers, who seem to think it incumbent on them to demonstrate every thing that is capable thereof. This is directly to forget the nature of their work; and dispense with the rules, both to their own and reader's cost. How dear, *e. gr.* must a competent demonstration of most of Euclid's propositions be here purchased? Either the reader must be at the pains of picking it piece-meal, out of twenty several parts of the book, where the alphabet has happened to cast it; or the author must relinquish the Dictionary-method, and deliver things together, that properly belong to so many several places; or else there must be a repetition of the same thing a dozen times over. And for what? Why, to make the Dictionary do the business of an Euclid's elements; which it is the unfittest in the world for. You might, with equal propriety, make an ozier-basket supply the office of a pleasure-boat; or a sword-pommel that of a portmanteau, as Paracelsus is said to have done.

WHEN a thing has been once regularly demonstrated, it may be assumed, or taken for granted: every body, perhaps, may be concerned in the truth of it, but not to see the truth of it. To make it a principle to take nothing on trust, would be as troublesome in the sciences, as in life; and would render us, for ever, both wretched and ignorant. Not only suppositions, but even errors, frequently lead us to knowledge otherwise inaccessible. Mathematicians themselves, who, of all others, keep most to demonstration, yet find themselves under a frequent necessity of admitting and making use of things as true, which they do not then see to be so; and thus are swayed, like other people, by authority. A person who makes use of the equality of the square of the hypotenuse, to the squares of the two sides, upon the credit of Pythagoras, or Euclid's having demonstrated it; does little more than what they themselves do on many occasions, who assume and make use of propositions they have no other evidence of, but the knowledge or remembrance of their having been demonstrated.

THE case is much the same with *experimenting*, which stands on the like footing as demonstrating. They are both necessary in their kind; the former, as it leads on our knowledge, the latter as it follows and secures the rear: but their use is to be restrained to these purposes; and may be dispensed withal, in cases where neither of these are concerned. A person who would discover any point in physics, or broach and establish any point in mathematics, must use them: but the occasion is, in great measure, private and personal; and does not extend to the public, in the same degree as the knowledge of the doctrines themselves. That is, the particular means by which a thing was first come at, or is shewn to be true, do not interest us so immediately as the knowledge of the thing itself, which might have arisen from various other means, and in other manners: a man may know a thing in the way of *presumption*, of *opinion*, of *surmise*, of *authority*, and forty other ways; which, though all much inferior, and less excellent than the way of *demonstration* and *certainity*; yet we are glad of them on many occasions, and use them to good purpose. Every degree of knowledge is valuable. It would be an unreasonable

able, as well as incommodious fullness in us, to refuse all light, except that of noon-day. We find our ease and happiness frequently depend on the doing of things by twilight, or even moon-light, or the still more dubious light of a rush, or a glow-worm.

PYTHAGORAS, in all probability, was not ignorant of the equality of the square of the hypotenuse, &c. before he demonstrated it; else, what should have led him to look for the demonstration? And the like may be said of many of Mr Boyle's experiments. Plato even observes, that "the very putting a question, implies some knowledge of the thing demanded; since, without this, we should not know that what is returned is an answer."

LESS might have sufficed, to shew why, in the course of this work, we have usually omitted the apparatus of demonstrations and experiments; and given the doctrines pure and unincumbered, by any thing not essential to them. The experiments, for instance, which led to the theory of light, and colours, what would they be, but like the scaffolding before a fine building, which break and interrupt the sight, and hide most of the beauties of the work? Such scaffolding, it is true, would be of use to the connoisseurs; who might have a mind to examine the work, to measure the proportions of the several parts, and enquire whether every stone were justly laid. But, to the generality, it would rather be an incumbrance, much to the disadvantage of the edifice. — Yet, in the case of experiments, as of demonstrations, we have receded a little from strict method, in favour of such as have any thing very remarkable or beautiful in them. For the rest, the reader, if his curiosity serve him, is told where to have them at first hand.

IN the case of definitions, too, we do not keep inviolably to what has been above laid down, but reserve to ourselves the discretionary right claimed by our predecessors. — We make use, occasionally, of all sorts of definitions, as they best suit our design, the conveying of knowledge. In effect, we have usually a regard to the degree of notoriety, importance, &c. of the term, though a point arbitrary and indeterminate enough; and endeavour to accommodate the explication thereto. The rule should be, to say, *Communia proprie, propria communiter*; to express common things so as that even the learned may be the better for them; and the more abstract and difficult so as that even the ignorant may enter into them. Accordingly, in popular terms, we endeavour to give a technical definition, *i. e.* to wave the general and obvious meaning, which is supposed to be known, and enter further into the nature of the thing, not known. But, in the more remote terms, the popular and nominal definition is also given, as being supposed there to be wanted.

THE literal and technical definitions of a term, are lame and imperfect without each other; the first gives its use and effect, as part of general, or abstracted science; the second, as applied to some particular subject. — The literal notion. *e. gr.* of *relation*, is that of "conformity, dependence, or comparison of one thing to another;" thus much is common to relation, both in grammar, logic, geometry, &c. *i. e.* it expresses this, both when applied to words, to propositions, to quantities, &c. — The technical notion of relation, in grammar, is "the dependence of words in construction;" this makes the grammatical notion of relation, *i. e.* it limits, or ties down the general abstract idea of relation, to the particular subject of grammar, words. So, the technical notion of relation with regard to arithmetic, geometry, &c. is "the conformity or dependence between two or more lines or numbers."

FROM the whole, it follows, that the two kinds of definitions differ as an art and a science, as general and particular reason. — And hence, from the several technical or particular meanings, one might run back to the general, or literal meaning, by abstracting, but not contrariwise, from the general or abstract, to the particular ones; in regard those other are arbitrary, and depend on the good pleasure of the artist, who first introduced them.

IN strictness, every term should be first given in its literal, or grammatical, meaning; especially if it be a term in several arts: as this helps to shew the orderly derivation of the word, from the simple or general idea that gave rise to it, to its last, and most complex state. — Yet we have not always kept to this method. In some words, there is much of the literal import of the word preserved in the term, or the technical one; as in the word *free*, or *freedom*: a man who has a notion of *freedom*, in its common or literal sense, will easily pass on to all the particular ones, as *free-city free-port, freedom of speech, of behaviour*, &c. so that, in this case, a literal definition might almost alone suffice; the meaning of the word having suffered little alteration at the hands of artists. — In other words, the literal or primary import of the word, is almost lost in the term: for instance, in the word *power*, in arithmetic: which will scarce bear any tolerable definition at all. Literally, the word implies a relation of superiority, or influence over something, which, in respect hereof, is conceived as weak, &c. According to the analogy of language, therefore, the arithmetical power should have somewhat of this relation of superiority over the root: but the root itself is also a *power*: so that the definition of power must take in two opposite relations, *viz.* both power and subjection.

PERHAPS, to go on in the most regular manner, and take up things at their source, we should begin with settling the etymologies of words; but the great alteration many words have undergone, and the great length they have been carried from their original meanings, in being borrowed from one language or age to another, would frequently make this not only a tedious, but an useless labour: so that here, too, we have used a discretionary power, and only meddled with etymologies, where they appeared of some significance.

TO explain a term, as a term, we usually express the circumstances wherewith it is attended, in the art to which it belongs, in their technical names. This is agreeable to the manner of artists, who, writing of their respective arts, use terms as common words, and suppose them to be known: and it is this that constitutes a technical explanation; not the giving the general effect or force, in such words as may equally agree to all other arts. — And yet, in some cases, we recede from this rule, particularly in divers of the lower classes of manual arts, and the structure of some machines: thus, *e. gr.* in turnery, we make no difficulty, instead of *chuck*, to say a round piece of wood, &c. The reason is, that where the several subordinate terms of a definition are themselves explained in their places, we may suppose them understood; but where the term defined is itself so low, that we do not go lower to define the parts couched under it; there we chuse, as more intelligible, to substitute some more obvious name, or the general meaning of the word for the term itself; and thus prefer the general or popular, to the technical definition.

FOR it is to be observed, that the Dictionary has its limits; it only carries matters to a certain pitch of simplicity, where we suppose people may take them up, and carry them farther as they please. We bring them into their sphere, and so leave them. So much knowledge, *i. e.* such a number of complex ideas, as we may presume people usually to have got in the common occurrences of life, we are willing to suppose, as a footing: where these end, our work is to begin, which is to take in the rest.

IF at any time we explain a complex idea, which it may be supposed most people have formed; it is because we think they do not take in all the simple ideas that go to constitute it: as in the case of *milk, blood*, or the like, where people are contented with two or three or the more obvious properties and phenomena, and stop over the rest. — Thus, in *milk*, *whiteness* and *fluidity* are almost alone considered; and these, in the common opinion, constitute *milk*; so that whatever has these two attributes, comes in for the denomination *milky*. The texture and component parts of this milk, the manner of that fluid's being secreted, collected, &c. with the peculiar

culiar properties and virtues resulting from all these, are left behind. So in *blood*, it is enough it be a reddish, pretty compact, animal juice; when warm, fluid and homogeneous, &c. This is going a great way, and even Dictionaries seldom go farther: but, for the component parts, the *cruur* and *serum*; with the component principles of these, viz. the *oil*, *phlegm*, &c. their form, properties, &c. whence arises the crasis, colour, heat, specific gravity, &c. of blood; Dictionary-writers do not ordinarily trouble themselves.

IF, by the artifice abovementioned, we get free of a vast load of plebeian words, which must have greatly incumbered us; the grammar and analogy of language, disengages us from a still greater number of all kinds. The various states of the same word, considered as it comes under different parts of speech, and accordingly assumes different terminations, increases the list of terms immensely: as, in *dark*, *darkness*, *darkening*; *project*, *projection*, *projectile*, *projective*, &c. which may either be considered as one and the same word, under different habitudes; in regard there is a common basis of them all: or, as so many different terms; in regard every one takes in something not contained in the other. — This latitude we make use of occasionally; and either consider the words this way or that, as seems most advantageous to our purpose. In some cases, where the alteration is merely grammatical, we content ourselves to explain them in one state, *e. gr.* *sheering*; and suppose the reader able, by grammatical, to form the rest, as *sporn*, &c. In others, where several particular ideas are arbitrarily superadded to the word in one part of speech, which do not belong to it in another, we there explain it in all: as *precipitate*, *precipitant*, *precipitation*, &c.

THIS gives an occasion to mention a strange kind of licence, frequently practised in our language. Though there be ordinarily a great deal of difference between the several states, or modifications of the same word, *e. gr.* *reflecting*, *reflection*, *reflectible*, &c. the same as between the action and quality, the power and the exercise of it in this or that case, the cause and the effect; yet authors make no difficulty of using them promiscuously; which would make downright nonsense, were the readers to keep to the strict import of the word. But the truth is, they are not so critical about the matter: if the meaning come within their reach, they jump at it, and are glad to take it; without waiting to see whether it would reach them in its present direction, or whether it might not rather fall short, or fly by them. What confusion should we make, even in our best and clearest writers, were we resolved not to understand them but according to the strict rules of grammar, and not indulge them the liberty of using one word for another? In a thousand cases, the same idea is denoted by opposite terms: thus, we say, such a medicine is good *for*, or *against*, the worms, plague, &c.

IT may be urged, that as custom has authorized this latitudinarian practice, it is become of grammatical authority; and that as the licence is known, it cannot deceive us; since the readers are led, on such occasions, to relax the bands of grammar, and annul the difference between words, in order to admit one a substitute for another. — But I am afraid this expedient scarce indemnifies us from the abuse. Besides the extraordinary embarrassments of reading what is thus promiscuously wrote; it is not always we know when and how to supersede the strict import of an author's words, and make him speak sense in his own despite. This I take to be none of the least occasions of controversy and dispute owing to language, and which we may almost despair of seeing rectified, unless in a new one.

I shall not here enter upon the merits and defects of the English tongue, considered as a language: a great deal has been said on that head by others, for which the reader may turn to the proper article in the Dictionary itself. — What we have to add, will be chiefly as it stands with regard to the arts, and more particularly to a Dictionary of arts.

I believe none will question but we have met with difficulties enough in the course of this work. The very bulk and dimensions of it confers as much, and the variety of its matter still more. But these were natural difficulties, appendant to the very design; and therefore did not afflict us so much as some others, which arose from it at second hand, or were superadded to it, as it were, by accident. And such was the present state of our language, which alone were sufficient to have baffled the best scheme, and broke though the best measures that could be formed.

WE have already represented language as something very important; and as having a near and necessary interest in knowledge. Names are solemn things, as they are representatives of ideas themselves, and used on most occasions in their stead: and terms, or combinations of ideas, are still more so; as much as complex engines are of farther and nicer consideration than the simple mechanic powers. But who would imagine this, to consider the of wanton use we make of them; and with how little fear or discretion words are treated among us? Every body thinks himself privileged to alter, or set aside the old, and introduce new ones at pleasure. England is open to all nations; and our traders in this commodity import their wares from every country, in all security. The humour of importing seems to have possessed every part of us: we are not only unwilling to be without the natural produce, the fashions, and the follies of our neighbour countries; but we even envy them their words and phrases. The effect is, that our language continues in a perpetual flux; and no body is master of it for two days together.

A man never knows when he is at the end of the terms, *e. gr.* in architecture. When he has got two or three names for some one member, and thinks himself over-stocked, it is odds he has not half. It is not enough he knows what the thing is named in English; but he must likewise learn what the French, Italians, Latins, and Greeks, likewise call it, or frequently find himself at a stand. Thus it is in the case of *fillets*, *lists*, *listels*, *reglers*, *plathands*, *bandelets*, *tania's* and *baguettes*; of *chaplets*, *astragals*, *batoons*, and *tores*; of *gula's*, *gueules*, *doucines*, *cyma's*, *cy-matiuns*, *ogees* and *talons*; of *ovums*, *ovolo's*, *echinus's*, *quarter-rounds*, *boultings*, &c. between which, there is no known, allowed differences; but they are either used indiscriminately, or distinguished arbitrarily; one person making this distinction, and the next another, or perhaps none at all. So that if we come strictly to Dictionaries, we should have a different one for every author.

BUT the mischief does not end here: for as the antient arts are, in many respects, different from the modern; the use of their terms necessarily involves us in a new confusion, and makes the same word stand in an antient author for one thing, and in a modern for another. Thus it is in *parastata*, *orthostata*, *anta*, &c. In effect, there is that alteration continually making in the language of architecture, that there ought to be a different Dictionary of it for every different age.

THE truth is, a fourth part of the words in some of our popular Dictionaries, stand on no better authority than the single practice of some one fanciful author; who has met with Dictionary-writers fond enough to take his frippery off his hands, and expose them to the public for legitimate goods. By such means these exotics have obtained a kind of currency; so that a Dictionary would be thought defective without them. To omit even our fopperies would be thought a failing; and might even be esteemed, by some, as the most unpardonable of all. — On these accounts we have been obliged to temporise a little, how much soever against the grain; and thus, perhaps, have contributed to the still farther establishment of a number of words, which we had much rather have proscribed.

UPON the whole, nothing could be more desirable than an *index expurgatorius*, to clear the language of superfluous words and synonymous; to expunge the modern French and Italian terms in the several arts, where we have Latin and Greek ones; and even the Latin and Greek ones, where we have English or Saxon ones, equal

in sound and significancy. I think the learned languages ought to have the preference to the modern, because every person may be supposed to have read, but not to have travelled; and our country words I would prefer to any others, because there is the most analogy between them, and they usually retain more of the origin and etymology, than those transplanted from other languages. — Such a reform would reduce our Dictionaries to more reasonable dimensions; and disencumber the arts of half the difficulty now to be surmounted in attaining them.

BUT there is another spring of words no less prolific than that hitherto spoke of, and which has produced a swarm of spurious, misshapen words, which no nation but our own would have owned: I mean the itch of coining or making English words, by a sort of analogy, from the Latin and Greek ones. This fault the tribe of lexicographers have carried to a strange excess. How must a man stare, to see what detestable stuff some late writers of that class have furnished us with; words of their own manufacture, scarce fit to do any thing with, except cureagues! Witness *scopulosity*, *sticulous*, *scatebrosity*, *siccific*, *pugnacity*, *segnity*, *spulative*, *multifrosity*, *mugient*, *fastuosufness*; and many thousand more, at the reader's service, to be met withal in a Dictionary which few people are without. We are already over-run with this writer's scarecrows: what shall we be, when, having thus anglicised all the Greek and Latin words, he proceeds to do the same with the Dutch, Irish, and Welsh? Indeed I am the less angry with him, for that he has carried the abuse so far, as must not only save people from being seduced, but bring the practice into contempt. Such monsters cannot possibly live long: if they have escaped the midwife, who ought to have strangled them ere they came to light; yet if ever they stir abroad, they must infallibly be knocked off the head.

HOW oddly will our practice in this respect look, when confronted with that of our neighbours? one of the most learned men, and best critics of the last age, M. Menage, incurred infinite censure, for only endeavouring to introduce the single word *profaneur*: and could not succeed in it, notwithstanding that a word of that import was confessedly wanting in the French, and both the sound and analogy of the new word were unexceptionable.

TO return — The different states of different arts is remarkable: some of them have been refined to a degree of subtilty that has ruined them: as metaphysics and logics: others have scarce had any culture, but lie waste and over-run for want of it; as agriculture, &c. The grossness of some is their fault; it being such as disgusts, and forbids a delicate mind from pursuing them: In others, their subtilty and nicety is their bane, as leaving nothing for the mind to feed on. What meagre fare, for instance, are the school rules, and doctrines of *mediums*, and *extremes*? &c. They furnish us indeed with relations, and true relations too; but these so remote from all purposes of life, that they are in great measure insignificant.

IT is certain all our knowledge and arts ultimately refer to the great end of preservation. The faculties of the mind, like those of the body, were not given us for the mere exercise, or gratification of them, but in sub-servency to further purposes. Our knowledge is all originally a sort of revelation; and the divine Being reveals nothing to us for the mere vague sake of our knowing it, but that it may minister to his ends, the being and well-being of his creatures. Our perceptions and notices are second causes, or at least occasions, of what we do; and, no doubt, are under the direction of him for whom we do; whose glory is served thereby. In reality, they all center and terminate, at last, in our preservation; and according as they are farther from, or nearer to this point, they are found fainter or stronger: very near, they are palpable and cogent; as they recede, they continually abate of their clearness and evidence; and when arrived at a certain distance, they dwindle to nothing, and are lost. At a great height from this center, the nexus or chain whereby things are held together, and in virtue whereof we conclude from things known, to things unknown, becomes insensible; so that we lose our hold, and wander on we know not where. Our faculties here falter; the objects they meet with are inadequate to them; the air grows too thin for respiration. But where we leave off, there possibly some superior order of beings may take it up.

IN effect, the several arts have been cultivated to more or less purpose, as our preservation is more or less immediately interested in them: and by this key one might almost venture to judge which arts are capable of being carried still farther, and which not. — Our knowledge of *very great*, and of *very little* things, is very imperfect, *e. gr.* of very great and little *objects*, *distances*, *sounds*, &c. And the reason, no doubt, is, that there is but little relation between us and them; so that we are but little interested in the knowledge of them. Those things we have necessarily and immediately to do withal, are made to our reach; for the rest, it is no great matter what they are.

AND yet our curiosity has found means of making even these more cognizable than otherwise they are: we can, in some measure, alter the established relation between our faculties and their objects; and make use of one law of nature to undo or supersede another. — Thus we can magnify a little sound, or little body, or a little distance, &c. or we can diminish large ones; and thus make things, in some measure, adequate objects, that naturally are not so.

BUT there is no great advantage in this; we only, by these means, come at a better apprehension of things which nature seemed to put out of our way, for no other reason, but because they did not concern us: lest we should be engaged to mistake, and run after things we had no business with, to the neglect of those with which we have. — Thus, anatomy is found of less use in physic, than at first sight one would imagine; as being employed in taking things asunder, and considering them in parts, which nature intended to act in conjunction. There is I know not what secret law, whereby the effect of a thing is, as, it were, annexed to its integral state; so that in proportion as you either diminish it, or enlarge it, its effect is altered, in a manner beyond what we can well account for, from the bare consideration of magnitude.

ABUNDANCE of the less useful notices we find, were kept back, and left to be accidentally turned up in course of time: such as the knowledge of optic glasses, and their effects. — This affords an illustration of the goodness of nature in contriving, that things most useful and necessary should be most obvious, so as to be almost discoverable by a sort of instinct; and the other less immediately useful ones, left to be accidentally turned up in the course of experiment and disquisition. We may admire her wisdom still farther in this, that she should, as it were, go out of her way, and annex a sort of pleasure, beyond her main purpose, to the knowledge even of things not immediately useful; in order to engage us to industry and activity. This shews that she has ends to serve by that very activity; and, perhaps, is the best demonstration in the world, of the necessity we are under to pursue knowledge; and may raise a suspicion, that this very pursuit may possibly contribute to our preservation, in some farther manner not yet attended to.

'TIS no wonder the school philosophy should be carried to such a length; considering the narrowness of its object, and the great number of hands to cultivate it for so long a time. Its chief employment is in assigning and enumerating the characters and differences of our perceptions, taken as they are excited in us in the natural course of things: by which it is distinguished from the modern philosophy, which is chiefly employed in means to vary and modify these perceptions, and thus find out farther relations and differences than would otherwise have appeared. — The philosophers of the former kind are contented to take nature as she comes home to them, and apply their reasonings thereto without more ado: those of the latter go out in quest of her, to have more matter to reason upon. — The former are more contemplative, the latter more active; the former, in fine, reason, abstract, and discourse more; the latter, observe, try, and describe more.

HENCE, we discover why the old is much more perfect in its kind than the new. The former has little to do but compare, order, methodize, &c. what is ready at hand; the latter has likewise to find. After which, all the labour of the other still remains. The former takes nature in all her simplicity; the latter adds art to her, and thus brings nature into consideration in all her diversity: the former chiefly considers natural bodies in their integral state; the latter divides and analyses them: so that the former finds most of the principal relations; the latter, many more curious, and amusing ones.—Hence, the former, halted to its perfection, and could not long hold out; for that its matter was limited: the latter can scarce ever arrive at perfection, since experiments are endless. To say no more, to have philosophy complete, we should have the order, precision, and distinctness of the old; and the matter, the copia of the new.

THE modern is yet wild, and unascertained: 'tis not arrived at the maturity of method; the mine is but just opened, and the adventurers are chiefly solicitous about the matter, to see what it affords: it will be long ere it arrive at a just extent, to give room and leisure for reducing it to regularity. Not but the rules and methods of the antients are, in some measure, applicable to the new, and will go a good way towards the arranging of it; but the present philosophers seem too warm and sanguine for such a business; and the farther they go on to dig materials, still the more difficult will the ranging of them be.—This a man may be positive of, he never will see half the experiments and observations already made, employed in a system of physics.

BUT when that is done, a deal will still remain, ere we have the chief uses of it. For physical knowledge, strictly considered, is only a means of arriving at a higher and farther kind.—Histories, observations, and experiments of the kinds, order, &c. for instance, of fossils, are useful things, as they tend to lay in a stock of sensible phenomena for the mind to work upon, digest, and draw new notices from, for the improvement of our own faculties, and the better conduct of life: but it is short-sightedness to forget this farther view, and look only to the things themselves. The bare acquisition of new ideas is no real advantage, unless they be such as are adapted to the circumstances of our wants, and occasions, or capable of being made so. Knowledge, in its first state, is like food in the stomach, which may please and satisfy us, but is of no use to the body, till farther prepared. It must be carried farther, and assimilated, ere it feed us.—The modern philosophy is not so properly a philosophy, as the adit or opening of one: its matter has yet only undergone the first concoction: we are yet chiefly conversant about new physical relations learned by sensation; whereas, to bring it to the perfection required, it must have undergone the farther operations of imagination, and reason. Mere physics, as such, do not make a philosophy; those physics must first be carried up to metaphysics, and ethics, ere we can justly stop.

SENSIBLE phenomena, we have already shewn, are the foundation of philosophy: but the edifice will neither make any figure, nor afford much convenience, till it be carried one or two stories higher. 'Tis but, as it were, the cellaring or ground-work; which one would think, were no very comfortable place to live and spend ones time in. 'Tis one extreme, to take our lodging, as some virtuoso's are contented to do, under ground; and another to reside altogether in the garrets, as the schoolmen may be said to have done.

THE school philosophy, however, is of some farther use, as matter of history: we learn by it how people have thought, what views have obtained, and in what various manners the same thing has been conceived; which, though it be knowledge, as it were, once removed, yet is not entirely useless. The history of human thoughts is, no doubt, the most valuable of all others; it being this alone that can make the basis of a just logic, as physiology of a just physics. We must know wherein people have failed, or fallen short, or been deceived, to learn the reasons thereof, or be able to form rules for avoiding the like. The several opinions that have obtained, may be considered as so many phenomena of the human mind, which must be considered and inquired into, to find its nature.—This, alone, were enough to have engaged us not to omit that part of learning in the present work: though there were not wanting other circumstantial reasons, which had also their share; as, the necessity hereof to the understanding not only of the antient writers, but even of the modern ones, who frequently combat, remark, &c. upon the antient notions. To which it may be added, that abundance of our terms and phrases are derived from them, and therefore could not be so completely understood without them.

THE language of the antient and modern philosophy is not very different: the chief diversity is in the different ideas affixed to the same words, and the different applications of them. And happy had it been for the moderns, had they formed a new set of terms, adapted to their new notions: by adopting the old ones, they have not only introduced much ambiguity and confusion, but have even lost the credit of many of their own discoveries, which now lie blended and buried among those of the antients. One is at a loss to think what could induce the great philosopher of our age to retain the word *attraction*, in the sense he has done. The stamp and impression it had already taken from the antients, made it less fit to receive a new one: it could, at best, but take it imperfectly; and the result was, a promiscuous image, wherein we neither see the old nor the new distinctly. 'Tis difficult for the imagination totally to divest a sound of its received meaning, and consider it as a different to all things; as much as it is to annihilate the characters on a piece of paper, and consider it as a mere blank. Accordingly, though the great author abovementioned explained over and over, in the clearest terms, the sense he affixed to his *attraction*, yet experience verifies how much he was overseen; the chief objections against his whole system having been drawn from misapprehensions of this very word, which keep half the philosophers in Europe still at a distance, afraid to admit a most excellent doctrine, merely out of distrust of the vehicle by which it is conveyed. But this by the way—the reader who desires to see farther, may turn to the articles *Attraction*, *Newtonian Philosophy*, *Gravitation*, &c.

WHAT has been spoke of the school philosophy, reminds us of *astrology*; the terms whereof are not omitted in this work.—Were it only that it once obtained, is still extant in books, and has given occasion to abundance of terms and phrases adopted into other arts; it would have a title to be remembered.—“The history of mens follies, says the inimitable Fontenelle, makes no small part of learning; and, unhappily for us, much of our knowledge terminates there.” But this is not all; and they who absolutely reject all astrology as frivolous, do not know it. Every art and science has its vanities and foibles, even philosophy, mathematics, and theology; and every one its good sense, even astrology. The heavenly bodies have their influences: the foundation therefore, of astrology is good: but those influences are not directed by the rules commonly laid down, nor do they produce the effects usually attributed to them: so that the superstructure is false. Astrology, therefore, ought not to be exploded, but reformed. Indeed, a reformation would reduce it into a little compass; but this little is too much to be lost, as it now is, among the heap of trumpery mixed with it.—We have even been careful to preserve what is just and rational in the doctrines of *physiognomy*, *witchcraft*, and many other fanciful arts. The time was, when physics was not much more worthy the study of a man of sense, than astrology now is; so that one might propose an *introducitio ad sanam astrologiam*, as a desideratum.

OUR Preface seems now grown into a Dissertation in good earnest: enough has been discoursed of the general nature and subject of the work: allow me now to descend a little more to particular and personal matters; and thus end my Preface, where I need not have wanted precedents for beginning it.

WHAT has been said hitherto, has been on the advantageous side of my work: to acquit myself to the reader it will be necessary I turn the medal, and represent some things which appear on the contrary side. — The book, in reality, is not without considerable failings, of more kinds than one. — The curious reader must expect he will here meet with omissions, and there with redundancies; here the method and œconomy are not kept to; there an article is imperfectly treated: here, a passage from some other language is not sufficiently naturalized; there, a sentiment of some other author is not sufficiently digested: here, in fine, the author was overseen; and there the printer.

ONE might palliate these objections, by alledging, that “they are things not peculiar to this work, but extend to all the kind; that most of them arise, of necessity, from the very nature and form of a Dictionary; and that many of them are not peculiar even to a Dictionary, but are found in all extensive undertakings, and are appendant to the very best part of the design, its universality.” But instead of extenuating, I had rather be taxed with enflaming and aggravating.

FOR errors, they cannot be very few, considering the hands through which most parts of our knowledge have passed, and from whom we are obliged to take many of our accounts! What one author, upon the narrowest subject can be produced, that has not his share of them? And what Argus could possibly see and correct the oversights in all the authors he had to do with? Scaliger, in his exertions against Cardan, has shewn some twenty thousand in one small work; and no one imagines he has pick’d it perfectly clean. Yet Cardan was no ill author. Bayle’s chief design in composing his Dictionary, was to detect the errors in Moreri; which he succeeded in so well, that his book has been called the *errata of Moreri’s*. Yet is not Bayle himself without his errors: a late writer has discovered some twenty-five in a single article of not quite so many lines. — F. Hardouin, in the preface to his *Nummi Antiqui Populorum & Urbium*, says, it may be called *Errata Antiquariorum*; and yet M. Vaillant spied not less than three hundred errors at the first reading it over. So easy a matter is it to discover faults in others, and so difficult to prevent them in ourselves! The most learned Dr***** who offered to point out five thousand faults in the Lexicon of Hesychius, has been charged with committing forty six in his emendations of the first book of Horace’s *Odes*, besides ninety in the notes.

NOTHING of this kind can appear surprizing, when we consider on what a multitude of sides a man is accessible to error! An author we trust to deceive us — our own judgment betrays us — our attention leaves us for a moment — our very eyes and hands play us false — or, suppose we escape all these snares: an amanuensis shall bring us into the scrape; or, if we get clear here too, we are in imminent danger of miscarrying in the printer’s hands.

IN a work of any considerable extent, and variety of matters, it seems impossible not to err. All the qualifications requisite for a faultless writer, scarce ever concurred in a more signal manner than they did in Jos. Scaliger, whose book *de Emendatione Temporum* is one of the top performances in the whole compass of literature. Yet has F. Petau discovered, at least, a thousand slips in it! — Who then can be safe? He only who writes nothing, or next to nothing. If a Baronius will compile *Annals*; Du Pin, a *Bibliothèque*; or Baillet, *Jugemens des Savans*, what triumphs do they prepare for future Pagi’s, Simons, and Menages?

THE most we can say, is, that we hope there will be few errors found in the present work, in comparison with others of the like kind: many thousands we have corrected, both in the Dictionaries and other writings we have collected from, by means of the light which other parts of knowledge afforded: but after so large a harvest, no doubt, there remains a sufficient gleanings. We flatter ourselves, however, that what we have overlooked, the reader will frequently be enabled to correct, by the means here afforded; and that there will not be many errors found in the book, which the book itself will not help to rectify.

AS to omissions, there is scarce any avoiding them; and the more intelligent the reader is, the more of this kind he will necessarily discover. Indeed, I must own myself greatly a debtor on this score; and though at present insolvent, yet if the reader will give me credit, it shall be my endeavour to see all I owe discharged: if not in a lump, yet by a course of payments.

FOR redundancies, people will hardly be agreed about them. After one man has picked what he thinks fit of this kind, and laid it by, ’tis odds but a second taxes his temerity, and want of taste, and restores half of them to their places; and a third will, perhaps, be tempted to replace the remainder.

As to irregularities, and breaches of method, I will not claim impunity on the score of being the first that has attempted to introduce any certain rules or method into this way of writing: but there will be, at least, this peculiarity attending my case, that I cannot easily be indicted for the breach of any laws but my own. — I am sensible, however, there is no point I have been more delinquent in, than this of method: and that the references, and necessary connexions between the parts, which should shew their relation, and help to put them together, are but too frequently either dropt, by which the reader is left without his clue; or misplaced, by which he is put on a wrong quest.

THE references, it may be necessary to observe, are of two kinds; the one *real*, which directs to some other article, wherein the matter in hand is further explained; the other *grammatical*, or *verbal*, serving to indicate some particularity relating to the name; *e. gr.* some synonym, paronym, opposite, etymon or the like. The use of the former is palpable, as they are conversant about the relation of *things*; that of the latter is more obscure, as dealing only in the relations of *words*: yet are these as essential to the work, considered as a Dictionary, as the others are to it, considered as a body, or system.

AS to *jejune*ness, and crudity, no doubt, there must be a deal of that kind, considering the short time so great a load of fruit had to hang and ripen. Much of it was gathered ere it could possibly be matured; so that it is no wonder it now and then tastes of the wood. But setting aside this; if a man may not be allowed to say a good number of but indifferent things in the compass of five hundred sheets, I know not who would be an author.

LASTLY, as to there being little *new*, and of my own growth, I must here change my style; and, from confession, turn to vindication. — The work is, what it ought to be, a *collection*; not the produce of one man’s wit, for that would go but a little way; but of a whole commonwealth. If any person will undertake to write a Dictionary, even of some one particular art, from his own fund alone, a man may safely venture to foretel, that it will not be good for much. — I do not pretend to entertain my guests at this rate, with just what my own scanty granaries afford: the whole country is ransacked to make them the fuller banquet. No body that fell in my way has been spared, antient nor modern, foreign nor domestic, Christian nor Jew, nor Heathen: philosophers, divines, mathematicians, critics, casuists, grammarians, physicians, antiquaries, mechanics, have been all brought under contribution.

NONE of my predecessors can blame me for the use I have made of them; since it is their own avowed practice. It is a kind of privilege attached to the office of lexicographer; if not by any formal grant, yet by connivance, at least. — I have already assumed the *bee* for my device; and who ever brought an action of trover or trespass against that avowed free-booter?

'TIS vain to pretend any thing of property in things of this nature. To offer our thoughts to the public, and yet pretend a right reserved therein to one's self, if it be not absurd, yet it is forbid. The words we speak, nay, the breath we emit, is not more vague and common than our thoughts, when divulged in print. You may as well prohibit people to use the light that shines in their eyes, because it comes from your candle: e'en clap it in a dark lantern, and let us not be amused and dazzled by it: if we may not be the better for the good things, let us not be the worse for the ill and indifferent ones mixed with them.

WE see the same thought, which was first started in one author under a world of crudity, borrowed by another, become farther improved, and ripened; and at length, being transmitted to a third, yield fruit in abundance. All plants will not thrive in all soils that will produce them; some languish in their mother beds: whence the gardener is under a frequent necessity of replanting, &c.

SOME persons, I know, condemn all use of Dictionaries, abridgments, and compilations whatever. The Scaligers, Salmassius's, Huets, and other critics, protest against every thing that may tend to facilitate and shorten the course of study, as it tends, at the same time, to lessen diligence and application, to exempt men from the necessity of going to the fountain-heads, and thus renders them superficial. What we attain easily, say they, is lost again as easily: one of the chief fruits of study, is to inure men to labour and attention: what room is left for the judgment to act, where every thing is methodized, and laid in order? what occasion for the memory, where a man can immediately have recourse to every thing he wants? and who would burthen his head with a stock of knowledge, which he can always keep by him on much easier terms? It is added, that the exact and profound learning of the antient writers, was chiefly owing to this, that they had no such helps, which obliged them to go painfully to the sources, and study their authors at first hand.

THIS is the common style of men of the first-rate erudition; and were it only directed to those who aspire to the same rank with themselves, it would undoubtedly be excellent. He who pretends to have a feat on that bench, must go to work the severe way: he must not study, *e. gr. antiquity*, in Dictionaries, or even in modern systems, but in the antient writers themselves; the *Jewish* antiquities, for instance, in the books of the Old Testament, Philo, Josephus, the Talmud, Maimonides and the rabbins: the *Grecian*, in Homer, the antient tragedians, Aristophanes's comedies, Diodorus Siculus, Pausanias, Athenæus, and others: the *Roman*, in Livy, Dionysius Halicarnassæus, and other antients in both languages; the *Christian* in the Acts of the apostles, and the Greek and Latin fathers. — These he is to be reading night and day, in order to arrive at the right understanding of them, meditating, and making frequent reflections on them, striving to penetrate into all their views; maturely weighing all the circumstances in them; and lastly, comparing all with the hints, remarks, and improvements, suggested in the writings and comments of the more learned among the moderns.

ALL this, no doubt, is excellent. — But it is not many subjects or branches of science that a man can thus go through! And the greater part of mankind consists of such as are not enough interested in any one, to be solicitous about so thorough and profound a knowledge of it. — Add, that those who do, are forced, on many occasions, to make use of Dictionaries and other helps; and that those who speak most contemptuously of them do the same, oftner than they care to own it.

IN reality, a reduction of the vast bulk of universal knowledge into a lesser compass, (as I have elsewhere had occasion to observe) is of no small advantage to all those concerned in the acquisition of learning, that is, of all persons in general: for I know of no rank, condition, or even sex, that is dispensed from the necessity of cultivating and improving their own minds. By means hereof a stock of knowledge becomes attainable on easy terms, sufficient for the purposes of most persons, except those who make learning their more immediate profession; and for those too in most parts of science, except that which makes their immediate province. Such a design may perhaps seem most adapted to the uses of men of business, who cannot spend a deal of time, or of men of pleasure, who do not care to be at such pains in the pursuit of knowledge: but it would be no less advantageous to men of letters and study, whatever faculty or branch of science the devote themselves to; since Polymathy, or a general acquaintance with all the rest, is indispensibly requisite to arrive at an excellency in any one, by reason of that near connexion which is between the several sciences, and the mutual lights they afford each other. And what a vast career does this open? what a multitude of books and subjects will they have to make their way through; and what helps are not requisite to facilitate so laborious a course? Without these, either a man's whole life will be in danger to be spent in preliminaries, and preparing himself for his province, or he must resolve to set out with less ceremony, exclude the numerous kindred sciences out of his scheme, and retrench himself within the narrow limits of a single one. This, it must be owned, is but too often done, to the no small dishonour both of learning itself, and of those who cultivate it. By this means the sciences become cantoned out into so many separate districts, and the due communication between them is cut off; by which each is defrauded of the improvements which might be derived to it from the rest. Hence, in great measure, the inferiority of the modern authors to the antient. A narrow compass of knowledge, it is certain, will not enable a man to write with that dignity and masterhood, which is found in most of the antient writers; who, besides the particular science they wrote on, were conversant in all the rest. Those who have the least acquaintance with the antient method of study, know how severe they were on this head: a man was not allowed to be an orator, historian, poet, grammarian, or even architect, or musician, much less a philosopher, without the whole circle of sciences. — The same we still find insisted on as necessary by later writers, though the difficulty of arriving at it is so much increased, and the modern *Cyclopædia* become so vastly more extensive, as well as intricate, than the antient. How many new arts and sciences, and new appendages of old ones, come under consideration among us, that the antients overlooked? How many languages, living and dead, is a modern obliged to learn, when a Roman or Athenian was thought sufficiently furnished with one, or two? And how many difficulties have we to struggle withal in the acquisition of their sciences; the antient chronology, for instance, geography, or the like, from which they were free? We charge ourselves with the knowledge of their affairs, as well as our own; study minutely not only their sciences, but their most indifferent actions and customs, and their very words and phrases, which with us make spacious fields of learning, under the denomination of *antiquity* and *philology*. The dilemma then is apparent; either our talents and application must be greater, or our lives must be longer than those of the antients; or else our proficiency must be less in proportion, unless some means be had recourse to, to expedite the same.

IN effect, a reduction of the body of learning is growing every day more and more necessary; as the objects of our knowledge are increasing, books becoming more numerous, and new points of dispute and enquiry turning up. For want of this, the sciences remain in great measure at a stand, or can advance only imperceptibly; since the whole life of those who should make discoveries, is spent in learning what is already found out. Hence, such improvements as are occasionally made, rarely arrive at any maturity, but terminate in hints and imperfect openings, or in queries and proposals for farther enquiry. Most of the late discoveries in the sciences remain thus crude and imperfect; the whole vast systems of microscopical plants and animals, and telescopic worlds, of attraction, magnetism, electricity, and the like, remain,

as it were in embryo. How many curious observations and anomalous cases, are scattered in the writings of modern philosophers, which want to be reduced to systems? And what numerous lights are held forth in the writings of modern virtuoso's, for supplying divers desiderata in the sciences, to no purpose? — How many operations are there both of nature and art, of which we have imperfect notices, which want to be compared and traced more minutely? Transmutations, petrefactions, reproductions of organical parts, recompositions of bodies from their principles, refuscitations, meliorations, accelerations of growth, multiplications of species; to say nothing of transfusions, inoculations, injections, and the like, which are like to perish, as multitudes have done before them, for want of time to pursue them.

TO do justice to a *collection*, I mean a general and promiscuous one, it has its advantages. Where numbers of things are thrown precariously together, we sometimes discover relations among them, which we should never have thought of looking for: as the painter's and sculptor's fancy is frequently led on to the boldest and most masterly designs, by something they spy in the fortuitous sketches of chance or nature; inasmuch that a celebrated Italian makes no scruple to lay this down as the first origin and occasion of all these arts. 'Tis certain, most of our knowledge is empirical, the result of accident, occasion, and casual experiment: 'tis but very little we owe to dogmatizing, and method; which, as already observed, are posterior things, and only come in play after the game is started. It was, in all probability, the hand of chance that first threw sulphur, charcoal, and saltpetre together, and little did he who thus produced gunpowder, imagine he was inventing a new art of making war.

'TIS, indeed, surprizing to consider what slender experiments and observations many of the capital doctrines have arisen from: the blows of a smith's hammer on his anvil, are said to have given rise to the musical notes, which Guido, a poor friar, perfected by what he observed in conning over his beads. — The inventions of printing, of glass, of dying, of the dipping needle, of phosphorus, of telescopes, of taffety, of antimony, &c. are supposed to have arisen in the like manner; as the reader may find under their proper articles: and how many more we know not, by reason the great obscurity of their first rise, ere they attained a degree of usefulness and perfection fit to be taken notice of, has buried the particular circumstances thereof. If we will hear the ancient Phœnicians and Egyptians, among whom most of the arts are supposed to have arisen; they all came from casual observations: geometry from the inundations of the Nile; the flight of the crane, gave occasion to the invention of the rudder; the ibis taught to administer a glyster, the swallow to build, and the spider to weave, &c. In effect, a new observation, in some peoples minds prepared for it, is like a spark in a heap of gunpowder, which may blow a whole mine.

WHAT advantages may not philosophy be expected to derive from such a collection, or farrago of arts, when it is considered, that every circumstance, every article of an art, is to be looked upon as a datum, a phenomenon, or experiment in philosophy? and that the least of them may possibly be the foundation of a new system? — To consider only the dying of cloth, or tanning, or currying of leather; what is the whole process, but a series of physical effects, arising from new applications of body to body? And how many lectures will the philosopher have from painting, gardening, agriculture, &c. touching planting, ingrafting, pruning, exposure, expression, walls, &c. which might never have come in his way, but by such a chance? When a thing is once started, it may be applied infinite ways, and no body knows where it will stop.

THROUGHOUT the whole of this work, a particular regard has been had both in the choice of the several heads, and in amplifying on them, to the extending of our views, and opening new tracks, new scents, new vistas. We have endeavoured not only to furnish the mind, but to enlarge it, by placing it in a great variety of situations, and presenting to it the sentiments, notions, manners, customs, &c. of most ages, people, sects, &c. that have any thing new, unusual, or original in them.

SUCH a variety of views, and manners of thinking, is a sure remedy against being too violently attached to any one; and is the best way of preventing the making of pedants, bigots, &c. of any kind. It may be said, that every art, every system, tends to give the mind a particular turn; and that the only way of maintaining it in its natural rectitude, is by calling in other opposite ones, by way of counter-balance. Thus what is unsufferable in the mere mathematician, critic, grammarian, chymist, poet, or herald, is qualified and rendered amiable, by a due admixture of the rest.

THIS, indeed, is not the way to make a very great progress in any art; but at the same time it is the only way to hinder our being spoiled by any. Though this is only to be understood with regard to personal benefit: for no doubt the public is more benefited by the mere pursuers of particular arts, than by the general appliers to all: since, by the former, each is brought to greater perfection, and the mixture and temperament wanting in the individuals is found in the whole.

TO conclude, the ultimate view of a work of this kind, should be, the forming a sound mind, *i. e.* acquiring a system of perceptions and notions agreeing to the system of things, or in the relations thereto intended by its author. The end of learning and study, is not the filling our heads with other mens ideas; that is an enrichment which may prove for the worse; richness is only a matter of secondary consideration; soundness is the first. There are many manures which the husbandman dare not use, by reason they would corrupt the land, at the same time they enriched it, and lay the foundation of a disease, which would in the end impoverish, and make it spend itself in unprofitable weeds. — But it must be owned, mens heads are not so easily filled: the memory is not so tenacious as we may imagine; ideas are transient things, and seldom stay long enough with us to do us either much good, or harm: ten to one but what we read to day, is most of it forgot again to morrow. And what chiefly makes new ideas of any significance, is their extending and enlarging the mind, and making it more capacious, and susceptible. — But neither is this enlargement the last aim; but is chiefly of use, as it contributes to the increasing our sensibility, to the making our faculties more subtle and adequate, and giving us a more exquisite perception of things that occur; and thus enabling us to judge clearly, pronounce boldly, conclude readily, distinguish accurately, and to apprehend the manner and reasons of our decisions. To which end several things may conduce, that are not so much direct matters of knowledge, as collateral to it; for instance, much of the school philosophy, which, by exercising and exciting the mind, has a kind of instrumental tendency to sharpen its faculties, and needs only be read, not retained, to produce its effect. — But even this does not amount to the full and adequate end of knowledge: this is only improving the organ; and there must be some farther end in such improvement. No man sharpens his weapon on the sole consideration of having it sharp, but to be the fitter for use. Briefly then, our faculties being only so many inlets whereby, and according to the measure whereof, we receive intimations of the Creator's will, and the effects of his power and action; all the improvements made in them, have a tendency to subject us more entirely to his influence and direction; and thus make us conspire and move more in concert with the rest of his works, to accomplish the great end of all things. In which our happiness and perfection consists; the perfection of a single nature arising in proportion as it contributes to that of the universe.

Concerning the C U T S.

THE Reader may be pleased to observe, that the Figures relating to each Art, are brought into a several Plate, and placed in the Book fronting the name of such Art; and referred to under that name: as *Tab. Architecture*, *Tab. Geometry*, *fig. 3.* &c. — This may also serve for

Directions to the BOOKBINDER:

Who is hereby instructed to place the several Cuts fronting those words which make their respective titles; *e. gr.* the Plate intitled ANATOMY, fronting the article ANATOMY; and so of the rest.

N. B. The Plate *Analysis*, is joined to that of ALGEBRA; and the Plate *Navigation*, to that of GEOGRAPHY.

A.

A, in the ancient inscriptions of marbles, &c. occasionally stands for *Augustus*, *ager*, *aiunt*, &c. When double, it denotes *Augusti*: and when triple *aure*, *argente*, *auri*. Lisdore adds, that when it occurs after the word *millis*, it denotes him young.

A on the reverse of ancient medals, denotes them struck by the city of Argos, sometimes by that of Athens.—And among the later coins, the same letter is the mark of Paris. See Medal.

A, among English writers, is ordinarily used for *anno*, as *A. D. anno domini*; for *artium*, as *A. M. artium magister*, &c.

A, *ā*, or *āā*, among physicians, is used in prescription for *ana*; to denote an equal portion of divers ingredients, whether in respect of measure or weight.

Thus, *R. Sal volat. olei. tinct. croc. āā ʒ ss.* expresses Sal volatile oleofum, and tincture of saffron, of each half an ounce. The same *ā* or *āā* is also used in the like sense, without expressing any limited quantity or weight: Thus, *ā* or *āā* *P. B.* denotes simply, equal parts of the ingredients there mentioned.

A A A, among chymists, signifies an amalgama, or the operation of amalgamating. See AMALGAMATION.

A, An. See ARTICLES.

ABACTOR*, in some law-writers of the middle age, denotes a thief who drives off cattle by open force; more usually called *abigeus*.

* The word is compounded of *ab*, from; and *actor*, a driver; from *agere*, to drive.

ABACTUS, among the ancient physicians, was used for a miscarriage procured by art, or force of medicine; in contradistinction to *aborsus*, which is natural. But the moderns know no such distinction. See ABORTION.

ABACUS*, among the ancients, was a kind of cupboard, or buffet. See BUFFET.

* The word is Latin, but formed from the Greek *αβαξ*, which among that people signified the same thing; which some suppose to be compounded of *a* privative, and *βασις* foundation; *q. d.* without a foot or frame, to be fastened some way to the wall. But Guichart goes higher: he derives *αβαξ* from the Hebrew *בִּנְיָן*, *extolli*, to be elevated, raised; and supposes its primary signification to be a high shelf, or other convenience for things to be laid upon out of the way.

In this sense, Livy describing the luxury into which the Romans degenerated after the conquest of Asia, says, They had their *Abaci*, beds, &c. plated over with gold. Dec. IV. Lib. ix.

ABACUS* was particularly used among the mathematicians, for a little table strewed over with dust, on which they drew their schemes and figures.

* In this sense, the word seems formed from the Phenician *אבאק*, *abak*, dust.

ABACUS *Pythagoricus*, a table of numbers, contrived for the ready learning of the principles of arithmetic; denominated from its inventor Pythagoras, *pythagoricus*.

Hence also, from an agreement in point of use, the names *Abacus* and *Abaco*, are used among Latin, and Italian Writers for an alphabet, or ABC, &c.

The *Abacus Pythagoricus* was, in all probability, no other than what we call multiplication-table.

Ludolphus and Wolfius give us methods of performing multiplication without the help of the *Abacus*; but they are too obsolete in ordinary cases for practice. See MULTIPLICATION.

ABACUS, in architecture, is the uppermost member of the capital of a column; serving as a kind of crowning, both to the capital and the whole column.

Divers of our dictionary-writers, make the *Abacus* to be the capital itself; which is altogether as just, as to make the crown of the head the whole head.

Vitruvius, and others after him, who give the history of the orders, tells us, the *Abacus* was originally intended to represent a square tile laid over an urn, or rather over a basket.—

An Athenian old woman happening to place a basket thus covered over the root of an acanthus; that plant shooting up the following spring, encompassed the basket all around, till meeting with the tile, it curled back in a kind of scrolls. An ingenious sculptor passing by, took the hint, and immediately executed a capital on this plan; representing the tile by the *Abacus*, the leaves by the volutes, and the basket by the vase, or body of the capital.—Such was the origin of the first regular order.—See the representation hereof in *Tab. Archit. fig. 21.*

There is some difference in the form of the *Abacus* in different orders. In the Tuscan, Doric, and ancient Ionic, it is a flat, square number, well enough representing its original tile; whence the French call it *tailloir*, trencher. See *fig. 24. lit. l.* & *fig. 28. lit. o.* & *fig. 32. lit. k.* See also the articles TUSCAN, DORIC, and IONIC.

In the richer orders it loses its native form; its four sides, or faces, being arched, or cut inwards, with some ornament, as a rose, or other flower, or fish's tail in the middle of each arch.—See *fig. 26. lit. d.* & *fig. 20.* See also the articles CORINTHIAN, and COMPOSITE.

But some architects take other liberties in the *Abacus*, both in

respect of its name, place, and office. Thus, in the Tuscan order, where it is the largest and most massive, as taking up one third of the height of the whole capital, it is sometimes called the dye of the capital.—In the Doric it is not always the uppermost member of the capital; a cymatium being frequently placed over it.—In the Ionic, some make it a perfect oggee, and crown it with a fillet. See the figures above referred to.

The proportion of the *Abacus*, as prescribed by Vitruvius (4.1) is, that its diagonal (from corner to corner) be twice its height. A rule which the moderns make no difficulty of dispensing with.

Abacus is also used by Scamozzi for a concave moulding in the capital of the Tuscan pedestal.

ABAST, in the sea-language, is used in speaking of things placed, or done, toward the stern, or hind-part of a vessel; called also *ast*, and stands opposed to *fore*.—Thus they say a thing is *abast* the fore-mast, when it is behind it, or nearer the stern than the fore-mast. The post of the master, captain, and other officers is *abast* the main-mast.

The stern, strictly speaking, is only the outside; *abast* includes both inside and out.

ABALIENATION*, in the Roman law, denotes a species of alienation; whereby those goods called *res mancipi* were transferred to persons legally capable thereof; either by a formula called *traditio neque*, or a surrender in open court. See ALIENATION.

* The word is compounded of *ab*, from; and *alienare*, to alienate.

The things here called *res mancipi*, which were the object of *abalienation*, were cattle, slaves, lands, and possessions within the territory of Italy.—The persons capable of purchasing were Roman citizens, Latins, and certain foreigners who were particularly indulged this traffic.—The manner in which it was transacted was either with the ceremony of weights and money in hand, or a surrender before a magistrate.

ABAPTISTON, or ANABAPTISTON, a name anciently given to an instrument in chirurgery, by modern writers more usually called *trepan*, *modiolus*, *terebra*, *terebellum*, and *traine*. See TREPAN.

ABARTICULATION, in anatomy, the same with diarthrosis. See DIARTHROSIS.

ABASED, lowered, or made low; from the French *bas*, low; which Nicod. derives from *βασις*, foundation.

ABASED, ABAISSE, in heraldry, is applied to the vol. or wings of eagles, &c. when the tip, or angle looks downward toward the point of the field; or when the wings are flut: the natural way of bearing them being spread, with the tip pointing to the chief, or the angles.

A chevron, a pale, bend, &c. are also said to be *abased*, when their points terminate in, or below the centre of the field.

Again, an ordinary is said to be *abased*, when below its due situation. Thus, the commanders of the order of Malta, who have chiefs in their own arms, are obliged to *abase* them under those of the religion.

ABASING, in the sea-language. See STRIKING.

ABATEMENT, in heraldry, something added to a coat-armour, to diminish its proper value and dignity, and note some dishonourable action, or stain in the character of the person who bears it.

It is a little controverted among authors, whether heraldry allows of any such things as regular *abatements*. Leigh and Guillim, however without any scruple as to their reality, give us several kinds.

Abatements, according to the last of those writers, are either made by reversion or diminution.

Reversion is either turning the whole escutcheon upside-down; or the adding another escutcheon, inverted, in the former.

Diminution, is the blemishing any part by adding a stain, or mark of diminution: such are a delf, a point dexter, a point champaign, a plain point, a goar finifter, and a guslet. See each under its proper article.

It may be added, that these marks must always be either tawny, or murrey; or otherwise, instead of diminutions, they become additions of honour.

The last editor of Guillim discards the whole notion of *Abatements*, as a chimera. He alleges, that no one instance is to be met with in such bearing; and that it implies a contradiction to suppose it. Arms, being *insignia nobilitatis* & *honoris*, cannot admit of any mark of infamy, without ceasing to be arms, and becoming badges of disgrace; which all would covet to lay aside. Add, that as no hereditary honour can be actually diminished; so neither can the marks thereof. Both, indeed, may be forfeited; as in the case of treason, where the escutcheon is totally reversed, to intimate a total suppression of the honour.

Some instances, however, are produced to the contrary by Colombiere, and others. But these, though they may show some extraordinary resentments of princes for offences committed in their preference, do not amount to a proof of such custom or practice; much less authorize the being of particular badges in the hands of inferior officers, as Kings at arms.

ABATEMENT is also used, in a law-sense, for the frustrating, or setting aside a suit, on account of some fault either in the matter, or proceeding thereof. Hence,

Plus in ABATEMENT, is some exception alledged, and made good, either against the plaintiffs writ, as wanting due form, or containing false Latin; or against his count, or declaration, as being insufficient, or varying from the writ, speciality or record; or against the matter of either, as insufficient, or being before another court; or against the allegations, as being uncertain, on account of some misnomer, or the death of one of the parties, or the marriage of the plaintiff being a woman: to which some add disability.—Upon any of these, the defendant prays that the plaintiff's writ, or plaint may *abate*, i. e. that his suit may cease for that time: if it be granted, all writs and process must be begun *de novo*.

ABATEMENT also denotes an irregular entry upon lands, or tenements, left vacant by their former possessor, and not yet laid hold of by the next heir.

As he that puts out the possessor is said to disseize; so he that interposes, or steps in between the former possessor and his heir, is said to *abate*.

Coke on Littleton distinguishes between *Abatement* and intrusion; but the new book of entries renders *Abatement* by intrusion. Some think it were better, for distinction-sake, to render it by *interpositio*. *Term de ley*, p. 2.

ABB, among clothiers, denotes the yarn of a weaver's warp.—In a riot at Melkham, J. Crab is said to have marched with *Abb* on a stick; another evidence calls this a blue skain on a stick; and a third, a chain on a stick.—They also use the phrase, *Abb-wool*.—Great quantities of *Abb-wool* were by rioters thrown into the river.

ABBESS the superiour of an abbey, or convent of nuns. See **ABBESS**.

The *Abbes* has the same rights, and authority over her nuns, that the abbots regular have over their monks. See **ABBOT**. The sex indeed does not allow her to perform the spiritual functions annexed to the priesthood, wherewith the abbot is usually invested; but there are instances of some *Abbesses*, who have a right, or rather a privilege, to commission a priest to act for them. They have even a kind of episcopal jurisdiction, as well as some abbots, who are exempted from the visitation of their dioceses.

F. Martene, in his treatise of the rites of the church, observes, that some *Abbesses* have formerly possessed their nuns. But he adds, that their excessive curiosity carried them such lengths, that there arose a necessity of checking it.

St. Basil, in his rule, allows the *Abbes* to be present with the priest at the confession of her nuns.

ABB:Y*, or **ABBY**, a monastery, or religious house, governed by a superiour under the title of abbot, or abbess. See **ABBOT**.

* In our ancient statutes the word is sometimes also written *Abbaty*. By 31 H. 8. c. 13. *Abbaties* are given to the king.

Abbeys differ from *priories*, in that the one are under the direction of an abbot, and the other of a prior: but abbot and prior (we mean a prior conventual) are much the same thing; and differ in little but the name.

Faucher observes, that in the early days of the French monarchy, dukes and counts were called abbots, and duchies and counties *Abbeys*. Many persons of the prime quality, without any concern in the monastic life, took the same quality; even some of their kings are mentioned in history under the title of abbots. Philip I. Louis VI. and afterwards the dukes of Orleans, are called abbots of the monastery of S. Agnan. The dukes of Aquitan were called abbots of the monastery of S. Hilary, at Poitiers; and the earls of Anjou of S. Aubin, &c.

One third of the best benefices in England were anciently, by the popes grant, appropriated to *Abbeys*, and other religious houses; which, upon their dissolution under King Henry VIII. became lay-fees: 190 such were dissolved between 200 l. and 35000 l. yearly revenue, which at a medium amounted to 2853000 l. per annum.

ABBOT*, or **ABBAT**, the superiour of a monastery of monks erected into an abbey, or prelatey.

* The name *Abbot* is originally Hebrew, where it signifies father. The Jews call father, in their language, *Ab*; whence the Chaldees and Syrians formed *Abba*; thence the Greeks *αββας*, which the Latins retained, *Abbas*; and thence our *Abbot*, the French *Abbé*, &c.—St. Mark and St. Paul use the Syriac *Abba* in their Greek; by reason it was then commonly known in the synagogues, and the primitive assemblies of the Christians; adding to it, by way of interpretation, the word father, *αββας ε ματρός*, *abba*, father, *g. d. Abba*, that is to say, father.—But the name *Ab* or *Abba*, which at first was a term of tenderness and affection, in the Hebrew and Chaldees, became at length a title of dignity and honour: The Jewish doctors affected it; and one of their most ancient books, containing the sayings or apophthegms of divers of them, is entitled *Præcæ Abbat*, or *Avoth*; i. e. chapters of the Fathers.—It was in allusion to this affection, that Jesus Christ forbade his disciples to call any man their father on earth: which word S. Jerom turns against the superiours of the monasteries of his time, for assuming the title of *Abbats*, or fathers.

The name *Abbot*, then, appears as old as the institution of monks itself.—The governors of the primitive monasteries assumed indifferently the titles *Abbot*, and *Archimandrite*.

They were really distinguished from the clergy, though frequently confounded with them, because a degree above laymen. St. Jerom, writing to Heliodorus, says expressly, *alia monachorum est causa, alia clericorum*.

In those early days, the *Abbats* were subject to the bishops, and the ordinary pastors. Their monasteries being remote from cities, and built in the farthest solitudes, they had no share in ecclesiastical affairs. They went on Sundays to the parish-church with the rest of the people: or, if they were too remote, a priest was sent them to administer the sacraments; till at length they were allowed to have priests of their own body. The *Abbot*, or *Archimandrite* himself was usually the priest: but his function extended no farther than to the spiritual assistance of his monastery; and he remained still in obedience to the bishop.

There being among the ancient *Abbats* several persons of learning, they made a vigorous opposition to the rising heresies of those times; which first occasioned the bishops to call them out of their deserts, and fix them about the suburbs of cities; and at length in the cities themselves: from which era their degeneracy is to be dated.

The *Abbats*, now, soon wore off their former plainness and simplicity, and began to be looked on as a sort of little prelates. In time they would be independent of the bishops; and became so insupportable, that some severe laws were made against them at the council of Chalcedon: notwithstanding this, in time, many of them carried the point of independency; and got the appellation of lord, with other badges of the episcopate, particularly the mitre.

Hence arose new species and distinctions of *Abbats*: mitred, and not mitred; croziered, and not croziered, *ecumenical Abbots*, cardinal *Abbats*, &c.

Mitred Abbots, were those privileged to wear the mitre; and allow'd, withal, a full episcopal authority within their several precincts.—Among us, these were also called *Abbots* sovereign, and *Abbots* general; and were lords of parliament. Of these Sir Edward Coke reckons twenty-seven in England, beside two mitred priors.

The rest, who were not mitred, were subject to the diocesan.

Pere Hay, a Benedictine monk, in his book entitled *Astrum inextinctum*, maintains, that the *Abbots* of his order have not only a sort of episcopal, but even of papal jurisdiction, *potestatem quasi episcopalem, imo quasi papalem*; and as such can confer the lower orders of deacon and subdeacon.

When the *Abbats* first assumed the mitre, the bishops made heavy complaints of their privileges being invaded by the monks; and were particularly offended, that in synods and councils there was no distinction between them. On this occasion pope Clement IV. ordered, that the *Abbats* should only wear their mitres embroidered with gold, and leave jewels to the bishops.

Croziered Abbots, are those who bear the crozier, or pastoral staff.

There are some croziered and not mitred; as the *Abbot* of the Benedictine abbey at Bourges: and others, both the one and the other.

Among the Greeks, some even took the quality of *ecumenical Abbots*, or universal *Abbats*, in imitation of the patriarchs of Constantinople.

Nor have the Latins been much behind them in that respect; the *Abbot* of Cluny, in a council held at Rome, assumed the title of *Abbas abbatum*, *Abbot of Abbots*; and pope Calixtus gave the same *Abbat* the title of cardinal *Abbot*.

To say nothing of other cardinal *Abbats*, thus denominated from their being the principal *Abbats* of monasteries, which came to be separated.

Abbats are now chiefly distinguished into regular, and commendatory.

Abbots regular, are real monks, or religious, who have taken the vows, and wear the habit of the order. See **REGULAR**, and **VOW**.

Such are all *Abbats* presumed to be; it being expressly provided by the canons, that none but a monk have the command over monks.—But, in fact, it is found far otherwise: in France, I think, there are now but six regular abbeyes.

Abbats in commendam, are seculars; though they have undergone the tonsure, and are obliged by their bulls to take orders when they come of age.

Though the term *commendam* insinuates, that they have only the administration of their abbeyes for a time; yet do they hold, and reap the fruits of them for ever; as well as the regular *Abbats*.

Their bulls give them a full power *tam in spiritualibus quam in temporalibus*. And yet, it is true, that the commendatory *Abbats* do not perform any spiritual offices; nor have they any spiritual jurisdiction over their monks. So that the *Abbat in spiritualibus*, is rather something of the Roman style, than a reality.

Some of their canonists rank the *commendam* in the number of benefices,

benefices, *inter titulos beneficiorum*. It is, in truth, no more than a canonical title, or provision to enjoy the fruits of a benefice : but as such provisions are contrary to the ancient canons, none but the pope, by dispensing with the old law, can grant them.

Our own history speaks very little of these commendatory Abbots ; and it is probable the practice never prevailed much among us. Hence, many of our writers have been led into the mistake, of supposing that all Abbots are monks. Of this we have a remarkable instance, in the dispute about the inventor of the lines for transforming geometrical figures, called by the French the Robervalian lines. Dr. Gregory, in the Philosophical Transactions anno 1694, railles the Abbot Galloys, who held the abbey of St. Martin de Cores in commendam, with being a monk : ' The good father, says he, ' imagines we are returned into that fabulous age wherein a monk might be allowed to say what he pleased.' Which passage the Abbot takes hold of, and returns the railery, with interit, on the doctor, in the *Memoir, de l'Academ. an. 1703*. The ceremony whereby Abbots are created, is properly called benediction ; or sometimes, though that abusively, consecration.

It anciently consisted in cloathing him with the habit called *cuculla*, a cowl ; putting the pastoral staff in his hand, and the shoes called *pedales*, or *pedules*, on his feet. These particularities we learn from the *ordo Romanus* of Theodoric archbishop of Canterbury.

ABBOT is also a title, which has been given to certain bishops, by reason their sees had originally been abbeys ; and that they were even elected by the monks : such are those of Catania and Montreal, in Sicily.

ABBOT is also an appellation sometimes given to the superiors, or generals of some congregations of regular canons ; as that of S. Genevieve at Paris. See CANON.

ABBOT is also a title bore by several magistrates, and other lay-persons.—Among the Genoese, one of their principal magistrates was called the *Abbot* of the people.

In France, particularly about the time of Charlemaign, there were several lords and courtiers, who having the superintendency of certain abbeys committed to them, were styled, *Abba-comites*, or abbey-counts.

ABBREVIATURE*, or ABBREVIATION, a contraction of a word, or passage ; made by dropping some of the letters, or by substituting certain marks, or characters in their place.

* The word is derived from the Latin *brevis*, of the Greek *breve*, short.

Lawyers, physicians, &c, use abundance of *Abbreviations* ; partly for the sake of expedition, and partly for that of mystery.—A list of the principal *Abbreviations* in the several arts and faculties, see under the article CHARACTER.

Of all people, the Rabbins are the greatest dealers in this way ; their writings are unintelligible, without an explication of the Hebrew *Abbreviations*. The Jewish authors and copists don't content themselves to abbreviate words, like the Greeks and Latins, by retrenching some of the letters, or syllables thereof ; but they frequently take away all but the initial letter. Thus, R stands for *rabbi*, and N for *רבי*, and א for *אבנא* according to the place it is found in.

But what is more, they frequently take the initial letters of several succeeding words, join them together, and adding vowels to them, make a barbarous sort of word, representative of all the words thus abridged. Thus, *Rabbi Schelemoh Jarchi*, in the jargon of Hebrew *Abbreviations*, is called *Rasi* ; and *Rabbi Moses ben Meïssam*, is *Rambam*. And thus again, *דוד מלך ישראל* is put for *דוד מלך ישראל* *domum in abdito evertit*. Meïssam, David de Pomis, Schindler, Buxtorf, &c, have given explications of such *Abbreviations*.—The most copious collection of Roman *Abbreviations*, is that of Sertorius Ursatus : *Sertorii Ursati, equitis, de notis Romanorum, commentarius*.

ABBREUVOIR*, in masonry, the joint, or juncture of two stones ; or the interstice, or space left between them and filled up with mortar.

ABROCHMENT, and literally denotes a watering place.

ABROCHMENT. See the article ABROCHMENT.

ABUTTALS. See the article ABUTTALS.

ABCEDARY, ABCEDARIAN, or ABCEDERIAN, is sometimes applied to compositions, whose parts are disposed in the order of the letters of the alphabet.

In this sense *Abcedarian* is synonymous with alphabetical.—Thus we meet with *Abcedarian* psalms, lamentations, prayers, and the like ; chiefly among Hebrew writers ; which makes it probable they were the inventors of this species of wit.

ABDICATIO*, ABDICATION, the act whereby a magistrate, or person in office, renounces, and gives up the same, before the legal term of service is expired.

* The word is derived from *abdicare*, which is compounded of *ab*, from ; and *dicere*, to declare.

Abdication is frequently confounded with *resignation* ; but, strictly speaking, there is a difference : *Abdication* being done

purely and simply ; whereas *resignation* is done in favour of some third person.

In this sense, Diocletian, and Charles V. are said to have *abdicated* the crown ; But Philip IV. of Spain resigned it. The parliament voted King James's violation of the laws, and his quitting the kingdom, without providing for the due administration of affairs in his absence, to import an *Abdication* of the crown.

ABDICATIO, among Roman writers, is more particularly used for the act whereby a father disclaimed or disclaimed his son, and expelled him the family.

In this sense the word is synonymous with the Greek *anexochia*, and the Latin *familia alienatio*, or sometimes *ablatio*, and *negatio* ; and stands opposed to adoption.—It is distinguished from *exhereditatio*, or disinheriting, in that the former was done in the father's life-time, the latter by will at his death : so that whoever was *abdicated*, was also disinherited, but not *vice versa*. See EXHEREDITATION.

ABDOMEN*, in anatomy, the belly, or lower venter ; or that part of the body comprehended between the thorax, and the hips.

* The word is purely Latin, and is derived from *abdere*, to hide ; either because many of the principal viscera of the body are contained, and as it were hidden in this part ; or as others imagine, because the part itself is usually covered and concealed from sight, whereas the part over it, *viz.* the thorax, is frequently left bare.—Others suppose the word *abdomen*, a compound of *abdere* and *omentum*, in regard the omentum or caul is one of the parts contained in it.—Others take it for a mere paronym, or different termination of *abderes* especially as in some ancient glosses it is written *abdomen*, which might have been formed from *abdere*, as *legumen* from *legere*, the *e* and *u* being of it interchanged.

Anatomists usually divide the body into three regions, or venters : the head, the thorax or breast, and the *Abdomen*, which makes the lowest part of the trunk ; being terminated by the diaphragm above, and by the inguen or pubis below. See BODY.

The *Abdomen* is lined internally with a thin, soft membrane, which investing all the viscera above mentioned, contains and keeps them in their place, this is called the *peritonæum* : upon a rupture or dilatation whereof, they are apt to fall, and form those tumors called hernias. See PERITONÆUM.

It is covered and defended with five pair of muscles ; which not only defend the viscera, but by their alternate relaxations, and contractions in respiration, promote the action of digestion, and the extrusion of the feces and urine. By their contraction, the cavity of the *Abdomen* is straitened, and the descent of the contents of the viscera through the intestines is promoted. They are the proper antagonists to the sphincters of the anus and bladder, and forcibly expel the excrements of those parts, as also the foetus in parturition.

These muscles are the *obliqui descendentes*, and *ascendentes*, the *rectus transversalis*, and *pyramidalis* ; see each under its proper article.

The *abdomen* is subdivided into three lesser regions or cavities : the uppermost, called the epigastric, commences from the diaphragm and cartilago ensiformis, and terminates two fingers breadth above the navel : the second, called the umbilical, begins where the former ends, and terminates two fingers breadth below the navel : the third, called the hypogastric, defends as low as the os pubis.

Each of these subdivisions, the more accurate writers divide further into three parts ; a middle, and two lateral ones, called the *hypochondriums*. The middle part of the umbilical, is called the *umbilicus*, or navel ; and its lateral parts the *lumbi*, or loins : the middle of the hypogastric, is called the *hypogastrium* ; and its sides the *ilia*, or flanks. To which may be added the pubes, groin, ischiatic region, and perineum. See each under its proper place.

ABDUCTION*, in logic, a kind of argumentation, by the Greeks called *apagoge* ; wherein the greater extreme is evidently contained in the medium, but the medium not so evidently in the lesser extreme as not to require some further medium, or proof to make it appear.

* It is called *Abduction*, from *ab*, from ; and *ducere*, to draw ; because, from the conclusion, it draws us on to prove the proposition assumed.

Thus, in the syllogism, ' All whom God absolves are free of sin ; but God absolves all who are in Christ : therefore, ' all who are in Christ are free of sin.' The major is evident ; but the minor, or assumption is not so, without some other proposition to prove it ; as, ' God received satisfaction for sin by the suffering of Jesus Christ.'

ABDUCTOR*, or ABDUCTENT, in anatomy, a name common to several muscles, whose action is the withdrawing, opening, or pulling back the parts they are fixed to.

* The name is Latin, compounded of *ab*, from ; and *ducere*, to draw.—Their antagonists are called *Adductores*. See ADDUCTOR.

ADDUCTOR Auricularis, or of the little finger, arises from the annular ligament, and the third and fourth bones of the carpus in the second rank; and is inserted externally into the first bone of the little finger: it serves to draw that finger from the rest, and also to bend it a little.—See *Tab. Anat.* (Myol.) fig. 2. n. 23.

In some subjects it appears divided into two or three muscles, consisting of so many different series of fibres.

ADDUCTOR Indicis, or of the fore-finger, arises from the inside of the bone of the thumb, and is inserted into the first bone of the fore-finger, which it draws from the rest towards the thumb.—See *Tab. Anat.* (Myol.) fig. 1. n. 32. & fig. 6. n. 24. & fig. 7. n. 8.

ADDUCTOR minimi digiti manus. See **ADDUCTOR Auricularis**.

ADDUCTOR minimi digiti pedis, or of the little toe, arises from the outside of the os calcis, near the exterior bone of the metatarsus, and is inserted laterally into the outside of the second bone of that toe, which it pulls from the rest.—See fig. 1. n. 74. & fig. 6. n. 45.

ADDUCTOR oculi, or of the eye, is one of the four recti, or straight muscles, arising from the bottom of the orbit, and spread over the first proper tunic; serving to draw the eye towards the outer canthus.

ADDUCTOR pollicis, called also *thenar*, springs from the annular ligament, and first bone of the carpus; from whence passing to the thumb, it makes that fleshy body called *mons lunæ*: it draws the thumb from the fingers.—See fig. 1. n. 31. & fig. 2. n. 21. & fig. 6. n. 25. & fig. 7.

ADDUCTOR pollicis pedis, or of the great toe, springs from the inside of the os calcis, and the greater os cuneiforme; and is inserted into the outside of the exterior os sesamoideum pollicis; it serves to draw the great toe from the rest.—See fig. 1. n. 72. & fig. 2. n. 52. See also the article **TOE**.

ABECEDARIAN. See the article **ABECEDARY**.

ABELIANS, **ABELONIANS**, or **ABELOITES**, a sect of heretics in Africa, not far from Hippo, whose distinguishing tenet, and practice was to marry, and yet live with their wives in a professed abstinence, without having any carnal commerce together.

These heretics, inconsiderable in themselves, (for they were confined to a little compass, and lasted not long;) are become famous, by the great pains the learned have taken to ascertain the principle they went upon, and the reason of their denomination.

Some will have them to have built on that text of St. Paul, 1 Cor. vii. 29. *Let them that have wives be as though they had none*. A late writer concludes, that they regulated their marriage on the foot of the terrestrial paradise; alleging, that there was no other union between Adam and Eve, but that of hearts. He adds, that they had likewise an eye to the practice of Abel, whom they held to have been married, but never to have known his wife: and that from him they derived their name.

Bochart observes, that it was a tradition current throughout the east, that Adam conceived so much sorrow for the death of Abel, that he was a hundred and thirty years without having to do with Eve. This, he shews, was the sentiment of the Jewish doctors; from whom the fable was transmitted to the Arabs: and hence it was, according to Gligzeus, that *אבל חבאלה*, in Arabic, came to signify, to abstain from one's wife. He concludes, that he is the most mistaken person in the world, or this story had reached Africa, and given occasion both to the sect, and the name.

It is true, the Rabbins do hold, that Adam, after the death of Abel, remained a long time without any use of marriage; and till the time when he begot Seth: but to say that this was a hundred and thirty years is a manifest error; and contrary to their own chronologies, which place Seth's birth in the hundred and thirtieth year of the world, or of Adam's life; as may be seen in their two *Seder Olams*.

Abarbanel says, it was a hundred and thirty years after Adam's fall; as believing, with the other Rabbins, that Cain and Abel were conceived immediately after Adam's transgression. But, say others, be this as it will, whether a continence on occasion of the fall, or of Abel's death; it was the continence of Adam, not of Abel, that these heretics imitated; who, on this footing, should have been called *Adamites*, rather than *Abelians*. In effect, it is more than probable, they took their name from Abel, for no other reason, but because like that patriarch they had no issue; not that he lived in continence after marriage; but because he was killed before he had married.

ABETTOR*, or **ABETTOR**, in law, one who incites, incourages, or sets another on to perform something criminal; or some way seconds, and assists him in the performance itself. See **ACCESSORY**.

* The word *abet* some deduce from *ad*, to; and *bet*, to lay on one's side;—others from the Belgic *baeten*, to profit.—It alludes to the Saxon *bedan*, and the French *baeter*, to stir up. Thus those who procure others to sue out false appeals of felony, or murder against men, to render them infamous, are particularly denominated *Abettors*.

So, *Abettors* in murder, are such as advise or procure a murder to be committed, or are accessory thereto. See **MURDER**.

VOL. I.

There are *Abettors* in felony, but not in treason; the law looking on all those concerned in treason as principals. See **TREASON**.

ABEYANCE*, **ABREIANCE**, or **ABRAYANCE**, in law-books; something that only exists in expectation, or in the intendment, or remembrance of the law.

* The word seems derived of the French *Abbaye*, or Italian *Abbaye*, to bark; by a metaphor taken from dogs, who when earnest for meat, bark, and as it were devour it with expectation. Though Spelman rather chuses to derive it from the phrase *tenir en Abbaye*, to hold at bay, to defer or keep off.

Abeyance in our law, amounts to much the same with *hereditas jacens*, among the Romans, and *κληρονομία ἀσπρόβητος*, or *κληρονομία*, among the Greeks; i. e. *hereditas sperata*, or *expectata*, or rather *novum Dominum expectans*. As civilians say lands and goods do *jacere*; so common lawyers say, that things in like condition are in *Abeyance*: much as logicians say a thing is in *potte*, or in understanding; and as we sometimes say a thing is in *nubibus*.

It is a maxim in law, that of every land, either there is a fee simple in somebody, or it is in *Abeyance*.—If a church become vacant by the death of the parson, the freehold is said to be in *Abeyance*, till a new parson be inducted: for the patron has not the fee, but only the right of presenting to it, the freehold itself being in the incumbent thus presented, and therefore till such presentation in no body.

ABIGEUS. See **ABACTOR**.

AB-INTESTATE, **AB-INTESTATO**, in the civil law, is applied to a person who inherits from one who died intestate. See **INTESTATE**.

ABISHERSING*, an antient law-term, denoting a being free, or exempt, from all americiaments for transgressions of any kind. See **AMERICAMENT**.

* According to Spelman, it originally signifies a forfeiture, or americiament; and should rather be wrote *Misbersing*, *Misbersing*, or *Misferring*.

The word *Abishersing*, in a charter or grant, is said to give the proprietor not only the forfeitures, and americiaments of all others for transgressions committed within his fee; but also to exempt him from all such controul by any within that compass.

ABJURATION*, in a general sense, the act of denying, or renouncing a thing in a solemn manner, and even with an oath.

* The word is Latin, *Abjuratio*, compounded of *ab*, and *jurare*, to swear from, or against.

Among the Romans, *Abjuration* signified the denying a debt, pledge, deposit, or the like trust, by a false oath. In which sense, *Abjuration* coincides with perjury; and stands distinguished from *ejuration*, where the oath is supposed just.

ABJURATION, more particularly is used for a solemn recantation, or renunciation of some doctrine, or opinion, as false and pernicious.

In our own laws, to *abjure* a person, is to renounce all authority or dominion of such a person.—By the *oath of Abjuration*, a person binds himself not to own any regal authority in the person called the Pretender, or ever pay to him the obedience of a subject.

ABJURATION is also used in our ancient customs, for an oath taken by a person guilty of felony; who flying to a place of sanctuary, would swear to forsake the realm for ever, in lieu of other punishment.—We also find instances of temporary *Abjurations*, viz. for three years, for one year and a day, and the like.

This, in some cases, was admitted from criminals in lieu of death. The devotion for the church was so warm, from the time of Edward the confessor to the reformation, that if a man having committed felony, could recover a church or church-yard before he were apprehended, it was an asylum from which he could not be brought to take his trial at law; but confessing his crime to the justices, or coroner, and *abjuring* the kingdom, he was at liberty.

After *Abjuration*, a cross was given him, which he was to carry in his hand through the highways, till he was got out of the king's dominions; this was called the banner of mother-church. In time, *Abjuration* dwindled into a perpetual confinement of the prisoner to the sanctuary; wherein, after *abjuring* his liberty and free habitation, he was allowed to spend his life. By Stat. 21 Jac. I. all use of sanctuaries, and consequently of *Abjuration*, is taken away.

ABLACTATION. The weaning a Child from the Breast. See **SUPPLEMENT** article **WEANING**.

ABLACTATION, in the ancient agriculture, is a method of engrafting; wherein the cyon of one tree, being united for some time to the stock of another, is afterwards cut off, and as it were weaned from its mother-tree.*

* Whence the name *Ablactation*, viz. of *ab*, from; and *lac*, milk.

Among the modern writers, *Ablactation* is more usually called *inarching*, or *grafting* by approach. See the manner of performing it under the article **INARCHING**.

Ablactation is only practicable where the stock to be grafted on, and the tree from which the graft is to be taken, stand so near, that the branch or cyon may be applied, without cutting

ing off. Hence, it is chiefly used on plants that grow in roots; as orange, lemon, and pomegranate trees, vines, jefumina, &c. The season is April or May. To perform it, the usual method is to take the branch intended for the graft, and pare it away, both the rind and wood, the length of three inches; then, paring likewise the stock, so that they may join closely to each other, they bind them together, and cover them over with clay, or grafting-wax. As soon as they are found well incorporated together, the head of the stock is to be cut off four inches above the binding; and the spring following, the graft leaving the stock to subsist by it self.

Or, the operation may be done, by cutting off the head of the stock at first, and leaving the top a little sloped, and applying the graft thereto, as in shoulder-grafting. But this method is not found equally successful.

ABLAQUEATION*, a name used by the ancient writers of agriculture, for an operation in gardening, whereby the earth is dug from about a vine, or other fruit-tree, and its roots are laid bare, to expose them more to the sun, rain, and air, in order to promote its fecundity.—This is generally done in January.

* The word is form'd from *ab*, from; and *lacus*, a hole or ditch.

ABLATIVE*, in grammar, the sixth case of Latin nouns.

* The word is Latin, formed from *aufferre*, to take away. Priscian also calls it the *comparative case*; as serving, among the Latins, for comparing, as well as taking away.

The *Ablative* is opposite to the dative; the first expressing the action of taking away, and the latter that of giving. See **DATIVE**.

The *Ablative* scarce answers to the just idea of a case; at least, it is the most vague of all others. It will be shewn in its place that the English, and other modern tongues, have properly no such thing as cases: (See **CASE**.) But even in the ancient languages, from which the notion of cases is borrowed, it is suggested that the *Ablative* is only a sort of superfluous, or supplement to the rest. The five proper cases not being found sufficient to express all the relations of things to each other, recourse was had to an expedient; viz. the putting a preposition before some of the other cases; and this made the *Ablative*.

It may be added, that in the plural number, the *Ablative* is still more obscure; as being only the dative repeated.

In English, French, &c. there is no precise mark whereby to distinguish the *Ablative* from other cases; and we only use the term in analogy to the Latin. Thus, in the two phrases, the magnitude of the city, and he spoke much of the city; we say, that of the city in the first is genitive, and in the latter *Ablative*; by reason it would be so, if the two phrases were expressed in Latin.

ABLEGATIO. See **ABDICATIO**.

ABLUENTS, ABLUENTIA, in medicine, a name which some authors give to a sort of remedies, better known by the name of *abstersents*. See **ABSTERGENT**.

ABLUTION, in antiquity, a religious ceremony, in use among the Romans; being a sort of purification, performed by washing the body, before they entered on sacrifice.

Sometimes they washed their hands, and feet, sometimes the head, and oftentimes the whole body: for which purpose, at the entrance into their temples were placed marble vessels filled with water.

This custom, they probably learnt from the Jews; since we read in scripture, that Solomon placed at the entry into the temple which he erected to the true God, a great laver, which the text calls a brazen sea, where the priests washed themselves before they offered sacrifice; having beforehand sanctified the water, by throwing into it the ashes of a victim that was slain in sacrifice.

ABLUTION is particularly used in the Romish church, for a sup of wine and water, which the communicants anciently took after the host, to wash it down, and help to digest it.

The same term also signifies the water which serves to wash the hands of the priest who consecrated it.

ABLUTION, in pharmacy, is a preparation divers remedies undergo, by washing them in water, or some other fluid, proper to cleanse, and free them of their impurities, and so to exalt their powers.

ABLUTION is sometimes also used, though with less propriety, for the washing, or infusing certain medicines in water, to freshen them, and dissolve their salts; this is otherwise called *dulcifying*.

ABOLITION*, **ABOLISHING**, in a general sense, the act of destroying a thing, or reducing it to nothing.

* The word is Latin; derived, as some think, from the Greek *anolluere*, to destroy; but, according to others, compounded of *ab* and *olere*, to smell; q. d. ita perdere ut ne olcat quidem, not to leave any smell of it behind: yet in Pliny we even meet with *abolere odorem*.

In our laws, the *Abolition* of a law, statute, or custom, is the abrogating or repealing it.

In the civil law, the leave given by a prince or judge, to

a criminal accuser, to desist from further prosecution of the accused, is peculiarly called *Abolition*. V. 25. H. 8. c. 51.

ABOMASUS, ABOMASUM, or ABOMASIUM, in comparative anatomy, one of the stomachs, or ventricles of animals of the ruminating kind. See **RUMINANT**.

Beasts that chew the cud are found to have four stomachs; viz. the rumen, or magnus venter, or stomach, properly so called, the reticulum, omasus, and *Abomasus*. See **RUMINATION**, &c.

The *Abomasus*, popularly called the *mesu*, is the last of the four; being the place wherein the chyle is formed, and from which the food descends immediately into the intestines.

It is full of a sort of leaves like the omasus; but its leaves have this particular to them, that beside the membranes they consist of, they contain a great number of glands, not found in any of the first.

It is in the *Abomasus* of calves and lambs, that the rennet or curdling is formed, wherewith housewives turn or curdle their milk.

ABORIGINES, or ABORIGENES, in geography, a name sometimes given to the primitive inhabitants of a country, or those who had their original therein; in contradistinction to colonies, or new races of inhabitants, derived from elsewhere.

The term *Aborigines* is famous in antiquity.—Though now an appellation, it was originally a proper name, given only to a certain people of Italy; and both the reason and origin of it are greatly disputed among the learned.

ABORIGINES then denoted a nation in Italy, which inhabited the ancient Latium, or country now called *Romania*, or *Campania di Roma*.

In which sense, the *Aborigines* are distinguished from the Janigenæ, who, according to the false Berofus, inhabited the country before them; from the Siculi, whom they expelled; from the Grecians, whom they descended from; from the Latins, whose name they assumed, after their union with Æneas and the Trojans; and lastly, from the Ausonii, Volsci, Oenotrii, &c. neighbouring nations in other parts of the country.

Whence this people came by the appellation, whether (1) as belonging to any of the species of *Aborigines*, above recited; or (2) from their having been *aberrigines*, i. e. wanderers; or (3) from their inhabiting the mountains; or on what other account, is much disputed.

(1) S. Jerom says, they were so called as being, *abque origine*, the primitive planters of the country, after the flood: Dion. Halicarnæus accounts for the name, as denoting them the founders of the race of inhabitants of that country: others think them so called as being originally Arcadians, who claimed to be earth-born, and not descended from any people.

(2) Aurelius Victor suggests another opinion, viz. that they were called *Aborigines*, q. d. *Aberrigines*, from *ab*, from; and *errare* to wander; as having been before a wandering people, to which opinion Festus gives some credit: it is added that Pelasgians, another name sometimes given them, is of the same import, and denotes vagabonds, like cranes.

(3) Paulanias rather thinks they were thus called *αὐτοὶ οἱ ἄρχαιοι*, from antiquity; which opinion seems confirmed by Virgil, who speaking of Saturn, the legislator of his people, says:

*Is genus indocile, ac dispersum montibus altis
Compositi, legesque dedit.*

The *Aborigines* were either the original inhabitants of the country, settled there by Janus, as some imagine, or by Saturn, or Cham, as others, not long after the dispersion; or even as some think before it: or they were a colony sent from some other nation; who expelling the ancient inhabitants the Siculi, settled in their place. About this mother-nation there is great dispute: some maintain it to be the Arcadians, parties of whom were brought into Italy at different times; the first under the conduct of Oenotrius, son of Lycaon, four hundred and fifty-five years before the Trojan war; a second from Theffaly; a third under Evander, sixty years before the Trojan war: besides another under Hercules; and another of Lacedæmonians, who fled from the severe discipline of Lycurgus: all these nations, are said to have formed the nation or kingdom of the *Aborigines*. Others will have them of Barbarian rather than Grecian origin, and to have come from Scythia; others from Gaul: and lastly others will have them to be Canaanites, expelled by Joshua.

ABORTION, is used in medicine, for the unreasonable exclusion of an imperfect human fœtus, either alive, or dead; before the legitimate time of delivery.

In this sense, *Abortion* amounts to the same with what we popularly call *miscarriage*; the Latins *abortus*, and sometimes *abactus*.

This may happen at any time of pregnancy; but if before the second month after conception, it is properly called a *false conception*, or effluxion.

We have also histories of irregular deliveries by the way of the anus, the navel, &c.

The usual causes of *Abortion*, are immoderate evacuations, violent motions, sudden passions, frights, &c. Other causes are, the largeness and heaviness of the fœtus, irritation of the womb,

womb, relaxation of the ligaments of the placenta, weakness, and want of nourishment in the foetus; excess of eating, long fasting or waking, the use of bulky for the shape, offensive smells, violent purgatives; and, in the general, any thing that tends to promote the menses.

The symptoms usually preceding, are a fever, either continual or intermitting; pain in the loins and head, heaviness in the eyes, a bearing down and constriction of the abdomen; an eruption of aqueous, or pure blood; falling of the breasts; watery milk, &c. When the time of miscarriage is just at hand, the pains are much the same as those in labour.

Abortion is dangerous where the time of pregnancy is far advanced, so that the foetus must be large, where the cause is very violent, or the patient strongly convulsed, and where a large hemorrhage precedes or entices, or the foetus is putrefied, &c. Under other circumstances it rarely proves mortal.

The treatment is to be adapted to the particular symptoms and circumstances: if the patient be plethoric, as soon as the first symptoms discover themselves, a vein is to be opened. In case of flooding, recourse is had to proper astringents; or if those fail, to fomentations, injections, and collutions. If a tenebrous attend, rhubarb is to be used; and if there be an habitual laxity of the uterine vessels, galuacum. See *GESTATION*.

ABORTION is also used, somewhat abusively, for a foetus which dying in the womb, continues there beyond the legitimate term; sometimes several years, and sometimes even during the whole life of the mother.

ABORTIVE, something come before its due time, or before it has arrived at its maturity and perfection.

F. Jerom. Florentinus has an express treatise of the baptism of *Abortives*, or *abortivus* children. His aim is to shew that an *Abortive* may, and ought to be baptized, at what time or term soever it come into the world; by reason the precise time when the foetus begins to be animated is not known. There are several curious, and uncommon things in this work, which is intitled *Homo dubius, sive de baptismo Abortivorum*. Ludg. 1674. 4to.

ABORTIVE Velum, is that made of the skin of an *abortive* calf. See *VELOM*.

ABRACADABRA *, a magic word, which being repeated in due form, a certain number of times, is supposed to have the virtue of a charm or amulet, in curing agues, and preventing other diseases.

* The word is of barbarous origin, formed from *ABRACAE*, the name of a god, supposed to contain great mysteries; from this, by lengthening the word with two additional syllables, to make it more quaint and sonorous, comes *Abacadabra*. See *BASILIDIAN*.

The invention of this charm is generally ascribed to the elder Serenus Sammonicus, who lived under Severus and Caracalla. Others suppose he only copied it from some other writer of the Basilidian sect. All we know for certain is, that in an heroic poem of this author still extant, concerning easy and parable remedies for most diseases, *de medicina parvo pretio parabili*, the word *Abacadabra* is preferred for semi-tertiary agues, with the manner how it is to be applied; viz. by writing it as many times as it contains letters, omitting each time the last letter in the former; so that the whole may form a kind of inverted cone *, in which there is this property, that way soever the letters be taken, beginning from the apex, and ascending either to the right or left, they make the same word, or as some will have it the same sentiment, as is found in the first whole line.—According to Julius Africanus, another ancient writer, the pronouncing of the word in the same manner will do as well.

* The prescription, as given by Serenus, is as follows:

*Inscribes chartæ quod dicitur Abacadabra,
Sapius & subter repetes, sed detrahe summam,
Et magis atque magis desint elementa figuris,
Singula quæ semper rapies, & cætera figes,
Donec in angulum redigatur littera conum.
His lino nexis collum redimire memento:
Talia languentis conducent vincula colli,
Lethalesque abigens (miranda potentia) morbos.*

ABRASION *, is sometimes used, among medical writers, for the act of wearing away the natural mucus which covers the membranes, and particularly those of the stomach and intestines, by sharp corrosive medicines, or humours.

* The word is compounded of the Latin *ab*, and *rado*, I shave, or scrape off.

ABRAXAS. The same as *ABRACADABRA*. Which see *ABRENUNCIATION*. See the article *RENUNCIATION*.

ABRIDGMENT, a summary, or contraction of a discourse; wherein the less material things being more briefly insisted on, the whole is brought into a lesser compass. See *EPILOGUE*.

The *Abridgments* of the Philosophical Transactions, of Mr. Boyle's Philosophical Works, &c. are works very useful in their kind: though it has been charged as a fault in the former of these, that the authors have taken upon them

entirely to omit a great number of such papers and discourses, as were not to much to their own taste; which is not the nature of an *Abridgment*, but of a florilege, analecta, or excerpta.

ABRIDGMENT, in law, is particularly used for the shortening a count, or declaration, by subtracting some of the substance of it.

A man is said to *abridge his plaint* in assize, or a woman her demand in an action of dower, when, having put any lands therein which are not in the tenure of the tenant or defendant; and non-tenure, or the like, is pleaded to that land in abatement of the writ; they are brought to *abridge*, i. e. to desist from and leave that parcel out of the demand; and pray that the tenant may answer to the rest, to which he has not yet pleaded any thing.—Though the demandant has *abridged* his plaint or demand; yet the writ still remains good for the rest. The reason is, that such writs run in general, and do not specify particulars. See 21 H. 8. c. 3.

ABROCHMENT, or *ABROCHMENT*, *ABROCAMENTUM*, in some ancient law-writers, denotes the act of ingrossing or buying up commodities by wholesale, before they come into the open market; in order to sell them off dear by retail: otherwise called *forestalling*.

ABROGATION, the act of abolishing a law, by authority of the maker.

In which sense, the word is synonymous with abolition, repealing, and revocation.

Abrogation stands opposed to rogation: it is distinguished from derogation, which implies the taking away only some part of a law; from subrogation, which denotes the adding a clause to it; from obrogation, which implies the limiting, or restraining it; from dispensation, which only sets it aside in a particular instance; and from antiquation, which is the refusing to pass a law.

ABSCISS *, in medicine, a kind of inflammatory tumor, containing purulent matter, pent up in a fleshy part, and corrupting and consuming the fibres, and other substance thereof. See *TUMOUR*.

* Authors are divided as to the reason of the appellation: some think the tumor thus called, by reason partly before contiguous, *abscedunt*, or separate from each other; others, because particles of the fibrous matters, are torn off and wasted; others, because the matter flows and is derived from another part, or is secreted from the blood; lastly, others derive the appellation from the running of the pus; on which principle they assert that it is not properly an *Abscess*, till it bursts and begins to vent itself. But this is a critic's decision; which physicians will hardly be determined by.

Abscess is the same with what the Greeks call *apoplema*, and the English, *imposthume*, or *imposthumation*.

Almost all *Abscesses* are the consequences of inflammation.

—The ripening of *abscesses* is promoted by poultices, &c.

—*Abscesses* are opened either by caustic or incision; but the latter in most cases is preferable. *Sharp Surg. Intr. c. 2.*

Abscesses arise often in women after delivery; and though dangerous in themselves, yet they often appear to be the crisis of the disease that gave rise to them.—For the cure, if they cannot be dissipated, i. e. carried off by proper artificial evacuations, as phlebotomy, purging, &c. with the use of calomel between whites, and gentle peripatives fomentations, liniments, and cataplasms; recourse is to be had to the contrary method, and they must be brought to suppuration. When the matter is fully ripened, they are to be opened with a lancet or caustic, and their cure attempted by digestives and incarnatives. See *RIPFENER*, and *INCARNATIVE*.

ABSCISSE, *ABSCISSA*, in conics, a part of the diameter, or transverse axis of a conic section, intercepted between the vertex or some other fixed point, and a semiordinate. See *CONIC SECTION*.

Such are the lines AP, AP, &c. (*Tab. Conicæ, fig. 20.*) intercepted between the vertex A and the semiordinates PM, PM, &c. which are called *Abscisses*, of the Latin *abscindere*, to cut off; as being parts cut off from the axis.—Others call them, *agittæ*, q. d. arrows.

In the parabola, the *Abscisse* is a third proportional to the parameter and semiordinate; and the parameter a third proportional to the *Abscisse* and semiordinate.

In the ellipsis, the square of the subordinate is equal to the rectangle of the parameter into the *Abscisse*, subtracting another rectangle of the same *Abscisse*, into a fourth proportional to the axis, parameter, and *Abscisse*.

In the hyperbola, the squares of the semiordinates are to each other as the rectangles of the *Abscisse* into another line, composed of the *Abscisse* and the transverse axis.

ABSENT. See the article *PRESENT*.

ABSIS. See the article *APSES*.

ABSOLUTE *, in a general sense, something that stands free or independent on others.

* The word is compounded of the Latin *ab*, from; and *solvare*, to loosen.

ABSOLUTE, in metaphysics, denotes a being, whose whole essence

fence does not consist in a mere habitude, or relation to another.

In which sense *Absolute* stands opposed to relative or respective.

ABSOLUTE is more particularly understood of a thing which does not proceed from any cause, or does not subsist by virtue of any other being, considered as its cause.

In which sense, God alone is *Absolute*.

Absolute in this sense is synonymous with independent, and stands opposed to dependent.

ABSOLUTE also denotes a thing's being free from conditions, or limitations.

In this sense, the word is synonymous with unconditional. We say, an *Absolute* decree, *Absolute* promise, *Absolute* obedience. The covenant with Noah was *Absolute*, and without conditions; that under the gospel, on condition of faith and obedience. The Antinomians also hold the gospel-covenant *Absolute*, and that Christ has purchased our salvation, without any conditions to be performed on our side.

ABSOLUTE Government, that wherein the prince is left solely to his own will, being not limited to the observance of any laws except those of his own discretion.

When the Danes made their king *Absolute*, in 1670, they declared him absolved from his coronation-oath.

ABSOLUTE Number, in algebra, is the known quantity or number which possesses one entire side, or part of an equation; being the rectangle, or solid whose root or value is to be found. See **EQUATION**.

Thus, in the Equation $aa + 16a = 36$, the *Absolute Number* is 36: which is equal to a multiplied by it self, added to 16 times a .

This is what Vieta calls *homogeneum comparationis*.

ABSOLUTE Equation, in astronomy, is the sum of the optic and eccentric equations.

Abolitive ABSOLUTE, in grammar, is a word or phrase detach'd, and independent of the rest of the discourse; neither governing, nor being governed of any other thing.

This is frequent among the Latins; in imitation of whom, the modern languages have likewise adopted it: *deleto exercitu*, the army being cut to pieces. *All things considered*, reason will appear the best guide in matters of religion.

ABSOLUTE Motion. See **MOTION**.

ABSOLUTE Place. See **PLACE**.

ABSOLUTE Space. See **SPACE**.

ABSOLUTELY, in a general sense, stands opposed to relatively. See the articles **ABSOLUTE** and **RELATIVE**.

Thus, the terms of a proposition are said to be taken *Absolutely*, that is, without relation to each other.—Man, considered *Absolutely*, and in himself, is a reasonable creature.

ABSOLUTELY is also used for unlimitedly or unconditionally.

In which sense, the schoolmen oppose it to *secundum quid*. Thus a thing is said to be *Absolutely*, and simply good.

ABSOLUTELY is also used, by divines, in opposition to declaratively.

The church of Rome holds, that the priest can forgive sins *Absolutely*; the protestants say, only declaratively and ministerially.

In grammar, we say, a word is taken *Absolutely*, *absolute sumptus*, when it has no regimen, or government. Thus, in the phrase *We should pray without ceasing*, the word *pray* is taken *Absolutely*, as it governs nothing.

In geometry, *Absolutely* is taken for entirely, or completely. Thus, we say, such a thing is *Absolutely* round; in contradistinction from what is only partly so, as a spheroid, cycloid, &c.

ABSOLUTION, **ABSOLUTIO**, in the civil law, &c. a definitive sentence, whereby a person accused of any crime, is acquitted, and declared innocent.

Among the Romans, the ordinary method of pronouncing judgment was this: After the cause had been pleaded on both sides, the *Præco* used the word *dixerunt*, *q. d.* they have said what they had to say. Then, three ballots were distributed to each judge; one marked with the letter *A.* for *Absolution*; another with *C.* for condemnation; and a third with *N. L.* for *non liquet*, it is not clear; to require respite of judgment: and according as the majority fell of this or that mark, the accused was *absolved* or condemned, &c. If he were *absolved*, the *Prætor* dismissed him with *videtur non fuisse*, or *jure videtur fuisse*?

When the votes were equally divided on the sides of *Absolution* and condemnation, the accused was *absolved*: this procedure is supposed to be founded on the law of nature. Such is the sentiment of Faber on the 125th law, *de Div. Reg. Jur.* of Cicero, *pro Cluentio*; of Quintilian, *Declam.* 254; of Strabo, lib. ix. &c.

ABSOLUTION, in the canon law, is a juridical act, whereby a priest, as a judge, and in virtue of a power given him by Jesus Christ, remits the sins of such as, upon confession, appear to have the conditions requisite thereto.

The Romanists hold *Absolution* a part of the sacrament of penance: the council of Trent, sess. xiv. cap. iii. and that of Florence, in the decree *ad Armenos*, declare the form or

essence of the sacrament to lie in the words of *Absolution*, *I absolve thee of thy sins*.

The formula of *Absolution* in the Romish church is absolute; in the Greek church, it is deprecatory; and in the churches of the Reformed, declarative. Arcuvius, indeed, contends that the Greek formula is absolute; and that it consists in these words, *Mea medicritas habet te venia donatum*. But the instances he produces are either no formula's of *Absolution*, or only of *Absolution* from excommunication, not of sacramental *Absolution*.

ABSOLUTION is chiefly used in the Reformed churches for a sentence whereby a person who stands excommunicated, is released or freed from the same.

In the church of Scotland, if the excommunicated shew real signs of godly sorrow, and if upon application to the presbytery a warrant be granted for his *Absolution*, he is brought before the congregation to confess his sin, and express his sorrow as often as the Presbytery shall think meet: when the congregation is satisfied of his penitence, the minister puts up a prayer, desiring Jesus Christ who has instituted the ordinance of excommunication, (*i. e.* of binding and loosing the sins of men on earth) with a promise of ratifying the righteous sentence above, to accept of this man, to forgive his disobedience, &c. This done, he pronounces his *Absolution*; by which his former sentence is taken off, and the sinner is again received into the communion.

In the church of Rome there are divers other political *Absolutions*; as,

ABSOLUTIO a sevis, which is necessary where a person has been concerned in seeing sentence of death executed on a criminal, or has any other way disqualified himself for the holding of a benefice.

ABSOLUTIO ad cautelam, is that granted to a person who has lodged an appeal against a sentence of excommunication, by which the force of the censure is suspended.

It being a maxim in the papal jurisprudence, that the sentence stands good notwithstanding any appeal; this sort of *Absolution* is sometimes granted until the issue of his appeal be known: by means hereof, some articles, at least, of his excommunication are taken off; inasmuch that persons may converse with him without danger: and beside, in case of death, this sentence is supposed to stand him in some stead.

ABSORBENTS, in medicine, remedies which by the softness or porosity of their component parts, become proper to sheath the asperities of sharp pungent humors; or to imbibed or dry away, as with a sponge, superfluous moistures.

Such are the testaceous powders, hartshorn, coral, crabs eyes and claws, calcined bones, burnt ivory, terra sigillata, and even iron it self: also divers woods; as sanders, mastic, guaiacum, sassafras; and divers roots, as china, sarsaparilla, &c.

Absorbents are much the same with what we otherwise call driers and sweetners. Latin writers also use the word as synonymous with *imbibentia*, and *saturantia*.

The term *Absorbent* is frequently confounded with *alcali*; *alcalies* having, really, the effect of *Absorbents* with respect to acids.

ABSTEMIOUS, is properly understood of a person who refrains absolutely from all use of wine.

In which sense, *Abstemiuous* is synonymous with the Latin *invinus*, *vinu abstinent*, and the Greek *αποσπονη*, or even *αποσπονη*, *q. d.* water-drink, water-advocate, &c. being compounded of *abs*, from; and *trmetum*, wine.

ABSTEMIOUS is particularly used among ecclesiastical writers, in speaking of persons, who are disabled from partaking of the cup in the eucharist, by reason of a natural aversion to wine.

It has been disputed, whether those naturally *Abstemiuous* may be allowed to communicate in the species of bread only? The Calvinists, in the synod of Charenton, permitted them to communicate by only touching the cup with the lips, without drinking a drop: the Lutherans exclaim against this toleration, as a sacrilegious mutilation of the sacrament. There is no devout person, say they, but by force of prayer to God, may obtain power to swallow, at least a drop of wine.—*V. Stricker*, in *Nov. lit. germ.* 1709. p. 304.

The bishop of Meaux alleges the case of the *Abstemiuous*, to justify the retrenchment of the cup; since it appears hence, that communion under both kinds is not a divine command, inasmuch as there are some cases wherein it may be dispensed withal.—*V. Nouv. rep. lett.* 4 p. 23. *Mém. de Trev.* 1708. p. 33. 1717. p. 1415.

The Roman ladies, in the first ages of the republic, were all enjoined to be *Abstemiuous*; and that it might appear by their Breath whether or no they kept up to the injunction, it was one of the laws of the Roman civility, that they should kiss their friends and relations whenever they accosted them.

ABSTERGENTS*, or **ABSTERSIVE medicines**, a class of remedies, whose effect is to abrade, and wipe away such mucous particles as they meet in their passage; and thus cleanse the parts from viscid, or impure adhesions, and carry off the morbid matter of wounds, ulcers, &c.

* The

* The word is compounded of the Latin *abs*, from; and *tergere* to wipe.

Abfergents are more usually called among physicians, *detergents*. See **DETERGENT**.

Many *Abfergents* are of the genus of balsamics; and some only differ in their degree of subtilty and efficacy, from what are called vulneraries.

The principal simples in the class of *Abfergents*, are the leaves of wormwood, garlick, leeks, capers, scurvygrafs, fumitory, liverwort, tanfy, and vervain: bitter almonds, figs, jubebs, raisins, dates, juniper-berries; gum ammoniac, balsam of Capivi, balm of Gilead, tacamahaca; turpentes; barberies, liquorice, turmeric, madder, parmasetty, mummy, sulphur, salt, mercury, and native cinnaabar.—These the reader will find particularly described under their proper articles.

ABSTINENCE *, in a general sense, the act or habit of restraining from something, which we have a propension to, or find pleasure in.

* The word is derived from the Latin *abstinere*; formed of *abs*, from; and *tenere*, to hold; *q. d. ab aliqua re se tenere*.

The Jews were obliged to *abstain* from their wives at certain seasons.—The same is enjoined in the apostolical constitutions on all fast and meagre days: the church of England recommends certain days of fasting, and *Abstinence*.—*Abstinence from flesh* has been enjoined by statute even since the Reformation, particularly on Fridays, and Saturdays, and on vigils, and all commonly called *flesh-days*. 2 and 3 *Ed. 6. c. 19.*—The like injunctions were renewed under Q. Elizabeth, but at the same time it was declared, that this was done not out of motives of religion, as if there were any difference in meats, but in favour of the consumption of sea-fish, and to multiply the number of fisher-men and mariners, as well as spare the flock of sheep, 5 *Eliz. c. 15.*—The great fast, says St. Augustine, is to *abstain* from sin. See **FAST**.

The ancient Athletes lived in a perpetual *Abstinence* from all kind of sensible pleasure, to render their bodies more robust, and hardy.

ABSTINENCE is more particularly used for a spare diet, or a slender parsimonious use of food, much below the ordinary standard of nature. See **FOOD** and **DIET**.

The physicians relate wonders of the effects of *Abstinence* in the cure of many disorders, and in protracting the term of Life.—The noble Venetian, Cornaro, after all imaginable means had proved vain, so that his life was despaired of at forty, recovered and lived to near an hundred, by mere dint of *Abstinence*; as he himself gives the account.

It is indeed surprizing to what a great age the primitive Christians of the East, who retired from the persecutions into the deserts of Arabia and Egypt, lived, healthful and cheerful, on a very little food: Cassian assures us, that the common rate for twenty four hours was twelve ounces of bread, and meer water: and that with this S. Anthony lived an hundred and five years; James the hermit, an hundred and four; Arsenius, tutor of the emperor Arcadius, an hundred and twenty; St. Epiphanius, an hundred and fifteen; Simeon the Stylite, an hundred and twelve; and Romuald, an hundred and twenty.

Indeed, we can match, nay out-do these instances of longevity from the same cause, at home: Buchanan writes, that one Laurence preserved himself to an hundred and forty by force of temperance and labour; and Spotwood mentions one Kentigern, afterwards called S. Mongah or Mungo, who lived to an hundred and eighty-five by the same means.—Other instances see under the article **LONGEVITY**.

Most of the chronicl diseases, the infirmities of old age, and the short lives of Englishmen, are owing, according to Dr. Cheyne, to repletion; and may be either cured, prevented, or remedied, by *Abstinence*.

Among the brute creation, we see extraordinary instances of long *Abstinence*. *—It is the natural course of divers species to pass four, five, or six months every year without either eating or drinking: accordingly, the tortoise, dormouse, serpent, &c. are observed regularly to retire, at certain seasons, to their respective cells, and hide themselves; some get into the caverns of rocks, or ruins; others dig holes under ground; others get into the woods, and lay themselves up in the clefts of trees; others bury themselves under water, &c.

* The serpent-kind bear *Abstinence* to a miracle. We have seen rattle-snakes that had subsisted many months without any food, yet still retained their vigour and fierceness.—Dr. Shaw (*Trav. p. 489.*) speaks of a couple of cerastes, (a sort of Egyptian serpents) which had been kept five years in a bottle close corked, without any sort of food, unless a small quantity of sand wherein they coiled themselves up in the bottom of the vessel, may be reckoned as such: yet when he saw them, they had just cast their skins, and were as brisk and lively as if just taken.

In effect, several species of birds, the whole tribe almost of insects, and many among the other tribes, are able to subsist all winter, not only without food, but many of them without respiration too.—This furnishes an admirable instance of

VOL. I.

the wisdom of the creator: The proper food of these creatures, especially the insect-tribe, being then wanting; there is a provision for them to live without it. When the fields are divested of their flowery furniture, and the trees and plants are stripped of their fruits; what would become of such animals as are subsisted only by the produce of the spring, and summer? And when the air is grown rigid and chilly with frost, what would become of those many tender species which are impatient of cold? To prevent the total destruction and extirpation of many species of animals, the author of nature has provided, that creatures thus bereaved of their food, should be likewise impatient of cold; to lead them thus to shelter themselves out of the way of danger; and that when there arrived, the natural texture and viscosity of their blood, should dispose it, by a further degree of cold, to lag and stagnate in the vessels: so that the circulation stopping, and the animal functions being in great measure suspended; there is no sensible waste or consumption of parts, but they remain in a kind of drowsy neutral state, between life and death; till the warm sun revive both them and their food together, by thawing the congealed juices both of such animals, and vegetables.

It is more than probable, that all motion of the animal juices is extinct in flies, and other insects, when thus asleep; in that, though cut in pieces they do not awake, nor does any fluid ooze out at the wound; unless some extraordinary degree of warmth have been first applied to unbind the congelation.—The sleep of such animals is little else than death; and their waking, a resurrection.—For if life do not consist in a circulation of the blood, we do not know what it consists in.

Hence it is no wonder that tortoises, dormice, &c. are found as fat and fleshy after some months *Abstinence* as before.—Sir G. Ent weighed his tortoise several years successively, at its going to earth in October, and coming out again in March; and found that of four pounds four ounces, it only used to lose about one ounce. V. *Philosoph. Transact. N° 194.* Indeed, we have instances of men passing several months as strictly *abstinent* as other creatures.—The records of the Tower mention a Scotchman imprisoned for felony, and strictly watched in that fortress for six weeks; in all which time he took not the least sustenance; for which he had his pardon. The German Ephemerides speak of men one Martha Taylor, who by a blow on the back fell into such a prostration of appetite, that she took no sustenance, besides a few drops with a feather, for thirteen months: but this was a morbid and unnatural case, for she slept but little all the time.—We may add the instance of S. Chilton of Tinsbury near Bath, who in the years 1693, 1694, 1695, slept sometimes four months, and sometimes above six together, with very little food; and six weeks without any more than a little tent, conveyed with a quill into his mouth through a hole in his teeth. V. *Philosoph. Transact. N° 304.*

It is to be added, that in most of the instances of long *Abstinence* related by naturalists, there were apparent marks of a texture of blood, and humours, much like that of summer-beasts, and insects.—Though it is no improbable opinion, that the air itself may furnish something for nutrition. It is certain, there are substances of all kinds, animal, vegetable, &c. floating in the atmosphere; which must be continually taken in by respiration. And that an animal body may be nourished thereby, is evident in the instance of vipers, which if taken when first brought forth, and kept from every thing but air, will yet grow very considerably in a few days. So the eggs of lizards are also observed to increase in bulk, after they are produced, though there be nothing to furnish the increment but air alone; after the like manner, as the eggs or spawn of fishes grow, and are nourished with the water.—And hence, say some, it is that cooks, turn-spit dogs, &c. though they eat but little, yet are usually fat.

ABSTRACT, **ABSTRACTUM**, in philosophy, a thing separated from some other thing, by an operation of the mind called *Abstraction*. See **ABSTRACTION**.

ABSTRACT, in a more particular sense, denotes an idea formed in the mind, when we consider a thing simply in itself, without respect to the subject wherein it resides; or it is a simple idea, detached and separated from any particular subject or complex idea, for the sake of viewing and considering it more distinctly.

Thus, magnitude, and humanity are *Abstracts*, or *Abstract* ideas, when considered in themselves, and without being attached to any particular body, or person; though they cannot have any real subsistence without such subjects, nor the subjects without them.

Whiteness is an *Abstract*, inasmuch as it does not denote any one white object, but that colour, or idea in the general, wherever found.

From the knowledge of *Abstracts* we arrive at that of concretes, which is the opposite term; concrete denoting a general or *abstract* idea's being attached to some particular subject, or considered as combined with some other ideas; as, great house, white wall.

ABSTRACT, is also used as a term which signifies an *abstract* idea.

In which sense, the words whiteness, paternity, animality, justice, crookedness, &c. are *Abstracts*, or *Abstract* terms. *Abstract* Terms may be conceived as words which denote a more simple conception of a form, or quality existing in a thing; without expressing the subject wherein it resides.—The school-philosophers define *Abstract* terms from the simplicity of their signification: *Abstracts*, according to them, express only the form of things, or attributes of things, distinct from the subjects whereof they are forms or attributes.

All our simple ideas, says Mr. Locke, have *Abstracts*, as well as concrete names; as, whiteness, white; sweetness, sweet, &c. The like also holds in our idea of modes, and relations; as, justice, just; equality, equal; &c.

But as to our ideas of substances, we have very few *Abstract* names at all.—Those few that the schools have forged, as *animalitas*, *humanitas*, &c. hold no proportion with the infinite number of names of substances; and could never get admittance into common use, or obtain the licence of public approbation: which seems to intimate a confession of mankind, that they have no ideas of the real essences of substances; since they have not names for such ideas.

It was only the doctrine of substantial forms, and the confidence of mistaken pretenders to a knowledge they had not, which first coined, and then introduced *animalitas*, *humanitas*, and the like; which yet went very little farther than their own schools, and could never get to be current among understanding men.

But the reality and existence of all *Abstract* ideas, and of any such faculty in the mind as *abstraction*, has of late been controverted. See *ABSTRACTION*.

In effect, if there were any such things as *Abstracts*, *Abstract* qualities, &c. we do not see how they could be destroyed; they must be permanent and immutable; for that which destroys the white warm flame, could not reach the whiteness or the warmth: that which destroys the figured, moving, solid ball, could not hurt the figure, motion, solidity, &c.—*Abstract* ideas, in fine, seem to tend to substantial forms.

ABSTRACT is also extended to divers other things, in respect of their purity, simplicity, subtilty, &c.—In which sense, we say, **ABSTRACT** Numbers are assemblages of units, considered in themselves, and not applied to denote any collections of particular sorts of things.

ABSTRACT Mathematics, are those branches employed about quantity considered absolutely, or in the general; without restriction to any certain kind, or species of it.

Such are geometry, and arithmetic.

In this sense, *Abstract* mathematics stand opposed to mixt mathematics; where the simple and *abstracted* properties and relations of quantity delivered in the former, are applied to sensible objects; and by that means become intermixed with physical considerations.—Such are hydrostatics, optics, navigation, &c.

ABSTRACT, is also used in matters of literature, for a compendious view, or epitome of a larger work.

An *Abstract* is supposed to be a degree shorter, and more superficial than an abridgement. See *ABRIDGEMENT*.

ABSTRACTION, an operation of the mind, whereby we separate things naturally conjunct, or existing together; and form, and consider, ideas of things thus separated. See *ABSTRACT*.

The faculty of *abstracting*, stands directly opposite to that of compounding.—By composition we consider those things together, which in reality are not joined together in one existence. And by *Abstraction* we consider those things separately and apart, which in reality do not exist apart.

Abstraction is chiefly employed these three ways.—First, when the mind considers any one part of a thing, in some respects distinct from the whole; as a man's arm, without the consideration of the rest of his body.

Secondly, when we consider the mode of any substance, omitting the substance itself, or when we separately consider several modes which subsist together in one subject. See *MODE*.

This *Abstraction* the geometricals make use of, when they consider the length of a body separately, which they call a line; omitting the consideration of its breadth and depth. See *LINE*.

Thirdly, it is by *Abstraction*, that the mind frames general, or universal ideas; omitting the modes, and relations of the particular objects whence they are formed.—Thus, when we would understand a thinking being in general, we gather from our self-consciousness what it is to think; and omitting the consideration of those things which have a peculiar relation to our own mind, or to the human mind, we think of a thinking being in general.

Ideas framed thus, which are what we properly call *abstract* ideas, become general representatives of all objects of the same kind; and their names applicable to whatever exists conformable to such ideas.—Thus, the colour that we receive from chalk, snow, milk, &c. is a representative of all of that kind; and has a name given it, *whiteness*, which signifies the same quality, wherever found or imagined.

It is this last faculty, or power of *abstracting*, according to Mr. Locke, that makes the great difference between men and brutes; even those latter must be allowed to have some share of reason: that they really reason in some cases, seems almost as evident as that they have sense; but it is only in particular ideas. They are tied up to those narrow bounds; and do not seem to have any faculty of enlarging them by *Abstraction*. *Essay on Human Understanding*, L. III. c. 3.

Such is the doctrine of *abstract* ideas, under the improvements of that excellent author.—In effect, it is the standing opinion, that the mind has such a power or faculty of framing *abstract* ideas, or notions of things; and on such very ideas do a great part of the writings of philosophers turn. These are supposed in all their systems; and without them there would be nothing done.—They are more especially reputed the object of logic, mathematics, and metaphysics, and all that passes under the notion of the most *abstracted* and sublime learning.

Yet has a late eminent and ingenious author, Dr. Berkeley, contested the reality of any such ideas; and gone a good way towards overturning the whole system, and consequently towards setting philosophy on a new footing.

The qualities or modes of things, it is on all hands agreed, do never really exist apart, and separated each from all others; but are constantly mixed and combined together, several in the same object.—But, say the philosophers, the mind being able to consider each quality singly, or *abstracted* from other qualities with which it is united, does by that means frame to itself *abstract* ideas, of a different nature and kind from the sensible ones.

For an example hereof: the eye perceiving an object extended, coloured, and moved, resolves this compound idea, into its simple constituent ones; and viewing each by itself, exclusive of the rest, frames *abstract* ideas of extension, colour, and motion themselves, or in their own nature.—Not that it is possible for such colour and motion to exist without extension; but only that the mind can frame to itself, by *Abstraction*, the idea of colour exclusive of extension; and of motion, exclusive both of colour and extension.

Again, say the same philosophers, the mind having observed that in the particular extensions perceived by sense, there is something common, and alike in all; and some other things peculiar; as, this, or that figure, or magnitude, which distinguish them one from another; it can consider apart, or single out by itself, what is common; making thereof a general *abstract* idea of extension, which is neither line, surface, nor solid, nor has any figure or magnitude, but is an idea entirely precluded from them all.—So, likewise, by leaving out of the several colours perceived by sense, that which distinguishes them from one another, and only retaining what is common to all, it makes an idea of colour in the *abstract*, which is neither red, nor blue, nor white, &c.—After the same manner, by considering motion *abstractedly*, both from the body moved, and from the figure it describes, and all particular directions, and velocities; an *abstract* idea of motion is framed, which equally corresponds to all motions whatever.

They add, that as the mind frames *abstract* ideas of qualities or modes; so does it by the same faculty, attain *abstract* ideas of the more compound beings, which include many coexistent qualities.—For an example.—Having observed that Peter, James, John, &c. resemble each other in shape, and other qualities; we can leave out of the complex idea we had of Peter, James, &c. that which is peculiar to each, retaining only what is common to all, and so make an *abstract* idea, wherein all the particulars equally partake.—And thus it is we are supposed to come by the *abstract* idea of man, or of humanity, or human nature; wherein there is indeed included colour, because no man but has some colour, but it is neither white, nor black, nor brown; because there is no one particular colour wherein all men partake. So likewise there is included stature, but then it is neither tall, nor low, nor yet middle stature, but something *abstracted* from all these: And so of the rest.

Farther yet, there being a general variety of other creatures, which partake in some parts, but not all, of the complex idea of man; the mind leaving out those parts which are peculiar to men, and retaining those only which are common to all living creatures, frames the idea of animal; which *abstracts* or participates not only of all men, but all birds, beasts, fishes, and insects.

The constituent parts of such *abstract* idea of animal, are body, life, sense, and spontaneous motion.—By body, is meant, body without any particular shape, or figure; there being no one common to all animals; without covering, either of hair, or feathers, or scales: nor yet naked; hair, feathers, scales, and nakedness, being the distinguishing properties of particular animals, and for that reason left out of the *abstract* idea.

Upon the same account, the spontaneous motion must be neither walking, nor flying, nor creeping; it is nevertheless a motion.—But what that motion is, it is not easy to conceive.

I will not affirm, says Dr. Berkeley, that other people have not this wonderful faculty of *abstracting* their ideas; but I am confident I have it not myself.—I have, indeed, a faculty of imagining, or representing to myself the ideas of things

things I have perceived, and of variously compounding or dividing them: I can imagine a man with two heads, or the upper parts of a man join'd to the body of a horse. I can consider the hand, the eye, the nose, each by it self, *abstracted* or separated from the rest of the body.—But then, whatever hand or eye I imagine, it must have some particular shape and colour.—So, again, the idea of a man I frame to my self, must be either of a white, or a black, or a tawny, a strait or a crooked, a tall, or a low, or a middle-sized man.

I cannot by any effort of thought conceive the *abstract* idea above described; and it is equally impossible for me to form the *abstract* idea of motion, distinct from the body moving, and which is neither swift nor slow, curvilinear, nor rectilinear.—And the like may be said of all other *abstract* general ideas whatever.

Since all things that exist are only particulars, 'Whence, says Mr. Locke, is it, that we come by general words, expressing five of a thousand individuals?' His answer is, terms only become general, by being made the signs of *abstract* and general ideas; so that the reality of *abstract* ideas, should follow from the reality of general words.—But this seems a deception.—A word becomes general, by being made the sign, not of an *abstract* general idea, but of several particular ones, any one of which it indifferently suggests to the mind.—For an example, when I say that *Whatever has extension is divisible*; the proposition is to be understood of extension in general: not that I must conceive any *abstract* general idea of extension, which is neither line, surface, nor solid, neither great nor small, &c. To make this more evident, suppose a geometrical to be demonstrating a method of dividing a line into two equal parts: In order hereto, he draws, for instance, a black line, an inch long; and this, which in it self is a particular line, is nevertheless, with respect to its signification, general: since it represents all lines whatever: so that what is demonstrated of this one, will hold of all others.—And as that particular line becomes general by being made a sign; so does the name *line*: and as the former owes its generality, not to its being the sign of an *abstract* or general line, but of any or all particular right lines that may possibly exist; so must the latter derive its generality from the same cause.

Mr. Locke, speaking of the difficulty of forming *abstract* ideas, says; 'And does it not require some pains and skill to form the general idea of a triangle, which yet is none of the most *abstract* and comprehensive; for it must be neither oblique, nor rectangular; neither equilateral, isosceles, nor scalenous; but all, and none of these, at once.'—Now, let any man look into his thoughts, and try whether he has, or can attain to an idea of a triangle, correspondent to this description.

From the notion of *abstract* ideas, Dr. Berkeley endeavours to shew, it was, that bodies first came to be supposed to have an existence of their own, out and independent of the mind perceiving them.—Can there be a greater strain of *abstraction*, says he, than to distinguish the existence of sensible objects from their being perceived, so as to conceive them existing unperceived?

We shall only add, that *abstracting*, on the common system, is no more than generalizing: it is making one thing stand for an hundred, by omitting the consideration of the differences between them: it is taking several differentes, *i. e.* different combinations, setting aside the peculiarities in each, and considering only what is found alike in all.—Thus it is that I say, *I love my friend, love my mistress, love my self, my bottle, my book, my ease, &c.*—Not that it is possible I should have the same perception with respect to so many different sorts of things, things that stand in such different relations to me; but only that there appearing something in them all that bears a resemblance to the rest, in some circumstance or other, I chuse to express all by one name, *love*. For if I consider the tendency and effects of them all, I shall find they lead me very different ways, to very different actions; all the analogy there is between them, is a sort of pleasure or satisfaction, arising upon the application of the particular object to its proper organ, or sense.—The *abstract* idea of love, then, will terminate in the idea of pleasure: but, it is certain, there can be no idea of pleasure, without a thing pleasant to excite it. Any other *abstract* idea of pleasure, will amount to no more than a view or perception of the circumstances wherewith our pleasures have been attended: but these are mere externals, foreign to the pleasurable sensation it self; which nothing but an object applied in such and such a manner, can excite.—To suppose an idea of pleasure produced indirectly, by any other than the proper cause, is as absurd as to suppose an idea of sound, produced without a sonorous object. The mind has no power of making any ideas, call them what you will, whether *abstract*, or concrete; or general, or particular: its activity goes no farther than in the perceiving of such as are presented to it: so that its action is really no other than a degree of passion.

ABSTRUSE*, denotes something deep, hidden, or far removed from the common apprehensions, and ways of conceiving; in opposition to what is obvious, and palpable.

* The word is of Latin original, *abstrusus*; formed of *abi*, from, and *trude*, I thrust; *q. d.* being far off, and out of reach.

In this sense, metaphysics is an *abstruse* science; the new doctrine of infinites is an *abstruse* point of knowledge that few people attain to.

ABSURD, ABSURDUM, a thing that thwarts, or goes contrary to the common notions, and apprehensions of mankind.

Thus, a proposition would be *absurd*, that should affirm, that two and two make five; or that should deny them to make four.

The logicians have a way of proving the truth of a proposition, by shewing that the contrary is *absurd*.

This they call

Reductio ad Absurdum, or *arguing ex Absurdo*. See **REDUCTION**.

ABSURDITY, a kind of error, or offence against some evident, and generally allowed truth, or principle.

The greatest of all *absurdities* is the contradiction. See **CONTRADICTION**.

The schoolmen make two species of *absurdities*—The one, *absolute*, *absolus*, which contradicts the common sense of mankind; the other *relative*, *relatus*, which gives the lie to some one, or more philosophers; or persons of great weight and authority.

In this sense, the doctrine of a *vacuum* is an *absurdity*, as being contrary to Aristotle: and that of a *plenum*; as being contrary to Sir Isaac Newton.—In effect, there is scarce one truth of any moment, but what is an *absurdity* in this sense; as being repugnant to the system of some sect, or party.

ABSYNTHIUM*, or **ABSINTHIUM**, a medicinal plant, of considerable efficacy in quality of a bitter, and stomachic; popularly called *wormwood*.

* The word seems compounded of the privative particle *a*, and *synthē*, *delectatio*, pleasure; alluding to the disagreeable taste of this plant.

There are divers kinds of *Absynthium* enumerated by botanists. Those which chiefly obtain in medicine, are, 1^o, the *Roman*, or small, called also *ponic*; used as a stomachic, astringent, and discutient, and to prevent putrefaction.—Etmuller says, there is not a chronological distemper in which it is not serviceable.—A conserve of the Roman *Absynthium* is now also much used in the shops.

2^o, The common, or large *wormwood*, *Absynthium Vulgare*, or *Vulgare Majus*, this is much bitterer than the former, and anciently was used not only as a stomachic, and a destroyer of worms, but also as a detergent, and prescribed against the jaundice, and dropsy: but it is now grown into disuse in those intentions, as being prejudicial to the eyes; and is chiefly retained as an ingredient in some of the official compositions; and particularly some cephalic distilled waters.—The infusion of *Absynthium* in wine, makes what they call *Vinum Absynthites*.

The pharmacopœias also mention an extract of *Absynthium*, *extractum Absynthii*; and a syrup of *Absynthium*, *Syrupus de Absinthio*—

Some will have it to be the common wormwood that yields the *semen sanctum* or *santonium*, *i. e.* wormseed; but Matthiolus with justice affirms the contrary. See **SANTONICUM**.

ABUNDANCE*, *Copia*, plenty.

* *Abundantia*, overflowing, is compounded of *ab*, from; and *unda*, wave, or water.

Abundance, when carried to an excess, is a fault, called *redundance*, *exuberance*, &c.

The author of the *Dictionnaire Oeconomique* gives divers manners or secrets of producing *Abundance*; as an *abundant* crop of wheat, pears, apples, peaches, &c. See **FECUNDITY**.

ABUNDANT Numbers, are those whose quota-parts added together, exceed the number it self whereof they are parts. See **NUMBER**.

Thus, the number 12 is *abundant*, its quota-parts, 1, 2, 3, 4, and 6, amounting to 16.—In opposition to *abundant* numbers stand defective ones. See **DEFECTIVE**.

ABUSE*, an irregular use of a thing; or the introducing something contrary to the true intention thereof.

* The word is compounded of *ab*, from; and *usus*, use.

The business of reformations, visitations, &c. is to correct *Abuses* secretly crept into discipline, &c.—Constantine the great, by introducing riches into the church, laid the foundation for those numerous *Abuses* in it, which the succeeding ages groaned under.

Self-ABUSE, is a phrase used by some late writers for the crime of self-pollution. See **POLLUTION**.

In grammar, to apply a word *abusively*, or in an *abusive* sense, is to misapply, or pervert its meaning.

A permutation of benefices, without the consent of the bishop, is deemed *abusive*, and consequently is null.

ABUTTALS, ABUTALS, ABUTALS, among law-writers, denote the buttings or boundings of a piece of land; expressing on what other lands, highways, or the like, the several extremes thereof do *abut*, or terminate. See **BOUNDARY**.

In this sense, the word is sometimes also written corruptly *Abuttals*, or *Abutals*.—In old surveys we often find them called

talled *headlands*.—*Abutments* amount to the same with what Latin writers call *capita*; Marculus, *frontes*; the French, *bouts*.—In Croke, the plaintiff is said to fail in his *Abutments*, that is, in setting forth how the land is bounded.

ABYSS*, in a general sense, denotes something profound, and, as it were, bottomless.

* The word is originally Greek *αβυσσος*; compounded of the privative *α*, and *βυσσω*, bottom; *q. d.* without a bottom. Suidas and others give different origins; as, from *α*, and *βου*, to cover, to hide; or from, *α*, and *βου*, &c. But the more judicious reject them, as but one degree better than that of the old glossarist, who derives *Abysus* from *ad ipsus*, in regard the waters flock hither.

We say, the *Abys* of a mountain, an *Abys* of waters, the great *Abys*, the Mosiac *Abys*, an unfathomable *Abys*, &c. *ABYSS*, in a more particular sense, denotes a deep mals, or fund of waters.

In this sense, the word is particularly used in the Septuagint, for the water which God created at the beginning with the earth, which encompassed it round, and which our translators render by the *deep*.—Thus it is that darkness is said to have been on the face of the *Abys*.

ABYSS is also used for an immense cavern in the earth, where God collected all those waters on the third day: which, in our version, is rendered the *deep*, and elsewhere, the *great deep*.

Dr. Woodward has let some light into this great *Abys*, in his *Natural History of the Earth*.—He asserts, that there is a mighty collection of waters inclosed in the bowels of the earth; constituting a huge orb in the interior or central parts of it; and over the surface of this water, he supposes the terrestrial strata to be expanded.—This, according to him, is what Moses calls the *great deep*, and what most authors render the *great Abys*.

That there is such an assemblage of waters lodged in the depths of the earth, is confirmed by abundance of observations. See *EARTH*, and *DELUGE*.

The water of this vast *Abys*, he asserts, does communicate with that of the ocean, by means of certain hiatus's, or chafms passing betwixt it and the bottom of the ocean: and this and the *Abys* he supposes to have one common centre, around which the water of both is placed; but so, that the ordinary surface of the *Abys* is not level with that of the ocean, nor at so great a distance from the centre as the other, it being for the most part restrained and depressed by the strata of earth lying upon it; but wherever those strata are broken, or are so lax and porous, that water can pervade them, there the water of the *Abys* ascends, fills up all the clefts, and fissures into which it can get admittance; and saturates all the interstices and pores of the earth, stone, or other matter all around the globe, quite up to the level of the ocean.

ACACIA*, in medicine, an inspissated juice of a shrub of the thorn kind; used as an astringent.

* The word is compounded of *α*, very, and *κακος*, evil: on account of the prickles.

There are two kinds, the *vera* and *germanica*.

The *ACACIA vera*, is brought from the Levant in round balls of different sizes, in fine bladders; and supposed to be the juice of the pods of a large thorny tree, growing in Egypt and Arabia.—Some naturalists will have it the same tree that yields the gum arabic.

This is very auster and binding; and on that account good against fluxes.—Chuse that of a tan-colour, smooth, and shining; and of an astringent disagreeable taste.—It is, or should be, an ingredient in the *Theriaca Andromachi*.

The *German ACACIA* is a counterfeiter of the former; being made of the juice of unripe floes, boiled to the consistence of a solid extract; and put up in bladders like the former.—It is distinguished from it chiefly by its colour, which is as black as that of Spanish liquorice.—It is used as a substitute to the true *Acacia*.

ACACIA, among antiquaries, something resembling a kind of roll, or bag; seen on medals in the hands of several of the consuls, and emperors, from the time of Anafasius.

Authors are not agreed either about the use of this roll, or about the substance whereof it consists; some taking it for a handkerchief rolled up, which the person who presided at the games threw out as a signal for their beginning; whilst others rather imagine it intended to represent a roll of memoirs, or petitions.

ACADEMICS, a sect of philosophers, who followed the doctrine of Socrates, and Plato, as to the uncertainty of knowledge, and the incomprehensibility of truth.

Academic, in this sense, amounts to much the same with *Platonist*; the difference between them being only in point of time. They who embraced the system of Plato, among the ancients, were called *Academici*, *Academic*; whereas those who did the same since the reformation of learning, have assumed the denomination of *Platonists*. See *PLATONIST*.

The original dogma of the *Academics* was this: *Unum scio, quod nihil scio*, I know this one thing, that I know nothing;

which was afterwards improved into, *Nihil scio, ne hoc quidem, quod nihil scio*, I know nothing, not even this, that I know nothing.—Accordingly they pleaded, that the mind ought always to remain in suspense; as having nothing to determine on but bare probability, or verisimilitude, which is as likely to lead into error as truth.

It should seem however that Plato, in recommending it to his disciples to distrust and doubt of every thing, had it not so immediately in view to leave them fluctuating and in continual suspense between truth and error, as to guard against those rash precipitate decisions, which young minds are liable to; and to put them in a disposition to secure themselves from error, by examining every thing without prejudice.

M. des Cartes, has adopted this same *Acatelephia*, or principle of doubting; but, it must be allowed, he makes a very different use of it.—The *Academics* doubted of every thing, and were resolved still to doubt: Des Cartes, on the contrary, sets out with doubting of every thing; but declares he will not always doubt; and that he only doubts at first, that his determinations afterwards may be the surer. See *CARTESIANISM*.—In Aristotle's philosophy, say the followers of Des Cartes, there is nothing doubted of; every thing is accounted for, and yet nothing is excluded, otherwise than by barbarous, unmeaning terms, and dark confused ideas: whereas Des Cartes makes you even forget what you knew before; but from your new, affected ignorance, he leads you gradually into the sublimest knowledge.—Hence they apply to him what Horace says of Homer:

Non fumum ex fulgore, sed ex fumo dare lucem

Cogitat, ut speciosa debinc miracula promat

Antiphatem, Scyllamque, et cum Cyclope Charydam.

It is thus the Cartesians talk; but we may add, that long before their master, Aristotle himself had said, that to know a thing well, a man must first have doubted it; and that it is with doubting that all our knowledge must begin.

ACADEMICS, or rather *ACADEMISTS*, is also used among us for the members of the modern *Academies*, or instituted societies of learned persons. See *ACADEMY*, and *ACADEMIST*.

ACADEMY, *ACADEMIA*, in antiquity, a fine villa, or pleasure-house, situate in one of the suburbs of Athens, about a mile from the city; where Plato, and the wise men who followed him, held assemblies for dispute and philosophical conference: and which gave the denomination to the sect of *Academics*. See *ACADEMIC*.

It took its name, *academy*, from one *Academos* or *Ecademus*, a citizen of Athens, to whom it originally belonged; and who used to have gymnastic sports or exercises therein.—He lived in the time of Theseus.

Some, mistakenly, derive its name and origin from *Cadmus* the Phœnician, as being the first who introduced learning, and the use of letters among the Greeks.

The *Academy* was further improved and adorn'd by Cimon, with fountains, trees, shady walks, &c. for the convenience of the philosophers, and men of learning, who here met to confer, dispute, &c.—It was also the burying-place of illustrious persons, who had deserved well of the republic.

Here it was that Plato taught his philosophy; and from him, all public places destined for assemblies of the learned and ingenious, have been since called *Academies*.

Scylla sacrificed the delicious groves and walks of the *Academy* planted by Cimon to the laws of war; and employed those very trees to make machines wherewith to batter the city. Cicero also had a villa, or country retirement near *Puzzuoli*, which he called by the same name *Academia*; where he used to entertain his philosophical friends.—It was here he composed his *Academical Questions*, and his books *De Natræ Deorum*.

ACADEMY also denotes a sect of philosophers, who maintained that truth is incomprehensible, all knowledge uncertain, and that a wife man therefore is always to doubt, and remain in suspense, never positively asserting or denying any thing.

In which sense, *Academy* is synonymous with the sect of *Academics*. See *ACADEMIC*.

We usually reckon three *Academics*, or sects of *Academics*; though some make five.—The ancient *Academy*, was that wherof Plato was the chief. See *PLATONISM*.

Arcebas, one of his successors, introducing some alterations into the philosophy of this sect, founded what they call the *second Academy*.

The establishment of the third, called also the *new Academy*, is attributed to Lacydes, or rather to Carneades.

Some authors add a fourth, founded by Philo; and a fifth by Antiochus, called the *Antiochan*, which tempered the ancient *Academy* with *Stoicism*. See *STOICISM*.

The ancient *Academy* doubted of every thing; and went so far as to make it a doubt, whether or no they ought to doubt.—It was a sort of principle with them, never to be certain, or fatished of any thing; never to affirm, or deny any thing, either for true or false.—In effect, they asserted an absolute *Acatelephia*. See *ACATELEPSIA*.

The *new Academy* was somewhat more reasonable; they owned several things for truths, but without attaching themselves to any with entire assurance. — These philosophers had found, that the ordinary commerce of life and society was inconsistent with the absolute and universal doubtfulness of the ancient *Academy*: and yet, it is evident they themselves looked upon things rather as probable, than as true, and certain: by this amendment, thinking to secure themselves from those absurdities into which the ancient *Academy* had fallen. See the *academical* questions of Cicero; where that philosopher explains, and unravels the fomentations of those who in his days called themselves followers of the new and old *Academy*, with great clearness and address.

ACADEMY is more frequently used among the moderns, for a regular society, or company of learned persons; instituted under the protection of a prince, for the cultivation, and improvement of arts, or sciences.

Some authors confound *Academy* with university; but though much the same in Latin, they are very different things in English. — An university is, properly, a body composed of graduates in the several faculties; of professors, who teach in the public schools; of regents or tutors, and students who learn under them, and aspire likewise to degrees. Whereas, an *Academy* is not intended to teach, or profess any art, such as it is, but to improve it: it is not for novices to be instructed in, but for those that are more knowing; for persons of distinguished abilities to confer in, and communicate their lights and discoveries to each other for their mutual benefit and improvement.

The first *Academy* we read of, was established by Charlemain at the motion of Alcuin: it was composed of the chief wits of the court, the emperor himself being a member. — In their *academical* conferences, every person was to give an account of what ancient authors he had read; and each of them assumed the name of some ancient author, who pleased him most, or some celebrated person of antiquity. Alcuin, from whose letters we learn these particulars, took that of Flaccus, the surname of Horace: a young lord, named Augilbert, took that of Homer: Adelard, bishop of Corbie, was called Augustin: Riculf, bishop of Mentz, was Dametas; and the king himself, David.

This lets us see a mistake in some modern writers, who relate, that it was in conformity with the genius of the learned men of those times, who were great admirers of Roman names, that Alcuin took the name of Flaccus Albinus.

Most nations have now their *Academies*, Russia not excepted: but, of all countries, Italy bears the bell in this respect. — We have but few in England. — The only one of eminence is called by another name, *viz.* the *Royal Society*: an account whereof, see under the article *ROYAL SOCIETY*.

Beside this, however, we have an *Academy* of music; and another of painting; established by letters patent, and governed by their respective directors.

The French having flourishing *Academies* of all kinds, established at Paris; mostly by the late king, — *viz.* the *ROYAL ACADEMY of Sciences*, for the improvement of physics, mathematics, and chemistry; first set on foot in 1666, by order of the king, though without any act of royal authority issued for that end. — In the year 1699, it had as it were a second birth; the same prince, by a regulation dated the 26th of January, giving it a new form, and putting it on a new and more solemn footing.

In virtue of that regulation, the *Academy* was to be composed of four kinds of members, *viz.* *honorary, pensionary, associates, and elevés.* — The first class to consist of ten persons; and the rest of twenty each. — The honorary *academists* to be all inhabitants of France; the pensionaries all to reside at Paris; eight of the associates allowed to consist of foreigners; and the elevés all to live at Paris. — The officers, to be a president, named every year by the king, out of the class of honorary *academists*; and a secretary and treasurer, to be perpetual.

Of the pensionaries, three to be geometers, three astronomers, three mechanics, three anatomists, three chemists, three botanists; the remaining two, secretary and treasurer. — Of the twelve associates, two to apply themselves to geometry, two to botany, and two to chemistry. — The elevés to apply themselves to the same kind of science with the pensionaries they are attached to; and not to speak, except when called thereto by the president. — No regular or religious to be admitted, except into the class of honorary *academists*; nor any person to be admitted, either for associate or pensionary, unless known by some considerable printed work, some machine, or other discovery. — Further, no person to be allowed to make use of his quality of *academist*, in the title of any of his books, unless such book have been read to, and approved by the *Academy*.

* Dr. Lister observes, that they would have been glad of F. Plumier; but they avoided making a precedent for the admission of any regulars.

The meetings of the *Academy* were appointed to be held twice a week, on Wednesdays and Saturdays, in the king's library: (though soon after, they were removed to a more commodious apartment in the Louvre.) And to last, at least, two hours, *viz.* from three to five. At the beginning of every

VOL. I.

new year, each pensionary to be obliged to declare in writing what work he intended chiefly to prosecute that year; and the rest to be invited to do the same. All the observations the *academists* bring to the meeting to be left in writing, in the hands of the secretary; who is to enter the substance of what passes at each assembly in a register: and at the end of every year, to publish the history, or transactions of the *Academy* for that year.

No person, not a member, to be present at their ordinary meetings; unless such as are introduced by the secretary, to propose some new machine, or discovery; though their public meetings, twice a year, shall be open to every body.

To encourage the members to continue their labours, the king engages not only to pay the ordinary pensions, but even to give extraordinary gratifications, according to the merit of their respective performances: furnishing withal, the expence of the experiments, and other inquiries necessary to be made. — If any member give in a bill of charges of experiments which he has made, or desire the printing of any book, and bring in the charges of gravings, the president allowing and signing it, the money is immediately paid by the King. — So if an anatomist require live tortoises, for instance, for making experiments about the heart, &c. they shall be brought him as many as he pleases at the king's charge. *Litt. Journ. 12. Paris.* — Their motto, *Invenit & perfit.*

In the year 1716, the duke of Orleans, then regent, made an alteration in their constitution; augmenting the number of honoraries, and of associates capable of being foreigners, to twelve; admitting regulars among such associates; suppressing the class of elevés, and establishing, in lieu thereof, a new class of twelve adjuncts, to the six several kinds of sciences cultivated by the *Academy*: and, lastly, appointing a vice-president, to be chosen yearly by the king, out of the honorary members; and a director, and sub-director out of the pensionaries.

Their secretary, M. de Fontenelle, has obliged the public with a great number of elegant volumes of the productions of this illustrious body; under the title of *Histoire de l'Académie Royale, &c. avec les Mémoires de Mathématique & de Physique tirez des Registres, &c.*

ACADEMY of Painting, Sculpture, and Architecture, was established under the cardinal Mazarin, first protector thereof; and the chancellor Seguier, vice-protector.

It consists of a director, a chancellor, four rectors, a treasurer, twelve professors; adjuncts to the rectors, and professors; counsellors; a secretary; a professor for anatomy, and another for geometry, and perspective.

Persons are here admitted either in quality of painters, or sculptors. — The painters are admitted according to their respective talents; there being a distinction made between those who work in history, and those who only paint portraits, or landscapes, or beasts, or fruits, or flowers, or paint in miniature; or only design; or engrave; or carve, &c. — Their productions are exposed to the public view, yearly, in the great hall of the Louvre; and there are prizes for those who perform best. *V. Guérin. descr. de l'acad. roy. de peint. & sculpt. Mém. erudit. 1717. p. 188.*

There is also a French *Academy* of painting, sculpture, &c. at Rome, established by Lewis XIV. wherein those who have won the annual prizes in the like *Academy* at Paris, are received and entertained for three years, to give them an opportunity for perfecting themselves. *Lett. Juiv. 15.*

ACADEMY of Medals and Inscriptions, was erected for the study, and explanation of ancient monuments; and to consecrate great, and memorable events to posterity, by similar monuments; as medals, reliefs, inscriptions, &c.

ACADEMY of Politics, is composed of six persons, who meet on certain days each week at the Louvre, in the chamber where the papers relating to foreign affairs are lodged. Here they peruse such papers as are put in their hands, by order of the secretary for foreign affairs, who acquaints the king with the progress they make, and the capacities of each, that his majesty may employ them accordingly.

French ACADEMY, established for the improvement and refining of the language. See *LANGUAGE*.

ACADEMY of Music, this consists of the managers, and directors of the opera.

The French have also considerable *Academies* in most of their great cities; as, at Montpellier a royal *Academy* of sciences, on the like footing as that at Paris; being as it were a counterpart thereof: at Toulouse an *Academy* under the denomination of *Lanternists*: others at Nîmes, Arles, &c.

The *Royal Spanish ACADEMY*, is an *Academy* for cultivating the Castilian tongue, established at Madrid, on the model of the French *Academy*. — The design of this was laid by the duke d'Escalona; and approved of by the king in 1714, who declared himself protector thereof. — It consists of twenty-four *academists*; including the director and secretary.

Its device is a crucible on the fire, with this motto, *Limpia, fija, y da splendor.*

ACADEMY of Natural Curiosities, in Germany, was first founded in 1652, by M. Baufch a physician; and taken in 1670 under the protection of the emperor Leopold.

There are other *academical* institutions at Berlin, and other

parts of the north; several of which having distinguished themselves by their journals, ephemerides, &c. the reader will find some account of them under the article JOURNAL.

Italy, alone, has more Academies of note than all the rest of the world; not a city but furnishes a set of learned persons for an Academy, which to them seems an essential part of a regular constitution.—Jarekcius has given us a specimen of their history, printed at Leipzig, in 1725; and withal, grounds to expect a fuller, and more perfect account from several learned persons, who had been long employed about the same; as Kraufius, professor of eloquence at Leipzig: Hyacynth, Gimma, and Mich. Richeyus.

The Academiſts, *e. gr.* of Boulogna, are called *Abbandonati, Anſioſi, Ocioſi, Arcadi, Conſuſi, Diſturbati, Dubbioſi, Impatienti; Inabili, Indifferenti, Indomiti, Inquieti, Inſtabili, Della notte, Piacere, Sittenti, Sonnoſenti, Torbidi, Veſpertini.*—Those of Genoa, *Accordati, Sopiti, Reſuegliati:* of Gubio, *Adormentati:* of Venice, *Acuti, Alletati, Diſcordanti, Diſgiunti, Diſingnati, Dodoni, Filadelfici, Incredibili, Inſancibili:* of Rimini, *Adagiati, Eutrapeli:* of Pavia, *Affiat, Della Chiave:* of Fermo, *Raffrontati:* of Molia, *Agitati:* of Florence, *Aterati, Humidi, Furfurati, Della Cruſca, Del Cimento, Inſuati:* of Cremona, *Animoſi:* of Naples, *Arditi, Infernati, Intronati, Lunatici, Secreti, Sirenes, Sicuri, Volanti:* of Ancona, *Argonauti, Caliginosi:* of Urbino, *Afforditi:* of Perugia, *Atomi, Eccentrici, Inſenſati, Inſipidi, Uniſoni:* of Tarentum, *Audaci:* of Macerata, *Catenati, Imperfetti:* of—*Chimariſti:* of Sienna, *Corteſi, Giovioli, Trapafſati:* of Rome, *Deſici, Humoriſti, Lyncei, Fantafici, Illuminati, Incitati, Indiſpoſiti, Inſecundi, Malenſici, Negletti, Notti Vaticane, Notturni, Ombrati, Pellegrini, Sterili, Vigilanti:* of Padua, *Dilii, Immaturi, Orditi:* of Trepano, *Difficili:* of Brelle, *Diſperſi, Eryvanti:* of Modena, *Diſſonanti:* of Recanatum, *Diſſonanti:* of Syracuſe, *Ebrii:* of Milan, *Elionii, Faticosi, Penici, Incerti, Naſcoſi:* of Candia, *Extravaganti:* of Peſaro, *Eteroclitici:* of Comacchio, *Flutuant:* of Arezzo, *Forzati:* of Turin, *Fulminanti:* of Reggio, *Fumoſi, Muti:* of Cortona, *Humorosi:* of Bari, *Inogniti:* of Roſſano, *Incurioſi:* of Brada, *Innominati, Pigri:* of Acis, *Intricati:* of Mantua, *Inuogiti:* of Agigento, *Mutabili, Offuſati:* of Verona, *Olympici, Uranii:* of Viterbo, *Oſinati:* of—*Vagabondi.*

ACADEMY, is also used among us for a kind of collegiate school, or seminary; where youth are instructed in the liberal arts, and sciences; in a private way.

The nonconformist ministers, &c. are many of them bred up in such private Academies; as not relishing the common university-education.

Frederic I. king of Prussia established an Academy in Berlin in 1703, for the education of the young nobility of the court, suitable to their extraction. The expense of the students was very moderate, the king having undertaken to pay the extraordinary. This illustrious school, which was then called the Academy of Princes, has now lost much of its ancient splendor. *Pallnitz. Mem. T. 3. p. 52.*

ACADEMY is also used in speaking of the schools of the Jews: *i. e.* those seminaries where the rabbins, or doctors instruct the youth of their nation in the Hebrew tongue; explain to them the Talmud; teach them the Cabbala, &c.

The Jews have had of these Academies ever since their return from their Babylonish captivity. The Academies of Tiberias and Babylon are particularly celebrated. See MASSORETES.

ACADEMY is particularly understood of a riding-school; or a place where young gentlemen are taught to ride the great horse, with other suitable exercises; as fencing, &c.

This is what Vitruvius calls *Ephebeum*, and some others among the ancient Gymnasium; the modern equestrian, or military Academy.

The duke of Newcastle will have the art of riding to have had its origin in Italy; and the first Academy of this sort to have been established at Naples, by Frederic Grifon; who, he adds, was the first that wrote on this subject; which he did like a true cavalier, and a great master.—Henry VIII. says the same author, called over two Italians, disciples of Grifon, into England; who soon flock'd the nation with ecuyers, or riding-masters.

He adds, that the greatest master Italy ever produc'd, was a Neapolitan, Pignatelli by name; that la Broue rid under him five years; Pluvinel nine; and S. Antoine many years: and that these three Frenchmen filled France with French masters; which till then had known none but Italians.

The ground set apart in an Academy, for riding, is called the *Manège*; having usually a pillar in the centre, and other pillars, placed two by two, at the sides.

ACADEMY, or ACADEMY-FIGURE, in painting, is a drawing,

or design made after a model, with a crayon, or pencil.—Or the copy of such a draught. See DESIGN.

ACANACEOUS. See the article ACANTHACEOUS.

ACANTHA, among some anatomists, is applied to the hind, or posterior protuberances of the vertebrae of the back; forming what we call the *spina dorsa*. See VERTEBRA, and SPINA.

ACANTHABOLUS*, *Ακανθαβόλος*, a surgeon's instrument, wherewith to extract foreign bodies, which by the sharpness of their points have penetrated, and entered the parts of the body.

* The word is sometimes also written, corruptly, *Acantabolus*. It is compounded of the Greek *ακανθα*, a thorn; and *βόλος*, to cast away.

The *Acantabolus* is the same with what is otherwise called *vossella*.—Its chief use is for extracting of fish-bones, or the like, sticking in the cæphagus; as also the fragments of weapons, bones, hair, &c. remaining in wounds.—Its figure resembles that of a pair of pincers: sometimes it is also made crooked, for more commodious application to the fauces.

ACANTHABOLUS is also sometimes used for an instrument, wherewith people pull out the hairs from their eye-brows.

ACANTHACEOUS*, among botanists, a term applied to a class of plants, popularly known under the name of the *thistle kind*. See THISTLE and CARDUS.

* The word is formed of the Greek *ακανθα*, *acus*, to sharpen; or *ακανθα*, *spina*, a thorn; in regard of the prickles they are beset withal.

ACANTHUS*, in architecture, an ornament in the Corinthian, and Composite orders; being the Representation of the leaves of an acanthaceous plant, in the capitals thereof.—See *Tab. Archit. fig. 21. lit. bb.*

* It takes its name from *ακανθα*, the name given this plant among the Greeks; as being prickly, or of the thistle kind. The Latin botanists, call it *Branca Ursina*, or bear's breech, from some supposed resemblance it bears thereto; and some *Branca Hircina*, by reason its leaves bend, and twist somewhat like a goat's horns.

There are two kinds of the plant *Acanthus*, one whereof grows wild, and is full of prickles; the other grows in gardens, and is by Virgil called *mollis*, in regard it is soft, and without any prickles.—The Greek sculptors adorned their works with the figure of the latter; as the Gothic did with that of the former, which they represented not only in their capitals, but also in other ornaments.

The garden *Acanthus*, is the most dented; bearing some sort of resemblance to smallage; and thus it is we find it represented in the composite capitals of Titus, and Septimius Severus at Rome. These leaves make the principal character, and distinction of the two rich orders from the rest: and their different number and arrangement does also distinguish the two orders from each other. See SUPPLEMENT, article ACANTUS.

The origin and occasion of the ornament, see under the article ABACUS.

ACATALECTIC*, ACATALECTICUS, in the ancient poetry, a term applicable to such verses as have all their feet and syllables; and are in no wise lame or defective at the end, See VERSE, and FOOT.

* The word comes from *κατα*, and *λεγειν*, to cease or end; whence *καταλεγειν*, which wants something at the end; and the privative *a* being prefixed *ακαταλεγειν*, which wants nothing at the end.

On the contrary, catalectic verses are those which end too hastily, and with a syllable too little. See CATALECTIC. In the following strophe of Horace, the two first verses are *Acatalectic*, and the last *catalectic*.

*Solvitur acris hyems, grata vice
Veris et Favoni:*

Trabuntque siccas machine carinas.—

ACATALEPSIA*, ACATALEPSY, in philosophy, an impossibility of a thing's being conceived or comprehended.

* The word is compounded of the privative *a*, and *καταλαμβάνω*, *deprehendo*, to find out; of *κατα*, and *λαμβάνω*, *capio*, to take. See CATALEPSIS.

Acatalepsia, is synonymous with incomprehensibility.

The Pyrrhonists or Sceptics asserted an absolute *Acatalepsia*: all human science and knowledge, according to them, went no further than to appearances, and verisimilitude; they declaimed much against the senses; and charged them with a principal share in seducing, and leading us to error. See PYRRHONIST.

ACATERY, ACCATRY, in the king's household, a kind of check betwixt the clerks of the kitchen, and the purveyors. See PURVEYOR.

The officers of the *Acatery*, are a Serjeant, (salary 6 l.) two joint-clerks, (sal. 120 l.) and a yoman of the salt-stores.

ACATIUM*, in the ancient navigation, a kind of boat or pinnace used for military purposes.

* The word is Greek, *Ακατιον*, formed, according to some, from *ακν*, point: on account of the sharpness of its make.

The *Acatium* was a species of those called *Actuaria Navis*, *i. e.* such as were wrought with oars. It was sometimes made use of

of in battle : Strabo represents it as kind of privateer, or pyrate sloop.

ACCAPITARE*, **ACCAPTARE**, **ACAPTARE**, in ancient law-books and records, the act of becoming vassal of a lord, or of yielding homage and obedience to him.

* The word is compounded of the Latin *ad*, to; and *caput*, head; by reason vassals own their lords for their head. Whence also the lords are sometimes called *domini capitales*; as those who command in an army are called *capitanei*, captains; and in old French, *cheveteines*, chieftains, in respect of their soldiers.—

ACCAPITUM*, a sum of money paid by a vassal, upon his admission to a feud. See **ACCAPTARE**.

* The word is also written *Acapitum*, *Accapitamentum*, *Acaptio*, *Acaptatio*, and *Acaptagium*.

ACCAPITUM, in our ancient law-books, signifies relief due to the chief lord. See **RELIEF**.

ACCATRY. See **ACATERY**.

ACCEDAS*, *ad Curiam*, an original writ, which lies for removing suits in any Court Baron except the County Court, into the King's Court; upon apprehension of partiality or false judgment in the other.

* *Accedas* is a Latin word signifying an order that thou come, &c. compounded of *ad*, to; and *cedere*, to come.

A like writ lies for him who has received false judgment in the County Court; where it is called *de falso judicio*. An *Accedas ad Curiam* lies also for justice delay'd, as well as falsely given; and is a species of the writ *Recordari*. See the article **RECORDARI**.

ACCEDAS ad Vice-comitem, is a writ directed to the coroner, commanding him to deliver a writ to the sheriff, who having a pone delivered to him, suppresses it. See **PONE**.

ACCELERATED Motion, in mechanics, is a motion which receives continual increments, or accessions of velocity. See **MOTION**.

If the accessions of velocity be equal in equal times; the motion is said to be *uniformly accelerated*.

The motion of falling bodies is an *accelerated motion*: and supposing the medium they fall through, i. e. the air, void of resistance; the same motion may be also considered as *uniformly accelerated*.

For the *Laws of ACCELERATED Motion*, see **MOTION**.

ACCELERATION*, in mechanics, the increase of velocity in a moving body.

* The word is compounded of *ad*, to; and *celer*, swift.

Acceleration stands directly opposed to retardation, which denotes a diminution of velocity.

ACCELERATION is chiefly used in physics, in respect of falling bodies, i. e. of heavy bodies tending towards the centre of the earth by the force of gravity. See **GRAVITY**, and **CENTRE**. That natural bodies are *accelerated* in their descent, is evident from various considerations, both *a priori* and *posteriori*.—Thus, we actually find, that the greater height a body falls from, the greater impression it makes, and the more vehemently does it strike the subject plane, or other obstacle.

Various are the systems and opinions which philosophers have produced to account for this *Acceleration*.—Some attribute it to the pressure of the air: the farther, say they, a body falls, the greater load of atmosphere is of consequence incumbent on it: and the pressure of a fluid, is in proportion to the perpendicular altitude of the column thereof.—Add, that the whole body of the fluid pressing in innumerable right lines, which all meet in a point, *viz.* the centre; that point, by the meeting of those lines, sustains, as it were, the pressing of the whole mass: consequently, the nearer a body approaches thereto, the effect or pressure of more united lines must it sustain.

But what overturns this account, is, that as the pressure of the air downwards increases; so, by the known laws of statics, does the resistance, or the force wherewith the same fluid tends to repel, or drive the body upwards again.

Others insist, that the incumbent air is the grosser and more vaporous, the nearer the earth; and filled with more heterogeneous particles, which are not true elastic air: and hence, say they, a descending body, meeting continually with less resistance from the elasticity of the air, and having the same force of gravity still acting on it, must necessarily be *accelerated*. Hobbs (*Philos. probl. c. 1. p. 3.*) attributes *Acceleration* to a new impression of the cause which makes bodies fall; which, on his principles, is also the air. As part of this mounts, part also must descend; for reasons drawn from the motion of the earth, which is compounded of two motions, one circular, the other progressive; consequently the air ascends, and circulates at once. As the body, in its fall, receives a new pressure in every point of its descent, its motion he says must needs be accelerated.

But what overturns all accounts where the air or atmosphere are concerned, is, that the *Acceleration* holds in vacuo, and even more regularly than in air. See **VACUUM**.

The Peripatetic account is worse than this: the motion of

heavy bodies downwards, say they, arises from an intrinsic principle, which makes them tend to the centre, as their proper seat, or element, where they would be at rest: Hence, add they, the nearer bodies approach thereto, the more is their motion intended.

The Gassendists, on the other hand, hold that the earth emits a sort of attractive effluvia, innumerable threads whereof continually ascend and descend; which threads, proceeding like radii from a common centre, divaricate the more, the further they go: So that the nearer a heavy body is to the centre, the more of these magnetic threads it receives; and hence the more is its motion *accelerated*.

But this is refuted by an easy experiment: for if a ball be let fall out of the lowest window of a high tower, and also out of the highest; the *Acceleration* will be the same in both cases, notwithstanding the greater vicinity to the centre in the one, than in the other case.

The Cartesians account for the *Acceleration*, from the repeated pulses of a subtil etherial matter, which is continually acting on the falling body, and impelling it downwards.

After all, the cause of *Acceleration* is nothing mysterious; the principle of gravitation, which determines the body to descend, determining it to be *accelerated* by a necessary consequence. See **GRAVITATION**.

Suppose a body let fall from on high: the primary cause of its beginning to descend, is doubtless, the power of gravity; but when once the descent is commenced, that state becomes in some measure natural to the body; so that if left to itself, it would persevere in it for ever, even though the first cause should cease: as we see in a stone cast with the hand, which continues to move, after it is left by the cause that gave it motion.

But, beside the propensity to descend impressed by the first cause, and which of itself were sufficient to continue the same degree of motion once begun, in infinitum; there is a constant accession of subsequent efforts of the same principle, gravity, which continues to act on the body already in motion, in the same manner as if it were at rest.

Here, then, being a double cause of motion, and both acting in the same direction, *viz.* directly towards the centre of the earth; the motion they jointly produce must necessarily be greater than that of any one of them.—And the velocity thus increased, having the same cause of increase still persisting, the descent must necessarily be continually *accelerated*.

For, supposing gravity, whatever it be, to act uniformly on all bodies, at equal distances from the earth's centre; and that the time in which a heavy body falls to the earth, be divided into equal parts infinitely small: let this gravity incline the body towards the earth's centre, while it moves in the first infinitely small part of the time of its descent; if after this, the action of gravity be supposed to cease, the body would proceed uniformly on towards the earth's centre, with a velocity equal to the force of the first impression.

But, now, since the action of gravity is here supposed still to continue; in the second moment of time, the body will receive a new impulse downwards, equal to what it received at first; and thus its velocity will be double of what it was in the first moment: in the third moment it will be triple; in the fourth quadruple, and so on continually: for the impression made in one moment, is not at all altered by what is made in another; but the two are, as it were, aggregated, or brought into one sum.

Wherefore, since the particles of time are supposed infinitely small, and all equal to one another; the impetus acquired by the falling body will be every where, as the times from the beginning of the descent.—And hence, since the quantity of matter in the body given, continues the same; the velocity will be as the time in which it is acquired.

Further, the space passed over by a moving body in a given time, and with a given velocity, may be considered as a rectangle made by the time and the velocity.—Suppose A, (*Tab. Mechan. fig. 62.*) a heavy body descending, and let AB represent the time of its descent; which line suppose divided into any number of equal parts, AC, CE, EG, &c. representative of the intervals, or moments of the given time.—Let the body descend through the first of those divisions, AC, with a certain equable velocity arising from the proposed degree of gravity: this velocity will be represented by AD; and the space passed over, by the rectangle CAD.

Now, as the action of gravity in the first moment produced the velocity AD, in the body before at rest; in the second moment, the same will produce in the body so moving, a double velocity, CF; in the third moment, to the velocity CF will be added a further degree, which together therewith, will make the velocity EH, which is triple of the first, and so of the rest. So that in the whole time AB, the body will have acquired a velocity BK.—Again, taking the divisions of the line, *e.g.* AC, CE, &c. for the times, the spaces gone through will be the areas or rectangles, CD, EF, &c. So that in the whole time AB, the space described by the moveable, will be equal to all the rectangles, *i.e.* to the dotted Figure ABK.

Such would be the case, if the accelerations of velocity only happened in certain given points of time, *e. g.* in C, in E, &c. So that the degree of motion should continue the same till the next period of Acceleration came up.—If the divisions or intervals of time were supposed less, *e. g.* by half; then the denatures of the figure would be proportionably smaller; and it would approach so much the nearer to a triangle.—If they were infinitely small, *i. e.* if the accelerations of velocity were supposed to be made continually, and in every point of time, as is really the case; the rectangles thus successively produced will make a just triangle, *e. g.* ABE, (fig. 63.)—Here, the whole time AB, consisting of the little portions of time A 1, A 2, &c. and the area of the triangle ABE, of the sum of all the little triangular surfaces answering to the divisions of the time: the whole area or triangle expresses the space moved through in the whole time AB; and the little triangles A 1 f, &c. the spaces gone through in the divisions of time a 1, &c.

But these triangles being similar, their areas are to one another, as the squares of their homologous sides A B, A 1, &c. and consequently, the spaces moved, are to each other as the squares of the times.

Hence we easily infer the great law of Acceleration, *viz.* "That a descending body uniformly accelerated, describes, in the whole time of its descent, a space which is just half of what it would have described in the same time, with the accelerated velocity, it has acquired at the end of its fall." For, the whole space the falling body has moved through in the time AB, we have already shewn, will be represented by the triangle ABE; and the space the same body would move through in the same time, with the velocity BE, will be represented by the rectangle ABEF.—But the triangle is known to be equal to just half the rectangle.—Therefore, the space moved, is just half of what the body would have moved with the velocity acquired at the end of the fall.

Hence, 1^o, we gather, that the space moved with the last acquired velocity BE, in half the time AB, is equal to that really moved by the falling body in the whole time AB. 2^o, If a falling body describe any given length in a given time, in double that time it will describe four times that length; in thrice the time, nine times, &c. and universally, if the times be in arithmetical proportion, 1, 2, 3, 4, &c. the spaces described will be, 1, 4, 9, 16, &c.

3^o, The spaces described by a falling body, in a series of equal moments or intervals of time, will be as the unequal numbers 1, 3, 5, 7, 9, &c.—And since the velocities acquired in falling are as the times; the spaces will also be as the squares of the velocities; and both times and velocities in a subduplicate ratio of the spaces.

The motion of a body ascending, or impelled upwards, is diminished or retarded from the same principle of gravity acting in a contrary direction, in the same manner as a falling body is accelerated. See RETARDATION.

A body thus projected upwards, rises till it has lost all its motion; which it does in the same time that a body falling would have acquired a velocity equal to that wherewith the body was thrown up.

Hence, the same body thrown up, will rise to the same height, from which, falling, it would have acquired the velocity wherewith it was thrown up.

And hence, the height which bodies thrown up with different velocities do ascend to, are to one another as the squares of those velocities.

ACCELERATION of bodies on inclined planes.—The same general law obtains here, as in bodies falling perpendicularly: the effect of the plane is, to make the motion slower; but the inclination being every where equal, the retardation rising therefrom will proceed equally in all parts, at the beginning and the ending of the motion.—The particular laws, see under the article *Inclined PLANE*.

ACCELERATION of the motion of pendulums.—The motion of pendulous bodies is accelerated in their descent; but in a less ratio than that of bodies falling perpendicularly. See the laws thereof under the article *PENDULUM*.

ACCELERATION of the motion of projectiles. See *PROJECTILE*.

ACCELERATION of the motion of compressed bodies, in expanding or restoring themselves. See *COMPRESSION*.

That the motion of compressed air, expanding itself by its elasticity to its former dimensions, is accelerated, is evident from various considerations.

ACCELERATION is also applied in the ancient astronomy, in respect of the fixed stars.—This Acceleration was the difference between the revolution of the primum mobile, and the solar revolution; which was computed at 3 minutes, and 56 seconds.

ACCELERATOR*, in anatomy, a muscle of the penis, whose office is to expedite the discharge of the urine, and semen.

* This is more peculiarly called *Accelerator urinae*: some make two muscles of it, and give them the denomination *Acceleratores*, or *acceleratory muscles*.

It arises tendinous from the upper and fore-part of the urethra, but soon grows fleshy, passes under the os pubis, and incompletes the bulb of the cavernous body of the urethra.—Both

fides of this muscle meet in a middle line, corresponding to the seam in the skin over it; and continue so united, the space of two inches; after which, it detaches two fleshy elongations, which become thin tendons at their terminations on the cavernous bodies of the penis.

Its upper part covering the bulb, when in action, straightens the veins which pass through it from the corpus cavernosum of the urethra, and hinders the reflux of the blood in an erection. By the repeated contractions of this upper part, the blood in the bulb is also driven towards the glands.

The two elongations comprise the channel of the urethra, and so force out the contained seed, or urine; whence the muscle takes its name.

ACCENSI*, in antiquity, denotes an inferior order of officers, appointed to attend the Roman magistrates, somewhat in the manner of ushers, sergeants, or tipstaves among us.

* They were thus called from *accire*, to send for; one part of their office being to call assemblies of the people, summon parties to appear and answer before the judges, &c.

ACCENSI*, also denotes a kind of supernumerary soldiers in the Roman armies; whose office was to attend the motions of their principals, and supply the places of those who were killed, or disabled by their wounds.

* They were thus denominated from *ad*, to; and *conferre*, to reckon.

ACCENSION*, **ACCENSIO**, in physics, the act of kindling, or setting a body on fire.

* The word is formed of the Latin *accendere*, to kindle; a compound of *ad*, to; and *candere*, to glow. Though some Grammarians suspect the primitive signification of *accendere*, to have been, to render famous.

Accension, on other occasions, is called *inflammation*, *ignition*, *conflagration*, &c. See the articles *IGNITION* and *INFLAMMATION*.

Accension, stands opposed to extinction. See *EXTINCTION*. Chemists furnish us various instances of the *Accension* of cold liquors by bare mixture: as of the acid spirits of minerals, and the essential oils of plants. V. *Mem. Acad. Scien. an.*

1726. p. 132. *Hist.* p. 39.

ACCENT*, in its primitive sense, an affection of the voice, which gives each syllable of a word its due pitch, in respect of height or lowness.

* The word is originally Latin, *accentus*, a compound of *ad*, to; and *cane*, to sing. *Accentus quasi Adcantus*; or *juxta cantum*.—In this sense, *Accentus* is synonymous with the Greek *ᾠδή*, the Latin *tonor*, or *tonor*, and the Hebrew *דוד גאליה*, *tafe*.

The *Accent*, properly, has only to do with high and low, or acute and grave.—Though the modern grammarians frequently also use it in respect of loud and soft, long and short; but this confounds *Accent* with *Quantity*. See the article *QUANTITY*.

The difference between the two may be conceived from that which we observe between the beat of a drum, and the sound of a trumpet: the former expresses every thing belonging to loud and soft, and long and short: but, so long as there is a *monotonia* in the sound, there is nothing like *Accent*.

ACCENT is also used in grammar, for a character placed over a syllable, to mark the *Accent*, *i. e.* to shew it is to be pronounced in a higher, or in a lower tone; and regulate the inflections of the voice in reading.

We usually reckon three grammatical *Accents* in ordinary use, all borrowed from the Greeks, *viz.* the *Acute Accent*, which shews when the tone of the voice is to be raised; and is expressed thus (´).

The *Grave Accent*, when the note or tone of the voice is to be depressed; and is figured thus (˘).

The *Circumflex Accent*, which is composed of both the acute and the grave; it points out a kind of undulation of the voice, and is expressed thus (ˆ or ˘).

Words which have no accent are called *Atonic*.

The Hebrews have a grammatical, a rhetorical, and a musical *Accent*; though the first and last seem, in effect, to be the same; both being comprized under the general name of *Tonic Accents*, because they give the proper tone to syllables: as the rhetorical *Accents* are said to be *Euphonic*; inasmuch as they tend to make the pronunciation more sweet and agreeable.

There are four euphonic *Accents*, and twenty-five tonic; of which some are placed above, and others below the syllables; the Hebrew *Accents* serving not only to regulate the risings, and fallings of the voice, but also to distinguish the sections, periods, and members of periods in a discourse; and to answer the same purposes with the points in other languages.

Their *Accents* are divided into *emperors*, *kings*, *dukes*, &c. each bearing a title answerable to the importance of the distinction it makes.—Their emperor rules over a whole phrase, and terminates the sense completely; answering to our point.—Their king answers to our colon; and their duke to our comma.—The king, however, occasionally becomes a duke, and the duke a king, as the phrases are more or less short.—It must be noted, by the way, that the management and

and combination of these *Accents* differs in Hebrew poetry from what it is in prose.

The use of the tonic, or grammatical *Accents*, has been much controverted; some holding that they distinguish the sense, while others maintain that they are only intended to regulate the music, or singing; alledging that the Jews sing, rather than read, the scriptures in their synagogues. V. Cooper, *dom. Music. clav. p. 31.*

The truth seems here to lie between the two opinions; for though we are inclined to think, that the primary intention of these *Accents* was to direct the singing; yet the singing seems also to have been regulated according to the sense; so that the *Accents* might serve not only to guide the singing, but also to point out the distinctions.—Though it must be confessed, that many of these distinctions are too subtle and inconsiderable; nor can the modern writers, or the editors of old ones, agree in the matter; some of them making twice as many of these distinctions as others.

The Hebrew *Accents*, in effect, have something common with those of the Greeks, and Latins; and something peculiar to themselves.—What they have in common, is, that they mark the tones; shewing how the voice is to be raised, and sunk on certain syllables. What they have peculiar, is, that they do the office of the points in other languages. See *PUNCTUATION.*

Be this as it will, it is certain the ancient Hebrews were not acquainted with these *Accents*; so that, at best, they are not just claims.—The opinion which prevails amongst the learned, is, that they were invented about the sixth century, by the Jewish doctors of the school of Tiberias, called the *Massoretes*.

The learned Hennin affirms them to be of Arabic invention; and to have been adopted and transferred thence into the Hebrew by the *Massoretes*: especially by the celebrated Rabbi Ben Asher, who flourished in the middle of the sixth century; on occasion of the emperor Justinian's prohibiting the reading their traditions in their synagogues. He adds, that they were first brought to their degree of perfection, by Rabbi Juda Ben David Ching, a native of Fez, in the eleventh century.—It is indeed possible, the Jews might borrow their points from the Arabs; but how they should have their *Accents* from them is hard to conceive, the Arabic language having no such thing as *Accents*, either in prose or verse.

The same Hennin makes the Arab Alchahil Ebn Ahmed, who lived about the time of Mahomet, the great improver of the Arabic *Accents*.—The chief ground of the opinion, is, that this writer is said to have been the first who reduced poetry into an art; marking the measures, and quantities of the verses, by the Latins called *Podas*, and by us feet.—Add, that the same Hennin, gives Rabbi Juda of Fez, in completing the Hebrew *Accents*, is chiefly founded on the common opinion, that this rabbin was the first grammarian among the Jews. But the opinion is erroneous; there having been a Hebrew grammar composed by R. Saadiah Gaon, many years before R. Juda. In M. Simon's critical history of the old testament, we have a catalogue of Hebrew grammarians, at the head of which is this of R. Saadiah: M. Simon, on this occasion, observes, “that after the Jews of Tiberias had added points, and *Accents* to the texts of the old testament, the doctors of the other schools began to do the like in their copies, which were afterwards imitated by the rest.”

As to the Greek *Accents*, now seen both in manuscript and printed books, there has been no less dispute about their antiquity and use, than about those of the Hebrews.—Isaac Vossius, in an express treatise de *Accentibus Græcæ*, endeavours to prove them of modern invention; asserting, that anciently they had nothing of this kind *, but only a few notes in their poetry, which were invented by Aristophanes the Grammarian, about the time of Ptolemy Philopater; and that these were of musical, rather than of grammatical use, serving as aids in the singing of their poems; and very different from those introduced afterwards.

* This appears from inscriptions as well as manuscripts, none of which till 170 years before Christ, have either accent, spirit, apostrophe, or even a subscriber. V. Maj. de Numm. Græc. *liber. p. 10, seq. Politian. Miscell. 78. Voss. Aristarcho.*

1. 8. *Idem de accent. p. 51.*

He adds, that Aristarchus, a disciple of Aristophanes, improved on his master's art; but that all they both did was only designed to facilitate youth in the making of verses.—The same Vossius shews from several ancient grammarians, that the manner of writing the Greek *Accents* in those days, was quite different from those now used in our books.

Hen. Christ. Hennin, in a dissertation published to shew that the Greek tongue ought not to be pronounced according to the *Accents*, espouses the opinion of Vossius, and even carries the matter still further.—He thinks that *Accents* were the invention of the Arabians, about nine hundred years ago; and that they were only used in poetry; that they were intended to ascertain the pronunciation of the Greek, and to keep out that barbarism which was then

breaking in upon them; that the ancient *Accents* of Aristophanes were perfectly agreeable to the genuine Greek pronunciation, but that the modern ones of the Arabs destroy it.

Wetstein, Greek professor at Basil, in a learned dissertation, endeavours to prove the Greek *Accents* of an older standing.—He owns that they were not always formed in the same manner by the ancients; but thinks that difference owing to the different pronunciation which obtained in the several parts of Greece.

He brings several reasons a priori for the use of *Accents*, even in the earliest days; as that they then wrote all in capital letters equidistant from each other, without any distinction either of words, or phrases; which without *Accents* could scarce be intelligible: and that *Accents* were necessary to distinguish ambiguous words and to point out their proper meaning; which he confirms from a dispute on a passage in Homer, mentioned by Aristotle in his *Poësis*, chap. V. Accordingly, he observes, that the Syrians, who have tonic, but no distinctive *Accents*, have yet invented certain points, placed either below or above the words, to shew their mood, sense, person, or sense. See further in his *Dissertatio Epistolica de Accentuum Græcorum Antiquitate et Usu*, Basil, 1686.

ACCENT is also applied, somewhat abusively, to the Characters which mark the quantities of syllables, or the time the voice is to dwell on them.

The spurious *Accents* answer to the characters of time in music; as crotchets, quavers, &c.—The genuine *Accents* rather answer to the musical notes, sol, fa, &c.

Such are the *long Accent*, which shews that the voice is to stop on the vowel, and is expressed thus (˘).

The *short Accent*, which shews that the time of pronunciation ought to be short, and is marked thus (˙).

Some even rank the hyphen, diastole, and apostrophe, among *Accents*.

ACCENT, also denotes a certain inflection of voice; or a peculiar tone, and manner of pronunciation, contracted from the country, or province where a person was bred.

In this sense, we say, the Welch tone or *Accent*, the northern *Accent*, the Gascon *Accent*, Norman *Accent*, &c.

ACCENT is also a tone or modulation of the voice frequently used as a mark of the intention of the speaker, and giving a good or an evil signification to his words.

One may give offence with the softest and most soothing words imaginable, by a proper management of the *Accent*, and manner of pronouncing them.—The *Accent* frequently gives a contrary sense to what the words themselves naturally imported.

ACCENT, in music, is a modulation of the voice, to express a passion.

Every bar or measure is divided into *accented* and *unaccented* parts.

The *accented* parts are the principal; being those intended chiefly to move and affect: It is on these the spirit of the music depends. See *BAR* and *MUSIC*.

The beginning and middle; or the beginning of the first half of the bar, and the beginning of the latter half thereof, in common time; and the beginning, or first of the three notes in triple time; are always the *accented* parts of the measures.

In common time, the first and third crotchet of the bar are on the *accented* part of the measure.—In triple time, where the notes always go by three and three, that which is in the middle of every three is always *unaccented*; the first and last *accented*. But the *Accent* in the first is so much stronger, that in many cases the last is accounted as if it had no *Accent*.

The harmony is always to be full, and void of discords in the *accented* parts of the measure. In the *unaccented* parts this is not so absolutely necessary; discord here passing without any great offence to the ear.

ACCENT, in Poetry. See *RESTR.*

ACCEPTANCE*, in a general sense, the act of accepting, i. e. of receiving, or admitting a thing offered to us, which by our refusal would have been frustrated, and rendered of no effect.

* The word is formed from *accipere*, to receive; which is compounded of *ad*, to; and *capere*, to take.

The *Acceptance* of a donation, is necessary to its validity; and is a solemnity essential thereto.—*Acceptance*, say the civilians, is the concurrence of the will, or choice of the donee, which renders the act complete; and without which the donor may revoke his gift at pleasure.

In beneficiary matters, the canonists hold, that the *Acceptance* should be signified at the same time with the resignation; not *ex intervallo*. See *RESIGNATION*.

ACCEPTANCE, in common law, denotes a tacit agreement to a preceding act, which might have been defeated and avoided, were it not for such *Acceptance* had.—If a man and his wife, seized of land in right of the wife, make a joint

lease, or feoffment by deed; reserving rent: the man dying, and the wife receiving the rent; such receipt is deemed an *Acceptance*, and shall make the lease good: so that she shall be barred from bringing the writ, *Cui in Vita*. See *Cui in Vita*.

ACCEPTANCE is more particularly used in the Romish ecclesiastical law, for the manner of receiving or admitting the pope's constitutions; or the act whereby they are received, and made obligatory.

There are two kinds of *Acceptances*; the one solemn, the other tacit.

The *solemn Acceptance* is a formal act, whereby some error, or scandal which the pope condemns, is expressly condemned by the acceptor.—Infinite disputes and dissensions have been raised in the Roman catholic world, especially in France, on occasion of the *Acceptance* of the constitution *Unigenitus*: and many of the French clergy still refuse to accept it.

When a constitution has been solemnly accepted by those it more immediately relates to; it is supposed to be tacitly accepted by all the other prelates in the Christian world, who have cognizance thereof: and this acquiescence is what they call a *Tacit Acceptance*.

In this sense, France, Poland, &c. tacitly accepted the constitution against the doctrine of Molinos, and the Quietists.—And Germany, Poland, &c. tacitly accepted the constitution against Jansenism.

ACCEPTANCE, in commerce, is particularly used in respect of bills of exchange.—To accept a bill of exchange, is to sign, or subscribe it; and thereby become principal debtor of the sum contained therein; with an obligation to pay, or discharge it at the time prefixed. See *BILL of Exchange*.

The *Acceptance* is usually performed by him on whom the bill is drawn; upon its being presented to him by the person in whose behalf it was drawn, or by some others by his order.—While the acceptor is master of his signature, i. e. before he have returned the accepted bill to the bearer, he may erase his *Acceptance*: but not after he has once delivered it.

Bills payable at sight are not to be accepted; as being to be acquitted at their first presenting; or, in defect of payment, to be protested.—In bills drawn for a certain number of days after sight, the *Acceptance* must be dated; in regard the time is to be accounted therefrom.—The form of this *Acceptance*, is, *Accepted such a day*, and then the signature.

Bills drawn payable on a day named, or at usance, or double usance, need not be dated; usance being reckoned from the date of the bill itself. See *USANCE*.—On these it is sufficient to write, *Accepted*, and the signature.

If the bearer of a bill be contented with an *Acceptance* to be paid in twenty days after sight, where, in the bill itself, only eight days are expressed; he runs the risk of the twelve additional days: so that if the acceptor fail, he has no remedy against the drawer. And if the bearer content himself to receive a less sum than is expressed, in part; he is to stand the chance of the rest.

ACCEPTATION, in grammar, the signification of a word; or the sense wherein it is taken and received. Thus we say:

Such a word has several *Acceptations*.—In its first and most natural *Acceptation*, it denotes, &c. See *SIGNIFICATION*.

ACCEPTILATION, in the civil law, an acquittance given without receiving any money; or a declaration of the creditor, in favour of the debtor, signifying, that he is satisfied for his debt, and forgives all further claim, or demand; though in reality no payment has been made.

ACCEPTION, or **ACCEPTATION**. See **ACCEPTATION**.

ACCEPTOR, of a bill of exchange, the person who accepts the bill.

The *Acceptor*, who is usually the person on whom the bill is drawn, becomes personal debtor by the acceptance; and is obliged to pay it, though the drawer fail before it become due. See **ACCEPTANCE**.

ACCESS*, in a general sense, signifies the approach of a thing towards another.

The word is of Latin original, *accessus*, or *accessio*; formed of *accidere*; compounded of *ad*, to; and *cadere*; to come.

In which sense, *Access* stands opposed to recess. See **RECESS**.

We sometimes say, the *Access* of bodies, the *Access* of the moon, the sun, planets, &c. but more frequently, the approach of bodies: the appulse of the moon, the rising of the sun, &c. geometricians speak of a line called the curve of equable *access*, or approach.

ACCESS, in a more particular sense, denotes entrance, or admission. See **ENTRY** and **ADMISSION**.

We say, such a person has *Access* to the prince: the *Access* on that side was very difficult, by reason of rocks, &c.

ACCESS, in medicine, denotes a fit, or return of some periodical disease.

We say an *Access* of the gout, but especially an ague, an intermitting fever, an epilepsy, &c. an *Access* of madness; sometimes also a prophetic *Access*, a cold *Access*, &c.

Access is frequently confounded with *paroxysm*; but they are different things; an *Access* being properly the beginning, or first onset of a disease, a *paroxysm* the height of it. See **PAROXYSM**.

ACCESSIBLE, something that may be approached; or, that *Access* may be had to.

Such a place, a fortress, is *accessible* from the sea-ward, i. e. the passage to it is practicable. See **FORTIFICATION**, and **FORTIFIED place**.

ACCESSIBLE height, or *distance*, in geometry, &c. is either that which may be mechanically measured by the application of a measure to it; or it is a height whose base and foot may be approached to, and a distance measured thence on the ground.

With the quadrant, &c. we can take altitudes both *accessible* and *inaccessible*.

Surveying, includes the measuring, plotting, &c. both of *accessible* and *inaccessible* distances.

ACCESSION, in a general sense, is the act of approaching, or going to a place, person, or thing.

ACCESSION, is more particularly used for the act whereby a thing is joined or united to something existing before.

ACCESSION is also used for a prince's succession to the throne. The first of August is observed in memory of the late king's *Accession* to the crown of Great Britain.

ACCESSION is also used for the act of engaging, and becoming a party in a treaty before concluded between other powers; on the same footing and conditions as if originally comprehended in the treaty itself, such as

The *Accession* of the States General to the treaty of Hannover; of the Czarina to the treaty of Vienna, &c.

ACCESSORY, or **ACCESSARY**, something that accedes, or is added to another more considerable thing.

In which sense, the word stands opposed to principal. See **PRINCIPAL**.

ACCESSORY, or **ACCESSARY**, in common law, is chiefly used for a person guilty of a felonious offence, not principally, but by participation; as, by advice, command, or concealment.

There are two kinds of *Accessories*; before the fact, and after it.—The first is he who commands, or procures another to commit felony, and is not present himself; for if he be present, he is a principal.

The second, is he who receives, assists, or comforts any man that has done murder, or felony, whereof he has knowledge.

A man may also be *accessory* to an *Accessory*, by aiding, receiving, &c. an *Accessory* in felony.

An *Accessory* in felony shall have judgment of life, and member, as well as the principal, who did the felony; but not till the principal be first attainted, and convicted, or outlawed thereon.—Where the principal is pardoned without attainer, the *Accessory* cannot be arraigned; it being a maxim in law, *Ubi non est principalis, non potest esse Accessorius*. But if the principal be pardoned, or have his clergy after attainer, the *Accessory* shall be arraigned.

4 & 5 IV. & M. c. 4. In the lowest and highest offences there are no *Accessories*, but all are principals: as in riots, routs, forcible entries, and other trespasses, which are the lowest offences.—So also in the highest offence, which is high treason, there are no *Accessories*. *Cok. Littlet. 71.*

Accessories in petty treason, murder, and felony, are riot to have their clergy.—There can be no *Accessory* before the fact in manslaughter; because that is sudden and unpremeditated.

ACCESSORY by statute, is such a one as abets, advises, aids, or receives one that commits an offence, which is made felony by statute.

ACCESSORY NERVES, *ACCESSORIIS Willisii*, or *Par Accessorium*, in anatomy, a pair of nerves, which arising from the medulla in the vertebrae of the neck, ascend and enter the skull, and pass out of it again, with the *par vagum*, wrapped up in the same common integument therewith; and after quitting the same, are distributed into the muscles of the neck and shoulders.—See *Tab. Anat. (Ofteal.) fig. 5. lit. rr.*

In their ascent towards the head, they receive branches from each of the first five pair of cervical nerves, near their rise from the medulla; and send forth twigs to the muscles of the larynx, gula, &c.—Uniting with a branch of the intercostal, they form the plexus gangliiformis.

ACCIDENTE, **ACCIDENTIA**, a name chiefly used for a little book, containing the first elements, or rudiments of the Latin tongue. See **GRAMMAR**.

ACCIDENS, **ACCIDENT**, in philosophy. See **ACCIDENT**.

Per ACCIDENS, is frequently used among philosophers to denote what does not follow from the nature of a thing, but from

from some accidental quality thereof: in which sense, it stands opposed to *per se*, which denotes the nature and essence of a thing. See *PER se*.

Thus, fire is said to burn *per se*, or considered as fire, and not *per accident*: but a piece of iron, though red-hot, only burns *per accident*, by a quality accidental to it, and not considered as iron.

ACCIDENT *, *ACCIDENS*, in philosophy, something additional, or superadded, to a substance; or not essentially belonging thereto, but capable, indifferently, either of being or not being in it, without the destruction thereof. See *SUBSTANCE*.

* The word is derived from *accidere*, to happen; which is compounded of *ad*, to; and *cadere*, to fall.

The schoolmen distinguish three kinds of *Accidents*; verbal, predicable, and predicamental.

Verbal ACCIDENT, *Accidens Verbalis*, stands opposed to essence; and in this sense, the adjuncts to a thing, though substances themselves, are denominated *Accidents* thereof.

Thus, the clothes a man has on, though real substances, yet, as they are not essential, but adventitious or accessory to his existence, are *Accidents*.

Predicable ACCIDENT, *Accidens Predicabile*, is used in opposition to *Proper*.—Such is any common quality; as whiteness, heat, learning, or the like.

Thus a man may be sick or well; and a wall white or black; yet the one be still a man, and the other a wall.

These are called in the schools, *Predicable Accidents*; because usually laid down and explained in the doctrine of predicables.

Predicable Accidents may either be taken in the abstract, as whiteness, learning; or in the concrete, white, learned. See *ABSTRACT*, and *CONCRETE*.

If taken in the abstract, as is done by Porphyry; the *Accident* is defined as above, that which may either be present, or absent, without the destruction of its subject.

If it be taken in the concrete; *Accident* is usually defined by the schoolmen, to be something capable of being predicated contingently, of many, in respect of quality.—As learning, which may probably be predicated of you, he, &c.

Predicamental ACCIDENT, *Accidens Prædicamentale*; which alone properly answers to the idea of an *Accident*; is a mode, or modification of some created substance, inhering or depending thereon, so as not to be capable of subsisting without the same.

In this sense, *Accident* is opposed to substance.—Whence, as substance is defined a thing that subsists of itself, and the substratum of *Accidents*; so an *Accident* is said to be that *cujus esse est inesse*; and therefore Aristotle, who usually calls substances simply *ousia*, entities, beings; commonly calls *Accidents*, *ousia entia*, entities of entity; requiring some substance wherein to reside, as their subject of inhesion.

An *Accident*, then, has an immediate, and essential dependence on its substance; both as to its production, its continuation, and its effects: it arises or is deduced from its subject, is preserved or subsisted by it; and can only be effected by what alters, or affects the subject.

The old schoolmen, however, will not have *Accidents* to be mere modes of matter, but entities really distinct from it; and, in some cases, separable from all matter.—But the notion of real *Accidents*, and qualities, is now exploded.

Aristotle and the Peripatetics make nine kinds or classes of *Predicamental Accidents*; others contract them into a less number.

Absolute ACCIDENT, is a term used in the Romish theology, for a predicamental *Accident* which subsists, or may possibly subsist, at least miraculously, and by some supernatural power, without a subject.

Such, they contend, are the *Accidents* of the bread and wine in the eucharist, *e. gr.* the colour, flavour, figure, &c. thereof, which remain after the substances they belonged to are changed into other substances of flesh.

This absurdity has been very fitly maintained by many of the casuists; and even solemnly decreed by some of their councils.—The eucharist, say they, being a sacrament, *i. e.* a visible sign of an invisible grace; it is necessary there be something sensible therein: now, this cannot be the substance, that being destroyed or transubstantiated; and therefore it must be *Accidents*.—Add, that in every conversion there must be something of the former nature remaining after the change; otherwise it would be no more than a simple substitution of one thing for another: as, then, nothing of the substance remains, it must be *Accidents*.—Hence, the council of Constance condemns the following proposition, which is the second of Wickliff, as heretical: The *Accidents* of bread do not remain without a subject in the sacrament. *SESS. VIII.*

Some of the fathers seem to give countenance to the same opinion.—S. Basil, in his sixth homily on the creation, ob-

erves that light, or rather brightness, the splendor of light, *τὸ φῶς ἢ λαμπρότης*, is a thing distinct from its subject, as whiteness is from a white body; and that it existed in the beginning, without this subject; having been created four days before the sun.

The Cartesians, to a man, combat the notion of *absolute Accidents*: It being their doctrine, that the essence of matter consists in extension; and that *Accidents* are only modifications thereof, in no wise distinct from it: An *Accident* therefore without a subject must be a contradiction.—And hence, Cartesianism is branded as contrary to the catholic faith.

Various expedients have been invented by the Cartesians, to account for transubstantiation, &c. without the hypothesis of *absolute Accidents*.—Some hold, that the usual impressions are made on the sense by the immediate agency of God; and without any thing remaining of the former nature. Others ascribe the whole to heterogeneous matters contained in the pores of the bread, &c. which remaining unaltered by the transubstantiation, produce the same sensations as the bread produced.

ACCIDENT, in the popular sense of the word, signifies a contingent effect; or something produced casually, and without any foreknowledge or destination thereof in the agent that produced it.

ACCIDENT, in heraldry, is an additional note, or mark in a coat-armour, not necessarily belonging thereto, but capable either of being retained, or omitted, without altering the essence of the armour.—Such are abatements, differences, and tincture.

ACCIDENTAL, something that partakes of the nature of an *Accident*; or, that is not essential to its subject, but indifferent thereto.

Thus, whiteness is *accidental* to marble; and heat, to a red-hot iron.

ACCIDENTAL Point, in perspective, is a point in the horizontal line, where lines parallel to one another, though not perpendicular to the picture, or representation, meet. See *POINT*, and *PERSPECTIVE*.

ACCIDENTAL Dignities, and *Debilities*, in astrology, are certain casual dispositions, and affections of the planets, whereby they are supposed to be either strengthened, or weakened, by their being in such a house of the figure.

ACCLAMATION *, a confused noise, or shout of joy, by which the public express their applause, esteem, or approbation of any thing.

* *Acclamatio*, the Latin term, is compounded of *ad*, to, or at; and *clamare*, to cry out, or shout.

These were formerly used in churches, as well as theatres; and the bishops and other ecclesiastical officers, were elected by the *Acclamations* of the people.—But their principal use has always been at the solemn entries of princes, and heroes; where they are usually attended with good wishes, prayers vows, &c.

Antiquity has handed down to us several forms of *Acclamations*; the Hebrews used to cry, *Hosanna*; the Greeks, *Ἀγαθὴ τύχη*, Good luck.—The Romans to their princes, generals, &c. *Dii te nobis servent, vestra salus, nostra salus*: 'the Gods preserve you for us; your safety, our safety.'—*In te omnia, per te omnia habemus, Antonine*. 'In you, Antoninus, and by you, we have every thing.'

—Lampridius relates, that at the entry of Severus, the people cried out, *Salve Roma, quia salvus Alexander*. 'O Rome, be safe; since Alexander is safe.'—Brissotius, in his treatise of Formula's, enumerates various sorts of *Acclamations*, used by the senate, the army, &c. Among the moderns, the English cry, 'God save the king.'—The French, *Vive le Roy*, 'May the King live,' &c.

ACCLIVIS, in anatomy, a muscle, otherwise called *Obliquus Ascendens*. See *OBLIQUUS Ascendens*.

ACCLIVITY *, the steepness, or slope of a line or plane inclined to the horizon; reckoned upwards. See *Inclined PLANE*.

* The word is compounded of the Latin *ad*, to; and *clivus*, a cliff, a flanting or sloping.

The ascent of a hill is an *Acclivity*; the descent of the same a declivity.

Some writers of fortifications, use *Acclivity* for *Talus*. See *TALUS*.

ACCOLA *, in a general sense, denotes an inhabitant near any certain place.

* The word is compounded of *ad*, to; and *colere*, to dwell, inhabit; *Accola eo quod adveniens terram colat*. Hence some place the distinguishing character of *Accole* in this, that they come from elsewhere: *Accola cultor loci in quo non est natus*; by which they stand opposed to *Incole*.—According to the verse: *Accola non propriam, propriam culti accola terram*.

ACCOLADE *, a ceremony anciently used in the conferring of knighthood.

* The word is French, and literally denotes an embrace, or hugging; being formed of *ad*, to; and *col*, or *collum*, neck.

The *accolade* consisted in the king's laying his arms about the young knight's neck, and embracing him; in token of friendship.—After the *accolade*, the prince giving him a little blow on the shoulder with the flat of a sword, he forthwith entered into the profession of arms.

ACCOMMODATION *, in philosophy, the application of one thing, by analogy, to another.

* The word is compounded of *ad*, to; and *commodus*, commodious.

To know a thing by *Accommodation*, is to know it by the idea of a similar thing referred thereto.

A prophecy of scripture is said to be fulfilled various ways; properly, as when a thing foretold comes to pass; and improperly, or by way of *Accommodation*, when an event happens to any place or people, like to what fell out some time before to another.—Thus, the words of Isaiah, spoke to those of his own time, are said to be fulfilled in those who lived in our Saviour's; and are *accommodated* to them: Ye hypocrites, well did Isaiah prophesy of you, &c. which same words, St. Paul afterwards *accommodates* to the Jews of his time.—This method of explaining scripture by *Accommodation*, serves as a key for solving some of the greatest difficulties relating to the prophecies.

On many occasions, a man finds it expedient to translate by *Accommodation*: thus, the word *Librarian*, scrivener, may be translated, by *Accommodation*, a printer; as it originally signifies those who made it their business to furnish copies of books, before the invention of printing.

ACCOMMODATION, is also used for an amicable agreement, or composition between two contending parties.—Thus we say the process is grown so intricate and perplex'd, that there is no hopes of getting out of it but by an *Accommodation*.

These *Accommodations* are frequently effected by means of compromise, and arbitration.

ACCOMPANYMENT, something attending, or added as a circumstance to, another; either by way of ornament, or for the sake of symmetry, or the like.

The music, in dramatic performances, should only be a simple *Accompaniment*.—The organists sometimes apply the word to several pipes which they occasionally touch to accompany the treble; as the drone, flute, &c.

The *Accompaniments*, in heraldry, are all such things as are applied about the shield, by way of ornament; as the belt, mantling, supporters, &c.

A thing is also said to be *accompanied*, when there are several bearings, or figures about some one principal one; as a falconer, bend, fess, chevron, or the like.

ACCOMPLICE *, one that has a hand in a business; or is privy in the same design or crime with another. See **ACCESSORY**.

* The word is compounded of *ad*, to; *con*, together; and *placare*, to fold.

ACCOMPLISHMENT *, the entire execution, achievement, or fulfilling of something proposed, or undertaken.

* The word is compounded of *ad*, to; and *compleo*, to fill up.

The *Accomplishment* of the prophecies of the Old Testament, in the person of our Saviour, is the great mark of his being the Messiah.

There are two ways of *accomplishing* a prophecy, directly, and by accommodation. See **ACCOMMODATION**.

Mr. Sykes has a particular enquiry into the meaning of those words used by the evangelists, That it might be fulfilled, or accomplished, which was spoke by the prophets: where he shews, that the *πληρωθη*, fulfilled, does not necessarily refer to a prediction of a future event accomplished; but is frequently a mere accommodation of words, borrowed from some other author, and accommodated to the present occasion.

ACCOMPT. See the article **ACCOUNT**.

ACCORD *, in music, is more usually called *concord*. See **CONCORD**.

* The word is French, formed, according to some, from the Latin *ad*, to; and *cor*, the heart; but others, with more probability, derive it from the French *corde*, a string, or cord; on account of the agreeable union between the sounds of two strings struck at the same time. Whence also some of the consonants in music come to be called *tetrachord*, *hexachord*, &c. which are a fourth, and a sixth. See **CHORD**, and **TETRACHORD**.

ACCORD, in law, is a verbal agreement between two, at the least, to satisfy an offence that the one hath committed against the other; whether it be a trespass, or the like; for which the one agrees to make, and the other to accept a certain satis-

faction.—This, if executed, becomes a good bar in law to any suit to be brought for the same matter.

ACCOUNT *, or **ACCOMPT**, in arithmetic, a calculus, or computation of the number of certain things.

* The word is compounded of *ad*, to; and *computus*, a computation.

There are various ways of *accounting*; as, by enumeration, or telling one by one; and by the rules of arithmetic, addition, subtraction, &c.

We *account* time by years, months, &c. The Greeks *accounted* it by olympiads; the Romans by indictions, lustris, &c. We *account* distances by mils, leagues, &c.

Money of Account, is an imaginary species, contrived for the facilitating, and expediting the taking, and keeping of *Accounts*.—Such are pounds, angels, &c.

ACCOUNT is also used in respect of a company or society, when two, or more persons have received, or disbursed money for each other; or when this has been done by their order, or commission. See **COMPANY**, and **COMMISSION**.

ACCOUNT, or **ACCOUNTS**, is also used, collectively, for the several books or registers which merchants keep of their affairs and negotiations.

Hence, to make out an *Account*; to pass one's *Account*, &c.

—Bankrupts are obliged to surrender their *Accounts*.

ACCOUNT, or **ACCOMPT**, in a legal sense, is a particular detail, or enumeration delivered to a court, a judge, or other proper officer or person, of what a man received or expended on the behalf of another, whose affairs he has had the management of.

In the remembrancer's office in the exchequer, are entered the states of all the *Accounts* concerning the king's revenue; for customs, excise, subsidies, &c. See **REMEMBRANCER**.

The great *Accounts*, as those of the mint, wardrobe, army, navy, tenths, &c. are called *imprest* *Accounts*.

All *Accounts* which pass the remembrancer's office, are brought to the office of the clerk of the pipe. See **PIPE**; see also **TALLY**, and **AUDITOR**.

ACCOUNT is also more particularly used for a writ which lies where an agent, steward, or other person, who ought to render an *Account*, refuses to give in the same.

Chamber of Accounts, in the French polity, is a sovereign court, of great antiquity, where the *Accounts* relating to the king's revenue are delivered in, and registered.

This answers pretty nearly to the court of exchequer in England.

There are presidents of *Accounts*, masters of *Accounts*, correctors of *Accounts*, &c.

ACCOUNTANT, or **ACCOMPTANT**, a person, or officer appointed to keep, or make up the *accounts* of a company, office, court, or the like. See **ACCOUNT**.

Thus there are *Accountants* in the custom-house, the excise, &c.

ACCOUNTANT-General of the Court of Chancery. See **CHANCERY**.

ACCOUNTING- or **ACCOMPTING**- or **COUNTING**-*House*. See **COUNTING-HOUSE**, and **BOOK-KEEPING**.

ACCOUNTREMENT *, an ancient term, used for an habilliment; or a part of the apparatus, and furniture of a soldier, knight, or even of a gentleman.

* The word is French; formed from the ancient German, *Kuster*; whence *Couture*, a name used in some cathedrals in France, e. g. at Bayeux, for the sacristan or officer, who has the care of furnishing, and setting out the altar, in the church; called in German *Kuster*, *altarbede*.

ACCRETION *, in physics, the growth, or increase of an organic body, by the accession of new parts.

* The word is compounded of *ad*, to; and *creresco*, to grow.

Accretion is of two kinds; the one, consisting in an external apposition of new matter.

This is what we otherwise call, *juxtaposition*; and it is thus, stones, shells, &c. are supposed to grow.

The other is by some fluid matter received into proper vessels, and gradually brought to adhere, or grow to the sides thereof.

—This is what we call *introsuption*; and it is thus that plants and animals are nourish'd.

ACCRETION, in the civil law, denotes the union or accession of a thing vague or vacant to another already occupied, or disposed of. See **ACCESSION**.

A legacy given to two persons jointly, *tam re quam verbis*, falls wholly to him that survives the testator, by right of *Accretion*.—Alluvion is another species of *Accretion*. See **ALLUVION**.

ACCRUE, or **ACCREW**, in law, is understood, of a part that accedes to, or follows the property of, another part, or person.

ACCUBITOR *, an ancient officer of the emperors of Constantinople; whose business was to lie near the emperor.

* The word is Latin, formed of the verb *accumbere*, to lie by; whence also *accubatio*, that state, or posture of the body, when we sit, and at the same time lean backwards.

ACCUMULATION *, the act of heaping, or amassing several things together.

* The word is originally compounded of *ad*, to; and *cumulus*, heap.

The lawyers speak of an *Accumulation* of titles; as, when a person claims lands, a benefice, or the like, in virtue of several titles, or pretensions of different kinds; *e. gr.* by death, by resignation, &c.

In a like sense, we sometimes read of *accumulative* treason, which is, where a fact is not treason in itself, but becomes so by an *accumulation* of circumstances.

The Earl of Strafford was condemned of *accumulative* treason; none of the facts alleged against him amounting singly to treason. 13 & 14 Car. 2. c. 29.

ACCURSED, something that lies under a curse, or a sentence of excommunication. See **ANATHEMA**.

ACCUSATION*, **ACCUSATIO**, in the civil law, the intending a criminal action against any person, either in one's own name, or that of the public.

* The word is compounded of *ad*, to; and *causari*, to plead.

By the Roman law, there was no public *Accuser*, for public crimes; every private person, whether interested in the crime, or not, might *accuse*, and prosecute the *accused* to punishment, or abolition.

But the *Accusation* of private crimes was never received but from the mouths of those who were immediately interested in them.—Thus none but the husband could *accuse* his wife of adultery.

Indeed, it was not properly an *Accusation* except in public crimes; in private ones it was called simply *actio*, or intending an action, *intendere actionem*, or *litem*. See **ACTIO**.

Cato, the most innocent person of his age, had been *accused* 42 times; and absolved as often.

When the *accused* *accuses* the *accuser*, it is called *recrimination*; which is not admitted till the *accused* has been first purged.

By the cruel laws of the inquisition, the *accused* is forced to accuse himself of the crime objected to him. See **INQUISITION**.

It has formerly been the custom in some parts of Europe, where the *Accusation* was very heavy, either to decide it by combat, or at least to make the *accused* purge himself by oath; which, however, was not admitted, excepting a certain number of his neighbours, and acquaintance, swore together with him.

ACCUSATIVE, in grammar, the fourth case of nouns that are declined.

Its use may be conceived from this, that all verbs which express actions that pass from the agent, as to beat, &c. must have subjects to receive those actions: for, if I beat, I must beat something; so that such verb evidently requires after it a noun, or name, to be the object of the action expressed. Hence, in all languages which have cases, the nouns have a termination, which they call *Accusative*: as, *amo Deum*, I love God; *Cæsar vicit Pompeium*, Cæsar over-came Pompey.

In English, we have nothing to distinguish this case from the nominative; but as we ordinarily place words in their natural order, it is easily discovered; the nominative constantly preceding, and the *Accusative* following the verb.—Thus, when we say, the prince loves the princess, and the princess loves the prince: the prince is the nominative in the first, and the *Accusative* in the last; and the princess the *Accusative* in the first, and the nominative in the second.

ACEPHALUS*, or **ACEPHALOUS**, something that wants a head.

* The word is composed of the privative *α*, and κεφαλη, *caput*, head.

Pliny represents the Blemmyes as a headless, or *acephalous* nation.—*Acephalus* worms, or what are supposed such, are frequent. See **WORMS**.

ACEPHALOUS, in a figurative sense, is more frequently applied to persons destitute of a leader, or chief.

Thus, the name *Acephali* is sometimes applied to such priests, or bishops, as are exempted from the discipline, and jurisdiction of their ordinary bishop, or patriarch.

Anastasius the library-keeper, calls this exemption from the jurisdiction of a patriarch, *autocephalia*.

We find a great number of canons of councils, capitulars of princes, &c. against *Acephalous* clerks.

ACEPHALOUS, in our ancient law-books, is also used for those poor people who had no proper lord; as holding nothing in fee, either of king, bishop, baron, or other feudal lord.

ACEPHALI, or **ACEPHALITÆ**, frequently occurs, in ecclesiastical history, as the denomination of divers sects: particularly,

1°, Of those who in the affair of the council of Ephesus, refused to follow either St. Cyril, or John of Antioch.

2°, Of certain heretics of the fifth century, who at first followed Peter Mongus; but afterwards abandoned him, upon his subscribing the council of Chalcedon; they themselves sticking to the errors of Eutyches.

3°, Of the adherents of Severus of Antioch; and of all in general who refused to admit the council of Chalcedon.

VOL. I.

ACERB, **ACERBUS**, a compound taste, consisting of sour, with the addition of a degree of roughness, and astringency.

Such is the taste of pears, grapes, and most other fruits before they are ripe.

Physicians usually make *Acerb* an intermediate flavour between acid, austere, and bitter. All matters which come under this denomination are astringent.

ACERRA, in antiquity, a kind of altar, erected near the bed of a person deceased. It was much used among the Romans; and the friends and familiars daily burnt incense on it, till the time of the burial.

ACETABULUM*, in antiquity, a little vase, or cup, used at table, to serve up things proper for sauce, or seasoning: much after the manner of our salts, and vinegar-cruets.

* Hence Agricola, in his treatise of Roman measures, L. I. takes the name to have been formed from *Acetum*, vinegar; as supposing it principally destined to serve vinegar on.

ACETABULUM also denotes a Roman measure, used both for liquid and dry things, chiefly in medicine. See **MEASURE**. The *Acetabulum* contained a cyathus, and a half, as is proved by Agricola, from two verses of Fannius; who speaking of the cyathus, says, it weighs ten drachms; and the *Oxybaphus*, or *Acetabulum*, fifteen.

Bis quinq; hunc faciunt drachmæ, si appendere tentes, Oxybaphus fiet si quinq; addantur ad illas.

Binet, in his treatise of weights and measures prefixed to his translation of Pliny, makes the *Acetabulum* of oil weigh two ounces and two scruples; the *Acetabulum* of wine, two ounces, two drachms, a grain, and a third of a grain; and the *Acetabulum* of honey, three ounces, three drachms, a scruple, and two filiquæ.

ACETABULUM, in anatomy, is used for a deep cavity, in certain bones, appointed for the reception of the large heads of other bones, in order to their articulation.—See *Tab. Anat. (Osteol.) fig. 12. lit. b.* Thus, the cavity of the ischium, or huckle-bone, which receives the head of the thigh-bone, is called *Acetabulum*, and sometimes *Cotyle*, or *Cotylodes*.

The *Acetabulum* is lined, and capped round with a cartilage, whose circular margin is called *supericilium*.—In its bottom lies a large mucilaginous gland.

ACETABULUM is also used, by anatomists; in the same sense with *Cotyledon*. See **COTYLEDON**.

ACETARIA*. See the article **SALLET**.

* The word is formed of *Acetum*, vinegar; in regard that fluid is commonly used for the seasoning of sallats.

ACETOUS, or **ACETOSE**, something relating to vinegar; called in Latin *Acetum*. See **ACETUM**, and **VINEGAR**.

We say, an *Acetous* taste; *Acetous* qualities, &c. Wine, and all vinous liquors, are rendered *Acetous*, by exciting their salts, and tempering, or abating their sulphurs. Chemists give the preparation of divers *Aceta*, or *Acetous* liquors.

ACETUM*, in medicine, &c. the same with vinegar; the properties, uses, and preparation whereof, see under the article **VINEGAR**.

* The word is pure Latin; formed of *acer*, to be sharp.

There are several medicines in the shops, whereof this liquor is the basis; as,

ACETUM Diffillatum, distilled vinegar; chiefly used in preparations, for dissolution, and precipitation.

Spiritus ACETI, spirit of vinegar; made by drenching copper filings, with distilled vinegar, then evaporating it till the fumes of the vinegar cannot be smelt; the saturation and evaporation to be again repeated, till the menstruum be satiated; which being then distilled, the spirit comes over.—Its qualities and uses are much the same with those of the distilled vinegar, only it is more powerful.

ACETUM Rosatum, vinegar of roses; this is made of rose-buds infused in vinegar forty or fifty days; the roses are then pressed out, and the vinegar preferred.—It is chiefly used by way of embrocation on the head and temples, in the head-ach.

After the like manner are made *Acetum Sambucinum*, vinegar of elder; *Acetum Anthosatum*, vinegar of rosemary-flowers; *Acetum Scilliticum*, vinegar of squills, &c.

The German dispensatories abound with medicated vinegars, chiefly aimed against pestilential diseases; but they are not used among us.—Our dispensatories retain indeed some of them, as the *Acetum Theriacale Norimbergense*, but it is never prescribed.

ACETUM Alcalizatum; is made of distilled vinegar; with the addition of some alkaline, or volatile salt. See **ALKALI**.

ACETUM Phosphorum, a four kind of liquor; made by dissolving a little butter of antimony in a great deal of water.

ACHANE, **ΑΧΑΝΗ**, an ancient Persian corn measure, containing 45 Attic medimni. *Arbuthn. Diff. p. 104.*

ACHAT, in our Law-French, signifies a contract, or bargain; especially in the way of purchase.

Purveyors were by act of parliament 36 Ed. III. ordained to be thenforth called *Achators*.

ACHE, or **ACH**, a painful ailment in any part of the body.

Aches, may be either scorbutic, rheumatic, owing to violent pains, or the like.

Head-ACH. See **HEAD-ACH**, and **CEPHALALGY**.

ACHERNER, or **ACHARNER**, in astronomy, a star of the first magnitude in the southern extremity of the river Eridanus.—Is longitude, latitude, &c. see under the article **ERIDANUS**.

ACHILLEIS, or **ACHILLEID**, a celebrated poem of Statius, wherein he propoed to deliver the whole life, and actions of Achilles.

It only takes in his infancy, the poet being prevented from proceeding by death.

The *Achilleid* is of the heroic, or epic kind; but extremely faulty in the plan, or fable.

It is a point controverted among the critics, whether the whole life of a hero, *e. gr.* of Achilles, be a proper subject matter of an epic poem? See **EPIC**, and **HEROIC**.

ACHILLES, a name which the schools give to the principal argument alledged by each sect of philosophers in behalf of their system.

In this sense, we say, this is his *Achilles*; that is, his master-proof: alluding to the strength, and importance of *Achilles* among the Greeks.

Zeno's argument against motion, is peculiarly termed *Achilles*.—That philosopher made a comparison between the swiftness of *Achilles*, and the slowness of a tortoise: whence he argued, that a slow moveable that precedes a swift one by ever so small distance, would never be out-run by it. See **MOTION**.

The ancient botanists gave the name *Achillea* to several plants; one of which is said to be the same with our milfoil; and took its name from *Achilles*, who, having been the disciple of Chiron, first brought it into use for the cure of wounds and ulcers.

Tendon of ACHILLES, *Chorda Achillis*, is a large tendon, formed by the union of the tendons of the four extensor muscles of the foot. See **FOOT**.

It is so called, because the fatal wound whereby *Achilles* is said to have been slain, was given there.

ACHOR, in medicine, the third species or degree of a tinea, or scald-head. See **TINEA**.

Achor is a sort of small running ulcer on the face, and head, chiefly of children while at suck; by which the skin is broken into a number of little holes, out of which issues a viscid humour.

ACHRONICAL, in astronomy. See the article **ACRONYCHAL**.

ACID*, **ACIDUM**, any thing which affects the tongue with a sense of sharpness, and sourness.

* The word is formed from *acere*, to be sharp; which is derived from *acis*, a point or edge.

Acids are divided by many into *manifest* and *dubious*.

Manifest ACIDS, are those above defined, which impress the idea sensibly.—Such are vinegar, and its spirit; the juices of crabs, citrons, oranges, lemons, barberries, and tamarinds; spirit of nitre, spirit of alum, spirit of vitriol, spirit of sulphur per campanam, spirit of sea-salt, and the like.

Dubious, or Latent ACIDS, are those which do not possess enough of the *Acid* nature to give sensible marks thereof on the taste, but agree with the manifest *Acids* in some other properties, sufficient to refer them to the same class.

Hence it appears, that there are some characters of acidity more general than that of a sharp taste; though it is that taste which is chiefly regarded in the denomination.

The great and general criterion, then, of *Acids*, is that they make a violent effervescence, when mixed with another sort of bodies, called *Alcalies*.

Yet is not this property alone universally to be depended on, to determine a body an *Acid*, without the joint consideration of the taste, and the changes of colour producible in other bodies thereby.—To distinguish dubious *Acids* from alkalies, mix them with a blue tincture of violets: if they turn it red, they are of the *Acid* tribe; if green, alkaline.

Acids are all of the tribe of salts; and compose a particular species thereof, called *Acid salts*.

Acid salts are all found to be volatile; by which they are distinguished from the rest, which are either fixed, or have an urinous, instead of an *Acid* taste.

Some late chymical philosophers have even made it very probable, that it is the *Acid* which is the saline part, or principle in all salts.—They consider it as a subtle, penetrating substance, diffused through the several parts of the globe; which according to the different matters it happens to be united

with, produces different kinds of bodies; if it meets a fossil oil, it converts it into sulphur; if it be received into the lapis calcarius, it coagulates with it, and becomes alum; with iron it grows into green vitriol; with copper, into blue vitriol, &c.

Of this sentiment is Sir I. Newton.—'In decomposing sulphur, says that author, we get an *Acid* salt, of the same nature with oil of sulphur per campanam: which same *Acid* abounding in the bowels of the earth, unites sometimes with earth, and thus makes alum; sometimes with earth and metal, and makes vitriol; and sometimes with earth and bitumen, and thus compounds sulphur.'

In effect, all our native salts, though without any mixture from art, are yet found to be real mixtures; and their composition and decomposition is easily made.—'As many as they are, they may be all reduced, according to M. Homberg, to three kinds, *viz.* salt-petre, sea salt, and vitriol; each whereof has its several species. Of the combinations of these with different oily matters, are all the other salts produced. By the analyses we have made of them, they all appear to be composed of an aqueous, an earthy, a sulphurous, and an *Acid* part; but the *Acid* we hold the pure salt: this makes our chymical principle salt, the common basis of all salts; and which antecedent to its determination to any particular species, appears to be one similar, uniform matter, though never found alone, but always accompanied with some sulphureous mixture or other; which determines it to some one of the three sorts of fossil salts above-mentioned.'

The *Acid*, accompanied with its determining sulphur, never becomes sensible to us, except when lodged either naturally in some earthy matter, or artificially in an aqueous one.—In the first case, it appears under the form of a crystallized salt; as salt-petre, sea-salt, &c. In the second, it appears in form of an *Acid* spirit; which, according to the determination of the sulphur accompanying it, is either spirit of nitre, or spirit of salt, or spirit of vitriol.

What is here spoken of the three simple fossil salts, may be equally applied to all the compound salts of vegetables and animals, with this difference, that the latter have always a larger proportion of the earthy matter than the simple ones, when in the form of a concrete salt; and a larger proportion of the aqueous matter, when in the form of an *Acid* spirit.—And hence we account for two important phenomena: 1°. That the *Acid* spirits of animal and fossil salts, are always weaker, and less penetrating, as well as lighter in weight, than those of the fossil salts: 2°. That after a vehement distillation, they leave a larger quantity of earthy matter behind them than those of the fossil do.

The salt naturally contained in plants, may be considered as a mixture of earth, oil, a little water, and an *Acid*: this last ingredient being separated from the plant with the help of fire, shoots into a new salt, which sometimes retains an *Acid* taste, as in the tartar of wine; sometimes it assumes a sweetness, as in sugar; sometimes is bitter, as in quinquina; and sometimes almost as insipid as in figs. This M. Homberg calls the *essential salt* of the plant; which, by a gentle distillation, resolves into an insipid water, and *Acid* liquor, and a ruddy fetid oil, containing part of the *Acid* salt, and part of the fetid oil of the plant: of the combination of which, is composed a particular kind of fetid salt, smelling like urine, called the *volatile salt*, or *volatile alcaly salt* of the plant: and the caput mortuum remaining, being reduced into ashes, is separated by lixiviation into one part of fixed alcaly salt, and another of insipid alkaline earth.—Add, that the *essential salt* always dissolves entirely in water, even the earthy part joined with it. But if the same salt have been robbed, by means of fire, of a great part of its *Acid*, the earthy part will not wholly dissolve, but a sediment of insipid earth, indissoluble in water, will be found at bottom; to which, if an *Acid* spirit be added, it then becomes intirely dissoluble in water: whence it may be fairly concluded, that the other part of the ashes, before dissolved in the water, and which after evaporation appears in form of a fixed lixivial salt, was only dissolved by virtue of the *Acid* it contained; or as having retained enough of the *Acid* to effect a solution.

Again, when the earth of the plant, fatiated with its *Acid*, becomes a crystallized salt; no more of the same *Acid* can be introduced into it: whereas the lixivious salt drawn from the ashes, does not crystallize, but still greedily imbibes the *Acid* spirits.

Hence it may be probably concluded, that the lixivious, or fixed alcaly salt, is no other than the earth of the plant, which, notwithstanding the violence of the fire, has retained a little portion of its *Acid* salt, sufficient to dissolve it in water; still reserving a sufficient number of loculi, or pores, to lodge the fixed *Acid* that shall offer itself, in lieu of that driven out of it by the fire.—And as the name alcaly is only given to a salt, in respect of its imbibing and retaining an *Acid* presented to it, in order to the producing a crystallized salt; the lixivious salts of plants may be said to be more or less alkaline.

caline, as they absorb more or less of the *Acid*; or, which amounts to the same, as they contain more or fewer vacuities which may be filled with *Acids*.

An alkali, after it has been fully satiated with one sort of *Acid*, will yet sometimes admit, and retain part of another *Acid*. This is chiefly observed where a vegetable *Acid* has been received first, and a fossil one is offered after. And it seems owing to this, that the vegetable *Acid* having undergone a greater degree of fermentation in the body of the plant, is become rare and pervious, in respect of the more solid, and weighty particles of the mineral *Acid*; which therefore force their way in.

The same is always the case, where an *Acid* appears an alkali with respect to another *Acid*; that is, where of two *Acid* spirits, one whereof has a mixture of some alkali; the rarer of the two having possessed the pores of the alkali, is compressed by the other denser *Acid*.—Thus, a pin-cushion, though ever so full of bran, will admit a good number of pins.

Now, urinous salts are alkalies as well as the lixivious kind, *i. e.* they greedily imbibe *Acids*, retain them, and together with them compose salts which crystallize.—But their volatility seems to make it plain, that they are not, like the former, a composition of a mere earthy matter, with a little *Acid*; in regard a mere earth can never become volatile by such admixture. Yet is there a great deal of reason to imagine, that their composition is no other than a part of the same matter which would have produced the lixivious salt, intimately mixed with a deal of the fetid oil of the plant; and that the oil is the sole cause of the volatility of these salts.

M. Homberg, in his *Essai du Sel principe*, makes three classes of acid salts, corresponding to the three species of sulphurs, wherewith the primitive *Acids* may be combined.

The first class consists of such as contain an animal, or a vegetable sulphur, which amount nearly to the same.—To this class belong all the distilled *Acids* of plants, fruits, woods, &c. which must necessarily retain part of the oil of the plant, which is their sulphur. To this class also belongs spirit of nitre; as being a substance procured from the excrements of animals, &c.

The second class is of those which contain a bituminous sulphur.—Such are vitriol, common sulphur, and alum; which are all usually procured from a mineral stone, wherein bitumen is the prevailing ingredient.

The third is of such as contain a more fixed mineral sulphur, approaching the nature of a metalline one.—Such are the *Acids* drawn from sea-salts, and sal gemma's; the latter of which is chiefly found in places near mines of metals; and the former probably arises from rocks, or veins of sal gemma running into the sea, and there dissolved.

From the peculiar nature, and properties of the sulphur thus accompanying the several kinds of *Acid* salts, their different phenomena and effects are to be accounted for.

The *Acids* of animals are doubtless chiefly derived from plants, in the ordinary way of food, and nutrition; and those of plants, again, from those of minerals. So that there should seem to be but one spring of *Acidity*: the diversities arise from what happens to them in passing through the organized bodies of plants, and animals. Hence it is, that plants and animals especially, yield a very volatile alkali salt; whereas, the salts of minerals are found altogether *Acid*, and much more fixed and concrete; though it is the same matter in both cases, under different assumed forms.

Thus, the younger Lemery argues, that as animals feed on plants, and reciprocally, in the instance of salt-petre, &c. plants feed on animals, inasmuch as their vegetation is excited by manure; it happens, that what was real salt-petre in plants, becomes only a nitrous sal armoniac in animals, and *vice versa*.—The same author accounts for this double metamorphosis, by supposing that the nitrous principle remains the same in both cases, and in both cases is attached to the same matrix, with this only difference, that the matrix becomes more earthy in plants, and by that means, fixed; and in animals, it loses its earthy parts, and assumes other oily ones, which render it volatile.

As to the manner wherein *Acids* act on alkalies, the great number of little bubbles produced during their action, and the heat arising thereupon: M. Homberg explains it thus.—The matter of light, which he supposes to be the chymical principle, sulphur, and to possess the whole extent of the universe, is kept in a perpetual motion by the continual impulses which the sun, and fixed stars give it: but this motion happening on some occasions to be slackened, may be retrieved again, and augmented by the near approach of flame, which that author supposes the only matter capable of giving motion to light.—This motion of light cannot proceed, without continually striking against the solid bodies, and even passing through all the porous ones, it meets in its way.

Suppose, now, *Acids* to be little, solid, pointed bodies, swimming at liberty in an aqueous fluid, and kept in continual motion, by the repeated impulses of the matter of light; and alkalies, to be spongyous bodies, whose pores have formerly been filled with the points of *Acids*, and which still retain

the dents, or impressions thereof; and are ready to receive the like points when driven into them. It is easy to conceive, that if some of those porous alkalies float in the same liquor wherein the solid *Acids* float; these latter, being impelled by the matter of light, will enter the cavities of the former, which are framed as it were on purpose for their reception; and that they will do it the more readily, if the motion of the matter of light, wherewith they are impelled, have been accelerated by external heat.

This introduction of *Acids* into the body of alkalies, is, in all appearance, effected with a great velocity and a deal of friction; inasmuch as it produces so considerable a degree of heat: and as the pores of the alkalies were before filled with an aerial matter, which is now expelled by the points of the *Acids*; that air is put in motion, and produces the bubbles, which are so much the more sensible, as the heat accompanying the action is the greater.

Sir I. Newton accounts for the effects of *Acid* in a different manner, *viz.* from the great principle of attraction.

The particles of *Acids*, he observes, are of a size grosser than those of water, and therefore less volatile; but much smaller than those of earth, and therefore much less fixed than they.—They are endued with a very great attractive force, wherein their activity consists; it being by this that they attract, and stimulate the organ of taste; and by this also, that they get about the particles of bodies, either of a metalline or stony nature, and adhere closely to them on all sides; so as scarce to be separable from them by distillation or sublimation: and when thus gathered about the particles of bodies, by the same power they raise, disjoin, and shake them one from another; that is, they dissolve them.

By their attractive force, also, wherewith they rush towards the particles of bodies, they move fluid ones, and excite heat; shaking asunder some particles, so as to turn them into air, and generate bubbles; and hence all violent fermentation; there being in all fermentation a latent *Acid*, which coagulates in precipitation.

Acids, also, by attracting water as much as they do the particles of other bodies, occasion the dissolved particles readily to mingle with water, or swim or float in it, after the manner of salts: and as this globe of earth, by the force of gravity, attracting water more strongly than it does lighter bodies, causes those bodies to ascend in water, and go upwards from the earth; so, the particles of salts, by attracting the water, mutually avoid and recede from one another as far as they can; and are thus diffused throughout the whole water.

The particles of alkalies consist of earthy and acid parts united together; but these *Acids* have so great an attractive force, that they cannot be separated therefrom by fire; and that they even precipitate the particles of dissolved metals, by attracting from them those acid particles, which before had dissolved, and kept them in solution.

If these acid particles be joined with earthy ones, in a small quantity; they are so closely retained by the latter, as to be quite suppressed and lost, as it were, in them; so that they neither stimulate the organ of sense, nor attract water; but compose bodies which are not acid, *i. e.* fatty and sweet bodies; as mercurius dulcis, brimstone; luna cornea, &c.—From the same attractive force in these acid particles thus suppressed, arises that property of fat bodies, that they stick or adhere to almost all bodies, and are easily inflammable.—Thus, the *Acid* that lies suppressed in sulphureous bodies, by more strongly attracting the particles of other bodies (earthy ones for instance) than its own; promotes a gentle fermentation, produces and cherishes natural heat, and carries it on so far sometimes, as to the putrefaction of the compound: putrefaction arising hence, that the acid particles which have long kept up the fermentation, at length insinuate into the little interstices that lie between the particles of the first composition; and so intimately uniting with those particles, produce a new mixture or compound, which cannot be returned into its original form.

Water has no great dissolving force, because there is but a small quantity of acid in it; for whatever strongly attracts, and is strongly attracted, may be reputed an *Acid*: but in such things as are dissolved in water, the dissolution is slowly performed, and without any effervescence.

When *Acids* are applied to the tongue, or any excoriated part of the body; leaving the subtiler earth wherewith they were before united, they rush upon the sensory, act there as menstruums, and disjoin its parts; thus causing a painful sensation.

The illustrious author, it must be owned, here carries the notion of *Acidity* a great length: dissolution, according to him, is only effected by attraction, and is proportional to the

degree of attractive power in the diffolvent; but all bodies which attract much, are *Acids*, on his principle; and consequently all powerful menstrua must belong to that class. —And yet spirit of urine, which readily dissolves iron or copper, even in the cold, is allowed an *alkali*; and accordingly it makes a vehement conflict with aqua fortis. —Boyle *Imperfect. of Chym. Doct. of Qual.*

Some chymical philosophers, in the last century, endeavoured to derive all the qualities of bodies, and the other phenomena of nature, from the consideration of *alkali*, and *Acid*.

It has been a point much controverted among physicians, whether, or no, there be any real *Acid* in human blood? the generality stand for the negative; and all Mr. Boyle's experiments, in his *History of Blood*, seem to give the thing on that side. —But the accurate M. Homberg has at last turned the scale the other way; and shewn by repeated experiments, that an *Acid*, or what is commonly called so, and judged such by the change of colour it causes in a tincture of violets, may be drawn from the blood of all animals in general, and from human blood in particular.

Hence, and from the careful analysis that author has made of the flesh, and excrements of divers animals, particularly man; he infers, that the *Acid*, or sea-salt of the aliment taken into the bodies of animals, is not destroyed therein, but passes into the substance of them: the superfluous portion being returned unaltered along with the excrements. *Acids*, are prescribed, in medicine, as coolers, anti-febrifics, anti-scorbutics, diaphoretics, alexipharmics, &c.

Acids, Mr. Boyle observes, not only disturb the body while they continue *acid*; but in many cases create distempers, whereof they should seem the remedies. —Though they be reputed to have an incisive and resolute virtue, and accordingly are prescribed to cut tough phlegm, and dissolve coagulated blood: yet there are some *Acids* which must evidently coagulate the animal fluids, and produce obstructions, with all their train of consequences. —Thus, it is known, that milk readily curdles with spirit of sea-salt, &c.

ACID Salts. See **ACID**. —See also **SALT**, **SPIRIT**, and **ACID Spirits**. } **PRINCIPLE.**

ACIDITY, **ACIDITAS**, the quality which constitutes, or denominates, a body, *acid*; or that sensation of sharpness and sourness which acids excite upon the taste. See **ACID**.

A little vitriol leaves an agreeable *Acidity* in water. —Vinegar and verjuice have different sorts of *Acidity*.

The predominancy of *Acidities* in the body, and their ill effect in coagulating the blood, &c. is prevented by either repelling and mortifying them with lixivious or urinous salts; or by sneezing and absorbing them with alkalious bodies. —Thus, out of the body, minium destroys the *Acidity* of spirit of vinegar; lapis calaminaris that of sea-salt, &c.

ACIDULÆ*, in natural history, a species of mineral waters, distinguished by a latent acidity in their nature.

* The word is a diminutive of *Acidus*; which is formed from the Greek *ακρ.* point, edge; in regard the points of acid substances prick and vellicate the tongue.

Acidulae are native waters, impregnated with particles of some acid mineral; as vitriol, allum, nitre or salt. Sometimes there is also a vinous flavour joined with the acid; by which they become peculiarly denominated vinous waters.

The class of *Acidulae* are usually very cold; whence some authors define *Acidulae* to be all such mineral, or medicinal waters as are not hot.

The physicians also frequently include chalybeate and aluminous or ferruginous waters, under the class of *Acidulae*. See **CHALYBEATE**, and **FERRUGINOUS**, &c.

ACIDULATED, any thing wherein acid juices have been put, in order to give it a coolness, and briskness.

ACINI*, in botany, small grains, or berries, growing in bunches; after the manner of grapes; also the stones or seeds of grapes.

* The word is Latin, formed from *acus*, or the Greek *ακρ.* a point.

Hence, anatomists have called some glands of a similar formation *Acini Glandulosi*. —See **Tab. Anat. (Splanchn.) fig. 41. lit. bb. & dd. &c.** See also **GLAND**.

ACINIFORMIS Tunica, the same with the *Tunica Uveae* of the eye. See **UVEA**.

ACME*, the height, or top of any thing.

* The word is Greek, *ακμην*, point, tip; of *ακμαζω*, *viges*, to grow sharp.

ACME is more especially used to denote the height, or utmost vehemence of a distemper.

Accordingly, some institution-writers divide diseases into four states, or periods:

1°. *Arche*, the beginning, or first attack. —2°. *Anabasis*, the growth. —3°. *Acme*, the height. —And 4°. *Paracme*, which is the declension of the distemper.

ACOMETÆ*, or **ACOMETI**, a name given to certain monks in the ancient church, who flourished particularly in

the east; and who were thus called, because they had divine service continually, and without interruption, performed in their churches.

* The word is Greek, *ακμαιοι*, formed of the privative, *α*, and *κοιμω*, to lay down, or sleep in bed.

The *Acemetæ* divided themselves into three bodies, each of which officiated in their turn, and relieved the others: so that their churches were never silent, night nor day.

Nicephorus mentions one Marcellus as the founder of the *Acemetæ*; whom some modern writers call, Marcellus of Apamea. —In Bollandus we have 'the life of S. Alexander, 'institutor of the *Acemetæ*, who were unknown before him,' says the author of the life, who was a disciple of Alexander. This saint, according to Ballandus, lived about the year 430. He was succeeded by Marcellus.

The *Stylites* were also sometimes called *Acemetæ*. See **STYLITES**.

There are a kind of *Acemetæ* still subsisting in the Romish church; the religious of the Holy Sacrament, coming properly enough under that denomination; in regard they keep up a perpetual adoration, some or other of them praying before the sacrament, day and night.

ACOLUTHI*, or **ΑΚΟΛΥΤΗΙ**, in antiquity, a term applied to such persons as were steady, and immovable in their resolutions.

* The word is Greek, *Ακωλύτοι*, compounded of the privative *α*; and *κωλύω*, *vias*, way; as still persisting in their way, or course.

For this reason, the Stoics were called *Acolythi*; in regard, nothing could shake or alter their resolves.

Among the ecclesiastical writers, the term *Acolythus*, or *Acolythist*, is peculiarly applied to those young people, who, in the primitive times, aspired to the ministry; and for that purpose continually attended the bishops: which assiduity occasioned their being distinguished by this appellation.

In the Romish church *Acolythi* were of longer continuance; but their functions were different from those of their first institution. They were such as had only received the first of the four lesser orders, whose business was to light the tapers, carry the candlesticks, and the incense-pot, and prepare the wine and water.

At Rome there were three kinds of *Acolythi*, viz. *Palatini*, who waited on the pope; *Stationarii*, who served in churches; and *Reginari*, who, together with the deacons, officiated in other parts of the city.

ACONITE*, **ΜΥΩΟΝΟΝ**, a plant, famous among the ancients, both in quality of a poison and a remedy. See **POISON**.

* *Aconitum* is said by some to take its name from *Acone*, a city in Bithynia, where it grew in great abundance: though it is also found in other places, particularly the mountains about Trent, &c. Others derive it from *ακων*, a rock naked or bare of earth, whereon the plant readily thrives. It was also called *godwinus*, as killing mice with its bare smell, according to Pliny. —The poets feign it to have arose from the foam of the dog Cerberus, when Hercules dragged him out of hell.

The ancient botanists give the name *Aconite* to several plants of different kinds. —One species they called *Lycoticon* *Ακωνικον*, wolfs-bane; or *Cynoticon* *Κυνωτικον*, dogs-bane; from its effects: of these they had likewise their divilions; as the *Napellus*, thus called *α napo*, because its root resembled the turnip-kind: another called *Anthora*, q. d. *Anti-thora*, good against disorders caused by the *Thora* another kind of *Aconite*.

The class of *Aconites* is held extremely caustic, and acrimonious, in virtue whereof they produce mortal convulsions, or inflammations, which end in mortifications: the ancients were so surprized at these effects, that they were afraid to touch the plants and hence a thousand superstitious precautions about the manner of gathering them. —Their roots are however held of service in malignant fevers by some; and accordingly make an ingredient in some orvieters, and other alexipharmic compositions.

The ancients used this plant against the sting of the scorpion, which is said to be deadened by the touch of the *Aconite*, and restored to its vigour by that of hellebore. —Theophrastus relates, that they had a way of preparing it in those days, so as it should only destroy at the end of one, or two years. —Arrows dipt in its juice are said to prove mortal, wherever they wound. —The Indians use *Aconite*, corrected in cow's urine, with good success against fevers. —*V. Lettr. Edif. & Cur.*

ACONITAS*, a name used by some authors, for a sort of comet or meteor, whose head appears round or oblong, and its tail very long and slender, resembling a javelin. See **COMET** and **METEOR**.

* It takes its denomination from a serpent thus called, frequent in Calabria and Sicily; where it is also named *saetense*, (from *saetia* an arrow) by reason of its flying at passengers like an arrow; in order to which, it winds itself up a tree, to spring thence with the greater violence. For the like reason the Greeks call it *Acontias*, of *ακων*, a dart or arrow.

ACOPUM,

ACOPUS*, among ancient physicians, a topical medicine, composed of warm, and emollient things, intended to allay the sense of weariness, occasioned by too violent labour, exercise, or the like.

* The word is compounded of the privative *α*, and *κοπος*, labor.

ACORUS, a medicinal plant, of the flag kind; frequently confounded by the ancients, and also by the modern apothecaries, with the *calamus aromaticus*.

They are distinguished by this, that from the middle of some of the leaves of the latter, there arises a longish cluster of an infinity of little flowers, the thickness of the little finger, and resembling macropiper, or long pepper.—The other is the common flag flower.

It is only the root of the *Acorus* that is used in physic; and it is this we usually call *Acorus*.—The *calamus aromaticus* is brought from Lithuania and Tartary: it is knotty, reddish without, and white within; as thick as the little finger, and half a foot long.

It is spicy and bitterish; and used in cephalic and stomachic compositions.—It is also an ingredient in the Theriaca Andromachi.

Some rank galangals as a species of *Acorus*. See SUPPLEMENT article ACORUS.

ACOUSTICS*, ACOUSTICA, the doctrine, or theory of hearing, or of sounds.

* The word is formed of the Greek *ακουω*, audio, to hear.

Acoustics, is the same with what we otherwise call *Phonics*. See PHONICS.

ACOUSTICS, ACOUSTICA, or ACOUSTIC Medicines, are remedies against the imperfections and disorders of the ear; or of the sense of hearing. See EAR and HEARING.

ACOUSTIC is particularly applied to instruments used by those who are dull of hearing; to supply that defect.

Dr. Hook says, it is by no means impossible to hear the lowest whisper that can be made, to the distance of a furlong; and that he knows a way of hearing any person speak through a stone-wall three foot thick.

ACOUSTIC Nerve. See the article AUDITORY Nerve.

ACQUEST*, or **ACQUIST**, is understood in a legal sense, of goods, or effects, not descended or held by inheritance; but acquired either by purchase, or donation. See GOODS.

* The word is French; formed of the verb *acquiesce*, from *acquiescere*, to acquire, or get.

The French laws make a deal of difference between *Acquests*, and hereditary effects. The civil law allows none. See HEIR, HEREDITARY, &c.

ACQUEST is also popularly used for conquest, or a place acquired by the sword.

ACQUIETANDIS Pleiis, a writ of justices lying for a surety against the creditor that refuses to acquit him after the debt is paid. *Reg. Orig. fol. 158. cit. Cov.*

ACQUIETARE, in ancient law-books, signifies to discharge, or pay the debts of a person deceased; as the heir thofe of his father, &c.

ACQUISITION, the act of procuring a right or title to the enjoyment, or property of a thing.

ACQUISITION is also sometimes used for an acquest. See ACQUEST.

ACQUITTAL, a discharge, deliverance or setting free of a person from the guilt or suspicion of an offence.

Acquittal is of two kinds; in *law*, and in *fact*.—When two are appealed or indicted of felony, one as principal, the other as accessory; the principal being discharged, the accessory is by consequence also freed: in which case, as the accessory is *acquitted by law*, so is the principal in *fact*.

ACQUITTAL is also used, where there is a lord mesn, and tenant, and the tenant holds land of the mesn, and the mesn holds over the lord paramount: here, the mesn ought to *acquit* the tenant of all services claimed by any other for the same lands; the tenant being to do service to the mesn only, and not to divers lords for one parcel of land. See MESN.

ACQUITTANCE, or QUITTANCE, a release, or discharge in writing, of a sum of money, or other duty, which ought to be paid, or done.

The verb *Acquit*, the participle *Acquitted*, and the noun *Acquittal*, do all signify a discharge from an offence objected.—In which sense, we meet with *Acquitted* by proclamation.

ACRASIA, AKPAZIA, is used by some writers in physic, for the excess or predominancy of one quality above another; either in a mixture, or in the constitution of a human body.

ACRE*, a quantity of land, containing four square roods, or 160 square poles, or perches. See MEASURE, ROOD, and PERCH.

* The word perhaps is formed from the Saxon *Acre*, or German *Acker*, field, of the Latin *Ager*. Salmassius derives it from *Acrea*, used for *Acena*, a land measure among the ancients, containing 10 feet.

By a statute of 31 Eliz. it is ordained, that if any man erect a new cottage, he shall add four *Acre*s of land to it. To find the quantity of *Acre*s in a piece of ground, &c. See SURVEYING.

The kingdom of England contains by computation 39038500 *Acre*s: the United Provinces 4382000, &c.

The French *Acre*, *Arpent*, contains 1½ English *Acre*, or 55206 square English feet, whereof the English *Acre* contains only 43560.—The Strasburg *Acre* is about half an English *Acre*. *Arbuth. Tab. anc. Coins*, &c. 33.

The Roman *Acre* was properly the jugerum: See JUGERUM.

ACRE-Tax, a tax laid on land at so much per *Acre* *.—In some places this is also called *Acre-shut*.

* Impositions on lands in the great level are to be raised by a proportionable *Acre-tax*, 20 Car. II. c. 8.—An *acre-tax* of 2s. 6 d. per acre, for draining Hadenham-level, 13 Geo. I. c. 18.

ACREME, a term sometimes used in ancient law-books, for ten acres.

ACRIBEIA, a term purely Greek, *ακριβεια*; literally denoting an exquisito or delicate accuracy; it is sometimes used in our language for want of a word of equal significance.

ACRIDOPHAGI*, in the ancient geography, a nation, or people said to have fed on locusts.

* The word is compounded of the Greek *ακρις*, locust, and *φαγω*, to eat.

The *Acridophagi* are represented as a people of Ethiopia, inhabiting near the deserts. In the spring they made provision of a large kind of locusts, which they falted, and kept for their standing food all the year: they lived to forty years of age, then died, as is said, of a sort of winged worms generated in their bodies. See S. Jerom against Jovinian, L. II. and on S. John, C. 4. Diodor. Sicul. L. III. c. 3, and 29. and Strabo, L. XVI.—Pliny also speaks of *Acridophagi* in Parthia; and S. Jerom, in Lybia.

Though the circumstances of these people be fabulous; yet may the *Acridophagia* be true; and to this day they are said to eat locusts in some parts of the east. And hence S. John the baptist is said to have lived on locusts, *ακριδες*, and wild honey, Math. c. 3. v. 4. Yet is the rendering of *ακριδες*, by locusts, as the English translators have done, much controverted.—Isidore of Pelusium, in his 132d epistle, speaking of this food of S. John, says, it was not animals, but the tops of herbs; and even charges those who understood the word otherwise of ignorance: but S. Augustin, Beda, Ludolphus, and others, are of a different opinion. Accordingly, the Jesuits of Antwerp reject, with contempt, the opinion of the Ebionites, who fote *ακριδες* put *αχρηδες*, a delicious diet prepared of honey and oil; that of some other innovators, who read *αχρηδες*, or *αχρηδες*, sea-crabs; and that of Beza, who reads *αχρηδες*, wild pears.

ACRIMONY, that quality in things which renders them acid, or acrimonious to the taste. See ACRID. *Acrimony* imports much the same with *asperity*, or sharpness; and expresses a quality in bodies, by which they corrode, destroy or dissolve others. Salts are only caustic in virtue of their *Acrimony*. The *Acrimony* of the bile is supposed the cause of divers disorders; and a catarrh is a deflection of *acrimonious* humour.

ACROATICS*, a name given to Aristotle's lectures in the more difficult, and nice parts of philosophy; to which none but his disciples and intimate friends were admitted. See ARISTOTELIAN, &c.

* The word is formed from *ακροασις*, to hear.

ACROMION*, **ACROMIUM**, in anatomy, the upper process of the scapula, or shoulder-blade. See SCAPULA.

* The word is derived from *ακρος*, highest, and *ωμος*, shoulder, q. d. the extremity of the shoulder: and not from *anchora*, on account of any resemblance in figure, which the *Acromion* bears to an anchor, as Dionis has imagined.

Some have thought the *Acromion* of a nature different from other bones; in regard, during infancy, it appears no more than a cartilage, which ossifies by little and little, and about the age of twenty years becomes hard and firm, like a common bone.

ACRONYCHAL*, **ACRONYCUS**, in astronomy, is applied to the rising of a star, or other point, above the horizon, when the sun sets; or its setting when the sun rises. See the article RISING and SETTING.

* The word is originally Greek, *ακρονυχος*; compounded of *ακρος*, extremity, and *νύξ* night: *Acronychos*, quod circa *ακρονυχον* videtur; whence some write it *Acronychal*, agreeably enough with the etymon, but not with usage.—Others write it corruptedly, *Abronical*, or *Abrornichal*, from a mistaken notion of its being derived from *α*, and *χρονος*, time.

The *Abrornychal* is one of the three poetical risings, and settings of the stars; and stands distinguished from *cosmical* and *heliacal*. See COSMICAL and HELICAL.

ACT

ACROSPIRE, in natural history, *&c.* the same with *Plumule*. See *PLUMULE*.

ACROSPİRED, is used in respect of Barley; which, in the operation of making malt, is apt, after coming, or sprouting, at the lower, or root-end, to become *acrospired*, i. e. to sprout also at the upper, or blade-end *. See *MALT*.

* By 6 G. 1. c. 21. *Malt makers* are forbid to wet or water their malt when on the floor, or couch; or to permit it to *acrospire*.

ACROSTIC*, a kind of poetical composition, the verses whereof are disposed in such manner, as that the initial letters make up some person's name, title, motto, or the like.

* The word is derived from the Greek *ακροστιχίς*, *stichis*, that which is at one of the extremes, and *στιχίς*, *versus*.

There are also *Acrostics*, where the name or title is made up by the initial letters of the middle words, or the last of the final ones.—And others which go backwards; beginning with the first letter of the last verse, and proceeding upwards. Some refiners in this trifling way, have even gone to *pentacrostics*; where the name is to be repeated five times. See *PENTACROSTIC*.

ACROSTIC is also an appellation given by some authors to two ancient epigrams in the first book of the *Anthology*; the one in honour of Bacchus, the other of Apollo. Each consists of 25 verses; the first whereof is the proposition or argument of the whole, and the other 24 composed of four epithets, beginning each with the same letter; and thus following in the order of the 24 letters of the Greek alphabet: so that the first of the 24 comprehends four epithets beginning with α; the second as many, with β; and so of the rest to ω; which make 96 epithets for each God.

ACROTHERIA*, or **ACROTHERS**, in architecture, little pedestals, usually without bases, anciently placed at the middle, and the two extremes of pediments; and serving also to support statues.

* The word, in its original Greek, signifies the (*ακρον*) extremity of any body; as the tip of a rock, &c.

Those at the extremes ought to be half the height of the tympanum; and that in the middle, according to Vitruvius, should be one eighth part more. See *PEDIMENT*.

ACROTHERIA sometimes also signifies figures, whether of stone or metal, placed as ornaments, or crownings, on the tops of temples, or other buildings.

Sometimes it also denotes those sharp pinnacles, or spiry battlements, which stand in ranges about flat buildings, with rails and balusters. See *PINNACLE*.

ACT, **ACTUS**, in physics, an effective exercise, or application of some power, or faculty.

In this sense, *Act* stands opposed to power, *potentia*, which is only the capacity of acting, not the exertion of that capacity.

Though the word *Act*, properly and primarily, be only applicable where the power might exist without being drawn forth into *Act*; yet the schoolmen extend it further; defining it by the presence of any power or perfection, even though it could not be absent.

In which sense, God himself is said to be a most pure *Act*; by reason his perfections are always and necessarily present. And thus, form is called an *Act*; inasmuch as the presence hereof compleats the power and perfection of matter.—Form, say some, is matter reduced into *Act*. See *MATTER* and *FORM*. Even existence is termed an *Act*; by reason when this is given a being, nothing further is wanted.

The Greeks sometimes call *Act*, *ἐνέργεια*, a term denoting an actual possession of perfection, by the Latins usually rendered *Perfection*.

Metaphysicians give various divisions of *Act*, viz. into *infinite*, as the *Act* of creating; and *finite*, as the *Act* of moving.—*Transient*, or those exercised in other beings, as heating; and *immanent*, which remain in their own subject, as thinking.

ACT, in logic, is particularly understood of an operation of the human mind.

Thus, to discern and examine, are *Acts* of the understanding; to judge and affirm, are *Acts* of the will.

There are voluntary *Acts*, and spontaneous ones which seem produced without the privacy, or participation of the soul.

ACT, in a legal sense, is an instrument, or other matter in writing; of use to declare, or justify the truth of a thing.—In which sense, records, decrees, sentences, reports, certificates, &c. are called *Acts*, authentic *Acts*, solemn *Acts*, &c. See *DEED*.

ACTS also denote the deliberations, and resolutions of an assembly, senate, council, or convocation; taken down by clerks, notaries, actuaries, or the like; and entered in a register.

Acts of parliament are particularly denominated *Statutes*. The *Acts* of the royal society are called *Transactions*; those of the royal academy of sciences at Paris, *Mémoires*; those

ACT

of the societies of Leipzig, &c. simply *Acts*, *Acta Eruditorum*, &c.

The edicts and declarations of the council of the Roman emperors, were called consistory *Acts*, *Acta Consistorii*. *Clerk of the Acts*, is an officer of the navy. See *CLERK*, and *NAVY*.

ACTS are also matters of fact transmitted to posterity in certain authentic books, and memoirs.

In which sense, we say, the *Acts* of the Apostles, *Acts* of the martyrs, &c.

The book called *Acts* of Pilate relating to Jesus, is a false and supposititious relation of our Saviour's trial before Pilate; impiously framed by the enemies of Christianity; and filled with the blackest blasphemy.—The emperor Maximin, by a solemn edict, ordered it to be sent into all the provinces of the empire; and enjoined the schoolmasters to teach and explain it to their scholars, and make them learn it by heart.

The piece was wrote with so much carelessness or ignorance, that our Saviour's death was therein referred to the 4th consulate of Tiberius, that is, to the 7th of his empire; which is eleven years before our Saviour's passion, and five before Pilate was made governor of Judea. See Eusebius, L. IX. c. 4. and 6. Rufin, L. I. c. 5. &c.

The true and genuine *Acts* of Pilate, were sent by him to Tiberius, who reported them to the senate; but they were rejected by that assembly, because not immediately addressed to them: as is testified by Tertullian, in his *Apol.* C. 5, and 20, 21. Euseb. *Hist.* L. II. c. 2.

There are also spurious *Acts* of the Apostles composed in Hebrew by one Abdias; translated into Greek by his disciple Eutropius; and thence into Latin, by Julius Africanus. Wolfgang Lazius published the piece in 1551, from a manuscript near 700 years old; supposing it an authentic work.—A disciple of Manes, named Leucius, or Seleucus, is also said to have composed *Acts* of the apostles, towards the close of the third century.

There have formerly appeared numerous other pieces in this way: as the *Acts* of S. Thomas, the *Acts* of S. Andrew, the *Acts* of S. Paul and Thecla, the *Acts* of S. Matthew, *Acts* of S. Peter, *Acts* of S. John, *Acts* of S. Philip; all which have been declared apocryphal.—The last were the production of the heretic Pecius; and those of S. Thecla were the work of a priest in Asia minor, whom S. John degraded for his offence.

ACT, in the universities, is a thesis maintained in public, by a candidate for a degree; or, to shew the capacity, and proficiency of a student.

The candidates for a degree of bachelor and master of arts, are to hold philosophy *Acts*; those for bachelor of divinity are to keep divinity *Acts*, &c. See *UNIVERSITY*.

At Oxford, the time when the masters or doctors compleat their degrees, is also called the *Act*; which is held with great solemnity: at Cambridge they call it the commencement.

ACT of faith, *Auto da fe*, in the Romish church, is a solemn day held by the inquisition, for the punishment of heretics, and the abolition of the innocent accused. See *INQUISITION*.

They usually contrive the *Auto* to fall on some great festival; that the execution may pass with the more awe, and regard: at least it is always on a Sunday.

The criminals are first led to church; where their sentence is read to them, either of condemnation, or abolition.—Those condemned to death, are here surrendered up by the inquisitors to the secular power, with an earnest intreaty that no blood may be shed.—If they persist in their supposed errors, they are burnt alive.

ACTS, in poetry, are certain divisions, or principal parts in a dramatic poem, contrived to give a respite, or breathing-time, both to the actors and spectators.

In the interval between the *Acts*, the theatre remains empty, and without any action visible to the spectators; though it is supposed all the while there is one passing out of sight.

It is not, however, purely for the sake of the respite, that these *Acts* are observed; but to give affairs a greater degree of probability, and render the intrigue more affecting. For the spectator who sees the action prepared that is to pass in the interval, cannot forbear acting, in his imagination, the part of the absent actors; by which means, he is the more agreeably surprized when a new *Act* coming upon the stage, he sees the effects of that action, which before he could but guess at.

To this it may be added, that authors contrive to have the most dry and difficult parts of the drama transacted between the *Acts*; that the spectators may have no notion of these, excepting what their fancy presents them with at a distance; and that nothing may appear upon the stage, but what is natural, probable, and entertaining.

The ancient Greek poets were unacquainted with this division of a play into *Acts*; though their episodes, or chorus's served almost the same purpose.

ACT

It is true, they considered their pieces as consisting of certain parts or divisions, which they called *protasis*, *epitasis*, *catástasis*, and *catastrophe*: but there were no real divisions or interruptions answering to them in the representation.

It was the Romans who first introduced *Acts* into the drama; and in Horace's time, the five *Acts* were grown into a law, as appears by the verse,

Ne breviar quinto, neu sit productior, actus.

This law stands unappealed to this day; though it seems to draw its force from the authority of Horace, rather than that of reason, or nature.—All plays are held irregular that have either more, or fewer than five acts.

Some indeed have asserted, that every just action consists of five distinct parts: and have undertaken to mark out the precise share of the action, which each of the five *Acts* ought to bear.

The first, say they, is to propose the matter or argument of the fable, and to shew the principal characters.—The second, to bring the affair or business upon the carpet.—The third to furnish obstacles and difficulties.—The fourth either points a remedy for those difficulties, or finds new ones in the attempt.—The fifth puts an end to all by a discovery.

Be this as it will, it is certain, on the principles of that great master of the drama, Aristotle, we may have a just and regular play, though only divided into three *Acts*.

These *Acts* are subdivided into scenes. See *SCENE*.

ACTIAN Games, *Ludi Actiaci*, solemn games, instituted, or according to some only restored, by Augustus, in memory of the victory at Actium.

Stephanus and some others will have them held every third year; but the more common opinion, is that of Strabo, who says, they only returned every fifth, and were celebrated in honour of Apollo, since surnamed *Actius*.

By the way, it is a gross oversight in some others, to imagine that Virgil insinuates them to have been instituted by *Æneas*; from that passage *Æn.* III. v. 289.

Alitque Iliaci celebramus littora ludis.

It is true, the poet there alludes to the *Actian* games; but he only does it by way of complement to Augustus, to attribute that to the hero from whom he defended, which was done by the emperor himself: as is observed by Servius.

ACTIAN Years, *Anni Actiaci*, were a series of years, commencing from the *Æra* of the battle of Actium; called the *Æra* of Augustus. See *YEAR*, and *EPACHA*.

ACTION, in a general sense denotes the operation of a power. See *ACT*.

The idea of *Action* is so familiar to us, that a definition may as easily obscure as explain it.—Some schoolmen, however, attempt to express its nature by 'a manifestation of the power or energy of a substance; made either within, or without it.'—Thus, say they, when the mind *acts*, what does it more, than perceive a vital power exerting it self; as, in reality, the several *Actions* of the mind, are no other than so many indications of its vitality!

It is a point controverted among the schoolmen, whether or no *Action*, thus taken, be a thing distinct both from the agent, and the term, or effect. The modists stand for the affirmative, and the nominalists assert the negative.

These latter observe, that the *Action* may be considered, two ways, *entitatively* and *connotatively*.

ACTION, *Entitatively* taken, is what we call a cause, or what may act. See *CAUSE*.

ACTION, *Connotatively* considered, is the same cause, only considered as acting, or connoting the effect it produces.

Now, say they, a cause may be without any *Action*, connotatively taken, i. e. it may be considered as not producing an effect: but it cannot be without it *entitatively*, for that would be to be without it self. Hence they conclude, that the cause differs from the *Action* connotatively, not *entitatively* taken; and the agent is the cause of the *Action*, considered connotatively, not *entitatively*.

Actions are divided, with respect to their principle, into *univocal*, where the effect is of the same kind with the cause; as the production of man by man: and *equivocal*, where it is different; as the supposed production of frogs by the sun. See *UNIVOCAL*, and *equivocal*.—And again, into *vital*; as nutrition, respiration, the *Action* of the heart, &c. And *not-vital*; as heating.

With respect to their subject, *Actions* are divided into *inmanent*; which are received within the agent that produced them: as are vital *Actions*, cogitation, &c.—And *Transient*, which pass into another.

In respect of duration, *Actions* are again divided into *instantaneous*, where the whole effect is produced in the same moment; as the creation of light: and *successive*, where the effect is produced by degrees; as corruption, fermentation, putrefaction, dissolution, &c.

The Cartesians resolve all physical *Action* into metaphysical: bodies, according to them, do not act on one another; the *Action* all comes immediately from the deity; the mo-

ACT

tions of bodies, which seem to be the cause, being only the occasions, thereof. See *OCCASIONAL cause*.

It is one of the laws of nature, that *Action* and reaction are always equal, and contrary to each other.

For the *Actions* of powers, &c. See *POWER*, *WEIGHT*, *MOTION*, *RESISTANCE*, and *FRICITION*.

For the laws of the *Action* of fluids, &c. See *FLUID*, and *SPECIFIC gravity*.

ACTION, in ethics, or moral **ACTION**, is a voluntary motion, of a creature capable of distinguishing good, and evil; whose effect, therefore, may be justly imputed to the agent. See *MORAL*.

A moral *Action* may be more fully defined to be whatever a man, considered as endued with the powers of understanding and willing, with respect to the end he ought to aim at, and the rule he is to regard in acting; resolves, thinks, does, or even omits to do; in such manner as to become accountable for what is thus done or omitted, and the consequences thereof.

The foundation, then, of the morality of *Actions*, is, that they are done knowingly, and voluntarily.

All moral *Actions* may be divided, with respect to the rule, into good and evil.

ACTION, in oratory, is an accommodation of the person of the orator to his subject; or, a management of the voice and gesture, suited to the matter spoken, or delivered. See *ORATORY*.

Actions make one of the greatest branches or divisions of rhetoric, as usually taught. The ancients usually call it *pronunciation*.

Action is a collateral or secondary method of expressing our ideas; and is susceptible of a kind of eloquence as well as the primary.—It is an address to the external senses; which it endeavours to move, and bring into its party, by a well-concerted motion and modulation; at the same time that the reason and understanding are attacked by force of argument. Accordingly, Tully very pertinently calls it *Sermo Corporis*, the discourse of the body; and *Corporis Eloquentia*, the eloquence of the body.—The Roman mimes and pantomimes, we read, had such a copia in this kind, such a compass even of mute *Action*, that voice and language seemed useless to them: they could make themselves understood to people of all nations; and Roscius, the comedian, is particularly famed, as being able to express any sentence by his gestures, as significantly and variously as Cicero with all his oratory.

Quintilian gives us a system of the rules of *Action*; taken not only from the writers of the ancient orators, but from the best examples of the Forum. See his *Institut. Orat.* L. XI. c. 3. *de Pronunciatione*.

The force and effects of *Action*, at least as practised among the ancients, appears to be very great; scarce any thing was able to withstand it. What we usually attribute to eloquence, was really the effect of the *Action* only, as some of the greatest masters in that way have frankly acknowledged.—Demosthenes expressly calls it, 'the beginning, the middle, and the end of the orator's office;' and Cicero professes, that 'it does not so much matter what the orator says, as how he says it.' *Neque tantum refert qualia sunt quæ dicas, quam quomodo dicatur.* De Orat.—Hence, the great Greek orator is represented as practising and adjusting his *Action* in the glass: *Demosthenes grande quoddam intuent speculo componere Actionem solebat.* Quintil.

Every part of the body is by them lifted into the service, and marshalled in its proper place: the hand, the eye, head, neck, sides, cheeks, nostrils, lips, arms, shoulders, &c.—*Præcipuum in Actione, Caput est. Cum gestu concordat, & Laceribus obsequatur. Oculi, Lachrymæ, Supercilium, Genæ, Rubor. Non manus solum sed & Natus. Dominatur autem maxime Vultus. Quin & in vultu Pallor. Nares, Labia, Dentes, Cervix, Humeri, Brachia. Manus vero, sine quibus trunca esset Actio.*—V. Quintil. XI. 3.

The hand is master of a whole language, or set of signs, it self.—Even every finger is laid down by the ancients as having its distinct office; and hence the different names they still bear, *Pollex, Index*, &c. See *HAND* and *FINGER*.

By such a multitude of rules and observances, it is no wonder some of the orators of those, as well as of our days, were perverted more than profited.—Rules only tend to perfect the *Action*, which must have its origin from another source, viz. nature, and good sense; where those are deficient, rules will sooner make an ape than an actor. *Eloquentia*, says Cicero, *sicut & reliquarum rerum fundamentum, sapientia.*—And hence we find the great masters above-mentioned continually softning, and even unfasting, and calling people off from the intemperate use of their own rules, *Nulle argutia digitorum, non ad numerum articulum cadens.* Cicero even assures us, he was a whole year in learning to keep his hand within his gown. *Pro Cal.*—The same author recommending a motion of the whole body, says, the orator should make more use of his trunk than of his hand; *Trunco magis toto se ipse moderans, & virili laterum flexione.* Brut.

Walking,

ACT

Walking, *incessus*, in oratory, is sometimes recommended as highly deserving to be cultivated; but Cicero will scarce allow it to be used at all. It seems, some of the active orators of that time had rendered it ridiculous; one of whom was pleasantly asked by Flavius Virginius, how many miles he had declaimed? Cassius Severus, when he perceived an orator given to walking, used to cry out for a line to be drawn round him, to keep him within bounds.—The orator Titus improved walking into a sort of dancing; and it is hence, as we are told by Quintilian, that the dance Titus took its name.—Junius rallied his father Curio's incessant libration, or tossing from one side to another, by asking, who that was haranguing in a ferry-boat? And to the like effect was that speech of C. Sicinius, when Curio having spoke with his usual bustle near Octavius, who by reason of his infirmities had divers liniments and plasters on his limbs; You can never be enough thankful, Octavius, to your good colleague, who has saved you this day from being eaten up by the flies.—Demosthenes, being naturally apt to be too busy, and especially with his shoulders, is said to have reformed himself by speaking in a narrow pulpitum, and hanging a spear pointed just over his shoulders; that if in the heat of his discourse he should forget himself, the puncture might remind him.

After all, it is a point that will bear being controverted, whether *Action* ought to be practised, and encouraged at all? A thing that has so much command over mankind, it is certain, must be very dangerous; since it is as capable of being turned to our disadvantage, as our advantage. It is putting a weapon in the hands of another, which, if he pleases, he may make use of to subdue and enslave us: and accordingly, history is full of the pernicious uses made thereof.—For this reason, eloquence and *Action* are generally discouraged in the modern policy; and both the bar and the pulpit, are brought to a more frigid way of delivery.

Perhaps the foundation of all *Action* may be vicious, and immoral.—Voice and gesture, we know, will affect brutes; not as they have reason, but as they have passions: so far as these are used in a discourse, therefore, it does not regard an assembly of men, more than it would a herd of quadrupeds: that is, their whole effort is spent not on the rational faculties, which are out of the question, but on the animal ones, which alone they endeavour to possess and actuate, independent of reason.—Nay more, our reason and the judgment itself are intended to be byassed and inclined by them; *Action* being only used as an indirect way of coming at the reason, where a direct and immediate one was wanting, i. e. where the judgment cannot be taken by the proper means, argument; it is to be taken indirectly, by circuit, and stratagem.

The natural order of things, then, is here inverted: our reason, which should go before, and direct our passions, is dragged after them: instead of coolly considering, and taking cognizance of things; and according to what we perceive therein, raising our selves to the passions of grief, indignation, or the like: we are attacked the other way; the impression is to be carried backwards, by virtue of the natural connection there is between the reason and the passions: and thus the helm, the principle of our actions, is taken out of our own hand, and given to another. See *PASSION*.

The case is much the same here, as in sensation and imagination: the natural and regular way of arriving at the knowledge of objects, is by sense; an impression begun there is propagated forward to the imagination, where an image is produced, similar to that which first struck on the organ.—But the process is sometimes inverted: in hypochondriac, lunatic, and other delirious cases, the image is first excited in the imagination; and the impression thereof communicated back to the organs of sense: by which means, objects are seen, which have no existence.

To say no more, *Action* does not tend to give the mind any information about the case in hand; is not pretended to convey any arguments or ideas which the simple use of language would not convey. But is it not that which we should form our judgments upon? And can any thing help us to make a just judgment, beside what some way enlarges our understanding? When Cicero made Cæsar tremble, turn pale, and let fall his Papers; he did not appraise him of any new guilt which Cæsar did not know of: the effect had no dependence on Cæsar's understanding; nor was it any thing more than might have been produced by the unmeaning sounds of a musical instrument duly applied. Logs of timber and stone have often trembled on the like occasions.

ACTION, in poetry, is an event, either real or imaginary, which makes the subject of an epic, or dramatic poem.

The *Action* of a poem coincides nearly with the fable thereof; it being the usual practice, not to take any real transaction of history, but to feign or invent one; or at least, to alter the historical fact, so as to render it in good measure fictitious.

F. Boffu has two chapters, *Of Real Actions*, the recitals whereof are fables: and of *Feigned Actions*, the recitals whereof are historical.

ACT

The critics lay down four qualifications, as necessary to the epic and tragic *Action*: the first, *unity*; the second, *integrity*; the third, *importance*; and the fourth, *duration*; to which some add a fifth, *viz. continuity*.

For the unity of the epic *Action*, see *UNITY*.

This unity is not only to exist in the first draught, or model of the fable; but in the whole episodized *Action*.

In order to the integrity of the *Action*, it is necessary, according to Aristotle, that it have a beginning, middle, and end.—If the three parts of a whole, seem to be generally denoted by the words, *beginning*, *middle*, and *end*; Boffu interprets them more expressly, thus: The causes, and designs of a man's doing an *Action*, are the beginning; the effects of these causes; and the difficulties met withal in the execution of those designs, are the middle of it; and the unravelling and extricating of those difficulties, is the end of the *Action*.

The poet, says Boffu, should so begin his *Action*, that, on one hand, nothing should be farther wanting for the understanding of what he afterwards delivers; and, on the other, that what thus begins require after it a necessary consequence. The end is to be conducted after the like manner, only with the two conditions transposed; so that nothing be expected after it, and that what ends the poem be a necessary consequence of something that went before it. Lastly, the beginning is to be joined to the end by a middle, which is the effect of something that went before it, and the cause of what follows.

In the causes of an *Action*, one may observe two opposite designs; the first, and principal, is that of the hero: the second comprehends all their designs, who oppose the pretensions of the hero. These opposite causes do also produce opposite effects, *viz.* the endeavours of the hero to accomplish his design, and the endeavours of those who are against it.—As the causes and designs are the beginning of the *Action*; so those contrary endeavours are the middle of it; and form a difficulty, plot, or intrigue, which makes the greatest part of the poem.

And the solution or clearing up of this difficulty, makes the unravelling.

The unravelling of the plot or intrigue, may happen two ways; either with a discovery, or without.

The several effects which the unravelling produces, and the different states to which it reduces the persons, divides the *Action* into so many kinds.—If it change the fortune of the principal person; it is said to be with a *peripetia*; and the *Action* is denominat *implex*, or mixed: if there be no *peripetia*, but the unravelling be a mere passing from trouble to repose; the *Action* is simple.

For the duration of the epic *Action*, Aristotle observes, it is not so limited as that of the tragic *Action*; the latter is confined to a natural day; but the epopee, according to that critic, has no fixed time.—In effect, tragedy being full of passion, and consequently of violence, which cannot be supposed to last long, requires a shorter time: and the epic poem being for the habits which proceed more slowly, requires a longer time either for them to take hold, or to be rooted up; and hence the difference between the epic and dramatic *Action*, in point of duration.

Boffu lays it down as a rule, that the more vehement the manners of the principal personages are, the less time ought the *Action* to last: accordingly, the *Action* of the *Iliad*, containing the wrath of Achilles, &c. holds but forty-seven days; whereas that of the *Odyssey*, where prudence is the reigning quality, lasts eight years and a half: and that of the *Æneid*, where the prevailing character of the hero is piety and mildness, nearly seven years.

As to the importance of the epic *Action*, there are two ways of providing for it: the first, by the dignity and importance of the persons. This way alone Homer makes use of; there being, otherwise, nothing great and important in his models, but what might have happened to ordinary persons.—The second, by the importance of the *Action* itself; such as the establishment, or downfall of a religion, or a state; which is Virgil's *Action*, and in which he has much the advantage of Homer.

Boffu mentions a third way of making the *Action* important, *viz.* by giving a higher idea of the personages, than what the readers conceive of all that is great among men.—This is done by comparing the men of the poem with the men of the present time.

ACTION is also used in painting and sculpture, for the posture of a figure; or the *Action* it is supposed to be in; expressed by the disposition of the body, or the passion appearing in the face.

In the manage, *ACTION* of the *Mouth*, denotes the agitation of the horse's tongue, and mandible, or his champing on the bit; discoverable by a white, rosy foam thereon.—This, with the masters, passes for a sign of healthy, vigour and mettle.

ACTION, in law, is a right of demanding, and pursuing, in a court of judicature, what is any man's due.

Or, *Action* is any kind of process which a person enters for the recovery of his right. See *CAUSE* and *PROCESS*.

Actions

Actions are divided, by Justinian, into two general kinds; *real*, or those against the thing; and *personal*, or those against the person.—For whoever brings an *Action*, either does it against one obnoxious to him, in respect either of contract, or of offence: in which case arise *Actions* against the person, which require the party to do, or give something: or, he does it against one not obnoxious, yet with whom a controversy is risen touching some matter; as, if Caius hold a field, which Julius claims as his property, and brings his *Action* for the same. See the *Instit. L. IV. Tit. 4.* where the principal *Actions* introduced by the Roman law, are summarily explained.

In common law, from the two classes of real and personal *Actions*, arises a third, called a *mixed Action*; which regards both the person, and thing.

Real ACTION, is that whereby the defendant claims title to lands, or tenements, rents, or commons, in fee-simple, fee-tail, or for life.

But real *Actions*, formerly so numerous and considerable, as writs of right, of entry, &c. with their appendages, as grand cape, petit cape, receipt, view, aid-prayer, voucher, counter-plea of voucher, counter-plea of warranty, and recovery of value, are now much out of use; by reason of the usual admixture of personal matters therewith, which change them into mixed *Actions*.

Personal ACTION, is that which one man hath against another on account of a contract for money, or goods; or of an offence done by him, or some other person, for whose fact he is answerable.

Mixed ACTION, is that laid indifferently for the thing detained, or against the person of the detainer; being thus called, because it has a mixed respect, both to the thing, and to the person.

Others better define it, a suit given by law to recover the thing demanded, and damages for the wrong done.

Such is, affize of novel disseisin, which, if the disseisor make a feoffment to another, the disseisee shall have against the disseisor, and the feoffee, or other ten-tenant; to recover not only the land, but damages also.—And the like in *Action* of waste, *Quare impedit*, &c. See *ASSIZE*.

Actions are also divided into *civil* and *penal*.—**Civil ACTION**, is that which only tends to the recovery of what, by reason of a contract, or other like cause, is a man's due.—As, if a person by *Action* seek to recover a sum of money formerly lent, &c.

Penal ACTION, aims at some penalty upon the party sued; either corporal, or pecuniary.

Such is the *Actio Legis Aquilæ*, in the civil law: and with us, the next friends of a man feloniously slain, or wounded, shall pursue the law against the offender, and bring him to condign punishment.

ACTION is also distinguished, as it lies for the recovery either of the simple value of the thing challenged; or of the double, triple, quadruple, &c.

Thus, a *Decies tantum* lies against embracers; and against jurors that take money for their verdict, of either, or both parties.

To this class also belong all *Actions* on a statute that punishes an offence by restitution, or fine, proportionable to the transgression.

Action, again, is divided into *prejudicial*, called also *preparatory*, and *principal*.

Prejudicial ACTION, is that which arises from some question, or doubtful point in the principal one.

As, if a man sue his younger brother, for land descended from his father; and it be objected, he is a bastard: this point of bastardy must be tried, before the cause can proceed: whence the *Action* is termed *Prejudicialis*, quia prius iudicanda.

Action, again, is either *ancestral*, or *possessory*.—**Ancestral ACTION**, is that which we have by some right descending from our ancestor.—**Possessory**, sometimes also called *personal Action*, is that which hath its beginning in, and from ourselves.

ACTION upon the Case, *Actio super Casum*, is a general *Action*, given for the redress of a wrong done any man without force, and not especially provided for by law.

This, of all others, is now most in use.—Where there arises an occasion of suit, that has neither fit name, nor certain form already prescribed; the clerks of the chancery, anciently, conceived a proper form of *Action* for the thing in question: which was called an *Action upon the Case*, by the civilians *Actio in factum*.

ACTION upon the Statute, *Actio super Statutum*, is a writ or *Action* brought against a man, upon an offence against a statute whereby an *Action* is given that did not lie before. See *STATUTE*.

Thus, where one commits perjury to the prejudice of another, he who is damaged shall have a writ upon the statute, and a cause accordingly.

ACTION Popular, only differs from an *Action* upon the statute, in that, where the statute gives the suit or *Action* to the party grieved, or otherwise to one single person certain, it is

called *Action* upon the statute; and where the authority is given by the statute to every one that will to sue, it is an *Action popular*.

Action is also divided into *perpetual* and *temporal*.

Perpetual ACTION, is that whose force is not determined by any period or term of time.

Of this kind were all civil *Actions* among the ancient Romans, viz. such as arose from laws, decrees of the senate, and constitutions of the emperors; whereas *Actions* granted by the prætor died within the year.

We have also perpetual and temporary *Actions* now in England; all being perpetual, which are not expressly limited.

Divers statutes give *Actions*, on condition they be pursued within the time prescribed.—Thus the Statute of 1 Edw. VI. gives *Action* for three years after the offences committed, and no longer; and the statute of 7 Hen. VIII. c. 3. does the like for four years; and that of 31 Eliz. c. 5. for one year, and no more.

But, as by the civil law no *Actions* were so perpetual, but that by time they might be prescribed against; so, in our law, though *Actions* be called *perpetual*, in comparison of those that are expressly limited by statute; yet is there a means to prescribe against real *Actions*, after five years, by a fine levied, or a recovery suffered. See *PRESCRIPTION*.

ACTION of a Writ, is when a person pleads some matter, whereby he shews, that the plaintiff had no just cause to have the writ he brought, though it be possible he might have another writ or *Action* for the same matter.—Such plea is called, a *plea to the Action of the writ*. See *WRIT*.

When by the plea it appears, that the plaintiff has no cause of any *Action* for the thing demanded; it is called, a *plea to the Action*.

ACTION, in affairs of commerce, or **ACTION of a Company**, is a part or share in the company's stock, or capital, which consists of a number of such *Actions*. See *COMPANY* and *CAPITAL*.

Actions, in France and Holland, amount to the same with *shares*, or *subscriptions* in England.

Thus, the capital of a company, which has three hundred *Actions* of a thousand livres each, consists of three hundred thousand livres. Hence, a person is said to have four or six *Actions* in such company, if he have contributed to the capital, and be interested therein, for four or six thousand livres.

ACTION also denotes an obligation or instrument, which the directors of such companies deliver to those who pay money into their stock. See *ACTIONARY*, and *BANK*.

Actions are always rising, and falling; according as the company's credit gains or loses. The smallest whisper of an approaching war or peace, true or false, shall frequently occasion a considerable alteration therein.

In the year 1719, the French company of the west, since called the *India company*, arrived at such an immense degree of credit; that in six months time, its *Actions* rose to eighteen hundred *per Cent.* a pitch no other company ever came near.

In 1672, the *Actions* of the Dutch East-India company were at six hundred and fifty *per Cent.* which was the highest they were ever known at.—But the war with France then coming on; they fell 250 *per Cent.* in a few months. After the peace of Nimeguen, they rose again; and in 1718 were 600 *per Cent.*

The French have three kinds of *Actions*.—*Simple*, which are entitled to a share in all, both the profits and losses of the company.—*Rentierer*, entitled only to a profit of two *per Cent.* sure; for which the king is security.—And *interested Actions*, which claim the two *per Cent.* secured by the king; and are also to share the excess of the dividend with the simple *Actions*.

There were several other kinds of *Actions* introduced by the brokers, in the busy days of the *Rue Quinquempoix*, but they have since dropt into oblivion; these were called mother *Actions*, daughter, grand-mother, grand-daughter *Actions*, &c.

To melt or liquidate an *Action*, is to sell, or turn it into money, &c.

ACTIONARY, or **ACTIONIST**, a term frequent in foreign newspapers; denoting the proprietor of an *Action*, or share in a company's stock.

ACTIVE, **ACTIVUS**, something that communicates motion, or action to another.

In this sense, the word stands opposed to *passive*. Thus we say, an *active* cause, *active* principles, &c.

The quantity of motion in the world, Sir I. Newton shews, must be always decreasing, in virtue of the *Vis Inertiae*, &c. So that there is a necessity for certain *active* principles to recruit it: such he takes the cause of gravity to be, and the cause of fermentation. Adding, that we see but little motion in the universe, except what is owing to these *active* principles.

ACTIVE Principles, in chymistry, are those which are supposed

posed to act of themselves, and do not need to be put in action by others. Salt, sulphur, and mercury, are usually considered by the chymists as *active principles*; and phlegm and earth, as passive ones.

M. Homberg, and some late chymists after him, only make one *active principle*, viz. sulphur, or fire; which they take to be the source or principle of all the motion, and action of the universe.

The term *active principles*, says Dr. Quincy, has been used to express certain divisions of matter, that are, by some particular modifications, comparatively *active*, in respect of others; such are spirit, oil, and salt, whose parts are better fitted for motion, than those of earth and water: but with how much impropriety will easily appear.

For in a strict sense, all motion in matter is rather passive; and there is no *active principle*, unless we call for the known powers of gravitation, attraction, and repulsion, on which the Newtonian philosophy is founded; so that let bodies exist under what modifications soever, there can be no alteration made of these universal properties.—Hence, the division of matter, into what, for distinction sake, may be called *spirit*, does not give it any properties inconsistent with this general law.

ACTIVE, in grammar, denotes a word that has a signification, that serves to explain, or denote an action.

Thus we say, a verb *active*, a conjugation *active*, &c. or an *active* participle.

Verbs ACTIVE, are such as do not only signify doing, or acting, but have also nouns following them, to be the subject of the action or impression.

Thus, to love, to teach, are verbs *active*; because we can say, to love a thing, to teach a man.

Verbs neuter also denote an action: but are distinguished from verbs *active*, in that they cannot have a noun following them.—Such are, to sleep, to go, &c.

Some grammarians, however, make three kinds of verbs *active*: the *transitive*, where the action passes into a subject different from the agent; *reflexed*, where the action returns upon the agent; and *reciprocal*, where the action turns mutually upon the two agents who produced it.

ACTIVITY, the power of acting, or the active faculty.

The *Activity* of fire exceeds all imagination.—The *Activity* of an acid, a poison, &c.—Bodies, according to Sir I. Newton, derive their *Activity* from the principle of attraction.

The *Sphere of ACTIVITY* of a body, is the space which surrounds it, so far as its efficacy or virtue extends to produce any sensible effect.

ACTOR, one that acts. See **ACT**.

ACTOR, in the drama, one who represents some person, or character upon the theatre.

The drama in its original only consisted of a simple chorus, who sung hymns in honour of Bacchus; so that the primitive actors were no more than singing men. Thespis was the first who took upon him to introduce a Person, or *Actor*; who was to ease the chorus, by reciting the adventures of some of their heroes. Thus came the recitation or declamation in use.

Æschylus finding a single person tiresome, thought to entertain the audience more agreeably by the introduction of a second person, who should converse and make dialogue with the first. He likewise dressed his *Actors* a little more decently than they had been before; and put them on the buskin.

Sophocles finding the two persons of Æschylus too few for the variety of incidents, added a third; and here the Greeks stopped; at least, we do not find in any of their tragedies above three persons in the same scene: though in their comedies, they took a greater liberty.

The moderns have brought a much greater number of *Actors* upon the stage.—This heightens the trouble and distress that should reign there; and makes a diversity in which the spectator is sure to be interested.

Horace speaks of a kind of secondary *Actors* in his time, whose business was to imitate the first; and lessen themselves, to become better foils to their principals. We have very little notion how these subaltern *Actors* behaved.

ACTUAL, something that is real, and effective; or that exists truly and absolutely.

In philosophy, we say, *Actual heat*, or cold; in opposition to *virtual* or *potential*.

Actual heat, considered actively, is the act of producing heat: passively taken, it is the quality whereby a body is denominated *hot*.—*Virtual* or *potential heat*, actively taken, is the power or faculty of producing heat: passively taken, it should be the power or faculty of being heated, or of receiving *actual heat*.

In theology, we say, *actual grace*; in opposition to *habitual grace*.

Actual grace is that which God gives us, to make or enable

us to act, or do some action.—*Habitual grace* is a sanctifying grace, a habit of charity, or a habit inherent in the soul, which renders us agreeable to God, and objects of eternal recompense.

So *actual fin* is used in opposition to *original fin*.

Actual fin is that committed knowingly, by a person arrived at years of discretion. *Original fin* is that we contract by descent, as being the children of Adam.

ACTUARIE Naves, in antiquity, a sort of long ships, thus denominated, as being peculiarly contrived for swiftness and expedition; they answer to what the French call *brigantines*.

Cicero, in an epistle to Atticus, calls a ship *decem scalmarum*, of ten banks of rowers, *Actuariola*.

ACTUS, in the ancient agriculture, the length of one furrow; or as far as a plough goes before it turns. *Plin. l. 18. c. 3.*

In English it may be rendered by a *furrow*.—It is also used as a determinate measure, where it contains 120 Roman feet.

ACTUS minimus, was 120 feet in length, and 4 in breadth; being equal to the sextans, or sixth part of the jugerum, or integer. See **JUGERUM**.

ACTUS major, called also *Actus quadratus*, was the square of 120 feet, or 14400; being the semis, or half of the jugerum.—This was also denominated *medius* and *mina*. *Varro de re Rust. l. 1. c. 10.*

ACTUATE, to bring into act; or put a thing in action.

Thus, an agent is said by the schoolmen to *actuate* a power, when it produces an act in a subject.—And thus the mind may be said to *actuate* the body.

ACUTE, *sharp*, something that terminates in a point, or edge; disposed either for piercing, or cutting.

In this sense, the word usually stands opposed to *obtuse*.

ACUTE Angle, in geometry, is that which is less than a right angle; or which does not subtend 90 degrees. See **ANGLE**.

Such is the angle AEC. (*Tab. Geometry, fig. 86.*)

ACUTE-Angle Triangle, is that whose three angles are all *acute*; called also an *Oxygonous Triangle*. See **TRIANGLE**.

Such is the triangle ACB. (*Tab. Geometry, fig. 68.*)

ACUTE-Angular Section, of a cone, is used by the ancient geometers for the ellipsis.

ACUTE, in music, is understood of a sound, or tone, which is sharp, shrill, or high, in respect of some other.

In which sense, the word stands opposed to *grave*.

Sounds considered as *acute*, and *grave*, that is, in the relation of gravity and *acuteness*, constitute what we call *tune*, the foundation of all harmony.

ACUTE Accent, in grammar, is that which denotes a syllable to be pronounced with a high or *Acute* tone of voice.

The *Acute accent*, is a little line, or virgula, placed over the vowel, a little sloping or inclined in its descent from right to left, as *á*.—It is not ordinarily used either in English, or Latin: the French indeed retain it; but it is only to mark the close or masculine *é*.

In the ancient Greek manuscripts, the *Acute accent* stoops a great deal more than in the modern writings, or editions.

ACUTE Disease, is that which terminates or comes to its period, in a few days; or, as the physicians express it, *cito & cum periodo terminatur*.

In this sense, the word stands opposed to *chronical*.—All diseases which hold above forty days, are reputed *chronical*.

Dr. Quincy thinks an *Acute disease* may be defined, that which is attended with an increased velocity of blood.

Acute diseases are the more dangerous, in that, beside the violence of the symptoms, if there be not time to empty the prime viæ, it is very difficult to stop their progress, and save the patient.

Acute diseases, are usually divided into those simply called *Acute*; and those which, by reason of the vehemence of the symptoms, are called *most Acute*.

ACUTENESS, in music, &c, that which constitutes, or denominates, a sound, *acute*.

There is no such thing as *Acuteness*, or gravity, absolutely so called; they are only relations; so that the same sound may be either *acute*, or *grave*, according to that other sound they refer, or are compared, to.

The degrees of gravity or *Acuteness*, make so many tones, or tunes of voice, or sound.

For the cause and measure of gravity and *Acuteness*, see **GRAVITY**, and **INTERVAL**.

AD, a Latin preposition, signifying *to*—frequently used in composition; and sometimes also prefixed to other terms: as—*ad inquiringum*—*ad jura regis*—*ad octo*—*ad pondus omnium*—*ad quod damnum*—*ad terminum qui præterit*—*ad ventrem inspiciendum*.—Which see, in the course of the alphabet.

ADAGE,

ADAGE*, **ADAGIUM**, a proverb, or popular saying.

- * The word is compounded of *ad*, and *agor*, according to Scaliger: *quod agatur ad aliud significandum*, because made to signify some other thing.

Erasmus has made a large and valuable collection of Greek and Roman *Adages*, from their poets, orators, philosophers, &c.

Adage, proverb, and paremia, are the same thing; but they differ from gnome, sententia and apophthegm.

ADAGIO, in music, one of the words used by the Italians, to denote a degree, or distinction of time.

Adagio expresses a slow time; the slowest of any, except grave.

ADALIDES, in the Spanish policy, are officers of justice, for matters touching the military forces.

In the laws of king Alphonsus, the *Adalides* are spoke of, as officers appointed to guide and direct the marching of the forces in time of war.—Lopez represents them as a sort of judges, who take cognizance of the differences arising upon excursions, the distribution of plunder, &c.

ADAMANT, **ADAMAS**, in natural history, &c. an ancient name for a precious stone, by us called a *diamond*. See **DIAMOND**.

ADAMI Pomum, **ADAM'S Apple**, in anatomy, a little prominence in the middle of the cartilago scutiformis. See **POMUM ADAMI**.

ADAMITES*, **ADAMITÆ**, a sect of ancient heretics, who took upon them to imitate the nakedness of Adam: as if man had been reinstituted in his original innocence.

- * The critics explain the name Adam, אָדָם from whence the term arises, variously; some by *terro*, others by *red*, others by *acquiescence*.—Some of the Greek interpreters explain it cabalistically: according to them, the A signifies *αυαρητος*, evil; D, *δωρε*, well; A, *αγρος*, north; and M, *μεσημβριος*, south; as being king of the four quarters of the world: or, in that he was to people it; or that he was a little world, or *μικροκοσμος*.

The *Adamites* assisted in the temples naked, and had to do with women in public.

Prodicus was their author, according to the account given by Theodoret.—They were, in reality, a branch sprung out of the Carpoctarians, and Basilidians. See **CARPOCTARIAN**, and **BASILIDIAN**.

This sect is said to have started up a-fresh in the 15th century, under Picard, their leader; who pretended to re-establish the law of nature, which, according to him, consisted in two things, *viz.* community of women, and nakedness.—These last walked naked in the public places; whereas the former only put off their clothes in their assemblies.—Jovet speaks of *Adamites* in England.

Pre-ADAMITES. See the article **PREADAMITES**.

ADAPTING. See the article **ACCOMMODATION**.

We say, to *adapt*, i. e. to fit, a recipient to the capital, &c. See **RECIPIENT**.

ADDER-STUNG, is used in respect of cattel, when stung with any kind of venomous reptiles; as adders, scorpions, &c. or bit by a hedge-hog, or threw.

ADDICE, or **ADZE**, a sharp tool, of the ax-kind, but different from the common ax.—It is made crooked, and by that means more convenient for cutting the hollow side of any board, or timber; being what the coopers generally make use of for that purpose.

ADDICTIO, **ADDICTION**, in the Roman law, a transferring, or passing over goods to another; whether by sentence of a court; or in the way of sale, to him that bids most for them.

The word stands opposed to *abdictio*, or *abdication*. See **ABDICTION**.

It is formed of *addico*, one of the stated words used by the Roman judges, when they allowed the delivery of the thing or person on whom judgment had passed.

Hence, goods thus adjudged by the prator, to the right owner, were called *bona addicta*; and the debtors delivered up in like manner to their creditors, to work out their debt, were called, *servi additi*.

ADDICTIO in diem, denoted the adjudging of a thing to a person for a certain price; unless by such a day the owner or some other person gave more for it.

ADDITAMENT, **ADDITAMENTUM**, a thing added to another.

Additaments, in phycic and chymistry, are things superadded to the ordinary ingredients of any composition.

ADDITION, the act of joining one thing to another; or of augmenting a thing, by the accession of others thereto.

In matters of Holy Scripture, it is forbid to make any *Addition* to the text, for fear of corrupting and altering the sense.—In phycic, we say, that natural bodies are formed by the *Addition* or aggregation of parts.

ADDITION, is also used for the additament, or the thing added itself.—In the new editions of books, authors use to make

Additions; and they frequently make needless *Additions*, in lieu of retrenching superfluities and impertinencies.

It is an axiom, that if to equal quantities you *add* unequal ones; the excess of the wholes, will be the same as the excess of the *additional* parts.

ADDITION, in arithmetic, is the first of the four fundamental rules, or operations of that art.

Addition consists in finding the amount of several numbers, or quantities severally added one to another.—Or, *Addition* is the invention of a number, from two or more homogeneous ones given, which is equal to the given numbers taken jointly, or together.

The number, thus found, is called the *sum*, or aggregate of the numbers given.

The character of *Addition* is +, which we usually express by *plus*. Thus 3+4 denotes the sum of 3 and 4; and is read 3 *plus* 4.

The *Addition* of simple numbers is easy. Thus it is readily perceived that 7 and 9; or 7+9 make 16; and 11+15 make 26.

In longer, or compounded numbers, the business is performed by writing the given numbers in a row downwards; homogeneous under homogeneous, i. e. units under units, tens under tens, &c. and singly collecting the sums of the respective columns.

To do this, we begin at the bottom of the outmost row or column to the right; and if the amount of this column do not exceed 9, we write it down at the foot of the same column: if it do exceed 9, the excess is only to be wrote down, and the rest reserved to be carried to the next row, and added thereto; as being of the same kind or denomination.

Suppose, *e. gr.* the numbers 1357 and 172, were given to be added; write either of them, *v. gr.* 172, under the other, 1357; so, as the units of the one, *viz.* 2, stand under the units of the other, *viz.* 7; and the other 1357 numbers of the one, under the correspondent ones of the other, *viz.* the place of tens under tens, as 7 under 5; and that of hundreds, *viz.* 1, under the place

of hundreds of the other, 3.—Then, beginning, say, 2 and 7 make 9; which write underneath; also 7 and 5 make 12; the last of which two numbers, *viz.* 2, is to be written, and the other one reserved in your mind to be added to the next row, 1 and 3: then say, 1 and 1 make 2, which added to 3 make 5; this write underneath, and there will remain only 1, the first figure of the upper row of numbers, which also must be writ underneath; and thus you have the whole sum, *viz.* 1529.

So, to add the numbers 87899+13403+885+1920 into one sum, write them one under another, so as all the units make one column, the tens another, the hundreds a third, and the place of thousands a fourth, and so on.—Then say, 5 and 3 make 8, and 8+9 make 17; write 7 underneath, and the 1 add to the next rank; saying, 1 and 8 make 9; 9+2 make 11, and 11+9 make 20; and having writ the 0 underneath, say again, 2 and 8 make 10, and 10+9 make 19, and 19+4 make 23, and 23+8 make 31; then, reserving 3, write down 1 as before, and say again, 3+1 make 4, 4+3 make 7, and 7+7 make 14; 14+2 make 16, and 16+8 make 24, and 24+1 make 25, and 25+1 make 26, which in the last place write down, and you will have the sum of them all.

ADDITION of numbers of different denominations, for instance, of pounds, shillings and pence, is performed by adding or summing up each denomination by it self, always beginning with the lowest; and if after the *Addition*, there be enough to make one of the next higher denomination, for instance, pence enough to make one or more shillings; they must be added to the figures of that denomination, that is, to the shillings; only reserving the odd remaining pence to be put down in the place of pence.—And the same rule is to be observed in shillings with regard to pounds.

For an instance, 5 pence and 9 pence make 14 pence; now in 14 there is once 12, or a shilling, and two remaining pence; the pence, set down; and reserve 1 shilling to be added to the next column, which consists of shillings. Then 1 and 8 120 15 9 and 2 and 5 make 16: the 6 put down, and 1 65 12 5 carry the 1 to the column of tens; 1 and 1 9 8 0 and 1 make three tens of shillings, or 30 shillings; in 30 shillings there is once 20 shillings, or a pound, and 10 over: write one in the column of tens of shillings, and carry 1 to the column of pounds; and continue the *Addition* of pounds, according to the former rules.

So, half of an even sum will be carried to the pounds; and the odd one (where it so happens) set under the tens of the shillings.

ADDITION of Decimals, is performed after the same manner as that of whole numbers; as may be seen in the following example. See also **DECIMAL**.

620.953
51.0807
305.27
987.3037

ADDITION of *Vulgar Fractions*, see under the article FRACTION.

ADDITION, in Algebra, or the ADDITION of *Species*, is performed by connecting the quantities to be added, by their proper signs; and also by uniting into one sum, those that can be so united. See QUANTITY, SPECIES, &c.

Thus a and b make $a+b$; a and $-b$ make $a-b$; $-a$ and $-b$ make $-a-b$; $7a$ and $9a$ make $7a+9a$; $-a/ac$ and b/ac make $-a/ac+b/ac$, or $b/ac-a/ac$; for it is all one in whatever order they be written.

But, particularly, 1^o, Affirmative quantities of the same species or kind, are united by adding the prefixed numbers whereby the species are multiplied. See POSITIVE.

Thus, $7a+9a$ make $16a$. And $11bc+15bc$ make $26bc$.

Also $\frac{3}{c}+\frac{5}{c}$ make $8\frac{a}{c}$; and $2/ac+7/ac$ make $9/ac$;

$6\sqrt{ab}-xx+7\sqrt{ab}-xx$ make $13\sqrt{ab}-xx$. And in like manner $6\sqrt{3}+7\sqrt{3}$ make $13\sqrt{3}$. Again, $a\sqrt{c}+b\sqrt{c}$ make $a\sqrt{c}+b\sqrt{c}$, by adding together a and b , as numbers multiplying \sqrt{c} . And so $\frac{2ax}{a+x}+\frac{3ax}{a+x}$ make $\frac{5a+3x}{a+x}$ since $2a+3x$ and $3a$ make $5a+3x$.

2^o, Affirmative fractions, which have the same denominator, are added together by adding their numerators.

Thus $\frac{1}{3}+\frac{2}{3}$ make $\frac{3}{3}$, and $\frac{2ax}{b}+\frac{3ax}{b}$ make $\frac{5ax}{b}$; and thus

$\frac{8a\sqrt{cx}}{2a+\sqrt{cx}}+\frac{17a\sqrt{cx}}{2a+\sqrt{cx}}$ make $\frac{25a\sqrt{cx}}{2a+\sqrt{cx}}$, and $\frac{aa}{c}+\frac{bx}{c}$ make $\frac{aa+bx}{c}$.

3^o, Negative quantities are added after the same manner as affirmative. See NEGATIVE.

Thus, -2 and -3 make -5 ; $-\frac{4ax}{b}$ and $-\frac{11ax}{b}$ make

$-\frac{15ax}{b}$; $-a/ax$ and $-b/ax$ make $-a-b/ax$.

When a negative quantity is to be added to an affirmative one; the affirmative must be diminished by the negative one.

Thus, 3 and -2 make 1 ; $\frac{11ax}{b}$ and $-\frac{4ax}{b}$ make $\frac{7ax}{b}$;

$-a/ac$ and b/ac make $b-a/ac$.

And note, that when the negative quantity is greater than the affirmative, the aggregate or sum will be negative. Thus,

2 and -3 make -1 ; $\frac{11ax}{b}$ and $\frac{4ax}{b}$ make $-\frac{7ax}{b}$; and

$2/ac$ and $-7/ac$ make $-5/ac$.

ADDITION of *Irrational Quantities*.—If they be of different denominations, reduce them to the same denomination; and if they be then commensurable, add the rational quantities without the vinculum; and to their sum prefix the radical sign.—The rest as in the addition of rationals.

Thus, we shall find $\sqrt{8}+\sqrt{18}=2\sqrt{2}+\sqrt{3}\cdot 2=5\sqrt{2}=50$. On the contrary, $\sqrt{7}$ and $\sqrt{5}$ being incommensurable, their sum will be $\sqrt{7}+\sqrt{5}$.

ADDITION, in law, is that name, or title which is given to a man, over and above his proper name, and surname; to shew of what estate, degree, or mystery he is; and of what town, village, or country.

ADDITIONS of *Estate*, or quality, are yeomen, gentlemen, esquire, and such like.

ADDITIONS of *Degree*, are those we call names of dignity; as knight, lord, earl, marquiss, and duke.

ADDITIONS of *Mystery*, are such as scrivener, painter, mason, and the like. See CHOPCHURCH.

ADDITIONS of *Place*, are, of Thorp, of Dale, of Woodstock.—

Where a man hath household in two places, he shall be said to dwell in both; so that his ADDITION in either may suffice. Knaue was anciently a regular ADDITION.

By Stat. 1. Hen. V. it was ordained, that in suits or actions where process of outlawry lies; such ADDITION should be made to the name of the defendant, to shew his estate, mystery, and place where he dwells; and that the writs, not having such ADDITIONS, shall abate, if the defendant take exception thereto; but not by the office of the court.—The reason of this ordinance was, that one man might not be troubled by the outlawry of another; but by reason of the certain ADDITION, every person might bear his own burden.

ADDITIONAL *Duty*. See DUTY.

ADDOUBORS, in law. See the article REDUBBORS.

ADDRESS*, a discourse presented to the king, in the name of a considerable body of his people; to express, or notify their sentiments of joy, satisfaction, or the like, on some extraordinary occasion.

* The word is French, *Adresse*, formed of the verb *Adresser*, to send or direct any thing to a person.

We say, the lords *Adressis*, the common *Adressis*.—*Adressis* were first set on foot under the administration of Oliver Cromwell.—At Paris, their office of intelligence is called *Bureau d'Adresse*.

ADDRESS, is also used for dexterity, or good management.

ADDUCENT*, *Muscles*, or ADDUCTORS, are those which bring forward, close, or draw together, the parts of the body whereto they are annexed. See MUSCLE.

* The word is compounded of *ad*, to; and *ducere*, to draw, or bring.

ADDUCENTS, or ADDUCTORS, stand opposed to ABDUCENTS or ABDUCTORS.

ADDUCTION, in anatomy, the motion, or action of the adducent muscles. See ADDUCENT, and ADDUCTOR.

ADDUCTOR *Oculi*, a muscle of the eye; so called, because, it inclines its pupil towards the nose.

It is also called *bilaterius*; because it directs the eye toward the cup in drinking.

ADDUCTOR *Pollicis*, is a muscle of the thumb, which arises tendinous, and ascends obliquely towards a broad termination, at the superior part of the first bone of the thumb.—See *Tab. Anat. (Myol.) fig. 1. n. 31. & fig. 7. n. 7.*—Its office is to bring the thumb near the fore-finger.

ADDUCTOR *Pollicis Pedis*, called also *Antithenar*, is a muscle of the great toe, which arises from the inferior part of the os cuneiforme tertium, and is inserted into the internal part of the ossa femoroidea of the great toe; which it draws nearer the rest.

ADDUCTOR *Indicis*, is a muscle of the fore-finger, arising from the inside of the bone of the thumb, and inserted into the first bone of the fore-finger, which it draws towards the thumb.

ADDUCTOR *minimi Digiti Pedis*: the same as TRANSVERSALIS *Pedis*.

ADELING. See the article ATHELING.

ADEMPTION, ADEMPATIO, in the civil law, the revocation of a grant, donation, or the like. See REVOCATION.

The *Ademption* of a legacy, may be either *express*; as when the testator declares in form, that he revokes what he had bequeathed: or *tacit*, as when he only revokes it indirectly, or implicitly. See RESCISSION.

ADEPS*, in anatomy, fat, found in the cavities of the abdomen, or other parts.

* It is so called, as being *adeptus*, gotten, or as it were excrescental.

The *Adeps* according to some differs from the common fat, called *pinguedo*; in that it is thicker, harder, and of a more earthy substance.

ADEPS is also used among physicians, as a general name for all animal fat.

The *Adeps anseris*, goose's fat; *Adeps canis*, fat of a dog; *Adeps hominis*, fat of a man; *Adeps viperæ*, viper's fat; and *Adeps ursi*, bear's fat, are all used in medicine, in quality of ripeners, or drawers; as being of a penetrating nature, and thereby suited to dissolve, and rarify the tumors, and bring them quickly to maturity. The specific virtues ascribed to certain of them, do not however seem well warranted.

ADEPTS*, ADEPTI, a denomination given to the proficients in alchymy; particularly to those who pretend to the secrets of the philosopher's stone, and the universal medicine.

* The word is Latin, *adeptus*, having obtained; formed of the verb *adipisci*, to obtain.

Ripley, Lully, Paracelsus, Helmont, Hollandus, Sendivogius, &c. are the principal among the *Adepti*.

It is a sort of tradition among the alchymists, that there are always twelve *Adepti*; and that their places are immediately supplied by others, whenever it pleases any of the fraternity to die, or transmute into some other place, where he may make use of his gold: for in this wicked world it will scarce purchase them a shirr.—*Harri*.

ADEQUATE, ADEQUATUM, something equal to, or co-extended with, another; and filling the whole measure and capacity thereof.

In this sense, the word stands opposed to *Inadequate*. See INADEQUATE.

ADEQUATE *Ideas*, or *Notions*, are such Images or conceptions of an object, as perfectly represent it, or answer to all the parts and properties of it.

M. Leibnitz defines an *adequate notion*, to be that of whose several characters we have distinct ideas.—Thus, a circle being defined a figure bounded by a curve line which returns into itself, and whose points are all equally distant from a certain intermediate point therein: our notion of a circle is an *adequate*, if we have distinct ideas of all these circumstances, viz. a curve returning upon itself, a middle point, an equality of distance, &c.

All simple ideas are *adequate* and perfect; and the faculty, be it what it will, that excites them, represents them entire. See SIMPLE IDEA.

The ideas of modes are likewise *adequate*, or perfect; except of those modes which occasionally become substances: for when we speak of modes separately existing, we only consider them separate from the substance by way of abstraction.

All abstract ideas are also *adequate* and perfect; since they represent all that part of the subject which we then consider.—Thus, the idea of roundness is perfect, or *adequate*, because it offers to the mind all that is in roundness, in general.

Of the same kind are all ideas, of which we know no original, or external object really existing out of the mind, by occasion of which they were excited in us, and of which we think them the images. Thus, when a dog is before us, it is the external object without us which raises the idea in our mind; but the idea of an animal in general, has no external object to excite it: it is created by the mind itself, and must of necessity be *adequate* or perfect.

On the contrary, the ideas of all substances are *inadequate*, and imperfect, which are not formed at the pleasure of the mind, but gathered from certain properties, which experience discovers in them.

This is evident, in regard our knowledge of substances is very defective; and that we are only acquainted with some of their properties: thus, we know that silver is white, that it is malleable, that it melts, &c. but we do not know what further properties it may have; and we are wholly ignorant of the inward texture of the particles whereof it consists.—Our idea of silver therefore, not representing to the mind all the properties of silver, is *inadequate*, and imperfect.

ADESSENIARI*, a name given to those who hold that Jesus Christ is really present in the eucharist; but in a manner different from what the Romanists hold.

* The name was first framed by Præteolus, from the Latin verb *adisse*, to be present.

The *Adessenarii*, called also *Inpanatores*, are divided into four different opinions touching the point.—Some hold that the body of Jesus Christ is in the bread; others, that it is about the bread; others, that it is with the bread; and lastly, others, that it is under the bread. See **IMPANATION**.

AFFECTED Equation is that where the unknown quantity is found in two or more different degrees, or powers. *E. gr.* $x^2 - px^2 + qx = a^2b$. Where there are three different powers of x ; *viz.* x^2 , x , and x^0 . See **EQUATION**.

ADHESION*, **ADHERENCE**, in physics, the act of two bodies which are joined or fastened to each other, either by the mutual impression of their own parts; or the compression of external bodies. See **COHESION**.

* The word is compounded of the Latin, *ad*, to; and *herere* to stick or cleave.

Anatomists sometimes observe prophytes, or *Adhesions* of the lungs to the sides of the thorax, the pleura, and diaphragm, which give occasion to various disorders.

The *Adhesions* of two polished planes, and two hemispheres, are phenomena urged in behalf of the weight, and pressure of the atmosphere. See **ATMOSPHERE**.

ADHESION, in logic. The schoolmen distinguish two kinds of certitude: the one of speculation, which arises from the evidence of the thing; and the other of *Adhesion*, or attachment, which has nothing to do with evidence, but arises purely from the importance of the matter, and the interest we have in its truth.

ADHESION, or **ADHERENCE** is also used for the persisting in a former opinion, or resolution.—After the free conference between the two houses, concerning the bill for preventing occasional conformity, when the lords retired and it came to the final vote of *adhering*, they were so equally divided, that in three questions put on different heads, the *adhering* was carried but by one vote in every one, and by a different person each time.—The commons likewise *adhered*: so the bill was lost. *V. Burnet Hist. of own Time*, T. ii. p. 338.

ADJACENT*, or **ADJOINING**, something situate near, or aside of another.

* The word is compounded of *ad*, to; and *jacere*, to lie.

ADIAPHORISTS*, **ADIAPHORISTÆ**, or **ADIAPHORITES**, a name given in the sixteenth century to the moderate Lutherans, who adhered to the sentiments of Melancthon; and afterwards to those who subscribed the interim of Charles V. See **LUTHERAN**.

* The word is originally Greek, *adiaphoros*, compounded of the privative *a*, and *diaphoros* different.

ADIAPHOROUS, **ADIAPHORUS**, is a name given by Mr. Boyle, to a kind of spirit distilled from tartar, and some other vegetable bodies; and which is neither acid, vinous, nor urinous; but in many respects different from any other sort of spirit.

ADJECTIVE*, in grammar, a kind of noun joined with a substantive either expressed, or implied, to shew its manner of being; that is, its qualities, or accidents.

VOL. I.

* The word is formed of the Latin *adjicere*, to add to; as being to be added to a substantive, without which it has no precise signification at all.

Father Buffier defines *Adjectives* in a manner somewhat different from other grammarians.—Nouns, according to him, are substantives, when the objects which they represent are considered simply, and in themselves, without any regard to their qualities: on the contrary, they are *Adjectives*, when they express the quality of an object.

Thus, when I say simply, a heart; the word *heart* is a substantive, because none of its qualities are expressed; but when I say a generous heart, the word *generous* is an *Adjective*; because it adds a quality, or attribute to the heart.

Adjectives, then, appear to be nothing else but modifications.

—In effect, the end of an *Adjective* being only to express the quality of an object; if that quality be the object itself whereof we speak, it becomes a substantive; *e. gr.* if I say, *this book is good*; *good*, here, is an *Adjective*: but if I say, *good is always to be chosen*, it is evident *good* is the subject I speak of; and consequently, *good*, there, is the substantive.

On the contrary, it often happens in other languages, and sometimes in our own, that a substantive becomes an *Adjective*; as for instance, in these words, *the king, hero as he is, remembers he is a man*: where the word *hero*, though ordinarily a substantive, is yet apparently an *Adjective*.

From this idea of an *Adjective*, it appears that many of the nouns, which in the common grammars, are accounted substantives, are really *Adjectives*, and vice versa; grammar in this and a thousand other instances depending upon custom.

AD INQUIRENDUM, a judicial writ, commanding inquiry to be made of any thing touching a cause depending in the king's court, for the better execution of justice; as of bastardy, or the like.

ADJOINING, **ADJUNCTIO**, in philosophy, &c. See **ADJUNCTION**.

ADJOINING is particularly used for the associating of a person to another; or appointing him a colleague, or adjunct. See **ADJUNCT**, &c.

ADJOURNMENT*, in law, the putting off a court, or meeting; and appointing it to be kept at another time or place. See **COURT**.

* The word is formed of the Latin *ad*, to; and the French *jour*, day; *q. d.* to another day.

In which sense, we meet with the phrase *Adjournment in eyre*, for an appointment of a day when the justices in eyre intend to sit again.

Adjournments of parliament differ from prorogations. And each house has the privilege of *adjourning* itself. See **PARLIAMENT**.

ADIPOSA Membrana, in anatomy, denotes a membrane investing the body, immediately under the cutis; supposed to be the basis of the fat, which is lodged in the spaces between its fibres, and in peculiar cells formed herein.

Anatomists are divided as to the reality of this membrane; most of the later writers taking it to be no other than the exterior membrane of the *membrana carnea*, or muscularum communis.

Vasa ADIPOSA, fat-vessels, making a part of the substance of the omentum, or caul. See **OMENTUM**.

ADIPOSE Cells, **Cellule ADIPOSEÆ**, or **Loculi ADIPOSI**. See **CELLULÆ ADIPOSEÆ**.

ADIPOSE Ducts, **Ductus ADIPOSI**. See **DUCTUS ADIPOSI**.

Malpighi starts a doubt whether the *Adiposa ducts* may not be propagated from the fibres which abound in the spleen; or those fibres from them?—As also whether there be not a yet undiscovered communication between the omentum and the *membrana Adiposa*?

ADIPOSUS, fat, or fatty. The word is chiefly used in anatomy, as an epithet of certain cells, ducts, membranes, and vessels.

ADIT of a Mine, the hole, or aperture whereby it is entered and dug, and by which the water and ores are carried away. See **MINE**.

ADJUDGING, in law, the act of passing a determinate sentence in behalf of a person. See **ADJUDICATION**.

ADJUDICATION, the act of adjudging the property of a thing to a person by a legal sentence, decree, or judgment.

ADJUDICATION is more particularly used for the addition, or confining a thing sold by auction, or the like, to the highest bidder.

ADJUNCT, **ADJUNCTUM**, in philosophy, something joined or superadded to a being from without. See **ADJUNCTION**. Or, an *Adjunct* is an additament or accession to a thing, not essentially belonging to it, but only accidental thereto.

There are two kinds of *Adjuncts*; the one, a substance (whether spirit or body) accidentally superadded to another, as its subject.—Such is water in a sponge, or vessel, and such is the soul in the body.

The second an attribute, or mode, accidentally likewise furnished to a substance; whether body or spirit.—Such is figure in a body, knowledge in the mind, &c.

Some divide *adjuncts* into *Absolute*; which agree to the whole thing, without any limitation: thus, passions are *absolute Adjuncts* of a man.—And *limited*; which only agree to their subject in a respect of some certain part thereof: thus, man only thinks, considered as to his mind; only grows, as to his body, &c.

In ethics, we usually reckon seven *Adjuncts*, popularly called *circumstances*; *Quis, quid, ubi, quibus auxiliis, cur, quomodo, quando*.

ADJUNCTS, in rhetoric and grammar, are certain words or things added to others; to amplify the discourse, or augment its force.

Such are adjectives, attributes, and epithets, which are added to substantives, subjects, &c. to express their nature, qualities, accidents, &c.

Arguments drawn from *Adjuncts*, are supplements or reinforcements of the proof arising from the circumstances of the fact.

ADJUNCT, is also used in civil concerns, for a colleague, or fellow-officer, associated to another, to assist him in his ministry, and share the functions thereof. See **COLLEAGUE**.

ADJUNCTION, the act of joining, or adding of one thing to another.

All *Adjunction* implies a subordination.—The *Adjunct* is for the sake of the thing it is joined to, not contrary-wise; as, the clothes for the man; not the man for the clothes.—Whatever is a part of a thing, cannot be called an *Adjunct* of it.

There are various species of *Adjunction*; viz. by adhesion, by apposition, adjacency, accubation, incubation, imposition, affection, &c. See **ADHESION**.

AD JURA REGIS, is a writ that lies for the king's clerk, against him that sought to eject him, to the prejudice of the king's title in right of his crown.

ADJURATION*, a part of exorcism, wherein the devil is commanded in the name of God, to depart out of the body of the possessed, or to declare something.

* The word is Latin, formed of *adjurare*, to adjure; *ad*, to; and *jurare*, to swear. See **CONJURATION**.

ADJUTAGE. See the article **ADJUTAGE**.

ADJUTANT, in the military art, an officer in the army, whose business it is to aid and assist the major.

Adjutant is the name that we otherwise call *Aid-Major*.

ADJUTANT is sometimes also used by the French for an *Aid de Camp*.

The word is formed of the latin *adjutare*, to help, to assist.

ADJUTORIUM*, in anatomy, the humerus, or shoulder-bone. See **HUMERUS**.

* It is thus called from *adjutare*, to help; on account of its office in lifting the arm up.

ADMEASUREMENT, **ADMENSURATIO**, in law, a writ which lies for the bringing those to reason, or mediocrity, who usurp more of any thing than their share.

This writ lies in two cases; termed,

ADMEASUREMENT of Dower, *Admensuratio dotis*, where the widow of the deceased holds more from the heir or his guardian, on account of her dower, than of right belongs to her. And,

ADMEASUREMENT of Pasture, *Admensuratio Pasturæ*; this lies between those who have common of pastures appendant to their freehold, or common by vicinage, in case any of them surcharge the common with more cattle than they ought. See **COMMON**.

ADMINICLE, or **ADMINICULE**, **ADMINICULUM**, a termed used in some ancient statutes, for aid, help, or support.

In the French jurisprudence, *Adminiculum* signifies the beginning of a proof; on imperfect proof; or a circumstance or conjecture, tending to form or fortify a proof.

Among antiquaries, the term *Adminicules* is applied to the attributes, or ornaments wherewith Juno and some other figures are represented on medals.

ADMINISTRATION, imports the government, or direction of affairs; and particularly the exercise of distributive justice.

Indolent princes confide the *Administration* of public affairs to their ministers.—Civil wars are usually raised on pretence of *male-Administration*; or of abuses committed in the exercise of justice, &c.

ADMINISTRATION, in the English law, signifies the act, or office of an administrator, in managing and disposing of a man's goods, or estate, that died intestate, or without any will; with an intent to give an account thereof.

In this case, instruments, or powers, called letters of *Administration*, are taken out in the prerogative court.

ADMINISTRATION is sometimes also used for the direction of the affairs of a minor, a pupil, a lunatic, or the like.

ADMINISTRATION is also used in respect of ecclesiastical functions.—The parson has the *Administration* of the sacraments in his parish.—*Administration* of the Eucharist is prohibited to persons excommunicate.

In beneficiary matters, they distinguish two kinds of *Administration*; *temporal*, which relates to the temporalities of a benefice, diocese, &c. and *spiritual*, to which belong the power of excommunicating, &c.

ADMINISTRATOR, in law, he to whom the ordinary commits the *Administration* of the goods of a dead man, in default of an executor.

An action lies for, or against an *Administrator*, as for, or against an executor; and he shall be accountable to the value of the goods of the deceased, and no further.—Unless there be waste, or other abuse chargeable on him. If the *Administrator* die, his executors are not *Administrators*; but the court is to grant a new administration.—If a stranger, who is neither *Administrator*, nor executor, take the goods of the deceased, and administer; he shall be charged, and sued as an executor, not as an *Administrator*.

If a woman have goods thus committed to her charge, or administration, she is called *Administatrix*; and is accountable, &c. in like manner as an *Administrator*.

ADMIRAL, **ADMIRALUS**, **ADMIRALLUS**, a great officer, who commands the naval forces of a kingdom or state, and takes cognizance by himself, or officers appointed by him, of all maritime causes.

Authors are divided about the origin and denomination of this important officer, whom we find established, with some variation, in most kingdoms that border on the sea.—Some borrow it from the Greeks; the captain of the seas, under the emperors of Constantinople, being called *Amiralus* or *Amiralis*, of ἀμύρα, saline; or ἀμύς, salt water; and *αμύρα*, princeps; in regard his jurisdiction lay on the sea, which the Latin calls *salum*.—But it is to be observed, that this officer had not the supreme administration of naval affairs; that immediately belonged to the *Dux Magnus*, or grand general; to whom the *Amiralus* was subordinate, in quality of *Protomes*, first count, or associate.

Others derive the name from the Arabic *Amir*, or *Emir*, lord; and the Greek *αμύρα*, marine, *q. d.* chief of sea affairs; and accordingly we find *Emir* in Zonaras, Cedrenus, Nicetas, and other Greeks of that time, used in the sense of a commander.—Add, that in the life of St. Peter Thomasius, we meet with *Admiratus Jerusalem*, for the governor of Jerusalem, under the foldan of Egypt. And hence, some will have both the name, and the dignity of oriental, and even Saracen extraction: in effect, there are no instances of *Admirals* in this part of Europe, before the year 1284; when Philip of France, who had attended St. Louis to the wars against the Sarazens, created an *Admiral*.—To say no more, Du Cange assures, that the Sicilians were the first, and the Genoese the next after them, who gave the denomination *Admiral* to the commanders of their naval armaments; and that they took it from the Sarazen, or Arabic *Amir*, a general name for any commanding officer.—The first *Admiral* we read of in our English affairs, was under Edward I.

The Lord High **ADMIRAL of England**, in some ancient records called *Capitaneus Marinarum*, is judge, or president of the court of admiralty.

He takes cognizance, by himself, his lieutenant, or deputies, of all crimes committed on the sea, or the coast thereof; and all the civil, and marine transactions relating thereto: as also of what is done in all great ships, riding in any great river, beneath the bridges thereof next the sea.

Anciently, the *Admiral* had also jurisdiction in all causes of merchants, and mariners; not only on the sea, but in all foreign parts.—We have had no *High Admiral* for some years; the office being put in commission, or under the administration of the lords *Commissioners of the Admiralty*. See **COMMISSION**, &c.

ADMIRAL is also used for the commander in chief of a single fleet, or squadron.

Thus, we say, the *Admiral* of the red; the *Admiral* of the white; and *Admiral* of the blue. See **SQUADRON** and **NAVY**. The term **ADMIRAL** is also applied to all flag-officers: in which sense it includes *Vice-Admirals*, and *Rear-Admirals*. See **FLAG-Officer**.

Rear-Admiral, } See { *REAR-Admiral*.
Vice-Admiral, } { *VICE-Admiral*.

Vice-Admiral, is also an officer appointed by the lord High *Admiral*, in divers parts of the kingdom, with judges and marshals subordinate to him; for the exercising of jurisdiction in maritime affairs, within his respective limits.

There are upwards of twenty *Vice-Admirals*.—From their decisions and sentences, appeal lies to the court of *Admiralty* in London.

There are also *Admirals of the Gallies*. See **GALLEY**. Montfret makes mention of an *Admiral of the Archers*, or cross-bow-men. See **ARBALET**.

ADMIRAL, is likewise the name of the principal vessel of a fleet, which carries the *Admiral* on board

When two ships of war, bearing the same colours, meet in the same port; that which arrived first, has the title and prerogative of *Admiral*; and the other, though of greater strength and rate, shall only be accounted *Vice-Admiral*.—It is pretty much the same with the vessels in the cod and whale fishery. That which arrives first, in any harbour or creek of Newfoundland, takes the title and quality of *Admiral*, which it retains during the whole fishing season.—Such ship may secure to himself so much beech, or flakes, or both, as are necessary for the number of boats he shall use, with an overplus of one boat only more than he uses.—The master of the second ship is *Vice-Admiral*; and the master of the third *Rear-Admiral*. See *FISHERY*.

ADMIRAL'S Court, or the *High Court of ADMIRALTY*, is a court held by the *High Admiral*, or commissioners of the admiralty; to which belongs the decision of all maritime controversies, trials of malefactors, and the like.

The proceedings in this court, in all civil matters, are according to the civil law; because the sea is without the limits of the common law, and under the *Admiral's* jurisdiction.

In criminal affairs, which ordinarily relate to piracy, the proceedings in this court were anciently likewise by information and accusation, according to the civil law; but that being found inconvenient, in regard no person could be convicted without either their own confession, or an eye-witness of the fact, so that the greatest offenders often escaped with impunity: there were two statutes made by Henry VIII. enacting, that criminals should henceforth be there tried by witnesses and a jury; and this by special commission from the king to the lord *Admiral*: wherein some of the judges of the realm are always to be commissioners; and the trial according to the laws of England, directed by those statutes.

The court of *Admiralty*, is said to have been first erected in 1357, by king Edward III.—To the civil law, first introduced in it by the founder, were afterwards added, by his successors, particularly Richard I. the laws of Oleron; and the marine uses and constitutions of several people; as those of Genoa, Pisa, Marseilles, Messina, &c.

Under this court is also a court-merchant, or court of equity; wherein all differences between merchants are decided, according to the rules of the civil law.

Between the courts of *Admiralty* and common law, there seems to be *divisum imperium*; for the sea, so far as the low-water mark, is accounted *infra corpus comitatus adjacentis*; and the causes thence arising are determinable by the common law: yet when the sea is full, the *Admiral* has jurisdiction there also so long as the sea flows, over matters done between the low-water mark and the shore.

ADMIRALTY.—*Court of ADMIRALTY, Commissioners of the ADMIRALTY, &c.* See *ADMIRAL'S Court, &c.*

Among the Hollanders, the five *Admiralties*, are so many chambers, composed of the deputies of the nobles, the provinces, and the towns; to whom belong the equipping out of fleets, the furnishing provisions for them; and directing what relates to maritime matters.

ADMIRATION, in grammar, a note, or character, intimating something worthy to be admired, or wondered at.—It is expressed thus (!). See *CHARACTER*.

ADMISSION, *ADMISSIO*, in the ecclesiastical law, an act whereby a bishop, upon examination, admits or allows a clerk to be able, or competently qualified for the office; which is done by the formula *Admitte te habilem*.

ADMITTENDO Clerico, is a writ granted to him who hath recovered his right of presentation against the bishop in the common pleas.

ADMITTENDO in Socium, is a writ for the association of certain persons to justices of assize formerly appointed. See *JUSTICE*, and *ASSIZE*.

ADNATA, in anatomy, a thick white membrane, investing the ball of the eye; and making the outermost coat thereof: called also *conjunctiva*.

It is the *tunica Adnata* that makes what we commonly call the *white of the eye*; whence it is also called the *Albuginea*. See *ALBUGINEA*, and *EYE*.

AD OCTO, *q. d.* to the eighth number; a term used by some ancient philosophers, to denote the highest, or superlative degree: because in their way of distinguishing qualities, they reckoned no degree above the eighth.

ADOLESCENCE *, *ADOLESCENTIA*, the state of growing youth; or that period of a person's age commencing from his infancy, and terminating at his full stature or manhood.

* The word is formed of the latin *adolescere*, to grow.

The state of *Adolescence* lasts so long as the fibres continue to grow, either in magnitude or firmness.

It is commonly computed to be between 15 and 25, or even 30 years of age; though in different constitutions its terms are very different.—The Romans usually reckoned it from

12 to 25 in boys; and to 21 in girls, &c.—And yet, among their writers, *Juvenis* and *Adolescentis* are frequently used indifferently, for any person under 45 years.

The fibres being arrived at the degree of firmness, and tension sufficient to sustain the parts, no longer yield and give way to the efforts of the nutritious matter, to extend them: so that their farther accretion is stopped from the very law of their nutrition.

ADONIA, in antiquity, solemn feasts, in honour of Venus, and in memory of her beloved Adonis.

They were begun by the women; who imitated the cries and lamentations of Venus, for the death of her paramour.

—When they were well weary of this, they changed their note, and sung his praises, and made rejoicings, as if he were raised to life again: or rather, according to Meursius, these two offices made two distinct feasts, which were held at different times of the year, the one six months after the other; Adonis being supposed to pass half the year with Proserpine, and half with Venus.

ADONIC, in poetry, denotes a short kind of verse, consisting of a dactyl, and a spondee, or trochee.—As *Rara juvenis*.

It takes its name from Adonis; as having been originally used in the Threnæ, or lamentations for that favourite.

The chief use of the *Adonic* verse is at the end of each strophe of Sapphic verse; or among Aristophanic Anapaests in the ancient tragedy.

ADOPTIANI, in church-history, a sect of heretics in the eighth century, whose distinguishing tenet was, that Christ, as to his human nature, was not the proper, or natural, but only the adoptive son of God.

The *Adoptiani* had their rise under the empire of Charlemain about the year 783; when Elipand, arch-bishop of Toledo, having consulted Felix, bishop of Urgel, about the manner of the filiation of Christ, received for answer, that Christ, in respect of his divine nature, is the true and proper son of God, begotten naturally by the father; but that the man Christ, or the son of Mary, was only the adoptive son of God: to which Elipandus also subscribed.

ADOPTION *, *ADOPTIO*, an act by which any one takes another into his family, owns him for his son, and appoints him his heir.

* The word is derived from *adoptare*; whence the latin barbarous *adobare*, to make a knight: and hence also, *miles adobatus*, a knight newly made, or dubbed; he who knighted him, being supposed in some sense to adopt him.

The custom of *adopting* was very familiar among the ancient Romans, who had an express formula for it.—They first learnt it from the Greeks, among whom it was called *ύιαση*, filiation.

As *Adoption* was a sort of imitation of nature, intended for the comfort of those who had no children; eunuchs were not allowed to adopt; as being under an actual impotency of begetting children.

Neither was it lawful for a young man to adopt an elder; because that would have been contrary to the order of nature; but it was even required, that the person who adopted, should be eighteen years elder than his adoptive son; that there might at least appear a probability of his being the natural father.

The Romans had two forms of *Adoption*; the one before the pretor: the other at an assembly of the people, in the times of the commonwealth, and afterwards by a rescript of the emperor.

In the first, the natural father addressed himself to the pretor, declaring that he emancipated his son, resigned all his authority over him, and consented he should be translated into the family of the adopter.

The latter manner of *Adoption* was practised, where the party to be adopted was already free; and this was called *Adrogation*.

The person adopted changed all his names; assuming the prename, name, and surname of the person who adopted him.

The Romans had likewise their *testamentary Adoptions*, wherein persons were adopted by the last will of the deceased; but these were never esteemed valid, till they had been confirmed by the people.

In later times another form of *Adoption* took place; viz. by cutting off the hair of a person, and delivering it to the father that was to adopt him.

It was this way that pope John VIII. adopted Boson king of Arles; which perhaps is the only instance in history of *Adoption* in the order of ecclesiastics; a law that professes to imitate nature, not daring to give children to those in whom it would be thought a crime to beget any.

M. Bouffac, in his *Noctes Theologice*, gives us divers modern forms of *Adoption*; some performed at baptism; others by the sword, &c.

ADOPTIVE, *ADOPTIVUS*, or *ADOPTIVUS*, denotes a person adopted by another.

Adoptive children, among the Romans, were on the same footing

footing with natural ones; for which reason, they were either to be instituted heirs, or expressly disinherited; otherwise the testament was null.

The emperor Adrian preferred *Adoptive* children to natural ones; by reason we chuse the former, but are obliged to take the latter at random.

M. Menage has published a book of elegies, or verses addressed to him; which he calls *Liber Adoptivus*, an *Adoptive* book; and adds it to his other works.—Heinsius, and Furfemburg of Munster, have likewise published *Adoptive* books.

ADOPTIVE, in church-history. See **ADOPTIAN**.

ADORATION *, the act of rendering divine honours; or of addressing God, or a being, as supposing it a God. See **GOD**, and **WORSHIP**.

* The word is compounded of *ad*, to; and *or*, *oris*, mouth; and literally signifies, to apply the hand to the mouth; *Manus ad os obsecrare*, *q. d.* to kiss the hand: this being, in the eastern countries, one of the great marks of respect and submission.

The *Adoration* of idols is called *Idolatry*.

The Romanists profess a subordinate *Adoration* to saints, images, relics, the cross, &c.

The election of popes is performed two ways, by *Adoration* and by scrutiny.—In the election by *Adoration*, the cardinals rush hastily, as if agitated by some spirit, and fall without more ado to the *Adoration* of some one among them, and proclaim him pope.

In the election by scrutiny, *Adoration* is the last thing, and follows the election; as in the other it is the election itself, or rather supercedes the election.

AD PONDUS Omnium, to the weight of the whole; an abbreviation among physicians, &c. signifying, that the last prescribed ingredient is to weigh as much as all the others put together.

AD QUOD Damnum, a writ directed to the sheriff, commanding him to enquire what hurt may befall the king by granting a fair, or market in any town, or place.

The same writ also issues for an inquitant to be made of what the king, or other person may suffer, by granting lands in fee-simple to a convent, chapter, or other body politic; by reason such land falls into mortmain: that is, into such condition, that the chief lord loses all advantage of heriots, service of court, and escheats, upon any traitorous or felonious offence committed by the tenant: for that a body politic dies not, nor can perform personal service to the king, or their mein lords; as single persons may do. See **MORTMAIN**.

ADRAGANTH, or **TRAGACANTH**, a sort of gum. See **TRAGACANTH**.

ADDRESS, or **ADDRESS**. See the article **ADDRESS**.

ADROGATION *, in antiquity, a species of adoption, whereby a person who was his own master, was taken by another into the relation of a son.

* The word is compounded of *ad*, to; and *rogare*, to ask; on account of a question put in the ceremony of it, whether the adopter, would take such person for his son? and another to the adoptive, whether he consented to become such a person's son?

AD TERMINUM qui præterit, is a writ of entry, which lies where a man, having leased lands or tenements for term of life, or years, is, after the term expired, held from them by the tenant, or other stranger who enjoys the same, and de facto the lessor.—The same writ also lies for the lessor's heir.

ADVANCE-FOSSE, or *Ditch*, in fortification, denotes a ditch of water round the esplanade, or glacis of a place; to prevent its being surprised by the besiegers. See **FOSSE**, and **GLACIS**.

ADVANCE-GUARD, or **VAN-GUARD**, is the first line, or division of an army ranged, or marching in battle-array; or that part of it which is next the enemy, or which marches first toward them.

The whole body of an army is divided into *Advance-guard*, *rear-guard*, and *main-body*.

The word is sometimes also applied to a small party of horse, viz. 15, or 20, commanded by a lieutenant, beyond, and in fight of, the main guard.

ADVANCER, among hunters, is one of the starts, or branches of a buck's attire, between the back antler and the palm.

ADVENT, **ADVENTUS**, in the calendar, the time immediately preceding Christmas; anciently employed in pious preparation for the *Adventus*, or coming on, of the feast of the nativity.

Advent includes four sundays, or weeks; commencing either from the Sunday which falls on St. Andrew's day, or that next before or after it, i. e. from the Sunday which falls between the 27th of November, and the third of December inclusive.—But it is to be noted, this rule has not always obtained.—In the Ambrosian office, there are six weeks marked

for *Advent*; and St. Gregory, in his Sacramentary, allows five.

The first week of *Advent*, in our way of reckoning, is that wherein it begins; but it was anciently otherwise; the week next Christmas was reputed the first; and the numeration carried backwards.

Great austerity was practised in the ancient church during this season.—At first they fasted three days a week; but they were afterwards obliged to fast every day: whence the season is frequently called in ancient writers, *Lent*, and *Quadragesima S. Martini*.

The courts of justice were at one time all shut.—In *advent* under king John, it was expressly declared, that *in Adventu Domini nulla Assisa capi debet*: but this was afterwards altered by the statute of Westminster; and it was made lawful, in respect of justice and charity, which ought at all times to be regarded, to take offices of novel disseisin, mort d'ancestor, and darrein presentment, in the time of *Advent*, Septuagesima, and Lent.

ADVENT is also one of the times, from the beginning whereof, to the end of the octaves of the Epiphany, the solemnizing of marriage is forbid, without express licence. See **MARRIAGE**.

ADVENTITIOUS, something accruing, or befalling a person, or thing, from without.

Thus, *Adventitious* matter is such matter as doth not properly belong to any body, but is casually joined to it.

ADVENTITIOUS, in the civil laws, is applied to such goods as fall to a man, either by mere fortune, or by the liberality of a stranger, or by collateral, not direct succession.

In this sense the word stands opposed to *Profecutitious*; by which are signified such goods as descend in a direct line, from father to son.

AD VENTREM inspicendum, in law. See **VENTRE inspicendum**.

ADVENTURE *, an extraordinary, and surprizing enterprise, or accident, either real, or fictitious.

* The word is French, and literally denotes an event, or accident.

Novels, romances, &c. are chiefly taken up in relating the *Adventures* of cavaliers, lovers, &c.

Mine-ADVENTURE. See the article **MINE-ADVENTURER**.

ADVERB, **ADVERBIUM**, in grammar, a particle joined to a verb, adjective, or participle, to explain their manner of acting or suffering; or to mark some circumstance or quality signified by them.

The word is formed from the preposition *ad*, to; and *verbum*, a verb, and signifies literally a word joined to a verb, to show how, or when, or where, one is, does, or suffers: as the boy paints neatly, writes ill; the house stands there, &c.

Not that the *Adverb* is confined purely to the verbs; but because that is its most ordinary use. Whence it becomes so denominated *κατ' ἔργον*. We frequently find it joined to adjectives, and sometimes even to substantives, particularly where those substantives signify an attribute, or quality of the thing spoken of: *v. gr.* he is *very* sick; he is *truly* king.

An *Adverb* is likewise joined sometimes to another *Adverb*, to modify its meaning: *v. g.* very devoutly, &c. Whence some grammarians chuse rather to call *Adverbs* modificatives; comprising under this one general term, both *Adverbs*, conjunctions, prepositions, and even adjectives.

Adverbs are very numerous, but they may be reduced under the general classes of *Adverbs* of time, of place, of order, of quantity, of quality, of manner, of affirmation, of doubting, and of comparison.

ADVERSARIA, among the ancients, was used for a book of accounts, like our journal or day-book.

Hence, **ADVERSARIA** is sometimes also used among us for a common-place-book.

ADVERSARY *. See **ANTAGONIST**.

* The word is formed of the Latin preposition *adversus*, against; from *ad*, to; and *vertere*, to turn.

ADVERSATIVE, in grammar.—A particle *Adversative*, is that which expresses some difference, or opposition between what goes before, and what follows.

Thus, *or* is an *Adversative*; *v. gr.* in yes, *or* no.

ADVERTISEMENT *, an intelligence, or information, given to persons interested in an affair.

* The word is formed either of the French *Avertissement*, or from the Latin *advocare*, to turn to, to advert, consider, regard.

ADULT *, **ADULTUS**, one who is arrived at years of discretion; and entered upon manhood, or the age of adolescence; and is old enough to have understanding, and discernment.

* The word is formed from the participle of the verb *adulescere*, to grow up. See **ADOLESCENCE**.

There is a notable difference between the proportions of infants and *Adults*.—A man, M. Dodart observes, formed like a fœtus, would be a monster, and would scarce be acknowledged

ledged for one of the species.—The Anabaptists confer the sacrament of baptism upon none but *Adults*. See BAPTISM, and ANABAPTIST.

ADULTERATION*, in a general sense, the act of corrupting, or debasing a thing that was pure, by some improper admixture.

* The word is Latin; formed of the verb *adulterare*, to corrupt, by mingling something foreign (*ad alterum*, to another) to any substance.

We have laws against the *Adulteration* of coffee, tea, tobacco, snuff, wine, wax, hair-powder, &c.

To adulterate or debase the current coin, is a capital crime in all nations.—The ancients punished it with great severity; among the Egyptians both hands were cut off; and by the civil law, the offender was thrown to wild beasts: The emperor Tacitus enacted, that counterfeiting the coin should be capital: and under Constantine it was made treason, as it is also among us. *Arbuth. Diff.* p. 8.

ADULTERINE, in the civil law, is particularly applied to a child issued from an adulterous amour, or commerce.

Adulterine children are more odious than the illegitimate offspring of single persons.—The Roman law even refuses them the title of natural children; as if nature disowned them.

ADULTERY, **ADULTERIUM**, (in ancient law-books called *Adovtery*) a crime committed by married persons, against the faith pledged to each other in marriage; by having carnal commerce with some other: or even by a person not married; by having to do with another that is.

The ancient Romans had no formal law against *Adultery*; but both the accusation, and punishment were arbitrary.—The emperor Augustus was the first who brought them into a law; which he had the misfortune to see executed in the persons of his own children.—This was the Julian law, by which *Adultery* was punished with death. But though this law left the accusation of *Adultery* open to every body; yet it is certain, *Adultery* has been always looked upon as a private, and domestic crime, rather than a public one; so that strangers were seldom suffered to prosecute, especially where the couple were peaceable, and the husband made no complaint.

Some of the succeeding emperors abrogated this law, which left the accusation of *Adultery* open to strangers; in regard such accusation could not be entered without setting the husband, and wife at variance, throwing the children into a state of uncertainty, and bringing contempt and derision upon the husband; for as the husband is the nearest interested in the matter, it is supposed he will examine his wife's actions with more circumspection than any other: so that where he is silent, it is not fair any body else should speak for him.

For this reason, the law, in some cases, has made the husband both judge, and executioner in his own cause; and has allowed him to revenge himself of the injury, by taking away the lives of the adulterers whom he should apprehend in the act.—It is true, where the husband made a trade of his wife's infamy, or where having seen her shame with his own eyes, he yet suffered patiently, and dissembled the affront; in these cases, *Adultery* became a crime of public concern: and the Julian law provides punishment for such husbands, as well as for their wives.

In most European countries, at this day, *Adultery* is not a public crime; and none but the husband is suffered to intermeddle, excepting where the scandal is very notorious.—Even the king's advocates, attorney, or the like, may not intermeddle.

Add, that though the husband who violates the conjugal bond be guilty of *Adultery* as well as the wife, yet is not the wife allowed to accuse, or prosecute him for the same.

Socrates relates, that under the emperor Theodosius, in the year 380, women convicted of *Adultery* were punished by a public confutation.

Lycurgus punished the adulterer as a parricide.—The Locians tore out his eyes; and most of the orientals still punish him very severely.

The Saxons formerly burnt the adulterers, and over her ashes erected a gibbet, whereon the adulterer was hanged.—In England, king Edmond punished *Adultery* as homicide; but Canutus ordained the man to be banished, and the woman to have her nose and ears cut off.—*Qui uxoratus faciet Adulterium, habet rex vel dominus superiorem; Episcopus inferiorem*. L. Hen. I. c. 12. De *Adulterio per totam Client (Cantium) habet Rex hominem, Episcopus mulierum*. Domesday, tit. Cestre Civit.

In Spain, they punished *Adultery* in men by cutting off that part which had been the instrument of the crime.

In Poland, before Christianity was established, they punished *Adultery* and fornication in a very particular manner.

Vol. I.

ner: the criminal they carried into the market-place, and there fattened him by the testicles with a nail; laying a razor within his reach, and leaving him under a necessity, either of doing justice upon himself, or of perishing in that condition.

By the civil law, as altered by Justinian, who, at the instance of his wife Theodora, mitigated the severity of the *lex Julia*, *Adultery* is punished with whipping, and shutting up in a convent for two years: during which time, if the husband do not consent to take her back again, she is thence and shut up for life.—This is called *authententicating*, as having been established by an authentic.

At present, the laws are still more favourable.—To divorce, and strip the adulteress of her dower, is all her punishment among us: in the Romish countries, they also shut her up in a nunnery.—The whipping is omitted in France, to make the husband less averse to take her back again within the two years.

The Lacedaemonians, instead of punishing *Adultery*, permitted it, or at least tolerated it; as we are told by Plutarch.

According to some of the papal decisions, *Adultery* renders marriage between the two criminals unlawful; this making what the schools call *impedimentum criminis*.

The Greeks, and other Christians throughout the east, adhere to the opinion that *Adultery* dissolves the bond of marriage: so that the husband, without more ado, may marry another.—The council of Trent condemns that opinion; and even in some measure anathematizes those who hold it. *Seff. XXIV. Can. 7.*

ADULTERY is also used by some fanciful astronomers and astrologers, for an eclipse of the sun, or moon; happening in an unusual, and; as they suppose, irregular manner: as in the case of horizontal eclipses; where, though the sun and moon be diametrically opposite, yet they appear as if both above the horizon at the same time.

ADVOCATE*, **ADVOCATUS**, among the Romans, a person skilled in their law, and who undertook the defence of caecies at the bar.

* The word is compounded of *ad*, to; and *vocare* to call: *q. d.* I call to my aid, or defence.

The Roman *Advocates* answered to one part of the office of a barrister among us, *viz.* the pleading part; for as to the giving counsel, they never meddled with it: that being the business of the juriconsulti.

The Romans, in the first ages of their state, held the profession of an *Advocate* in great honour; and the seats of their bar were crowded with senators, and consuls; they, whose voices commanded the people, thinking it an honour to be employed in defending them.

They were styled, *Comites, Honorati, Clarissimi*, and even *Patroni*; as if their clients were not less obliged to them, than freedmen to their masters. See **PATRON**, and **CLIENT**.

The bar was not at that time venal.—Those who aspired to honours, and offices, took this way of gaining an interest in the people, and always pleaded *gratis*.

But no sooner was luxury and corruption brought into the commonwealth, than the bar became a sharer in them.—Then it was that the senators let out their voices for pay, and zeal and eloquence were sold to the highest bidder.—

To put a stop to this abuse, the tribune Cincius procured a law to be passed, called from him, *Lex Cincia*, whereby the *Advocates* were forbid to take any money of their clients.—Fred. Brunnerus has published an ample comment upon this law.

It had before this been prohibited the *Advocates* to take any presents, or gratuities for their pleading.—The emperor Augustus added a penalty to it: notwithstanding which, the *Advocates* played their part so well, that the emperor Claudius thought he did a great thing, when he obliged them not to take above eight great sesterces, which are equivalent to upwards of 64 pounds sterling, for pleading each cause.

ADVOCATE is still used in countries, and courts, where the civil law obtains, for those who plead and defend the causes of clients trusted to them.

In Scotland they have a college, or *Faculty of Advocates*, 180 in number; appointed to plead in all actions before the lords of session.—They have a dean, treasurer, clerks, examiners, and a curator of their library.

By the articles of the union, none are to be named ordinary lords of session, except those who have been *Advocates*, or principal clerks of session for five years, &c.

In France, they have two kinds of *Advocates*, *viz.* pleading *Advocates*, *Avocats Plaidants*; and counsel *Advocates*, *Avocats Consultants*.

This distinction was formed with a view to the two branches among the Romans, *Advocati*, and *Juriconsulti*.—Yet there is this difference, that the function of the *Juriconsulti*, who only gave their bare advice, was of a different kind from that of the *Advocati*; being a sort of private, and perpetual magistra-

magistrature, principally under the first emperors; and the *Advocati* never became *Juriconsulti*. Whereas, on the other hand, in France, after the *Advocates* have attained to reputation, and experience enough at the bar, they quit so busily a province, and become as it were chamber council.—They have also their *Advocate* general, and king's *Advocate*, *Avocat du Roy*.

LORD ADVOCATE, in Scotland, is one of the officers of state, whose business is to give his advice about the making, and executing of laws; to defend the king's right and interest in all public meetings; to prosecute all capital crimes before the judiciary; and to concur in all pursuits before sovereign courts for breaches of the peace; and also in all matters wherein the king, or his donator, has interest.—He intends no process of treason, except by warrant of privy council.

The *Lord Advocate* is sometimes an ordinary lord of session; in which case, he only pleads in the king's causes: otherwise, he is at liberty to plead in all causes.

FISCAL ADVOCATE, *Fisci Advocatus*, was an officer instituted by the emperor Adrian, to defend the cause, and interests of the *Fiscus*, or private treasury; in the several tribunals where that might be concerned. See **FISCUS**.

CONSISTORIAL ADVOCATE, is an officer of the court of Rome, whose business it is to plead on the oppositions made to the provisions of benefices in that court. See **PROVISION**. There are ten of these in number.

ADVOCATE of a City, or Town, is a magistrate established in several places of Germany, for the administration of justice in that city, in the emperor's name. See **ADVOWEE**.

ADVOCATE*, is more particularly used in church history, for a person appointed to defend the rights and revenues of a church, or religious house.

* In this sense it amounts to the same with *Advocatus*, *Defensor*, *Conservator*, *Oeconomus*, *Causidicus*, *Mundiburdus*, *Tutor*, *Azor*, *Lay Pastor*, *Vidams*, or *Scholasticus*.

The word *Advocatus*, or *Advocatus* is still retained, for what we usually call the *Patron*, or he who has the advowion, or right of presentation in his own name.

The abbies and monasteries had also all their *Advocates*, or *Advocatus*.

ADVOCATIONE Decimarum, a writ which lies for the claim of the fourth part, or upward, of the tithes that belong to any church. See **TITHES**.

ADVOWEE*, in ancient customs and law-books, denotes the *advocate* of a church, religious house, or the like.

* The word is otherwise written *Advocatus*, *Advocatus*, and *Advocatus*; sometimes *Advocatus*; being derived from the French *Advouer*, to own, or acknowledge.

There were *Advocates* of cathedrals, abbies, monasteries, &c.—Thus, Charlemain gave the title of *Advocatus* of St. Peter's; king Hugh, of St. Riquier; and Bolandus mentions some letters of pope Nicholas, by which he constituted king Edward the confessor, and his successors, *Advocates* of the monastery at Westminster, and of all the churches in England.

These *Advocates* were the guardians, protectors, and, as it were, administrators of the temporal concerns of the churches, &c. and under their authority, were passed all contracts which related thereto.

It appears also, from the most ancient charters, that the donations made to churches, were conferred on the persons of the *Advocates*.—They always pleaded the causes of the churches in court, and distributed justice for them, in the places under their jurisdiction.—They also commanded the forces furnished by their monasteries, &c. for the war; and even were their champions, and sometimes stood duels for them.

This office is said to have been first introduced in the fourth century, in the time of Stilico; though the Benedictines do not fix its origin before the eighth century. *Act. Sancti Benedicti*. S. III. P. 1. Pref. p. 91, &c.

By degrees, men of the first rank were brought into it, as it was found necessary, either to defend with arms, or to protect with power and authority. In some monasteries, they were only called *Conservators*; but these, without the name, had all the functions of *Advocates*.

There were also sometimes several *Sub-Advocates*, or sub-advocates in each monastery, who officiated instead of the *Advocates* themselves; which, however, proved the ruin of monasteries; those inferior officers running into great abuses.

Hence also, husbands, tutors, and every person in general, who took upon him the defence of another, were denominated *Advocates*, or *advocatus*.—Hence several cities had their *Advocates*; which were established long after the ecclesiastical ones, and doubtless from their example.—Thus, we read in history of the *Advocates* of Augsburg, of Arras, &c.

The vidames assumed the quality of *Advocates*; and hence it is, that several historians of the eighth century, confound the two functions together. See **VIDAME**.

Hence also it is, that several secular lords in Germany bear mitres for their crests, as having anciently been *Advocates* of the great churches.

Spelman distinguishes two kinds of ecclesiastical *Advocates*.—The one, of causes, or processes, *Advocatus Causarum*, the other, of territory, or lands, *Advocatus Soli*. The former were nominated by the king, and were usually lawyers, who undertook to plead the causes of the monasteries.

The other, which still subsist, and are sometimes called by their primitive name, *Advocatus*, though more usually patrons, were hereditary; as being the founders, and endowers of churches, &c. or their heirs. See **PATRON**.

Women were sometimes *Advocates*, *Advocatiſſæ*. And, in effect, the canon law mentions some who had this title, and who had the same right of presentation, &c. in their churches, which the *Advocates* themselves had.

In a Stat. 25 Edw. III. we meet with *Advocatus Paramount*, for the highest patron; that is, the king.

There were also *Advocates* of countries, and provinces.—In a charter of the year 1187, Berthold duke of Zeringhen, is called *Advocatus* of Thuringia; and in the *Notitia* of the Belgic churches, published by Miræus, the count of Lovain is styled count and *Advocatus* of Brabant.—In the eleventh and twelfth centuries, we also meet with the *Advocates* of Alstia, of Suabia, &c.

Raymond, d'Agiles relates, that after the recovery of Jerusalem from the Saracens, it being proposed to elect a king thereof, the bishops pleaded, *Non debere ibi eligi regem, ubi Deus passus & coronatus est*, &c. That "they ought by no means to appoint a king, in a place where God had suffered and been crowned; but should content themselves with electing an *Advocatus*, or advocate of the city, to take care of the garrison, &c."—In effect, Dodechin, a German abbot, who wrote a voyage to the Holy Land in the twelfth century, calls Godfrey of Bulloign, *Advocatus of the holy sepulchre*.

ADVOWING*, or **AVOWING**, **ADVOCARE**, in law, the justifying, or maintaining an act formerly done.

* Bracton, and other ancient lawyers, use the Latin term *Advocare*, in the same signification; as, *Advocatio diffinire*, L. IV. c. 26. Cassaneus also uses the substantive *Defavocamentum*, for a disavowing, or refusing to avow.

Thus, if one take a distress of rent, or other thing, and he that is distrained sues a replevin, the distrainer, justifying or maintaining the act, is said to *avow*.

The original use of the word was this.—When stolen goods were bought by one, and sold to another, it was lawful for the right owner to take them wherever they were found; and he in whose possession they were found, was bound, *Advocare*, i. e. to produce the seller to justify the sale, and so on till they came at the thief.

Afterwards, the term was applied to any thing which a man acknowledged to be his own, or done by himself; in which sense, it is mentioned by Fleta, L. I. pars 4. *Si vir ipsum in domo sua suscepit, nutritur & advocaverit solum suum*.

ADVOWSON, **ADVOCATIO**, the quality, or office of an *Advocatus*, or advocate.

ADVOWSON, or **ADVOWZEN**, in common law, signifies a right to present to a vacant benefice.

In this sense, the word imports as much as *Jus patronatus* in the canon law. See **PATRONAGE**.

The reason of the name *Advowson*, *Advocatio*, is, that anciently those who had a right to present to a church, were maintainers of it, or great benefactors to it; and were sometimes called *Patroni*, and sometimes *Advocati*, or *Advocatus*.

In the general, an *Advowson* is where either a bishop, dean and chapter, or a lay-patron, have a right to present whom they please to any spiritual benefice, when it becomes void.

This *Advowson* is of two kinds.—*Advowson in gross*, that is, not immediately restrained, or adhering to any manor, as parcel thereof.

And *Advowson appendant*, which depends on a manor, as appurtenant to it.—This *Kitchen* calls an *Incident*, which may be separated from its subject.

Add, that as the builders and endowers of a church were the patrons of it; so those who founded any religious house, had the *Advowson* or patronage of it.

Sometimes the patron had the sole nomination of the prelate, abbot, or prior; either by investiture, (i. e. delivery of a pastoral staff) or by direct presentation to the diocesan: and if a free election was left to the religious, yet a *Congé d'Elire*, or licence of election, was first to be obtained of the patron, and the person elected was confirmed by him.

If the founder's family became extinct, the patronage of the convent went to the lord of the manor.—Unless the several colleges in the universities be restrained in the number of *Advowsons* they may receive; it is argued they will in time acquire such a stock, as to frustrate the design of their foundation (which is the education of youth) by creating too quick a succession of fellows; so that there will not be in the colleges a sufficient number of persons of sufficient age, knowledge and experience.

hience to instruct and form the minds of the youth.—In some colleges the number of *Advowsons* is said to be already two thirds, or more of the number of fellows.—'Tis objected on the other side, that the succession of fellows may be too slow, as well as too quick; whereby persons well qualified may be detained too long in colleges, as not to have strength or activity enough left for the discharge of parochial functions. V. *Kenn. Paroch. Antiq. in voc.*

ADVOWTRY. See the article **ADULTERY**.

ADUST*, **ADUSTUS**, among physicians, &c. is applied to such humours, as by long heat become of a hot, and fiery nature.

* The word is formed of the Latin *adurere*, to burn.

Such is cholera supposed to be:—Melancholy is usually considered as black, and *adust* bile.

Blood is said to be *adust*, when by reason of some extraordinary heat, its more subtle parts are all evaporated, leaving the grosser, with all the impurities therein, half torried, as it were.

ADYTUM*, *Adytos*, a secret, or retired place in the Pagan temples, where oracles were given, and into which none but the priests were admitted.

* The word, originally Greek, signifies inaccessible; being compounded of *α*, not; and *δύω*, or *δύω*, to enter.

ADZE, or **ADDICE**, a cutting tool, of the ax-kind; having its blade made thin, and arching; and its edge at right-angles to the handle; chiefly used for taking thin chips of timber or boards, and for paring away certain irregularities which the ax cannot come at.

The *Adze* is used by carpenters, but more by coopers, as being convenient for cutting the hollow sides of boards, &c. It is ground from a bafe on its inside to its outer edge. So that when it is blunt, they cannot well grind it without taking its helve out of the eye.

Æ, or **Æ**, a diphthong, or double vowel, compounded of **A** and **E**.

Authors, are by no means agreed as to the use of the *æ* in English words.—Some, out of regard to etymology, insist on its being retained in all words, particularly technical ones, borrowed from the Greek and Latin; while others, from a consideration that it is no proper diphthong in our language, its found being no other than that of the simple *e*; contend, that it ought to be intirely disused, except in words which retain the Latin and Greek form in every thing else.

For our own part, till the point is a little better settled, we must be continued to steer a kind of middle course; conforming ourselves to custom as nearly as may be.—Such articles, therefore, as are omitted under *Æ*, the reader may please to look for under *E*.

ÆACEA, in antiquity, solemn feasts and combats, celebrated in *Ægina*, in honour of *Æacus*, who had been their king, and who on account of his singular justice upon earth, was supposed to have a commission given him, to be one of the judges in hell.

ÆCHMALOTARCHA, *Αἰχμαλωτοάρχης*, in antiquity, a Greek term, signifying, the chief, or leader of the Jewish captives in Babylonia.

The Jews, who refused to follow Zorobabel, and return with him to Jerusalem, after the Babylonish captivity; created an *Æchmalotarch*, to govern them.—Not that the Jews themselves called him by this name, as some authors have asserted; for that people spoke Hebrew, or Chaldee, not Greek. But Origen, and others, who wrote in the Greek tongue, rendered the Hebrew name מֶלֶךְ שָׂרָן *Rofch galuth*, q. d. *Chief of the Captivity*, by a Greek name of the like import, *αἰχμαλωτοάρχης*, formed from *αἰχμαλωτος* captive, of *αἶχμη*, point, spear, or war: and *αρχων*, commander, chief.

However, the Jews seemed to have had officers of this kind before the return from Babylon: witness the history of *Sufannah*; the two elders who condemned her, being supposed to have been *Æchmalotarches* that year.—The Jewish writers assure us, that the *Æchmalotarches* were only to be chosen out of the tribe of Judah.

ÆDES, in antiquity, a chapel, or inferior kind of temple, distinguished by this, that it was not consecrated by the Augurs, as those properly called temples were. See **TEMPLE**.

Such was the *Ærarium*, or treasury; called *Ædes Saturni*. See **ÆRARIUM**.

ÆDILE*, **ÆDILIS**, in antiquity, a Roman magistrate, vested with divers functions, chiefly that of superintending the buildings both public and private; as baths, aqueducts, roads, bridges, caufeways, &c.

* The word is formed of *Ædes*, temple, or house, on account of their having the care of temples, houses, &c.

The *Ædiles* at Rome corresponded to what the Greeks called *Agoranomi*, and *Alynomi*; they differed from *Oeconomi* and *Arcarii*, who were rather receivers of the revenues; also from *Logistæ*, *Curatores* & *Patres civitatis*.

To the *Ædiles* belonged the inspection of the weights and measures. They fixed the rates of provisions, and took care the people were not exacted on therein. The inquiry and cognizance of debauchees, and disorders in public houses, likewise belonged to them: they were also to revise comedies; and it belonged to them to treat the people with grand games, and spectacles at their own expence.

To the *Ædiles* also belonged the custody of the plebiscita, and the censure and examination of Books. They had the power on certain occasions of issuing edicts; and by degrees they procured to themselves a considerable jurisdiction, the cognizance of various causes, &c.—This office ruin'd numbers by its expensiveness, so that in Augustus's time, even many senators declined it on that account.

All these functions, which rendered the *Ædiles* so considerable, belonged at first to the *Ædiles* of the people, *Ædiles plebeii*, or *minores*. These were only two in number; and were first created in the same year as the tribunes: for the tribunes, finding themselves oppressed with the multiplicity of affairs, demanded of the senate to have officers, whereon they might discharge themselves of matters of less importance; and, accordingly, two *Ædiles* were created. And hence it was, that the *Ædiles* were elected every year, at the same assembly as the tribunes.

But these plebeian *Ædiles*, having refused, on a signal occasion, to treat the people with shews; as pleading themselves unable to support the expence thereof: the patricians made an offer to do it, provided they would admit them to the honours of the *Ædilate*.

On this occasion, there were two new *Ædiles* created, of the number of the patricians, in the year of Rome 388. They were called *Ædiles curules*, or *maiores*; as having a right to sit on a *curule* chair, enriched with ivory, when they gave audience; whereas the plebeian *Ædiles*, only sat on benches. See **CURULE**.

Besides that the *curule Ædiles* shared all the ordinary functions with the plebeian, their chief employ was, to procure the celebration of the grand Roman games, and to exhibit comedies, shews of gladiators, &c. to the people.

To ease these four first *Ædiles*, Cæsar created a new kind, called *Ædiles cereales*, as being deputed chiefly to take care of the corn, which was called *donum Cereis*; for the heathens honoured Ceres as the goddess who presided over corn, and attributed to her the invention of agriculture. These *Ædiles cereales* were also taken out of the order of patricians. In the municipal cities there were *Ædiles*, with the same authority as at Rome.

We also read of an *Ædilis alimentarius*, expressed in abbreviation by *Ædil. alim.* whose business seems to have been to provide diet for those who were maintained at the public charge, though others assign him a different office.

In an ancient inscription we also meet with *Ædile* of the camp, *Ædilis castrorum*.

ÆGILOPS*, in medicine, a tumor, or rather ulcer, in the great angle of the eye; either with, or without an inflammation.

* The word in its original Greek, *αἰγίλη*, signifies a goat's eye; compounded of *αἶξ*, goat, and *ἄλη*, eye; in regard, goats are supposed extremely liable to this distemper.

Authors frequently use the words *Ægilops*, *Anchilops*, and *Fistula Lachrymalis* promiscuously; but the more accurate, after *Ægineta*, make a difference.—The tumor, ere it becomes ulcerous, is properly called *Anchilops*; and, after it is got into the lachrymal passages, and has rendered the *Os Lachrymale* carious, *Fistula Lachrymalis*.

If the *Ægilops* be accompanied with an inflammation; it is supposed to take its rise from the abundance of blood, which a plethoric habit discharges on the corner of the eye.—If it be without an inflammation, it is supposed to proceed from a viscous pituitous humour, thrown upon this part. The method of cure is the same as that of the *Ophthalmia*.

If the *Ægilops* be neglected; it bursts, and degenerates into a fistula, which eats into the bone. See **FISTULA**.

ÆGIPAN*, in antiquity, a denomination given to Pan, and the Panes. See **SATYR**.

* The word is compounded of *αἶξ*, *αἶγος*, goat; he being represented with the horns, legs, feet, &c. of that animal.

The ancients also give the name *Ægipans* to a sort of monsters mentioned by Pliny, Solinus, and Pomp. Mela, L. I. c. 8.—Salmastius, in his notes on Solinus, takes *Ægipan* to have signified the same in Lybia with *Sykranus* among the Romans. See **SYLVAN**.

Vossius rejects the opinion, and shews, that the *Ægipans* had not faces like men, as the *Sylvans* had; but like goats. In effect, the whole upper part of the body resembled that animal; and as to the lower, they painted it with a fish's tail. The monster represented on some medals of Augustus, by antiquaries called *Capricornus*; appears to be the true *Ægipan*.

ÆGIS, in the ancient mythology, a name given to the shield, or buckler of Jupiter, and Pallas.

The

The goat Amalthea, which had suckled Jove, being dead; that God is said to have covered his buckler with the skin thereof: whence the appellation *Ægis*, from *αις*, *αιγος*, the-goat.

Jupiter, afterwards restoring the beast to life again, covered it with a new skin, and placed it among the stars.

As to his buckler, he made a present of it to Minerva; whence that goddess's buckler is also called *Ægis*, in Virgil, *Æneid* L. VIII. v. 354, and 435, and by other authors.

Minerva, having killed the Gorgon Medusa, nailed her head in the middle of the *Ægis*, which henceforth had the faculty of converting into stone all those who looked thereon; as Medusa herself had done during her life. See Homer, *Iliad* L. 5.

Others take the *Ægis* not to have been a buckler, but a cuirass, or breast-plate. And it is certain, the *Ægis* of Pallas, described by Virgil, *Æneid* L. VIII. v. 435, must have been a cuirass; since the poet says expressly, that Medusa's head was on the breast of the goddess. But the *Ægis* of Jupiter, mentioned a little higher, v. 354, seems to have been a buckler. The words

*Cum septe nigrantem
Ægida concuteret dextra,*

agreeing very well to a buckler; but not at all to a cuirass, or breast-plate.

Servius makes the same distinction on the two passages of Virgil; for on v. 354, he takes the *Ægis* for the buckler of Jupiter, made as above mentioned of the skin of the goat Amalthea: and on verse 435, he describes the *Ægis* as the armour which covers the breast; and which in speaking of men is called *Cuirass*, and *Ægis* in speaking of the gods. Many authors have overlooked these distinctions for want of going to the sources.

ÆGYPTIACUM, in medicine, a name given to divers unguents of the detergent, or corrosive kind. See **UNGUENT**, &c.

We meet with a *black*, a *red*, a *white*, a *simple*, a *compound*, and a *magistral Ægyptiacum*.

The *simple Ægyptiacum*, which is that usually found in our shops, is a composition of verdigrise, vinegar and honey boiled to a consistence: the prescription is Metue's.—It is usually supposed to take its name from its dusky colour, wherein it resembles that of the natives of Egypt.—It is improperly called an unguent; as there is no oil, or other fat in it. Some chuse to call it, *Mel Ægyptiacum*. It is chiefly used for eating off rotten flesh, and cleansing foul ulcers; particularly venereal ones in the throat, &c. It also destroys those cancerous crostions apt to grow in children's mouths.

ÆNIGMA*, a proposition put in obscure, ambiguous, and generally contradictory terms, to puzzle, or exercise the wit, in finding out its meaning. Or, an obscure discourse, covering some common, and well known thing, under remote and uncommon terms.

* The word is Greek, *Αἰνίγμα* formed of *αἰνιωδης*, *obscuri innuere*, to hint a thing darkly, of *αινος*, an obscure speech, discourse. The Latins sometimes call it *serpens*, *serpens*, or *serpens*, Gell. l. 12. c. 6. The popular with us name *riddle*: from the Belgic *ræden*, or the Saxon *araethan*, to interpret.

Fran. Junius defines an *Ænigma* to be an obscure parable, or allegory; and makes two kinds: the one *greater*, rendering the sentence more intricate and knotty, by a multitude of words; the other *lesser*, consisting of only one or two remote words, or allusions; as in Isaiah, C. XI. 1. where Jesus Christ is called *צֶדֶק*, *justice*, rod, or branch.

Fa. Boubours, in the memoirs of Trevoux, defines an *Ænigma*, a discourse, or painting, including some hidden meaning, which is proposed to be guessed.

Painted Ænigma's, are representations of the works of nature, or art, concealed under human figures, drawn from history, or fable. Thus Jesus Christ, in the middle of the doctors, represents the bible, &c.

A *Verbal Ænigma* is a witty, artful and abstruse description of any thing. Boubours.

Fa. Menestrier, has given us a learned treatise of *Ænigma's* and ænigmatical figures.

The use of *Ænigma's* was very great among the Egyptians. That people, Gale observes, covered their doctrines, both of divine, human, and natural things, under this sort of disguises: thus some of the stars, Clemens Alexand. *Strom.* 5. observes, were, on account of their oblique motions, likened to serpents, the sun to a crocodile, a ship, &c.

Gale thinks they might borrow the custom from the Hebrews, among whom, it is certain the *Ænigmatical* way was not less in use. Witness Samson's riddle, *Judg.* XIV. 12. 13. *I will now put forth a riddle to you, &c.* דִּירָה *i. e.*

according to Vatable, an *Ænigmatical* problem: the LXX render it, *αἰνιγμα*. Out of the eater came forth meat, and out of the strong came forth sweetness. Where, by eater and strong, is meant a lion; and by meat, honey. Solomon is said to have been particularly skilful in the solution of *Ænigma's*. Joseph Antiq. Lib. V. C. 2. Clemens assures us, that the Egyptians placed Sphinges before their temples; to inti-

mate that the doctrines of God and religion were *Ænigmatical* and obscure. See **HEROGLYPHIC**.

ÆOLIC, or **ÆOLIAN**, in grammar, denotes one of the five dialects of the Greek tongue.

It was first used in Bœotia; whence it passed into Æolia, and was that which Sappho and Alceus wrote in.

The *Æolic* dialect generally throws out the aspirate or sharp spirit, and agrees in so many things with the Doric dialect, that the two are usually confounded together. See **DORIC**.

ÆOLIPILE*, **ÆOLIPILA**, a hydraulic instrument, consisting of a hollow, metalline ball, with a slender neck, or pipe arising from the fame. This being filled with water, and thus exposed to the fire, produces a vehement blast of wind. See **WIND**.

* This instrument, Des Cartes and others have made use of, to account for the natural cause, and generation of wind.—And hence its name, *Æolipila*, q. d. *pila Æoli*, Æolus's ball; Æolus being reputed the god of the winds.

Sometimes the neck is made to screw into the ball, which is the most commodious way, because then the cavity may the more readily be filled with water: if there be no screw, it may be filled thus.—Heat the ball red-hot, and throw it into a vessel of water; the water will run in at the small hole, and fill about two thirds of the cavity.

If, after this, the *Æolipile* be laid on, or before, the fire; so that the water and vessel become very much heated; the water being rarified into a kind of momentary air, will be forced out with very great noise and violence; but it will be by fits, and not with a constant and uniform blast.

These phenomena the reader will be easily enabled to solve, from what is shewn under the articles, **AIR**, **WATER**, and **RAREFACTION**.

The air or vapour issuing out of the *Æolipile*, is found sensibly hot near the orifice; but at a farther distance, cold; like what we observe of our own breath: the cause of which is controverted.—The Corpuscularians account for it hence, that the fire contained in the rarified vapour, though sufficient to be felt near the orifice, disengages itself in the progress of the stream; and becomes insensible ere it be arrived at the journey's end. See **FIRE**.—The mechanical philosophers, on the other hand, hold that the vapour, at its exit from the ball, is endued with that peculiar species of circular motion, which constitutes the quality heat; and that the further it recedes therefrom, the more is this motion destroyed, by the reaction of the contiguous air; till the heat at length becomes insensible. See **HEAT**.

Chauvin suggests some further uses of the *Æolipile*.—1^o, He thinks it might be applied instead of a bellows to blow the fire, where a very intense heat is required. 2^o, If a trumpet, horn, or other sonorous instrument were fitted to its neck, it might be made to yield music. 3^o, If the neck were turned perpendicularly upwards, and prolonged by a tube or hollow cylinder fitted to it, and a hollow ball laid on the orifice of the tube; the ball would be blown up, and kept fluctuating or playing up and down: as in the stream of a fountain. See **FOUNTAIN**.—And, 4^o, it might serve to scent, or fumigate a room, if filled with perfumed, instead of common water.

ÆON, **Αἰών**, *age*; literally signifies the duration of a thing.

Some ancient heretics have ascribed another idea to the word *Æon*: in order to which, they have made use of the philosophy of Plato, giving reality to the ideas, which that philosopher had imagined in God; and even personifying them, and feigning them distinct from God, and to have been produced by him; some male, others female. See **IDEA**, and **PLATONISM**.

These ideas they call *Æons*; of an assemblage whereof they compose the deity, calling it *πνευμα*, a Greek word, signifying *substance*.

Simon Magus is said to have been the first inventor of these *Æons*; which were afterwards brought to perfection by Valentinus, who refining on those who had preceded him in this way, produced a long genealogy of *Æons*, to the number of 30. The first, and most perfect, he particularly denominates *Πρωτον*, *Proton*, that is, pre-existent; beside other names, the most usual whereof was that of *Bythos*, *Βυθος*, depth.

This Bythos he says continued long alone with *Ενοια*, *Ennoia*, thought; whom Valentinus also called *Χαρις*, grace, and *Σιγη*, silence. At length, Bythos with Sige, produced *Νους*, *Nous*, understanding, and *Αληθεια*, truth, her sister. *Nous* begot two *Æons*; *Λογος*, *Logos*, word, and *Ζωη*, *Zoe*, life: which two begot others, *Ανθρωπος*, *Ανθρωπος*, man, and *Εκκλησια*, church. And these eight *Æons* were the chief of all the rest.

The word, *Αγγελος*, and life, *Ζωη*, begot ten other *Æons*: Man and the Church begot twelve more; among whom were the Paraclete, Faith, Hope, Charity, the Perfect, *Τελειος*, and wisdom, *Σοφια*. And thus were 30 *Æons* made up; which all together made the *Pleroma*, *Πληρωμα*, or spiritual and invincible plenitude.

These 30 *Æons*, the Valentinians hold to have been figured by the 30 years of our Saviour's private life. See Gnostics.

ÆQUATION.

ÆQUATOR.

ÆQUILIBRIUM.

ÆQUINOX.

ÆQUINOCTIAL.

ÆQUIPOLLENT.

ÆQUIVALENT.

ÆQUIVOCAL.

ÆQUIVOCATION, &c.

ÆRA *, in chronology, a fixed point of time, from whence to begin a computation of the years ensuing.

* The word is sometimes also written in ancient authors, *Era*: its origin is contested, though it is generally allowed to have had its rise in Spain. Sepulveda supposes it formed from A. ER. A. the note or abbreviations of the words, *Annus, Era, Augusti*, occasioned by the Spaniards beginning their computation from the time their country came under the dominion of Augustus, or that of their receiving the Roman calendar. This opinion, however ingenious, is rejected by Scaliger, not only on account that in the ancient abbreviations A never stood for *Annus*, unless when preceded by V for *vixit*; and that it seems improbable they should put ER for *erat*, and the letter A without any discrimination both for *Annus* and *Augustus*. Vossius nevertheless favours the conjecture, and judges it at least as probable, as either that of Isidore, who derives *Era* from *Ær*, the tribute money, wherewith Augustus taxed the world: or that of Scaliger himself, who deduces it likewise from *Ær*, though in a different manner: *Ær*, he observes, was used among the ancients for an *article*, or *item*, in an account. And hence it came also to stand for a sum or number itself. From the plural *Era*, came by corruption *Era*, *Eram*, in the singular; such as *Offia, Ofiam*, the name of a place from *Ofia*, the mouths of the Tyber. The opinion of Christmannus carries still less probability, who derives the word from the Arabic *Arach*, to compute: and the fame may be said of that of H. Vossius, who supposes *Era* to be originally the same with *Hegira*, and to be derived from *Heger*, q. d. stranger; a name given by the Jews to Herod.

ÆRA is more particularly used in speaking of the ancient method of computing time among the Spaniards, which anticipated the common *Era* from the birth of Christ, by 37 years. See EPOCHÆ.

* This is by some called the *Era* of *Cæsar*, by others the *Era* of *Æras*, by the later writers the *Spanish Era*.

ÆRARIIUM *, the public treasury of the Roman state. See FISCUS.

* The temple of Saturn at Rome, being the great treasury of the state, was first called *Ærarium*; from *Ær*, *Æris*, copper; that being the only money in use before the year of Rome 485.

It was first erected under Augustus, and maintained by a yearly voluntary contribution; but that proving insufficient, the twentieth part of all legacies and inheritances, except of such as fell to the next of kin or the poor, were consigned to this treasury.

For the custody hereof, three of the emperor's lifeguard were constituted *Præfeti Ærarii*.

AERIAL, AERIUS, something that consists of, or has relation to, air. See AIR.

The Effeni, the most refined and rational sect among the Jews, held that the human soul consisted of an *aerial* substance.

Angels or spirits, whether good or evil, said sometimes to appear, are supposed to assume an *aerial* body, in order to become sensible.

Porphyry and Jamblicus admit a sort of Dæmons or *aerial* spirits, to which they give various names.

And the Rosicrucians, and other visionaries, fill the atmosphere with *aerial* inhabitants.

AERIAL Perspective, is that which represents bodies weakened, and diminished, in proportion to their distance from the eye. See PERSPECTIVE.

Aerial Perspective, has chiefly to do with the colours of objects, whose force and lustre it takes off more, or less, to make them appear as if more, or less, remote.

It is founded on this, that the longer column of air an object is seen through; the weaker do the visual rays emitted from it affect the eye.

AERIANS, AERIANI, in antiquity, a religious sect denominated from Acrius, an Armenian priest of the fourth century.

The *Aerians* had much the same sentiments, in respect of the Trinity, as the Arians; beside which, they had some dogmas of their own, and particularly this: that there is no difference between priests, and bishops; but that the priesthood, and episcopate are absolutely one and the same order, or dignity: an opinion since strenuously asserted by many modern divines. See BISHOP, PRIEST, PRESBYTER, &c. Acrius built his doctrine chiefly on some passages in St. Paul; and, among others, that in the first epistle to Timothy, Ch. IV. v. 14. where that apostle exhorts him not to neglect the gift he had received by the laying on of the hands of the presbytery. Here, observes Acrius, is no mention of bishops; but

VOL. I.

Timothy evidently received his ordination from the presbyters or priests.

St. Epiphanius, *Har. 75.* stands up briskly for the superiority of bishops, against the Aerians.—The word *presbytery* in St. Paul, he observes, includes both bishops and priests; the whole senate, or assembly of the ecclesiastics of the place: and in such an assembly had Timothy been ordained. See PRESBYTERY.

AEROMANCY *, **AEROMANTIA**, an ancient species of divination, performed by the means of the air, and phenomena happening therein.

* The word is compounded of the Greek, *an*, air; and *mantia*, divination. See HYDROMANCY.

AEROMETRY *, **AEROMETRIA**, the art of measuring the air, its powers, and properties. See AIR.

* The word is compounded of *an*, air; and *metron*, to measure.

Aerometry includes the laws of the motion, gravitation, pressure, elasticity, rarefaction, condensation, &c. of the atmospheric fluid.

The word *Aerometry* is but little used: in lieu hereof, we commonly call this branch of philosophy, *Pneumatics*. See PNEUMATICS.

C. Wolfius, professor of mathematics at Hall, having reduced many of the affections of this fluid to geometrical demonstration; first published *Elements of Aerometry*, at Leipzig, 1709, in High-dutch, and afterwards more largely in Latin.—Thus is the doctrine of the air incorporated into the mathematical sciences.

ÆRUGINOUS, something partaking of, or like to, the rust of copper.

Authors do not seem perfectly agreed about the colour to be expressed by this word, some expressing by it green, others brown.

ÆRUGO, denotes rust, especially that of copper. See RUST.

ÆRUGO is also used for the common verdigrease. See VERDIGREASE.

ÆERY, or AIRY *, in speaking of hawks, eagles, or the like, answers to the nest of other birds. See NESTS.

* The word is formed from the French *aire*; and that from the German, *Ey*, egg, in the plural *Eyer*.

ÆS, a Latin term, signifying copper, money, &c.

Æs, in antiquity, is frequently used for *As*. See AS.

Æs Grave denotes money paid by weight, and not by tale. Liv. l. 4. in fine.

Æs Ustum, is a chemical preparation, ordinarily made of copper cut into thin plates, put into a crucible with sulphur and salt, *stratum super stratum*; and thus set in a hot charcoal fire, till the sulphur be consumed.

It is very detestive; and is used for eating of dead flesh. They who make this use of it, are ordered to heat it red-hot in the fire nine times; and quench it as often in linseed oil. But this is a precaution rarely complied with.

ÆSCHYNOMENOUS Plants, among botanists, are those popularly called *sensitive plants*. See SENSITIVE.

ÆSNECY, in law, priority of age among coparceners.

ÆSTIMATIO Capitis, in our ancient law-books. See WERE, and WERELADE.

King Athelstan, in a great assembly held at Exeter, declared what mulcts were to be paid *pro æstimatione capitis*, for offence committed against several persons according to their degrees: the *æstimation* of the king's head to be 30000 thymæ; of an archbishop, or satrapa, or prince, 15000; of a bishop or a senator, 8000; of a priest, or athane, 2000, &c. Cressy's *Church Hist.* fol. 834. b. and L. Hen. I.

ÆSTIVAL, or ESTIVAL, of, or belonging to summer.

Thus, we say, the *Æstival* solstice, &c. in opposition to Brumal.

ÆSTUARY, ÆSTUARIUM, in geography, an arm of the sea, running up a good way into the land. See SEA.

Such is Bristol channel, many of the firths of Scotland, &c. See ARM, BAY, and FRITH.

ÆSTUARY, is sometimes also used in pharmacy, for a vapour-bath, *balneum vaporosum*. See VAPOUR and BATH.

ÆTHER *, is usually understood of a thin, subtle matter, or medium, much finer and rarer than air; which commencing from the limits of our atmosphere, possesses the whole heavenly space.

* The word is Greek, *æther*, supposed to be formed from the verb *ætho*, to burn, to flame; some of the ancients, particularly Anaxagoras, supposing it of the nature of fire. See FIRE.

The philosophers cannot conceive that the largest part of the creation should be perfectly void; and therefore fill it with a species of matter under the denomination of *Æther*.—But they vary extremely as to the nature and character of this *Æther*.—Some conceive it as a body *sui generis*, appointed only to fill up the vacuities between the heavenly bodies; and therefore confined to the regions above our atmosphere.—Others suppose it of so subtle and penetrating a nature, as to pervade the air, and other bodies; and possess the pores and intervals thereof.—Others deny the existence of any such specific matter; and think the air it self, by that immense tenuity and expansion it

is found capable of, may diffuse it self through the interstellar spaces, and be the only matter found therein.

In effect, *Æther*, being no object of our sense, but the mere work of imagination, brought only upon the stage for the sake of hypothesis, or to solve some phenomenon, real or imaginary; authors take the liberty to modify it how they please.—Some suppose it of an elementary nature, like other bodies, and only distinguished by its tenuity, and the other affections consequent thereon; which is the philosophical *Æther*.—Others will have it of another species, and not elementary; but rather a sort of fifth element, of a pure, more refined, and spirituous nature, than the substances about our earth; and void of the common affections thereof, as gravity, &c. The heavenly spaces, being the supposed region or residence of a more exalted class of beings; the medium must be more exalted in proportion.—Such is the ancient and popular idea of *Æther*, or *æthereal* matter.

The term *Æther* being thus embarrassed with a variety of ideas, and arbitrarily applied to so many different things; the later and severer philosophers chuse to set it aside: and in lieu thereof, substitute other more determinate ones.

Thus, the Cartesians use the term *Materia Subtilis*; which is their *Æther*: and Sir I. Newton, sometimes, a *Subtile Spirit*, as in the clofe of his *Principia*; and sometimes a *Subtile* or *Æthereal Medium*; as in his *Optics*.

The truth is, there are abundance of considerations, which seem to evince the existence of some matter in the air, much finer than the air it self.—There is an unknown something, which remains behind when the air is taken away; as appears from certain effects which we see produced in *Vacuo*.—Heat, Sir I. Newton observes, is communicated through a vacuum, almost as readily as through air: but such communication cannot be without some interjacent body, to act as a medium. And such body must be subtile enough to penetrate the pores of glass; and may be very well concluded to penetrate those of all other bodies; and consequently be diffused through all the parts of space: which answers to the full character of an *Æther*. See *HEAT*.

The existence of such an æthereal medium being settled, that author proceeds to its properties; inferring it to be not only rarer and more fluid than air, but exceedingly more elastic, and active: in virtue of which properties, he shews, that a great part of the phenomena of nature may be produced by it.—To the weight, *e. gr.* of this medium, he attributes gravitation, or the weight of all other bodies; and to its elasticity, the elastic force of the air, and of nervous fibres, and the emission, refraction, reflection, and other phenomena of light; as also, sensation, muscular motion, &c.—In fine, this same matter seems the *primum mobile*, the first source or spring of physical action in the modern system.

The Cartesian *Æther* is supposed not only to pervade, but adequately to fill all the vacuities of bodies; and thus to make an absolute plenum in the universe. See *MATERIA subtilis*.

But Sir I. Newton overturns this opinion, from divers considerations; by shewing, that the celestial spaces are void of all sensible resistance: for, hence it follows, that the matter contained therein, must be immensely rare, in regard the resistance of bodies is chiefly as their density; so that if the heavens were thus adequately filled with a medium or matter how subtile soever, they would resist the motion of the planets and comets much more than quicksilver, or gold.

Æther of plants. See *ÆTHERIAL*.

ÆTHERIAL, *ÆTHERIUS*, something that belongs to, or partakes of the nature of *Æther*.

Thus, we say, the *Æthereal* space; *Æthereal* regions, &c.—Some of the ancients divided the universe, with respect to the matter contained therein, into elementary and *æthereal*.

Under *Æther*, or the *Æthereal* world, was included all that space above the uppermost element, *viz.* fire. This they supposed to be perfectly homogeneous, incorruptible, unchangeable, &c. See *CORRUPTION*, &c.

It is a point has been much controverted, whether or no the *Æthereal* matter has the property of gravity?—Many late philosophers, not only at home but abroad, contend for its gravity; and even for its being the cause of gravity in all other bodies.—In effect, says Chauvin, bodies do not defend by any inherent principle; but by the impulse, or trusion of something external: which can be nothing but *æther*; in regard they fall in *vacuo* as readily, nay more so, than in open air; and from the same principle they say arises the cohesion of bodies.

ÆTHERIAL OIL, is a fine, subtile, essential oil, approaching nearly to the nature of a spirit. See *OIL*.

Thus, the pure liquor rising next after the spirit, in the distillation of turpentine, is called the *Æthereal Oil* of turpentine. See *SUPPLEMENT*, article *OIL ESSENTIAL*. Some chymists distinguish two principles in urine; the one

a volatile urinous salt, resembling spirit of nitre; the other an *Æthereal Oil*, or sulphur; partaking of the nature of spirit of wine.

ÆTHERIAL Heaven. See *ÆTHERIAL HEAVEN*.

ÆTHIOPS Mineral, a preparation of mercury, usually made by grinding equal quantities of crude quicksilver and flower of sulphur, in a stone or iron mortar: till they become incorporated into a black powder.

It is prescribed for the worms, and all crudities and acrimony of the humours; and is reputed infallible against the itch, and other cutaneous diseases.

ÆTIAN, *ÆTIANI*, in church history, a sect, or branch of Arians, so called from their leader *Ætius*, surnamed the *Atheist*, in the fourth century. See *ARIAN*.

The *Ætians* were of the stricter kind of Arians, who held that the Son, and Holy Ghost, are in all things dissimilar to the Father. See *HETEROUSIAN*.

Whence also they are called *Anomaci* and *Heteronians*; sometimes *pure Arians*.

ÆTIOLOGY *, *ÆTIOLOGIA*, in medicine, a rationale, or discourse of the cause of a disease.

* The word is compounded of the Greek *αιτια*, cause, and *λογος*, sermo, discourse.

In this sense, we say, the *Ætiology* of the small-pox, of the hydrophobia, of the gout, the dropsy, &c.

ÆTITES *, in natural history, a flinty, or a cruusted stone, hollow within side, and pregnant, as it were, with another; formerly in repute for several extraordinary medical, as well as magical powers.

* The word is formed from the Greek, *αετης*, eagle; the popular tradition being, that it is found in the eagle's nest, whither it is supposed to be carried while the female sits, to prevent her eggs from being rotten.

The *lapis Ætites* is found in several parts: near Trevoux in France, one can scarce dig a few feet, without finding considerable strata or beds, of the coarser or ferruginous kind: this sort is found of various forms, and sizes; but its texture or consistence is pretty uniform; consisting of two or three layers or coats of a matter resembling baked earth: especially the innermost.—They are originally soft, and of the colour of yellow ocher.

Dioscorides says, it is of use in discovering a thief; for by mixing it with his meat, he will be unable to swallow it.—Mathiolus informs us, that birds of prey never hatch their young without this stone; and that they seek it as far as the Indies.

The use now made of the stone, is to assist women in labour; to which end they fasten it about the knee: it being a tradition, that according as it is applied above, or below the matrix, it has the faculty of retaining, or excluding the child.

Hence, it is sometimes directed to be bore about the arm to prevent abortion. See *SUPPLEMENT*, article *ÆTITES*.

AFFECTION *, in a proper sense, denotes an attribute peculiar to some subject, and arising from the very idea or essence thereof. See *ATTRIBUTE*.

* The word is originally Latin, formed from *afferre*, to affect; the subject being here supposed in some measure *affected*, or acted on by the thing attributed to it. See *SUBJECT*.

In this sense, *Affection* is synonymous with *Property*, or what the schoolmen call *Proprium quarto modo*.

Philosophers are divided as to the doctrine and division of *Affections*: according to Aristotle, they are either *subordinating*, or *subordinated*; under the first of which comes only *mode*; and under the second *finiteness*, *place*, and *time*.

The generality of Peripatetics divide *Affections* into *internal*, as motion, and finiteness; and *external*, as place and time. According to Sperslingus, *Affections* are better divided into *simple* or *united*, and *disjunct* or *separate*: under the first come *quantity*, *quality*, *place*, and *time*: under the second, *motion*, and *rest*.

Sperslingus then seems to reject finiteness from the number of *Affections*; and Aristotle and the Peripatetics, quantity, and quality: but the difference is not irreconcilable; since Sperslingus does not deny body to be finite, nor Aristotle and his followers, that it has *quantum*, and *quale*. Only they have not made peculiar heads and titles for these.

Affections are also distinguished into those of *body*, and those of *mind*.

AFFECTIONS of *Body*, are certain modifications thereof; occasioned or induced by motion; in virtue whereof, a body comes to be so and so disposed.

The *Affections* of *Body* are sometimes subdivided into *primary* and *secondary*.

Primary AFFECTIONS are those which arise either from the idea of matter; as quantity, and figure; or from that of form, as quality, and power; or from both together, as motion, place, and time.

Secondary, or derivative AFFECTIONS, are those which arise from some of the primary; *e. gr.* from quantity, as divisibility,

bility, continuity, contiguity, finity, impenetrability; from *figure*, as regularity and irregularity; from *quality*, as health; strength, &c.

AFFECTIONS of Mind, are what we more usually call *passions*. See **PASSION**.

Mechanical AFFECTIONS. See **MECHANICAL Affection**.

AFFECTION is more peculiarly used in medicine, for a morbid, or preternatural state of the body, or some of its parts. See **DISEASE**, &c. Thus we say an hypochondriacal, an hysterical *Affection*. And, in like manner, such a part of the body is *affected*, i. e. indisposed, or seized with a disease. The sick are frequently mistaken as to the place *affected*, by reason of the consent between the several parts, which often makes a disorder in one part be felt in another.

Hypochondriacal AFFECTION, } See { **HYPOCHONDRIACAL**
Hysterical AFFECTION, &c. } **HYSTERIC**, &c.

AFFEEORORS*, **AFFERATORS**, in law, persons, appointed in court-leets, and other places, upon oath, to settle and moderate the fines of such as have committed faults arbitrarily punishable, or which have no express penalty set down by statute. See **FINE**.

* The word is formed, according to Cowel, of the French *affir*, to affirm; by reason those appointed to this office, do affirm upon their oaths, what penalty they think in conscience the offender hath deserved. Others better derive it from *affuer*, a word in the customary of Normandy, rendered by the latin interpreter *taxare*, to set the price of a thing; as *affimare*, *indicare*, &c.—Kitchin joins the three words as sononyms; *affidati*, *amerciatores*, *affertores*.

AFFERI, in law. See the article **AVERIA**.

AFFIANCE, in law, the plighting of troth, between a man and a woman; upon an agreement of marriage to be had between them.

AFFIDATIO Dominorum, signifies an oath taken by the lords in parliament; thus called in the *Rot. Parl.* Hen. VI.

AFFIDATUS, or **AFFIDIATUS**, in our law-books, denotes a tenant by fealty.

Affidati are not properly vassals, but quasi-vassals, or persons who vow fealty to, and put themselves under the protection of, another.

In this sense they amount to the same with what are otherwise called *commendati*, and *recommendati*.

AFFIDAVIT, an oath in writing, sworn before some person who hath authority to take such oath; and made use of, and read in court, upon motions; though not allowed upon trials.

In the court of chancery is an *Affidavit office*; under the direction of a master. See **OATH**.

AFFILIATION, **ADFIATIO**, in middle-age writers, the same with adoption.

Among the ancient Gauls, *Affiliation* was a sort of adoption only practised among the great.—It was performed with military ceremonies: the father presented a battle-ax to the person he was to adopt for his son; as an intimation that he was to preserve the effects he thus called him to succeed to, by arms.

AFFINAGE, is sometimes used in ancient law-books, for the refining of metals.

AFFINITY*, properly imports a relation contracted between one of two parties married, and the kindred of the other party.

* The word is originally Latin, compounded of *ad*, to; and *finis*, boundary, limit: by reason, as the lawyers say, that one of the families here approaches to the bounds of the other: *Quod due cognationes per nuptias copulantur*, & altera ad alterius cognationis finem accedit. Or as another expresses it, *Quod utriusque cognationis fines in unum locum conferuntur*.

In which sense, the word stands contradistinguished from consanguinity; which is a relation by blood.

In the Mosaic law, there are several degrees of *Affinity*, wherein marriage is expressly prohibited; which yet seem not at all prohibited by the law of nature.—Thus, Levit. C. XVIII. ver. 16. a man was forbid to marry his brother's widow, unless he died without issue; in which case, it became enjoined as a duty. So it was forbid to marry his wife's sister, while she was living, v. 18. which was not forbidden before the law, as appears from the instance of Jacob.

The ancient Roman law is silent on this head; and Papinian is the first who mentions it; on occasion of the marriage of Caracalla.—The lawyers who came after him, stretched the bonds of *Affinity* so far, that they placed adoption on the same foot with nature. See **ADOPTION**.

Affinity, according to the modern canonists, renders marriage unlawful to the fourth generation, inclusive: but this is to be understood of direct *Affinity*; and not of that which is secondary, or collateral.—*Affinis mei affinis, non est affinis meus*.

It is further to be observed, that this impediment of marriage, does not only follow an *Affinity* contracted by lawful

matrimony, but also that contracted by a criminal commerce; with this difference, that this last does not extend beyond the second generation; whereas the other, as has been observed, reaches to the fourth.

The canonists distinguish three species of *Affinity*.—The first, that contracted between the husband and the relations by blood of his wife; and between the wife, and the relations by blood of her husband.

The second, between the husband, and those related to his wife by marriage; and the wife, and those so related to her husband.

The third, between the husband, and the relations of his wife's relations; and the wife, and the relations of her husband's relations.

By the fourth council of Lateran, held in 1213, it was decreed, that none but the first kind was any real *Affinity*; the rest being mere refinements, which ought to be set aside. *C. non debet, Tit. de Consang. & Affin.*

The degrees are reckoned after the same manner in *Affinity*, as in consanguinity; and therefore differently in the canon law from what they are in the civil law.

The Romanists talk of a *spiritual Affinity*, contracted by the sacrament of baptism, and confirmation.—In that church, a god-father may not marry with his god-daughter, without a dispensation.

AFFIRMATION, **AFFIRMATIO**, a positive proposition, alledging the truth, or reality of something.

Affirmation is defined by the logicians, an act whereby we attribute one idea to another; as supposing it to belong, or agree thereto.—As when, conceiving perfection to agree to the Deity, we say, *God is perfect*.

This, on other occasions, is called *enunciation*, *proposition*, *composition*, and *judging*.

AFFIRMATION in law, signifies the ratifying or confirming a former law, or judgment.

We say, to *affirm* a judgment: the house of lords on an appeal *affirmed* the lord chancellor's decree.

AFFIRMATION is also used in grammar, by some late refinements upon that art, for what is usually called a verb; in regard the office of that part of speech, is to express what we *affirm*, or attribute to any subject.

AFFIRMATION, is also used for a solemn form of attesting the truth, allowed to be used by the Quakers, instead of an oath, which they hold absolutely unlawful to take. See **QUAKER**.

This people, by their refusal of all oaths, lay liable to much trouble; particularly for, declining the oath of allegiance, in the time of king Charles II.—But by an act passed anno 1689, it was decreed, that their solemn declaration of allegiance and fidelity, should be accepted instead of an oath.

In 1695, they also obtained, by a temporary act, that their solemn *Affirmation* should be accepted in all cases where an oath is by law required; except in criminal cases, upon juries, and in places of profit and trust under the government. In this form:—*I, A. B. do declare, in the presence of almighty God, the witness of the truth of what I say, &c.*

This act was afterwards continued; and at last made perpetual.—But this form not being such as was desired, and having, in reality, all the essentials of an oath; they applied to the parliament for an alteration, which they obtained anno 1721: when the following form was settled to their general satisfaction, *viz.*—*I, A. B. do sincerely, solemnly, and truly declare and affirm.*—Which is the form now used, in the same manner, and under the same limitation with the former.—Any person deposing, upon his solemn *affirmation*, a known falsehood, incurs the penalty of wilful and corrupt perjury.

AFFIRMATIVE, in logic, &c. is understood of a proposition, or the like, which imports an *Affirmation*; or that says, *a thing is*.

In which sense the word stands opposed to negative.

There are universal *Affirmative* propositions; and such, usually, are the first of syllogisms. See **SYLLOGISM**.

In algebra we have also *Affirmative* or positive quantities. See **QUANTITY**, and **POSITIVE**.

AFFIRMATIVE Sign, or character. See **CHARACTER**.

In grammar, authors distinguish *affirmative* particles: such is, *yes*.

The term *Affirmative* is sometimes also used substantively.—Thus we say, the *Affirmative* is the more probable side of the question: there were so many votes, or voices for the *Affirmative*.

AFFIRMATIVE is particularly applied in the Roman inquisition, to such heretics as own the errors, and opinions they are charged withal; and maintain the same in their examination with firmness, and resolution.

AFFORESTING, **AFFORESTATIO**, the turning ground into forest. See **FOREST**.

In this sense, the word stands opposed to *deafforesting*. See **DEAFFORESTING**.

The conqueror, and his successors, continued *afforesting* the lands

lands of the subject, for many reigns; till the grievance became so notorious, that the people, of all degrees and denominations, were brought to sue for relief; which was at length obtained, and commissions were granted to survey and perambulate the forest, and separate all the new *afforested* lands, and re-convert them to the uses of their proprietors, under the name and quality of *purlieu* or *pouraille land*. See the article *PURLIEU*.

AFFRAY, or **AFFRAYMENT**, in law, an affright put upon one, or more persons.

This, according to the lawyers, may be done without a word spoke, or a blow struck.—As, where a man shews himself armed, or brandishes a weapon, it may strike a fear into others unarmed.

Affray is a common injury; in which it differs from an assault, which is always a particular injury.

AFFREIGHTMENT*, or **AFFRETAMENT**, **AFFRETAMENTUM**, in law, signifies the freight of a ship. See **FREIGHT**.

* The word is formed from the French, *Fret*, which expresses the same thing.

AFFRONTE, in heraldry, is understood of animals bore in an escutcheon, as facing, or with their heads turned toward each other.—This is otherwise called *confronté*.

* The word is French; and literally signifies the same. It is compounded of *ad*, to; and *frons*, forehead.

AFFILIATION. See the article **AFFILIATION**.

AFRICAN Company. See the article **COMPANY**.

AFT. See **ABAST**.

AFTER-BIRTH, among midwives, the coat, or membranes wherein the fetus is inclosed, *in utero*. It is thus called, by reason it comes away some time after the fetus; by way of a second birth, or delivery.

Physicians usually call it the *sevadine*; it also includes the *placenta uterina*, popularly called the *womb-cake*. See **SECUNDINE**.

In brutes it is denominated the *beam*, or *cleaning*. See **HEAM**, &c.

AFTER-PAINS, are pains felt in the loins, the groin, &c. after the birth is brought away. See **DELIVERY**.

They seem to arise from a distention of the ligaments of the uterus in time of delivery; and are seldom dangerous, unless aggravated by a detention of the lochia.—To prevent them, oil of sweet-almonds, sperma-ceti, syrup of capillus veneris, &c. are usually prescribed.

AFTER-MATH, among husbandmen, the after-grass, or second mowings of grass; or else grass or stubble cut after corn.

AGA, in the language of the Mogols, &c. signifies a great man, lord, or commander.

In this last sense, the term is also used among the Turks: thus, the *Ag* of the Janizaries, is their colonel; and the *Capi-Aga*, the captain of the gate of the seraglio.

The title *Aga* is also given by way of courtesy, to several persons of distinction; though not in any office, or command to entitle them to it.

On some occasions, in lieu of *Aga*, they say, *Agassi*, or *Agassi*: thus, the *Aga* or governor of the pages, is called *Capi-Agassi*; and the *Aga* or general of the horse, *Shpahilar Agassi*. See **PAGE**, **ODA**, and **SPAH**.

AGAL, or **AGIO**. See the article **AGIO**.

AGAPES*, or **AGAPÆ**, in church-history, a kind of religious festival, celebrated in the ancient church, to keep up a harmony, and concord among its members.

* The word is formed of the Greek *αγαπη*, love, dilection; of *αγαπας*, dilige, I love.

In the primitive days the *Agapes* were held without scandal, or offence; but in after-times, the heathens began to tax them with impurity.—This gave occasion to a reformation of these *Agapæ*.

The kiss of charity, with which the ceremony used to end, was no longer given between different sexes; and it was expressly forbidden to have any beds or couches, for the convenience of those who should be disposed to eat more at their ease. Notwithstanding these precautions, the abuses committed in them became so notorious, that the holding of them (in churches at least) was solemnly condemned at the council of Carthage in the year 397.

Some critics will have it to be these *Agapæ* that St. Paul speaks of, 1 Cor. ch. XI. under the name of the *Lord's Supper*; which, they contend, was not the eucharist, but a feast accompanying it; held by the Christians of those times, in commemorating of our Saviour's instituting that sacrament, in his last supper with the apostles.—The text seems to intimate, that the feast was first held before the communion; but by an ordinance afterwards made, they were obliged to communicate fasting: so that the *Agapæ* were postponed till the sacrament was over.

Some authors imagine the *Agapæ* to have been, not a commemoration of our Saviour; but a custom borrowed from the heathens: *Mos vero ille, ut referunt*, says Sordulius on the Xth chapter of the epistle to the Corinth. *de Gentili adhuc superstitione veniebat*. And Faustus the Manichee is represented in St. Augustine, as reproaching the Christians, with

converting the heathen sacrifices into *Agapæ*: *Christiani sacrificia paganorum convertisse in Agapai*.

AGAPETÆ, in ecclesiastical history, a name given to certain virgins and widows, who in the ancient church associated themselves with, and attended on ecclesiastics, out of a motive of piety and charity.

In the primitive days, there were women instituted deaconesses; who devoting themselves to the service of the church, took up their abode with the ministers, and assisted them in their functions. See **DEACONESSE**.

In the fervour of the primitive piety, there was nothing scandalous in these societies: but they afterwards degenerated into libertinism; inasmuch, that St. Jerom asks, with indignation, *unde Agapetorum pestis in ecclesias introiit*? This gave occasion to councils to suppress them.—St. Athanasius mentions a priest named Leontius, who, to remove all occasion of suspicion, offered to mutilate himself, to preserve his beloved companion.

AGARIC, in pharmacy, a kind of fungous excrecence, growing on the trunks, and large branches of several trees; but chiefly on the larch-tree.

This is also called *Fungus Agarici*, by way of contradistinction from the *mineral Agaric*. Dioscorides derives its name from a province of Sarmatia, called *Agaria*; whence it was first brought.

Several authors, and among the rest, Galen, took it for a root; but the common opinion is right, which makes it a fungus.—It is brought chiefly from the Levant; being found in Muscovy, and Tartary; though an inferior sort also grows on the Alps, and the mountains of Dauphiné, and the Trentine. It is white, light, tender, smooth, brittle, of a bitter taste, pungent, and a little styptic.—This was what the ancients called the *female Agaric*. For the *male*, it was usually rough, yellowish and woody, and was generally excluded out of physic, being only used in dying. It is probable, this latter was what grows on old oaks, and beech-trees; the former only on the larch.

Agaric was a medicine in mighty use among the ancients, not only for the purging of phlegm, but in all distempers proceeding from gross humours and obstructions; as the epilepsy, madness, asthma, &c.—Yet they complained, that it weakened the bowels, and purged too violently. They had divers correctors for it; these were chiefly of the aromatic kind: but Dr. Quincy says, that the best way is to banish it for good and all, as the present practice has almost done: for that it rather makes people sick than purges them; being very nauseous, and but little cathartic: slow in its operation, and by staying too long in the stomach, exciting terrible nausea, followed by sweats, syncopes, and languors, which last a long time.

By a chymical solution, it passes almost wholly into oil: it yields no volatile salt, but abounds with a sort of starchy earth, and an acid phlegm; as to texture, it seems much to resemble colocynth.

We read of *Pillule de Agarico*, and *Fraches of Agaric*: but they are diffused.—*Agaric* is also an ingredient in the theriaca Andromachi, where it is admitted in quality of a cordial; though its cardiac virtue is excepted to as much as its purgative.

AGARIC is also a denomination given to an earthy concretion, of the colour, and consistence of coagulated milk, which by drying, forms a white, light, friable mass, not unlike the vegetable *Agaric*.

This is more peculiarly called, *mineral Agaric*, sometimes *stony Agaric*, *lac luna*, or *moon's milk*, *steinmarga*, *lithomarga*, &c. See **SUPPLEMENT**, article **LAC LUNÆ**.

AGAT*, in natural history, a precious stone, partly transparent, and partly opaque; usually diversified with a variety of colours, veins, spots, &c. and sometimes exhibiting figures, or appearances of natural objects.

* The word is sometimes also written *Achat*; by the Greeks and Latins *Axalæ*, and *Achatæ*; a denomination taken from that of a river in Sicily, on the banks of which it was first found.

There are various kinds of *Agats*; which, according to their different colours, degrees of transparency, &c. have different names.—The principal may be reduced to these four, viz. the *onyx*, the *calcedony*, the *black*, and the *German Agats*.

The *Agat* has often a reddish teint; and is finely variegated with spots and stains; many of which seem very naturally to represent woods, rivers, trees, animals, fruits, flowers, &c.—De Boot mentions one, of the size of a nail, wherein a bishop, with his mitre, was very well represented: and on turning it a little, a man and a woman's head were seen in its place.

The *fardians*, and *fardonyx Agats*, are very valuable; the latter is of a sanguine colour, and is divided into zones, which seem to have been painted by art.—Pliny, Strabo, and Cicero say, that Polycrates's ring was a *fardonyx*. See **SARDONYX**.

Authors also speak of Roman *Agats*, Egyptian *Agats*, *onyx* and *fardonyx Agats*, &c.—The ancients mention a red *Agat*, spotted with points of gold, found in Candia; and called *ja-cared*, as being a preservative against the poison of vipers, icor-

scorpions, and spiders.—Pliny has a whole chapter of the virtues of *Agats*.

Agat has always been esteemed for seals; as being a stone that no wax will stick to.

The gold wire-drawers burnish their gold with an *Agat*; whence the instrument made use of on that occasion, is also called an *Agat*.

Mr. Boyle takes *Agats* to have been formed of separate beds, or strata of fine clay or earth, brought by a petrifying liquor to coagulate into a stone. The same author observes, that the fire will purge away the colours of *Agat*. He also mentions an *Agat* with a moveable spot or cloud in it.

M. du Fay has given the art of staining *Agats*, with divers beautiful colours. *Vid. Mem. Acad. R. an. 1728. p. 71.*

The figures and ramifications of *Agats*, whether natural or artificial, may be discharged with aqua fortis. *Vid. Eund. ibid. an. 1733. p. 38.* See SUPPLEMENT, articles AGAT, and SARDONYX.

AGE, properly denotes the natural duration of the life of man. See LIFE.

The ordinary *Age* of mankind has been occasionally varied, in such manner as to afford a fine instance of the wisdom of Providence.

AGE is also used in chronology, for a century; or a system, or period of an hundred years. See the article CENTURY. In which sense *Age* amounts to much the same with *seculum*, and differs from *generation*.

AGE is also understood of a certain state or portion of the ordinary life of man: which is divided into four different *Ages*; viz. infancy, youth, manhood, and old *Age*. Infancy, or childhood, *pueritia*, extends as far as the fourteenth year.

Youth, adolescence, or the *Age* of puberty, commences at 14, and ends at about 25.

Manhood, or the virile *Age*, terminates at 50.

Old *Age*, *senectus*, succeeds, which is the last: though some divide this into two; calling it *decrepit Age* after 75. See LONGEVITY.

AGE, in horsemanship, makes a considerable point of knowledge; the horse being an animal that remarkably shews the progress of his years, by correspondent alterations in his body.

We have characteristics from his teeth, hoofs, coat, tail, and eyes.

The first year he has his foal's teeth, which are only grinders and gatherers: the second, the four foremost change, and appear browner and bigger than the rest: the third, he changes the teeth next to these; leaving no apparent foal's teeth, but two on each side above, and two below: the fourth year, the teeth next to these are changed, and no foal's teeth are left, but one on each side above and below.

At five years, his foremost teeth are all changed; and the tushes on each side are complete: those which come in the places of the last foal's teeth, being hollow, and having a little black speck in the midst; which is called the *mark in a horse's mouth*: This continues till eight years of age. — At six years, he puts out new tushes; near which appears a little circle of young flesh, at the bottom of the tush: the tushes withal being white, small, short, and sharp.

—At seven years, the teeth are all at their growth, and the mark in the mouth appears very plain. — At eight, all his teeth are full, smooth, and plain, and the mark scarce discernable; the tushes looking yellowish. — At nine, the foremost teeth shew longer, yellower, and fouler than before; and the tushes become bluntness. — At ten, no holes are felt on the inside of the upper tushes; which till then are very sensible: add, that the temples begin to be crooked, and hollow. — At eleven years, his teeth are very long, yellow, black, and foul; but he will cut even, and his teeth stand directly opposite to one another. — At twelve, the upper teeth hang over the nether. — At thirteen, the tushes are worn close to his chaps, if he have been much ridden; otherwise they will be black, foul, and long.

2°. As to the hoof. — If it be smooth, moist, hollow, and well-founding, it is a sign of youth: on the contrary, if rugged, and as it were leamed, one seam over another, and withal dry, foul, and rusty, it is a mark of old *Age*.

3°. For the tail. — Taking him by the stern thereof, close at the setting on to the buttock, and gripping it between the finger and thumb; if a joint be felt to stick out more than the rest, the bigness of a nut, the horse is under ten: but if the joints be all plain, he may be fifteen.

4°. The eyes being round, full, and staring; the pits that are over them filled, smooth, and even with his temples; and no wrinkles to be seen, either under or above: are marks of youth.

5°. The skin being plucked up in any part betwixt the finger and thumb, and let go again; if it return suddenly to its place, and remain without wrinkles, he may be believed to be young.

6°. A dark-coloured horse, growing grizzly above the eyebrows, or under the main; or a whitish horse growing

VOL. I.

meanelled, either with white or black, all over; may be infallibly concluded extremely aged.

Lastly, a horse being young, the bars of his mouth are soft and shallow; otherwise they are deep, and feel hard and rough. See BARS.

AGE, in hunting, is an article of consequence. — Deer, and other beasts of game, have different denominations, according to their *Age*; which see under the article HUNTING. The *Age* of a hart, &c. is chiefly judged of by the furniture of his head.

The first head, called in fallow deer, *Bracher*, and in red deer, *Pricks*, does not come till the second year of their *Age*: the next year, they bear four or six small branches: the fourth year, eight or ten; the fifth, ten or twelve; the sixth, fourteen or sixteen; the seventh year, they bear their heads beamed, branched, and fumed, as much as ever they will be. The huntmen have several other marks, whereby to know an old hart without seeing him; as, the slot, entries, abatements, foils, fewmets, gate, and fraying posts.

AGE of the Moon, in astronomy, is understood of the number of days elapsed since the last conjunction, or new moon; called also her *quarter*. See CONJUNCTION, and QUARTER.

To find the Moon's AGE. See the article MOON.

AGE, in chronology, and antiquity, is also used in speaking of the time passed since the creation of the world.

The several *Ages* of the world, may be reduced to three grand epochs, viz. the *Age* of the law of nature, from Adam to Moses. — The *Age* of the Jewish law, from Moses to Christ. — And the *Age* of grace, from Christ to the present year. The first *Age*, according to the Jews, consisted of 2447 years; according to Scaliger, of 2452; and according to Usher, 2513. — The second *Age*, according to the Jews, consisted of 1312 years; according to Scaliger, of 1508; and according to Usher, of 1491. — Of the third *Age*, there have elapsed 1749 years; though this, too, is controverted by chronologers. Petavius will have our Saviour to have been born four years before the vulgar epocha; on which footing, the current year should be 1753; according to Capella it should be 1754; and according to Baronius and Scaliger, 1751. See INCARNATION.

The Romans distinguished the time that preceded them into three *Ages*: the *obscure* or *uncertain Age*, which reached down as low as Ogyges king of Attica; in whose reign the deluge happened in Greece. — The *fabulous*, or *heroic Age*, which ended at the first Olympiad; and the *historical Age*, which commenced at the building of Rome.

Among the poets, the four *Ages* of the world, are the *golden*, the *silver*, the *brazen*, and the *iron Age*. See the *Metamorphosis* of Ovid, Lib. I. or rather, Hesiod in his poem, *Erga nam nupar*, *Opera & Dies*, ver. 108, &c. He is the first that has described the four *Ages*, and the best.

The East-Indians also reckon four *Ages* since the beginning. — The first, which they represent as a sort of golden *Age*, lasted, according to them 1728000 years: in this the god Brahma was born; and the men were all giants; their manners were innocent: they were exempt from diseases, and lived 400 years. — In the second *Age*, which lasted 1296000, their Rajas were born: vice now crept into the world; mens lives were fallen to 300 years, and their size retrenched proportionally. — Under the third *Age*, which lasted 806400 years, vice being more increased, men only attained to 200 years. — The last *Age* is that wherein we now live, of which 4027200 years are already gone; and the life of man sunk to one fourth of its original duration.

AGE of Medals. See the article MEDAL.

AGE, in law, is particularly understood of a certain state or time of life, wherein a person is qualified for certain offices of civil society, which before, for want of years, and discretion, he was incapable of.

By the common law, there are two principal *Ages* in a man: at fourteen, he is at the *Age of discretion*; at twenty-one years, at full *Age*.

In a woman, there were anciently six *Ages* observed: at seven years, her father might distrain the tenants of his manor for aid to marry her; for at those years the may consent to matrimony. — At nine years old she is dowable; for then, or within half a year after, she is said to be able *promereri dotem*, & *virum sustinere*. — At twelve years, she is able finally to ratify, and confirm her former consent to matrimony. — At fourteen, she may take her lands into her own hands; and should be out of ward, if she were at this *Age* at her ancestor's death. — At sixteen, she should be out of ward, though at the death of her ancestor she was under fourteen: the reason is, that then she might take a husband able to perform knight's-service. — At twenty-one years, she may alienate lands, and tenements.

For a man; the *Age* of twelve years binds to appearance before the sheriff and coroner, for inquiry after robberies, 52 H. III. 14. at the *Age* of fourteen he may chuse his own guardian, and claim his lands held in fofage. Though

Bracton limits this to fifteen years; with whom Glanville agrees.—At fourteen, a man may consent to marriage, as a woman at twelve.—At fifteen he ought to be sworn to the peace, an. 24 Edw. I. Stat. 3.—At the *Age* of twenty one, a man was obliged to be a knight, if he had twenty pounds land per annum in fee, or for term of life, anno 1 Edw. II. Stat. 1. But this statute is repealed, 17 Car. I. cap. 10.—The same *Age* also enables him to make contracts, and manage his own estate; which, till that time, he cannot do with security of those that deal with him.
The *Age* of twenty-four years enabled a man to enter into an order of religion, without consent of parents, anno 4 Hen. IV. cap. 17.

AGE Prier, *actum prieri*, a petition, or motion made in court, by one in his minority, having an action brought against him for lands coming to him by descent; requesting, that the action may rest till he come to full *Age*.—This, the court, in most cases, ought to grant.
It is otherwise in the civil law; which obliges children in their minority to answer by their tutors, or curators. See **CURATOR**.

AGEMOGLANS*, or **AZAMOGLANS**, children of tribute raised every third year by the Grand Seigneur, among the Christians whom he tolerates in his dominions.

* The word, in its original, signifies a Barbarian's Child; that is a child not a Turk.—It is compounded of two Arabic words, 1^o, **AGEM**, which among the Turks signifies as much as *barbarous*; among the Greeks; the former people dividing the world into Arabs or Turks, and *Agem*: as the latter into Grecians and Barbarians. 2^o, **GLANS**, child.

The commissioners appointed for this levy, take them by force, even out of the houses of Christians; always claiming one in three, and pitching upon such as seem the handsomest, and promise to be the most handy.
These are immediately conveyed to Gallipoli or Constantinople; where they are first circumcised, then instructed in the Mahometan faith, taught the Turkish language and the exercises of war, till such time as they become of age to bear arms: and out of these the order of Janizaries is formed: See **JANIZARY**.

Such as are not judged proper for the army, they employ in the lowest and most servile offices of the seraglio; as in the kitchen, stables, &c.

AGENT, **AGENS**, in physics, that whereby a thing is done, or effected; or that which has a power whereby it acts on another; or by its action induces some change therein.
The word *Agent* is used promiscuously with *efficient*; and in contradistinction to *patient*. See **EFFICIENT**, **PASSIVE**, &c.
The schools divide *Agents* into *natural* and *free*.

Natural or Physical AGENTS, are those immediately determined by the author of nature, to produce one sort of effect; with an incapacity to produce the contrary thereto.—Such is fire, which only heats, and does not also cool.

Free or voluntary AGENT, is that which may equally do any thing, or the opposite thereof; as acting not from any predetermination, but from choice.—Such is the mind supposed to be; which may either will, or will the same thing.

Natural Agents, again, are subdivided into *univocal*; which are such as produce effects of the same kind, and denomination with the *Agents* themselves: and *equivocal*, whose effects are of a different kind, &c. from the *Agents*.

The schoolmen reckon the following circumstances necessary to the being of an *Agent*, viz. that it be contiguous to the object, distinct from it, have a power over it, a sphere of activity, and a proportion, or rate of acting.

AGENT, is also used for a person entrusted with the management of the affairs, either of a corporation, or a private person. In which sense, the word coincides with *deputy*, *procurator*, *syndic*, *factor*, &c.

Among the officers in the exchequer, are four *Agents* for taxes. See **EXCHEQUER**, &c.

AGENTS of Bank and Exchange, are public officers, established in the trading cities of France, to negotiate matters between merchants, relating to bills of exchange, and the buying and selling of goods. These amount to what, among us, are called *exchange-brokers*. See **BROKER**, and **EXCHANGE**.

AGENT and Patient, in common law, is where a person does, or gives, something to himself; so that he is at the same time both the doer or giver, and the receiver or party it is done to.—Such is a woman when she endows her self with part of her husband's inheritance.

A GEOMETRIA*, a defect in point of geometry, or a deviation from the strict principles, and conclusions of that science. See **GEOMETRY**.

* This is otherwise called *Agrometresia*; the words are both pure Greek, *Agrometria* and *Agrometresia*; though sometimes retained in English, and other writers.

Some have complained of the *Agometria* of the scriptures in respect of the proportions of the brazen sea, ark, &c. See **ARK**, &c.

AGER Terræ, in middle-age writers, the same with an acre of land.

AGERIUM. See **ACGESTMENT**.

AGGLUTINANTS* **AGGLUTINANTIA**, in medicine, a species of strengthening medicines, whose office, and effect is to adhere to the solid parts of the body, and thus recruit, and supply the place of what is wore off, and wasted in the animal actions.

* *Agglutinants* are most of them of the glutinous kind, or such as easily form themselves into jellies, and gummy confidences; whence the name *Agglutinant*, which is formed of *ad*, to; and *gluten*, glue. See **GLUE**, and **ACGLUTINATION**.

For the operation and use of *Agglutinants*, see **STRENGTHENERS**.

The principal simples which come under this class, found in the shops, are ising-glass, olibanum, gum arabic, dragons blood, castia, saffron, vermicelli, pulve, comfrey, plantain, &c.

AGGLUTINATION, literally, denotes the act of joining, or cementing two bodies together, by means of a proper gluten, or glue. See **CEMENT**, **GLUE**, &c.

In medicine, the term is peculiarly used for the apposition or adherence of new substance; or the giving a greater consistence to the animal fluids, to fit them the more for nourishment.

AGGRAVATION*, the act of augmenting a crime, or the punishment thereof. See **CRIME**, and **PUNISHMENT**.

* The word is compounded of *ad*, to; and *gravis*, heavy, grievous.

Aggravation, in the Romish canon-law, is particularly used for an ecclesiastical censure, threatening an excommunication, after three admonitions used in vain.

From *Aggravation*, they proceed to *re-aggravation*; which is the last excommunication. See **EXCOMMUNICATION**.

AGGREGATE*, the sum, or result of several things aggregated, or added together.

* The word is formed of *ad*, to; and *greg*, *gregis*, a flock, or company.

Natural bodies are *Aggregates*, or assemblages of particles, or corpuscles, bound together by the principle of attraction.

AGGREGATION, **AGGREGATIO**, in physics, a species of union, whereby several things which have no natural dependence, or connexion with one another, are collected together, so as in some sense to constitute one. See **UNION**. Thus, a heap of sand, or a mass of ruins, are bodies by aggregation.

AGGREGATION is also used figuratively, for association. See **ASSOCIATION**.

We say, to be of a company, or community by *Aggregation*.—An *Aggregation* of several doctors to the faculty of laws.—In Italy, *Aggregations* are frequently made of houses, or families; by virtue whereof, they all bear the same name, and arms.

AGGRESSOR, in law, he, of two contending parties, who makes the assault, or attack; or who began the quarrel, encounter, or difference.

In criminal matters, it is always first enquired who was the *Aggressor*.

AGILD*, or **AGILDE**, in our ancient customs, a person so vile, that whoever killed him was to pay no mulct for his death.

* The word comes from the privative *a*, and the Saxon, *gildan*, *salvare*, to pay.

AGILITY, **AGILITAS**, a light, and active habitude, or disposition of the members, and parts designed for motion.

AGILLARIUS, in ancient law-books, a hayward, or keeper of a herd of cattle in a common field. See **HAYWARD**.

AGIO*, in commerce, is a term used, chiefly in Holland, and at Venice, for the difference between the value of bank notes, and current money.

* The word is originally Italian; where it signifies ease, or convenience.

AGISTMENT*, **AGISTAGE**, or **AGISTATION**, in law, the taking in, and feeding the cattle of strangers in the king's forest, and gathering the money due for the same.

* The word is usually supposed to be formed of the French *Giste*, a bed, or lying place: though Kennet excepts to this etymon, and chooses rather to derive it from *Ager*, the field, or feeding place of cattle; imagining *Agistment* to have originally been the same with *Aggratum*, *Agrium*, or *Agromaticum*, the profit of feeding cattle on such a piece of ground.

AGISTMENT is also used metaphorically for a charge, or burden on any thing.

In this sense we meet with *Terræ ad custodiam maris Agistatæ*, i. e. charged with a tribute to keep out the sea.—So *Terræ Agistatæ*, are lands whose owners are bound to keep up the sea-banks.

AGISTOR, or **AGISTATOR**, an officer of the forest, who takes in the cattle of strangers, to feed therein; takes care they do not wander beyond their bounds, or stay beyond the

the stated time; and receives for the king's use, all such tack-money as becomes due on that account.

In English, they are otherwise called, *Guest-takers*, or *Gift-takers*; they are made, by letters patent, to the number of four, in every forest, where his majesty has any pannage. See PANNAGE.

Their function is termed *Agistment*, and *Agistage*.

AGITATION, *AGITATIO*, properly signifies *shaking*; or a reciprocal motion of a body this way, and that. See MOTION.

The prophets, quakers, Pythian priestesses, &c. were subject to violent *Agitations* of body.

Among physiologists, the term is sometimes appropriated to that species of earthquake, called *Tremor*, or *Arietatio*. See EARTHQUAKE.

Among the philosophers, it is chiefly used for an intestine commotion of the parts of any natural body.

Thus, fire is said to *agitate* the minute particles of bodies. —Fermentation, and effervescence, are attended with a brisk *Agitation* of the particles.

AGITATION of Beasts in the Forest, anciently signified the drift of beasts in the forest. See DRIFT.

AGITATORS, in our English affairs, were certain officers, created by the army in 1647, to take care of the interests thereof.

Cromwell leagued himself with the *Agitators*, whom he found to have more interest than the council of war. —The *Agitators* undertook to make proposals relating to the reformation of religion and the state.

AGLEETS, *AGLETS*, or *AGLEEDS*, among florists, the apices, or pendants hanging on the tip-ends of chives, or flamina; as in tulips, roses, spike-grass, &c. See CHIVE, and APICES.

AGNATI, in the Roman law, the male descendants from the same father.

Agnati stand contradistinguished from *Cognati*, which include also the females descended from the same father. See COGNATI.

AGNATION*, in the civil law, the kinship, or relation, between the descendants of the same father, being males, and issued only from males.

* The word is originally Latin, formed from *ad*, to; and *nasci*, to be born.

Agnation differs from *Cognition*, as the latter is an universal name, under which the whole family, and even the *Agnati* themselves are contained; and *Agnation*, a particular branch of *Cognition*, which only includes the descendants in the male line. Again, *Agnation* is properly only a civil name, as that of *Geni*, or family; *Cognition*, a natural name, or derived from blood.

By the law of the twelve tables, males and females succeeded one another, according to the order of proximity, and without any regard to the sex: but the laws were afterwards changed in this respect, by the *Lex Voconia*; and women were excluded from the privileges of *Agnation*, excepting such as were within the degree of consanguinity, i. e. excepting the sisters of him who died intestate: and it was hence that the difference between *Agnati*, and *Cognati* first took its rise. But this difference was again abolished by Justinian, (*Inst.* 3. 10.) and the females were re-instituted in the right of *Agnation*, and all the descendants on the father's side, whether males or females, were appointed to succeed each other indiscriminately, according to the order of proximity.

Hence, cognition came to take in all the relations of the mother as well as father; and *Agnation* to be retrained to those of the father alone.

Adoptive children enjoy the privileges of *Agnation*; which was called *civil* in their respect, in opposition to the other, which was *natural*. See ADOPTION.

AGNOETÆ*, in church history, a sect of ancient heretics, who maintained that Christ, considered as to his human nature, was ignorant of certain things, and particularly of the time of the day of judgment.

* The word is Greek *ἄγνοεταί*, formed of *ἄγνοω*, *ignoro*, to be ignorant of.

Eulogius, patriarch of Alexandria, ascribes this heresy to certain solitaries in the neighbourhood of Jerusalem, who in defence hereof, alleged divers texts of the New Testament, and among others, that of St. Mark, C. XIII. ver. 32. "Of that day and hour knoweth no man; no not the angels who are in heaven, neither the son, but the father only." —The same passage was made use of by the Arians; and hence the orthodox divines of those days were induced to give various explications thereof: some alledge, that our Saviour here had no regard to his divine nature, but only spoke of his human. Others understand it thus, That the knowledge of the day of judgment does not concern our Saviour considered in his quality of Messiah, but God only. Which is the most natural solution.

AGNOMEN, in antiquity, an epithet given to a person,

either by way of praise, or dispraise, or from some remarkable event which became, as it were, an additional name, but peculiar to the person, and not defensible to his issue. Thus, one of the Scipio's was named *Africanus*, and the other *Asiaticus*, from the brave achievements which the one did in Africa, and the other in Asia.

The *Agnomen* was the third in order of the three Roman names. —Thus in Marcus Tullius Cicero, Marcus is the prænomen, Tullius the nomen, and Cicero the *Agnomen*.

AGNUS CASTUS*, a medicinal shrub, having a monopetalous flower, and a narrow digitated leaf; famous among the ancients as a specific for the preservation of chastity, and the preventing of all venereal desires, pollutions, &c.

* The Greek called it *ἀγνος*, chaste; to which has since been added the reduplicative *Castus*, q. d. chaste chaste.

The Athenian ladies, who made profession of chastity, lay upon leaves of *Agnus Castus*, during the feast of Ceres. See CERESALIA.

It is reputed a cooler, and particularly of the genital parts; and was anciently used in phycic, to allay those inordinate motions arising from femal turgecences: but it is out of the present practice.

AGNUS DEI*, in the Romish church, denotes a cake of wax, stamped with the figure of a lamb, supporting the banner of the cross, consecrated in due form by the pope, to be distributed in presents among the people, and supposed to have great virtues annexed to it.

* The name literally signifies *lamb of God*; this being supposed an image, or representation of the lamb of God, who took away the sins of the world.

They cover it up with a piece of stuff, cut in form of a heart, and carry it very devoutly in their processions. —The Romish priests, and religious, make a good penny, by selling these *Agnus Dei's* to some, and presenting them to others. The pope consecrates fresh ones once in seven years, the distribution whereof belongs to the master of the wardrobe; and they are received by the cardinals, with a world of reverence, in their mitres. —This ceremony they pretend to derive from an ancient custom of the church, wherein part of the paschal taper, consecrated on holy Thursday, was distributed among the people, to perfume their houses, fields, &c. in order to drive away devils, and to preserve them from storms and tempests.

AGNUS DEI, is also a name popularly given to that part of the mass, wherein the priest, striking his breast three times, rehearses, with a loud voice, a prayer beginning with the words *Agnus Dei*.

AGNUS SCYPIUS. See the article ZOOPHYTE. See also SUPPLEMENT, article BAROMETZ.

AGON, in antiquity, a dispute or contest for the mastery, either in some exercise of the body, or of the mind. There were *Agones* on certain days, in most of the ancient feasts, and other ceremonies in honour of the gods, or heroes.

There were also *Agones* established expressly, and not attached to any other solemnity. —Such was the *Agon Gymnicus*, at Athens; the *Agon Nemeus*, instituted by the Argians in the 53d olympiad; the *Agon Olympius*, instituted by Hercules, 430 years before the first olympiad.

The Romans had also *Agones* instituted after the example of the Greeks: the emperor Aurelian established the *Agon Solis*, *Agon* of the sun; and Diocletian, the *Agon Capitolinus*, which was held every fourth year, after the manner of the olympic games. —Hence, the years instead of lustra, are sometimes numbered by *Agones*.

AGON was also a minister of sacrifice, whose business was to strike the victim.

The name is supposed to have been derived hence, that standing ready to give the stroke, he asked *Agon?* or *Agone?* shall I strike?

The *Agon* was also called *Papa*, *Cultarius*, and *Victimarius*. **AGONALES**, in antiquity, an epithet given to the Salii, consecrated by Numa Pompilius to the god Mars surnamed *Gradivus*. See SALII.

They were also called *Quirinales*, from the *Mons Quirinalis*, where they officiated. Rosinus calls them *Agonenfes Salii*.

AGONALIA, in antiquity, feasts celebrated by the Romans, in honour of Janus; or, as some will have it, in honour of the god *Agonius*, whom the Romans used to invoke upon their undertaking any business of importance.

Authors vary as to the etymology of this solemnity; some derive it from the mount *Agonus*, afterwards called *Mons Quirinalis*, whereon it was held. —Others suppose it taken from that ceremony in the feast, where the priest holding the naked knife, and ready to strike the victim, which was a ram, asked, *Agone?* shall I do it? —This last is Ovid's opinion. *Fest. L. I. v. 319.*

AGONISTICI*, in antiquity, a name given by Donatus to those of his sect, whom he sent into the neighbouring places,

fairs, markets, &c. to preach his doctrine; for which reason they were also called *Circuitores*, *Circellianes*, *Catropites*, *Coropites*, and at Rome, *Montenses*.

* They were called *Agonistici*, from the Greek *αγων*, combat; in regard they were sent as it were to fight, and subdue the people to their opinion.

AGONOTHETA*, **AGONOTHETES**, in antiquity, a magistrate chose among the Greeks, to preside, and have the superintendency of their sacred games, or combats; to defray the expences thereof, and to adjudge the prizes to the conquerors.

* The word is compounded of *αγων*, combat, sacred sport; and *θετης*, he who disposes, appoints, ordains.

Among the Romans, the like officer was denominated *Designator*, and *Munerarius*.

AGONY*, **AGONIA**, denotes the extremity of pain, or a disease; when nature makes her last effort, or struggle, to throw off the evil that oppresses her.

* The word is formed from the Greek *αγων*, certamen, combat; this being a kind of strife, between life and death.

AGONYCLITE*, or **AGONYCLITES**, in antiquity, a sect in the seventh century; whose distinguishing principle it was, never to kneel, but to deliver all their prayers standing. See **GENUFLECTION**.

* The word is compounded of the privative particle, *α*, *γινω*, knee, and *κλιω*, to bend.

AGORANOMUS*, in antiquity, a magistrate of Athens, established for the maintenance of good order, and policy in the markets, settling the prices of provisions, and deciding disputes relating to buying, and selling, inspecting the weights, measures and the like.

* The word is Greek, compounded of *αγορα*, market; and *νομος*, law.

The *Agoranomus* among the Greeks was much the same with the *Clerus* *Ædile* among the Romans. See **ÆDILE**. Aristotle distinguishes two kinds of magistrates, the *Agoranomi*, who had the intendency of the markets; and the *Asynomi*, who inspected the buildings of the (public) cities.

AGRARIAN*, in the Roman jurisprudence, a denomination given to such laws as relate to the partition, or distribution of lands.

* The word is formed of the Latin *Ager*, field.

There are fifteen or twenty *Agrarian* laws, whereof, the principal are, the *Lex Apuleia*, made in the year of Rome 653; the *Lex Bæbia*; the *Lex Cassia*, in the year 267; the *Lex Cornelia*, in the year 673; the *Lex Flaminia*, in the year 525; the *Lex Flavia*; the *Lex Julia*, in the year 691; the *Lex Licinia*, in 377; the *Lex Alia Licinia*; the *Lex Livia*; the *Lex Marcia*; the *Lex Roscia*, made after the taking of Carthage; two *Sempronian* laws, in the year 620; the *Lex Servilia*, in 690; the *Lex Thorcia*; and the *Lex Titia*.

The *AGRARIAN LAW*, *LEX AGRARIA*, absolutely, and by way of eminence so called, was a celebrated law, published by Spurius Cassius, about the year 268, for an equal division of the conquered lands among all the citizens, and for limiting the quantity of ground possessed by each person to a certain number of acres.—Those other two in the Digest, the one published by Cæsar, and the other by Nerva, only relate to the limits, or boundaries of grounds; and have no relation to that of Spurius Cassius.

AGRARIUM, See **AGREEMENT**.

AGREEMENT, **AGREEMENTUM**, in law, a joining, or putting together of two, or more minds in any thing done, or to be done.

Of this there may be three sorts.—The first, an *Agreement executed* at the beginning; mentioned in the statute of 25 Edw. III. c. 3. which says, 'That the goods bought by forefathers, being thereof attained, shall be forfeited to the king; if the buyer thereof have made *Gree* with the seller; where the word *Gree*, otherwise called *Agreement executed*, signifies payment for the things, or satisfaction.

The second is, an *Agreement after an act*, that is, where one does an act, and another agrees or assents thereto, afterwards. The third is, an *Agreement executory*, which is, when both parties at one time are agreed that such a thing shall be done in time to come. It is called executory, in regard the thing is to be done afterwards.

AGRESSES, or **OGRESSES**, in heraldry, the same as *Pellets*. See **PELLETS**.

AGRICULTURE*, the art of tilling, or cultivating the earth, in order to render it fertile, and make it bear plants, trees, fruits, &c.

* The word is formed of the Latin *Ager*, field; and *cultura*, tilling; of *colere*, to till.

The principal and most general operations in *Agriculture*, are manuring, ploughing, fallowing, sowing, harrowing; as also, reaping, and mowing. See the articles **MANURE**, **PLOUGHING**, **SEMINATION**, &c.

To the operations of *Agriculture* do also belong the management of the productions of particular countries; as hops, hemp, vines, tobacco, saffron, liquorice, woad, &c.

To the same art belong planting, transplanting, pruning, engraving; the culture of forests, timber, copes, &c. See

PLANTING, **PRUNING**, **ENGRAFTING**, **TIMBER**, **TREE**, &c.

Even gardening, or horticulture it self, is only a branch of *Agriculture*. See **GARDEN**.

Among the ancients, *Agriculture* is frequently called *Georgica*.

We forbear to say any thing about the antiquity or usefulness of this art; every reader's imagination will supply that defect.—It has been cultivated by many of the greatest men among the ancients; as emperors dictators, and consuls; and has been treated of by some of their greatest authors. Virgil for instance, Cato, Varro, Columella, Constantinus Porphyrogenitus, Palladius, &c.

The latter authors on *Agriculture*, are Baptista Porta, Heresbachius, and Agricola in Latin; Alphonso Herrera, in Italian; Stephens, Liebaud, de Serres, de Croiscens, Bellon, and Chomel, in French; and Nourie, Evelyn, Mortimer, Switzer, Bradley, Lawrence, Miller, and Tull, in English.

AGRIPPA*, a name applied, among the ancients, to children delivered in an unusual, or irregular manner; particularly such as come with the feet foremost, instead of the head.

* They were called *Agrippæ*, according to Pliny, on account of their being (*agris partii*) born with difficulty.

AGRYPNIA, **APTYPNIA**, a privation of sleep; otherwise called *watching*, *waking*, *vigilia*, *pervigilium*, &c. See **WATCHING**.

AGUE, a periodical disease, of the fever kind, consisting in a cold shivering fit, succeeded by a hot one; and going off in a diaphoresis, or sweating.

If the coldness and shivering be inconceivable, and only the hot fit felt; the disease is called an *intermitting fever*.

According to the periods or times of the returns of the fit, the disease is either a quotidian, tertian, or quartan *ague*, or fever. See **QUOTIDIAN**, **TERTIAN**, and **QUARTAN**.

The cause of *Agues*, seems to be an obstructed perspiration, or whatever by overloading the juices, retards their motion, or occasions a lentor in the blood.—The symptoms are heaviness and reaching; a weak, slow pulse; coldness and shivering, felt first in the joints, thence creeping over the whole body; pain in the loins, and an involuntary motion of the under jaw.

A vernal *Ague* is easily cured; but an autumnal one is more obstinate, especially in aged and cachectical persons; and particularly if complicated with a dropsy, peripneumony, &c.

When an *Ague* proves fatal, it is usually in the cold fit, thro' the oppression of the spirits.

The cure is usually begun with an emetic of ipecacuanha, an hour before the access; and completed with the cortex peruvianus, administered in the interval between two fits; and continued at times, to prevent a relapse.

Quincy endeavours to account for the effect of the bark, from the irregularity, asperity, and solidity of its particles, which fit it to break those viscidities in the juices whereby the capillaries were obstructed, and to draw up the solids into a tension, sufficient by the vigorous vibrations ensuing thereon, to prevent any future accumulation thereof.—The first intention, he observes, is answered by giving the blood a greater momentum; and the second, by its corrugating the nerves, and rendering the contractions of the vessels more brisk and forcible.—Hence also its effects upon such as are apt to sweat immoderately. See **SUPPLEMENT**, article **AGUE**.

AGUGLIA. See **OBELISK**.

AID, or **AYDE***, **AUXILIUM**, literally denotes the help, succour, or assistance, which any person lends another, when too weak to do, or avoid something.

* The word is French, formed, according to M. Menage, from the Italian *Aitare*; and that from the Latin *Adjutare*, to help, or assist.

AID, or **AYDE**, in law, is when a petition is made in court, for the calling in of help from another person interested in the matter in question; who, it is probable, may not only strengthen the party's cause who thus prays for *Aid*, but also prevent a prejudice arising to his own right.—This is called *Aid prier*, but this course of proceeding is now much disused.

A city or corporation, holding a fee-farm of the king, may pray in *Aid* of him; if any thing be demanded of them relating thereto.

The *Aid prier*, is sometimes also used in the king's behalf, to prevent any proceeding against him till his council be called, and heard what they have to say for avoiding the king's prejudice, or loss.

AID de Camp, an officer in an army, whose business is to attend the general officers, and receive, and carry their orders, as occasion requires.

When the king is in the field, he usually appoints young volunteers of quality to carry his orders, who are called the king's *Aids de Camp*.

AID Major, or **Adjutant**, is an officer, whose business is to ease the *Major* of part of his duty; and to perform it all in his absence. See **MAJOR**.

Some Majors have several *Aid Majors*.—Each troop of guards has but one major, who has two *Aid Majors* under him; or more, according as the business requires. Every regiment of foot has as many *Aid Majors* as it contains battalions.—When the battalion is drawn up, the *Aid Major's* post is on the left, beyond all the captains, and behind the lieutenant-colonel.

AID, AUXILIUM, in our ancient customs, denotes a subsidy or sum of money due to the lord, from his tenants, on certain occasions.

It differed from a *Tax*, which is imposed at any time when wanted; whereas the *Aid* could only be levied where it was customary, and where the particular occasion fell out.

Such was the *Aid de Relief*, due from the tenants in fee, upon the death of the lord mesn, to his heir; towards the charge of a relief of the fee, of the superior lord.

Such also was the *Aid Cheval*, or *capital Aid*, due by vassals, to the chief lord, or the king, of whom they held in *capite*. See **CAPITE**.—Of this there are three kinds.

The first, of chivalry; or, as they call it, *Pur suite fize Chevalier*, towards making his eldest son a knight, when arrived at the age of 15 years, the second, of marriage, or *pur suite marier*, towards marrying his eldest daughter.—Both these, with all charges incident thereto, are taken away by Stat. 12 C. II. See **TENURE, SERVICE, &c.**—Some will have them to have been first established in England, by William the conqueror, and afterwards transferred to Normandy; but the more common opinion is, that the conqueror brought them with him. The third was of ransom, due when the lord was taken prisoner by the enemy. See **RANSOM**.

In some provinces there was a fourth kind of *Aid*: due whenever the lord should undertake an expedition to the holy land.

We also read of *Aids* paid the lord, when he was minded to purchase any new land, or tenement. These were only granted once in his life.—Also *Aids* for the repairing, and fortifying of castles, feats, &c.

Aids were at first imposed by the lord, or king, at what rate he pleased; but by a statute of 3 Edw. I. a restraint was laid on common persons being lords, and they were tied down to a fixed proportion: and by a subsequent statute, the same rate was extended even to the king.

Aids seem to have been first established with a view to the clients and freedmen of ancient Rome, who made presents to their patrons towards his daughter's fortune, as also on his birth-day, and on other solemn occasions.—Accordingly, Bouetier relates, that in his time, these *Aids* depended on the courtesy and good will of the vassals; for which reason they were called, *Droits de Complaisance*.

The bishops also received *Aids* from their ecclesiastics, called *Synodals*, and *Pentecostals*. They were to be paid at the time of their consecration; or when they had a king to entertain; or when called by the pope to his court, or to a council; as also when they went to receive the *Palium*.

Add, that the archdeacons also exacted *Aids* from the clergy of their jurisdiction. See **PROCURATION**.

Aids are also used in matters of policy, for any extraordinary taxes, or impositions occasionally levied by the king, and parliament, upon the subjects; to support the charges of the government, when the ordinary revenue proves short.

Royal Aid is a name frequently given to the land-tax.

AIDS, in the manege, are helps, or assistances, by which the horseman contributes towards the motion, or action required of the horse; by a discreet use of the bridle, cavesson, spur, pommel, rod, calf of the leg, and voice.

Such a horse knows his *Aids*, answers his *Aids*, takes his *Aids* with vigour, &c.—The *Aids* are made use of, to avoid the necessity of corrections.—The *Aids*, given in a different manner, become corrections.

The *Aids* used to make a horse go in airs, are very different from those required in going upon the ground. See **COLE**.

The inner heel, inner leg, and inner rein, are called *inner Aids*.—The outer heel, outer leg, &c. are *outer Aids*.

Court of Aids, in France, is a sovereign court, erected for the cognizance of matters relating to the taxes.—Appeals come to this from the court of elections, where matters relating to the taille are first heard.—The *Court of Aids* of a province is sometimes separated from the parliament of the province, and fixed in another city, as at Montpelier, Montauban, &c.

AIGLETTE, in heraldry. See the article **EAGLET**.

AIGUE Marine, in natural history. See **AQUA Marina**.

AIGUISCE, **AIGUISSE**, or **EGUISCE**, in heraldry, a term applied to a cross, when its four ends are sharpened, so however as to terminate in obtuse angles. See **CROSS**.

The cross *Aiguisee* differs from the cross *fitchée*, in that the latter goes tapering by degrees to a sharp point; whereas only the ends of the former are tapered. See **PITCHÉE**.

VOL. I.

AILE*, or **AIEL**, in law, a writ which lies where the grandfather, or great grandfather called *Besaille*, was seized of lands or tenements in fee-simple, on the day he died; and a stranger abates or enters the same day, and dispossesseth the heir or grandchild. See **ABATEMENT**.

* The word is formed of the French *Aile*, *Aous*, grandfather.

AIR, AER, in physics, a thin, fluid, transparent, compressible, and dilatable body; surrounding the terraqueous globe to a considerable height.

Air was considered by some of the ancients as an element; but then, by element they understood a different thing from what we do.

It is certain, that *Air*, taken in the popular sense, is far from the simplicity of an elementary substance; though there may be something in it, which bids fair for the appellation.—Hence, *Air* may be distinguished into *vulgar*, or heterogeneous; and *proper*, or elementary.

Vulgar or Heterogeneous Air, is a coalition of corpuscles of various kinds, which together constitute one fluid mass, wherein we live and move, and which we are continually receiving and expelling by respiration.—The whole assemblage of this, makes what we also call the *atmosphere*.

Where this *Air*, or atmosphere terminates, there æther is supposed to commence; which is distinguished from *Air*, in that it does not make any sensible refraction of the rays of light, which *Air* does.

The substances whereof *Air* consists, may be reduced to two kinds, *viz.* 1^o. The matter of light, or fire, which is continually flowing into it from the heavenly bodies.—To which, probably, may be added the magnetical effluvia of the earth.

2^o. Those numberless particles, which in form either of vapours, or dry exhalations, are raised from the earth, water, minerals, vegetables, animals, &c. either by the solar, subterraneous, or culinary fire.

Elementary Air, or *Air properly so called*, is a certain subtle, homogeneous, elastic matter; the basis, or fundamental ingredient of the atmospherical *Air*, and that which gives it the denomination.

Nature and Origin of Air.—The peculiar nature of this aerial matter, we know but little of; what authors have advanced concerning it being chiefly conjectural. We have no way of examining it apart, or separating it from the other matters it is mixed with; and consequently no way of ascertaining with evidence what belongs to it abstractedly from the rest.

Dr. Hook, and some others, will have it to be no other than the æther itself; or that fine, fluid, active matter, diffused through the whole expanse of the celestial regions: which coincides with Sir I. Newton's *Subtile Medium*, or spirit.

In this view it is supposed a body *sui generis*, ingenerable, incorruptible, immutable, present in all places, and in all bodies. Others, considering only its property of elasticity, which they account its essential and constituent character; suppose it mechanically producible; and to be no other than the matter of other bodies altered, so as to become permanently elastic.—Mr. Boyle gives us several experiments, which he made “for the production of *Air*; taking production for the obtaining

“a sensible quantity thereof, from bodies wherein it did not appear either at all, or in so great plenty.”—Among the several ways of doing this, ‘the fittest for practice,’ he observes, ‘are fermentation, corrosion, dissolution, decomposition; the boiling of water and other fluids; and the mutual action of bodies, especially saline ones, upon each other.’

Hist. of Air.—He adds, ‘that various solid and mineral bodies, unsuspected of elasticity, being plunged in corrosive unelastic menstrua, will, by a proper comminution of their parts in the conflict, afford a considerable quantity of permanently elastic *Air*.’ *Ubi supra*.

Of the same opinion is Sir I. Newton; ‘The particles of dense, compact, and fixed substances, cohering by a strong attractive force, are not separable without a vehement heat, or perhaps not without fermentation; and such bodies being at length rarified by such heat or fermentation, become true permanent *Air*.’ *Optics*.—‘Thus, the same author adds, ‘gunpowder generates *Air* by explosion.’ *Ibid*.

We have here, therefore, not only the materials whereof *Air* should be made; but the means of doing it: with regard to which, the *Air* is divided into real or permanent; and apparent or transient.—For, that all which appears to be *Air* does not continue such, is evident from the instance of an æolipile; the water of which being sufficiently rarified by the fire, rushes out in a sharp whistling blast, perfectly resembling *Air*, while the motion lasts; but it soon loses that resemblance, especially in the cold, and returns by condensation into its original water: and the same may be observed of alcohol of wine, and other subtle and fugitive spirits, raised by distillation.—Whereas real *Air* is not reducible by any compression, condensation, or the like, into any other substance beside *Air*. Water, then, though it may put on an aerial nature for a while, yet is not capable of persisting therein: and the same

may be said of other fluids.—The furthest they can go, is to become vapour; which is the matter of the fluid rendered much rarer, and put in a brisk motion.—For a substance to become permanent *Air*, it must be of a fixed kind; otherwise, it is not capable of undergoing the alteration necessary to be induced in it; but gives way and flies off too soon. So that the difference between permanent and transient *Air*, amounts to the same as that between vapour and exhalation; the one, *e. gr.* being dry, the other moist.

We can go a little further yet.—This elastic property of *Air*, is supposed by many philosophers, to depend on the figure of its corpuscles, which they suppose to be ramous: some will have them to many minute flocculi, resembling fleeces of wool; others conceive them rolled up like hoops, and curled like wires, or shavings of wood, or coiled like the springs of watches, and endeavouring to restore themselves in virtue of their texture: so that to produce *Air*, must be to produce such a figure and disposition of parts; and those bodies only are proper subjects, which are susceptible of such disposition; which, fluids, from the smoothness, roundness, and slipperiness of their parts, are not.

But Sir I. Newton (*Optics*, p. 371.) puts the thing another way; such a texture he thinks by no means sufficient to account for that vast power of elasticity observed in *Air*, which is capable of diffusing into above a million of times more space than it before possessed.—But, as all bodies are shewn to have an attractive and a repelling power; and as both these are stronger in bodies, the denser, more solid and compact they are: hence it follows, that when by heat, or any other powerful agent, the attractive force is surmounted, and the particles of the body separated so far as to be out of the sphere of attraction; the repelling power commencing thence, makes them recede from each other with a strong force, proportionable to that wherewith they before cohered; and thus they become permanent *Air*.—Hence, says the same author, it is, that as the particles of permanent *Air* are grosser, and rise from denser bodies, than those of transient *Air*, or vapour: true *Air* is more ponderous than vapour; and a moist atmosphere is lighter than a dry one.

But, after all, there may still be reason to doubt, whether the matter thus produced from solid bodies have all the properties of *Air*; and whether such *Air* be not transient, as well as that from humid ones; though not to that degree.—Mr. Boyle argues, from an experiment made in the *Air*-pump with lighted match; that those light and subtle fumes into which the fire itself flutters dry bodies, have no such spring as *Air*; since they were unable to hinder the expansion of a little *Air*, included in a bladder they surrounded. *Phys. Mech. Exper.*—Yet, in some subsequent experiments, by dissolving iron either in oil of vitriol and water, or in aqua-fortis; a large aerial bubble was produced, which had a real spring; so as to hinder the surrounding liquor from regaining its place; and which, by the application of a warm hand, readily dilated itself like other *Air*, and broke into the liquor in several succeeding bubbles; and even through the liquor into the open *Air*. *Ubi supra*.

The same excellent person farther assures us, he procured a really elastic substance from divers other matters; as bread, grapes, must, ale, apples, peas, beef, &c. and from some bodies by only burning them in vacuo, particularly paper, hartshorn, &c. which yet, upon farther examination, was so far from being pure *Air*, that animals inclosed in it, not only could not respire it without harm; but even died sooner than in vacuo, where there was nothing like *Air*. *Phys. Mechan. Exper.*

We may here add an observation of the members of the Royal Academy of Sciences at Paris; which imports, that the property of elasticity is so far from constituting *Air*; that *Air* is rendered more elastic by the admixture of some other matters along with it, than it is in its purity.—Thus, from some experiments of M. de la Hire at Paris, and of M. Stancari at Boulogne, M. Fontenelle assures us, that *Air* moistened with water, is considerably more elastic, and expands farther, than when pure.—M. de la Hire even found the moist *Air* eight times more elastic than the dry. *V. Hist. de l'Acad. an. 1708*. But it must not be omitted, that Dr. Jurin explains the experiments another way; and endeavours to shew, that the conclusion does not necessarily follow from them. *V. Append. ad Var. Geogr.*

Thus much for *Air* considered in itself.—But such *Air*, we have observed, no where exists in its purity.—That wherewith we are concerned, and whose properties and effects are chiefly considered, is acknowledged by Mr. Boyle to be the most heterogeneous body in the universe: Boerhaave even shews it to be an universal chaos, or colluvies of all the kinds of created bodies.—Whatever fire can volatilize is found in the *Air*; and there is no body that can withstand the force of fire.

Hence, for instance, 1°. The whole fossil kingdom must necessarily be found therein: for all of that tribe, as salts, sulphurs, stones, metals, &c. are convertible into fume, and thus capable of being rendered part of the *Air*.—Gold

it self, the most fixed of all natural bodies, is found to adhere close to the sulphur in mines; and thus to be raised along with it.

2°. All the parts of the animal kingdom must also be in the *Air*: for, besides the copious effluvia continually emitted from their bodies, by the vital heat, in the ordinary course of perspiration; by means whereof an animal, in the course of its duration, impregates the *Air* with many times the quantity of its own body. Beside this, we find that any animal when dead, being exposed to the *Air*, is in a certain time carried wholly off, bones and all. So that the whole of what before was an animal, *e. gr.* a man, an ox, or the like, is now in the *Air*.

By the way, it may be noted that huge swarms of the grosser excrementitious matters of animals must swim in the *Air*: at Madrid, we are assured, they have no necessary houses; and that they always make a jakes of their streets over night: yet does the *Air* imbibe the filth as fast as it is laid; inasmuch, that there is no increase of any fetid smell.

3°. As to vegetables, nothing of that class can be supposed wanting; since we know that all vegetables by putrefaction become volatile: even the earthy or vascular part, in time following the rest.

Of all the effluvia floating in this grand ocean the atmosphere; the principal, are the saline. These, authors commonly conceive, are chiefly of the nitrous kind; but there is no doubt but that there are of all the sorts, vitriolic, aluminous, and of the nature of sea salt, &c.

Mr. Boyle even observes, that there may be many compounded kinds of salts in the *Air*, which we have not on earth; arising from different saline spirits, fortuitously meeting and mixing together.—Thus, the glass windows of ancient buildings are sometimes observed to be corroded, as if they had been worm-eaten; though none of the simple salts above-mentioned have the faculty of corroding glass.

The sulphurs, too, must make a considerable article in the *Air*; on account of those many volcanos, grottos, caverns, and other spiracles chiefly affording that mineral, dispersed through the globe.

And the associations, separations, attritions, dissolutions, and other operations of one sort of matter upon another, may be considered as a source of numerous other neutral or anonymous bodies, unknown to us.

Air, in this general sense, is one of the most considerable and universal agents in all nature; being concerned in the preservation of life and the production of most of the phenomena relating to our world.—Its properties and effects, including a great part of the researches and discoveries of the modern philosophers, have some of them been reduced to precise laws and demonstrations; in which form they make a branch of mathematics, called *Pneumatics*. Which see.

Mechanical Properties and Effects of Air. The most considerable of these are its fluidity, weight, and elasticity.—1°. Fluidity.—That the *Air* is a fluid, is evident from the easy passage it affords to bodies through it; as in the propagation of sounds, smells, and other effluvia: for this argues it a body whose parts give way to any force impressed, and in yielding, are easily moved among themselves; which is the definition of a fluid.

They who, with the Cartesians, make fluidity consist in a perpetual intestine motion of the parts, find *Air* also answers to that character: thus, in a darkened room, where the species of external objects are brought in by a single ray; they appear in a continual fluctuation; and thus even the more accurate weather-glasses are observed never to remain a moment at rest. See *WEATHER-Glass*.

The cause of this fluidity of *Air*, is attributed by some late philosophers to the fire intermixed therewith; without which, they imagine, the atmosphere would harden into a solid, impenetrable mass.—And hence, the greater the degree of fire therein is, the more fluid, moveable and pervious is the *Air*: and thus, as the degree of fire is continually varying, according to the circumstances and position of the heavenly bodies; the *Air* is kept in a continual reciprocation.

Hence, in a great measure, it is, that on the tops of the higher mountains; the senses of smelling, hearing, &c. are found very feeble. See *MOUNTAIN*.

II°. Weight, or gravity.—That the *Air* is heavy, follows from its being a body; weight being an essential property of matter.

But we have infinite arguments of the same thing also from sense, and experiment: thus, the hand, applied on the orifice of a vessel empty of *Air*, soon feels the load of the incumbent atmosphere.—Thus, glass vessels, exhausted of their *Air*, are easily crushed to pieces by the weight of the *Air* without. So, two small hollow segments of a sphere, exactly fitting each other, being emptied of *Air*, are pressed together with a force equal to an hundred pounds, by the pondus of the ambient *Air*. Farther, a tube close at one end, being filled with mercury, and the other end immersed in a basin of the same fluid; and thus erected: the mercury in the tube will be suspended to the height of about thirty inches above the surface of that in the basin. The reason of which suspension, is, that the mercury

in the tube cannot fall lower, without railing that in the basin; which being pressed down with the weight of the incumbent atmosphere, cannot give way, unless the weight of the mercury in the tube, exceeds that of the *Air* out of it.—That this is the case, is evident hence; that if the whole apparatus be included in an *Air*-pump; in proportion as the *Air* exhausted from the flame, the mercury falls: and on gradually letting in the *Air* again, the mercury reascends to its former height.—This makes what we call the *Toricellian experiment*.

To say no more, we can actually weigh *Air* for a vessel, full even of common *Air*, by a very nice balance, is found to weigh more than when the *Air* is exhausted; and the effect is proportionably more sensible, if the same vessel be weighed full of condensed *Air* in a receiver void of *Air*.

The weight of *Air* is continually varying, according to the different degree of heat, and cold.—Riccioli estimates its weight to that of water, to be as 1 to 1000; Merfennius as 1 to 1300, or 1 to 1356; Lana, as 1 to 640; Galileo only makes it as 1 to 400.—Mr. Boyle, by a more accurate experiment, found it about London, as 1 to 938, and thinks, all things considered, the proportion of 1 to 1000 may be taken as a medium; for there is no fixing any precise ratio, since not only the *Air*, but the water itself, is continually varying. Add, that experiments made in different places necessarily vary, in regard of the different heights of the places, and the different confidences of *Air* arising therefrom. Boyle, *Phys. Mechan. Exper.*

It must be added, however, that by experiments made since before the Royal Society; the proportion of *Air* to water was, first, found as 1 to 840; then, as 1 to 852; and a third time, as 1 to 860. *Phil. Trans.* N° 181.—And lastly, by a very simple and accurate experiment of the late Mr. Hawksbee; the proportion was settled as 1 to 885. *Phys. Mechan. Exper.*—But these experiments being all made in the summer months, when the barometer was twenty-nine inches $\frac{1}{2}$ high; Dr. Jurin thinks, that at a medium between heat and cold, when the barometer is thirty inches high; the proportion between the two fluids, may be taken as 1 to 800.

Air, then, being heavy and fluid; the laws of its gravitation, or pressure, may be inferred to be the same as in other fluids; and consequently, its pressure must be as its perpendicular altitude.

This is also confirmed by experiment.—For, removing the Toricellian tube to a more elevated place, where the incumbent column of *Air* is shorter; a proportionably shorter column of mercury is sustained; it being found to descend at the rate of one fourth of an inch, for every hundred foot of ascent.

On this principle depends the structure and office of the barometer.

From hence, also, it follows, that the *Air*, like all other fluids, must press equally every way.—This is confirmed by what we observe of soft bodies sustaining this pressure without any change of figure; and brittle bodies, without their breaking, though the pressure upon them be equal to that of a column of mercury thirty inches high, or a column of water of thirty-two foot.—It is obvious, that no other cause can preserve such bodies unchanged, but the equable pressure on all sides, which resists as much as it is resisted. And hence, upon removing or diminishing the pressure on one side only; the effect of the pressure is soon perceived on the other.

For the quantity and effect of this pressure of the atmosphere on the human body. See ATMOSPHERE.

From this gravity of the *Air*, considered with its fluidity, several of its uses and effects are deducible.—And, 1°, by means hereof, it closely invests the earth, with all the bodies on it; and constringes and binds them down with a force amounting, according to the computation of M. Pascal, to 2232 pounds weight, upon every square foot, or upwards of 15 pounds upon every inch square.—Hence, it prevents, *s. gr.* the arterial vessels of plants and animals, from being too much distended by the impetus of the circulating juices, or by the elastic force of the *Air* so plentifully contained in the blood.—Thus, we see, in the operation of cupping, that upon a diminution of the pressure of the *Air*, the parts of the body grow tumid; which necessarily alters the manner of the circulation through the capillaries, &c.

The same cause hinders the juices from oozing and escaping through the pores of their containing vessels: this is experienced by such as travel up high mountains, who, in proportion as they ascend, find themselves grow more and more relaxed; and at length fall into a spitting of blood, and other hemorrhages; by reason of the *Air* not sufficiently binding up the vessels of the lungs.—The like is observed of animals inclosed in the receiver of the *Air*-pump, who, as the *Air* is taken from them, swell, vomit, drivel, dung, urine, sweat, &c. See VACUUM.

2°, The mixture of contiguous bodies, especially fluid ones, is chiefly owing hereto.—Hence many liquids, as oils and salts, which readily and spontaneously mix in *Air*, upon taking that away, remain quietly in their state of separation.

3°, It determines the action of one body upon another.—Thus,

the fire which burns wood immediately goes out, and its flame dissipates upon removing the *Air*; by reason something is then wanting to press the corpuscles of fire against those of the fuel, and prevent the too speedy diffusion of the flame. The same is observed of aqua-regia, and gold; that menstruum ceasing any longer to operate on the metal, after the *Air* is taken away. And upon the same determining power of the *Air* it is, that Papin's digester is built.

Hence also it is, that on the tops of high mountains, as on the pike of Teneriffe, the most acrid bodies, as pepper, ginger, salts, spirit of wine, &c. have no sensible taste; for want of their particles being pressed upon the tongue, so as to enter its pores, but instead thereof, being dissipated and blown away by its heat. The only thing that there retains its flavour, is canary wine, which is chiefly owing to its unctuous quality; in virtue whereof, it adheres closely to the part, and is not easily blown away.

From this principle of gravity chiefly arise our winds; which are only *Air* put in motion by some alteration in the equilibrium thereof.

III°, Elasticity,—or a power of yielding to an impression by contracting its dimensions; and, upon removing or diminishing the impressing cause, returning to its former space or figure.—This elastic force is accounted the distinguishing property of *Air*; the other properties hitherto enumerated being common to it with other fluids.

Of this power we have numerous proofs.—Thus, a blown bladder being squeezed in the hand; we find the included *Air* sensibly resist; so as upon ceasing to compress, the cavities or impressions made in its surface, are readily expanded again, and filled up.

On this property of elasticity, the structure and office of the *Air*-pump depends.

This visus or endeavour to expand, every particle of *Air* always exerts; and thus strives against an equal endeavour of the ambient particles; whose resistance happening by any means to be weakened, it frantically diffuses into an immense extent.—Hence it is, that thin glass bubbles, or bladders filled with *Air*, and exactly closed; being included in the exhausted receiver of an *Air*-pump, burst, by the force of the included *Air*. So a bladder quite flaccid, containing only the smallest quantity of *Air*; swells in the receiver, and appears quite full. The same effect is also found, by carrying the flaccid bladder to the top of an high mountain.

This power does not seem to have any limits assigned it; nor does it appear capable, by any means whatever, of being destroyed or diminished.—Mr. Boyle made several experiments, with a view to discover how long *Air*, brought to the greatest degree of expansion he could reduce it to in his *Air*-pump, would retain its spring; and could never observe any sensible diminution; even though this poor thin *Air* was clogged some months with a weight which one would wonder how it should support a moment.

Yet, Mr. Hawksbee, by a later experiment, has shewn, that the spring of the *Air* may be so disturbed by a violent pressure, as to require some time to return to its natural tone.

The weight or pressure of the *Air*, it is obvious, has no dependence on its elasticity; but would be the same, whether the *Air* had such property or not.—But the *Air*, in being elastic, is necessarily affected by the pressure, which reduces it into such a space, as that the elasticity which re-acts against the compressing weight, is equal to that weight.

In effect, the law of this elasticity, is, that it increases as the density of the *Air* increases; and the density increases, as the force increases wherewith it is pressed. Now, there must necessarily be a balance between the action and re-action: *i. e.* the gravity of the *Air*, which tends to compress it, and the elasticity of the *Air* which endeavours to expand it, must be equal.

Hence, the elasticity increasing, or diminishing universally as the density increases, or diminishes, *i. e.* as the distance between the particles diminishes or increases; it is no matter whether the *Air* be compressed, and retained in such space by the weight of the atmosphere, or by any other means: it must endeavour, in either case, to expand with the same force.—And hence, if *Air* near the earth be pent up in a vessel, so as to cut off all communication with the external *Air*; the pressure of the inclosed *Air* will be equal to the weight of the atmosphere. Accordingly, we find Mercury sustained to the same height, by the elastic force of *Air* inclosed in a glass vessel, as by the whole atmospherical pressure.

On the same principle may *Air* be artificially condensed. And hence the structure of the wind-gun.

Dr. Halley asserts, in the *Philosoph. Transactions*, that from the experiments made at London, and by the academy del Cimento at Florence, it may be safely concluded, that no force whatever is able to reduce *Air* into eight hundred times less space than what it naturally possesses on the surface of our earth. In answer to which, Monsieur Amontons, in the memoirs of the French academy, maintains, that there is no fixing any bounds to its condensation; that greater and greater

greater weights will still reduce it into less and less compacts; that it is only elastic in virtue of the fire it contains; and that as it is impossible ever absolutely to drive all the fire out of it, it is impossible ever to make the utmost condensation.

The dilatation of the *Air*, by virtue of its elastic force, is found to be very surprising; and yet Dr. Wallis suggests, that we are far from knowing the utmost it is capable of.—In several experiments made by Mr. Boyle, it dilated first into nine times its former space; then into 31 times; then into 60; then into 150. Afterwards, it was brought to dilate into 8000 times its space; then into 10000, and even at last into 13679 times its space; and all this by its own expansive force, without any help of fire.

On this depends the structure and use of the manometer. Hence, it appears, that the *Air* we breathe, near the surface of the earth, is compressed by its own weight into at least the 13679th part of the space it would possess in vacuo.—But if the same *Air* be condensed by art; the space it will take up when most dilated, to that it possesses when condensed; will be, according to the same author's experiments as 550000 to 1.

Hence, we see how wild and erroneous was that observation of Aristotle, that *Air*, rendered ten times rarer than before, changes its nature, and becomes fire.

M. Amontons, and others, we have already observed, take the rarefaction of *Air* to arise wholly from the fire contained in it; and hence, by increasing the degree of heat, the degree of rarefaction may be carried still further than its spontaneous dilatation.

On this principle depends the structure and office of the thermometer.

M. Amontons first discovered that *Air*, the denser it is, the more it will expand with the same degree of heat.

On this foundation, the same ingenious author has a discourse, to prove "that the spring and weight of the *Air*, with a moderate degree of warmth, may enable it to produce even earthquakes, and other of the most vehement commotions in nature."

According to the experiments of this author, and M. de la Hire, a column of *Air* on the surface of the earth, 36 fathoms high, is equal in weight to three lines depth of mercury; and it is found, that equal quantities of *Air* possess spaces reciprocally proportional to the weights wherewith they are pressed: the weight of the *Air*, therefore, which would fill the whole space possessed by the terrestrial globe, would be equal to a cylinder of mercury, whose base is equal to the surface of the earth, and its height containing as many times three lines, as the atmospherical space contains orbs equal in weight to 36 fathoms of that wherein the experiment was made.—Hence, taking the densest of all bodies, *e. gr.* gold, whose gravity is about 14630 times greater than that of *Air* in our orb, it is easy to compute, that this *Air* would be reduced to the same density as gold, by the pressure of a column of mercury 14630 times 28 inches high, *i. e.* 409640 inches: since the bulk of *Air*, in that case, would be in the reciprocal ratio of the weights wherewith they are pressed. This 409640 inches, therefore, expresses the height at which the barometer must stand, where the *Air* would be as heavy as gold, and the number $2 \frac{2}{3} \frac{1}{2} \frac{1}{2}$ lines, the thickness to which our column of 36 fathoms of *Air*, would be reduced in the same place.

Now, we know, that 409640 inches, or 43528 fathoms, is only the 74th part of the semidiameter of the earth: and therefore when you are past that, whatever matters there be, they must be heavier than gold: It is not improbable, therefore, that the remaining sphere of 6451538 fathoms diameter, may be full of dense *Air*, heavier, by many degrees, than the heaviest bodies among us.—Hence, again, as it is proved, the more *Air* is compressed, the more does the same degree of fire increase the force of its spring, and render it capable of so much the greater effect; and that, for instance, the heat of boiling water increase the spring of our *Air*, beyond what it ordinarily is, by a quantity equal to one third of the weight wherewith it is pressed: we may infer, that a degree of heat, which in our orb can only produce a moderate effect, may have a very violent one in such lower orb; and that as there may be many degrees of heat in nature, beyond that of boiling water, it is probable there may be some, whose violence, thus assisted by weight of the *Air*, may be sufficient to tear asunder the solid globe. *Mem. de l'Acad. An. 1703.*

This elastic power of the *Air*, is the second great source of the effects of this important fluid.—In virtue hereof, it insinuates into the pores of bodies, carrying with it this prodigious faculty of expanding; and that so easy to be excited: whence it must necessarily put the particles of the bodies it is mixed withal, into perpetual oscillations. In effect, the degree of heat, and the *Air*'s gravity and density, and consequently its elasticity and expansion, never remaining the same for two minutes together; there must be an incessant vibration, or dilatation and contraction, in all bodies.

This reciprocation we observe in several instances, particularly in plants, the tracheæ or *Air*-vessels whereof, do the office of lungs: for the contained *Air* alternately expanding and contracting, as the heat increases or diminishes, by turns presses the vessels, and eases them again; and thus promotes a circulation of their juices.

Hence, we find, that no vegetation or germination will proceed in vacuo.—Indeed, beans have been observed to grow a little tumid therein; and this has led some to attribute that to vegetation, which was really owing to no other than the dilatation of the *Air* within them.

From the same cause it is, that the *Air* contained in the bubbles in ice, by its continual action, bursts the ice: and thus glasses and other vessels frequently crack, when their contained liquors are frozen. Thus, also, entire columns of marble sometimes cleave in the winter-time, from some little bubble of included *Air*'s acquiring an increased elasticity.

From the same principle arise all putrefaction and fermentation; neither of which will proceed, even in the best disposed subjects, in vacuo.

In this we have a singular instance of the wonderful efficacy of *Air*, that it can change the two kingdoms, and convert vegetable substances into animal, and animal into vegetable.

In effect, all natural corruption and alteration seems to depend on *Air*; and metals, particularly gold, only seem to be durable and incorruptible, in virtue of their not being pervious to *Air*.—Accordingly, names slightly wrote in the sand, or dust, on the tops of high mountains, have been known to remain 40 years, without being in the least altered or effaced.

Effects of the different ingredients of the Air.—*Air* not only acts by its common properties of gravity, and elasticity, but there are numerous other effects, arising from the peculiar ingredients wherewith it consists.

Thus, 1^o, it not only dissolves and attenuates bodies by its pressure and attrition, but as a chaos containing all kinds of menstruums, and consequently having wherewithal to dissolve all kinds of bodies.

It is known, that iron and copper readily dissolve, and become rusty in *Air*, unless well defended with oil.—Boerhaave assures us, he has seen pillars of iron so reduced by *Air*, that one might crumble them to dust between the fingers; and for copper, it is converted by the *Air* into a substance much like the verdegreafe produced by vinegar.

Mr. Boyle relates, that in the southern English colonies, the great guns rust so fast, that after a few years lying in the *Air*, large cakes of crocus martis may be easily beat off them.—Acolta adds, that in Peru the *Air* dissolves lead, and considerably increases its weight.—Yet gold is generally esteemed indissoluble by *Air*; being never found to contract rust, though exposed to it ever so long. The reason hereof is, that sea salt, which is the only menstruum capable of acting on gold, being very difficult to volatilize; there is but a small proportion of it in the atmosphere. In the chymists laboratories, where aqua regia is preparing; the *Air* becoming impregnated with an unusual quantity of this salt; gold contracts a rust like other bodies.

Stones also undergo the common fate of metals.—Thus, Purbee stone, wherewith Salisbury cathedral consists, is observed gradually to become softer, and moulder away in the *Air*; and the like Mr. Boyle relates of Blackington stone. He adds, that *Air* may have a notable operation on vitriol, even when a strong fire could act no further on it. The same author has even found the fumes of a sharp liquor to work more suddenly and manifestly on a certain metal, when sustained in the *Air*, than the menstruum it self did which emitted fumes, on those parts of the metals it covered; in this he seems to refer to the Effect of the effluvia of vinegar on copper. See SUPPLEMENT, article COPPER.

2^o, *Air* volatilizes fixed bodies. Thus sea-salt being first calcined, then fused by the fire, and when fused exposed to the *Air* to liquify; when liquified left to dry again, then fused again; and the operation thus repeated: will by degrees be almost wholly evaporated; nothing remaining but a little earth behind.

Helmont mentions it as a mighty arcanum in chymistry to render fixed salt of tartar volatile: but the thing is easily effected by *Air* alone; for if some of this salt be exposed to the *Air* in a place replete with acid vapours, the salt draws the acid to it self, and when saturated therewith, is volatile.

3^o, *Air* also fixes volatile bodies.—Thus, though spirit of nitre, or aqua-fortis readily evaporate by the fire; yet, if there be any putrified urine near the place, the volatile spirit will be fixed, and fall down in form of aqua secunda.

4^o, Add, that *Air* brings many quiescent bodies into action, *i. e.* excites their latent powers.—Thus, if an acid vapour be diffused through the *Air*, all the bodies whereof that is a proper menstruum, being dissolved thereby, are brought into a state proper for action. See ACID, &c.

In chemistry, not only the presence or absence of the *air*, but even its being barely open, or inclosed, is of great consequence.—Thus, camphire fired in a close vessel, runs wholly into flowers; whereas, if during the process, the cover be removed, and a candle applied, the whole flies off in fume. So to make sulphur inflammable, it requires a free *air*; in a close cucurbit, it may be sublimed a thousand times without kindling; whereas being put under a glass bell, and a fire applied, it rises into spirit of sulphur per campanam: So an ounce of charcoal, inclosed in a crucible well luted, will remain without loss for fourteen days in the intensest heat of a melting furnace; though the thousandth part of the fire in open *air* will presently turn it into ashes.—Helmont adds, that the charcoal remains all that while without any alteration of its black colour; but the minute *air* is let in, it falls instantly into white ashes. The same holds of the parts of all animals and vegetables; which can only be calcined in open *air*: in close vessels they never become any other than black coals.

The *air* is liable to abundance of alterations, not only in respect to its mechanical properties, gravity, density, &c. but also in respect of the ingredients it consists of.—Thus, in places abounding with marcasites, a fretting vitriolic salt is observed to predominate in the *air*, which rots the hangings, and is often seen lying on the ground in a whitish efflorescence.—At Fahlun in Sweden, noted for copper-mines, the mineral exhalations affect the *air* so sensibly, that their silver coin is frequently discoloured in their purses; and the same effluvia change the colour of bras.—Mr. Boyle was assured by a gentleman who possessed some ground wherein there were several veins of metals, and other minerals, that he had frequently seen pillars of fumes ascending thence; some having no scent, some an ill one, and some few a good one.—In Carniola, Campania, &c. where there are mines of sulphur, the *air* at times becomes very unwholesome; whence frequent epidemic diseases, &c.—It is added, that the mines near the cape of Good Hope, emit such horrible fumes from the arsenic that abounds there, that no animal can live near them; so that such as have at any time been opened, were obliged to be immediately closed up again.

The effluvia of animals also have their effect in varying the *air*; as is evident in contagious diseases, plagues, murrains, and other mortalities which are spread by the *air*.

The like is observed in vegetables.—Thus, a good part of the clove-trees which grew so plentifully in the island of Ternate, being felled at the solicitations of the Dutch, in order to heighten the value of that fruit; such a change ensued in the *air*, as shewed the salutary effect of the effluvia of the clove-trees, and their blossoms: the whole island, soon after they were cut down, becoming exceeding sickly. This, a physician who had been upon the spot, and from whom Mr. Boyle had the relation, attributed to the noxious steams of a volcano there; the ill quality whereof, had been corrected by the aromatic effluvia of those spicy blossoms.

The *air* is also liable to alterations from the season of the year.—Thus, few subterraneous effluvia are emitted in the winter; by reason the pores are locked up by the frost, or covered by snow; the subterraneous heat being all the while at work, and preparing a fund, to be discharged the ensuing spring.—Hence it is, that if the same seed be sown in the same soil, in autumn and spring, and the degree of heat be the same, a very different effect will be found; and for the like reason, rain-water gathered in the spring, is found to have a peculiar virtue in respect to corn; which being steeped therein, affords a much larger quantity of spirits than otherwise.—Hence also, we see why a very severe winter, is usually followed by a wet spring and fruitful summer; and *vice versa*.

Again, from the winter's solstice to the summer's, the sun's rays growing still more and more perpendicular; their impulse on the earth's surface becomes more and more powerful; by which the glebe or soil is more and more relaxed, softened and putrified; till he arrives at the tropic: where, with the force of a chemical agent, he resolves the superficial parts of the earth into their principles, water, oil, salt, &c. which are all swept away into the atmosphere.

And hence we conceive the nature of meteors, which are either collections of such effluvia, or dispersions thereof.—These meteors, too, have considerable effects on the *air*; and thus thunder is known to put liquors upon fermenting afresh.

In effect, whatever alters the degree of heat; will make a proportionable alteration in the matter of the *air*. Mr. Boyle suggests something farther on this head, *viz.* that the salts, &c. which in a warm state of weather were kept in a fluid, and mixed together, so as to be in a condition to act conjointly; upon a remission of the warmth, may lose their fluidity and motion, shoot into crystals, and thus separate again.

The height or depth of the *air* makes a farther alteration, the exhalations being few of them able to ascend above the tops of high mountains, as appears from those plagues, where

the inhabitants of one side of a mountain have all perished without the least disorder on the other side. Nor must drought and moisture be denied their share in varying the state of the atmosphere.—In Guinea, the heat with the moisture, conduce so much to putrefaction, that the purest white fufurs are often full of maggots; and their drugs soon lose their virtue, and many of them grow verminous. It is added, that in the island of St. Iago, they are obliged to expose their sweet-meats daily to the sun, to exhale the moisture they had contracted in the night, which would otherwise occasion them to putrify.

On this principle depends the structure and office of the hygrometer.

These diversities in the *air* are found to have an influence on the operations, experiments, &c. of philosophers, chemists, and other operators.

Thus, it is very difficult to procure oil of sulphur per campanam in a clear dry atmosphere, its parts being then more ready to escape into the *air*: but in a thick, moist *air*, the oil comes in abundance.—So, all salts melt easiest in a cloudy *air*; and when melted, act most forcibly. And all separations succeed best in such weather.—If salt of tartar be exposed in a place where any acid spirit is floating in the *air*, it will imbibe the same; and of fixed become volatile. Hence, the experiments made of salts at London, where the *air* is plentifully impregnated with sulphur exhaled from sea-coal, prove different from those made on the same subjects in other parts of the kingdom, where wood, turf, &c. are the usual fuel. Hence also, metalline utensils, &c. rust much sooner at London, than in other parts, where there are fewer acid corrosive corpuscles in the *air*; and fermentation, which is easily raised and carried on in a place free of sulphur, is impracticable in places where sulphurous exhalations abound.—If pure well-fermented wine be carried into a place where the *air* is replenished with the fumes of new wine then fermenting; it will begin to ferment afresh. So salt of tartar swells, and as it were ferments, when carried into a place where spirit of nitre, vitriol, or sea-salt is preparing.—It is matter of common observation among brewers, distillers, vinegar-makers, &c. that at the time when the several plants use to be in flower, the respective juices ferment, and each process succeeds the best.—Add, that stains caused by vegetable juices, are observed to be best taken out of linen, at the time when the several plants that afford them are in their prime. This, Mr. Boyle observes, has been experienced in the stains of juice of quinces, hops, &c. one of which latter, eluding all the endeavours that could be used to get it out, has vanished of it self the next hop-season.

After all, some of our more curious and penetrating naturalists, have observed certain effects of *air*, which do not appear to follow from any of the properties, or the materials above recited.—On this view, Mr. Boyle has composed an express treatise of *Suspensions about some unknown properties of the air*.—The Phenomena of fire and flame in vacuo, seem, according to him, to argue some odd unknown vital substance diffused through the *air*, on account whereof that fluid becomes so necessary to the subsistence of flame: but whatever this substance be, it should seem by its sudden wasting or spoiling, that the quantity thereof is very inconsiderable, in proportion to the bulk of *air* it impregnates with its virtue; in regard, when the flame can no longer subsist in it, the *air*, upon examination, is not found to have undergone any alteration in any of its known properties.

Other instances to countenance such suspicions, are, the appearance and growth of salts in many bodies, which either afford them not at all, or not in that plenty, unless exposed to the *air*. Mr. Boyle mentions some marcasites dug from under ground, which being kept in a dry room, were soon covered over with a vitriolic efflorescence, and in a little time, by the operation of the *air* on them, were in great part crumbled into a powder exceeding rich in coppers; though they had probably lain many ages entire under ground: so, the earth or ores of allom, and many other minerals, robbed of their salt, metals, or the like, it is said will in tract of time recover them; and the like is observed of the cinders of sea-coal and at the iron works. See SUPPLEMENT, article IRON.

Mr. Boyle adds, that some lime in old walls has in time gained a large efflorescence of a nitreous nature, from which salt-petre was procurable. Add, that the colcothar of vitriol is not naturally corrosive, nor can any salt be procured from it, even by the assiduous of water; but being exposed awhile to the *air*, it yields a salt, plentifully.

The existence of such hidden properties, is also argued, from the access of the *air* rendering antimonial medicines emetic, and disposed to produce faintings and heart-burnings; and from its speedy corruption and moulding of trees dug from under ground, which had for ages remained firm, and almost impervious to the ax.

To say no more, the silks in Jamaica, if exposed to the *air*, soon rot; even while they preserve their colour: whereas, if

if kept from the *air*, they hold their firmness and dye: and the sable taffety worn at Brasl, becomes in a few days of an iron grey colour in the *air*; but in the shops preserves its hue: and some leagues beyond Paraguay, white people soon grow tawny; but as soon recover their native colour, upon removing out of that quarter.—These, out of a great number of instances tending the same way, may convince us, that notwithstanding all the discoveries hitherto made concerning *air*, there still remains a field for future inquiries. Whether *air* be convertible into water, or water into *air*, is also a problem among philosophers.

AIR, in medicine, &c. makes one of the six non-naturals. From observations on bleeding in rheumatisms, and after taking cold, it is evident, the *air* can enter with all its qualities, and vitiate the whole texture of the blood, and other juices.

From the palsies, vertiges, and other nervous affections caused by damps, mines, &c. it is evident that *air* thus qualified can relax and obstruct the whole nervous system. And from the colics, fluxes, coughs, and consumptions produced by damp, moist, and nitrous *air*, it is evident it can corrupt and spoil the noble organs, &c.—See farther under the article **ATMOSPHERE**.

The salubrity of frequently changing the *air* induced Dr. Henhew to contrive a method of doing it without removing from place to place, by means of an air-chamber fitted for the purpose. See his *Aero-chalin*. c. 5. ap. *Phil. Transf.* N° 133. p. 834.

Dr. Desaguliers has lately contrived a machine for the like service, viz. for changing the *air* of a sick person's room, by either drawing out the foul, or forcing in fresh *air*, by what he calls a centrifugal wheel, without opening either door, or window: an expedient which may be of considerable use in hospitals, mines, &c.—Something of it is said to have been actually put in practice over the house of commons, to draw away the hot steam from the candles, breath, sweat, &c. of so many persons in hot weather. Vid. *Phil. Transf.* N° 437. p. 41.

Innate AIR, is a fine aerial substance, supposed, by some anatomists, to be inclosed in the labyrinth of the inner ear, and to minister to the due conveyance of sounds to the sensory. But the existence of such *innate air*, has of late been called in question, and even disapproved. See **EAR**.

AIR, in music, signifies the melody, or the infection of a musical composition. See **MELODY**.

The word is also used for a tune, or song it self, that is, for a composition whose movements are just and equal; and the times, especially the first of such measure, well marked—being usually to be played pretty quick, and lively; unless there be something to indicate the contrary: as, *larga*, or *affettuosa*, &c.

Thus we say an *air* of Lully: Handel's *airs* with their symphonies and accompaniments, are made into concertos for the violin, &c.

AIRS, in horsemanship, denote the artificial or practised motions of a managed horse.

Such are the demi-volt, curvet, capriole, croupade, balotade, and step and leap; also, advancing, yerking, and bounding.

Some authors take *airs* in a more extensive sense; and divide them into *low*, and *high*.

The *low airs* include the natural paces, as walking, trotting, galloping, and terra-terra. See **PACE**, **TROT**, **GALLOP**, &c. — To which may be added, prancing, sidling, stopping, and turning.

The *high*, or *raised airs*, are all such motions as rise higher than the terra-terra; as the demi-volt, curvet, &c.

AIR-PUMP, a machine, by means whereof the *air* may be exhausted out of proper vessels. See **AIR**.

The use and effect of the *air-pump*, is to make, what we popularly call, a *vacuum*; but this, in reality, is only a degree of rarefaction sufficient to suspend the ordinary effects of the atmosphere.

By this machine, therefore, we learn, in some measure, what our earth would be without an atmosphere; and how much all vital, generative, nutritive, and alterative power, depend thereon.

The principle on which the *air-pump* is built, is the elasticity of the *air*; as that on which the common, or water-pump is founded, is the gravity of the same *air*.

The structure of the *air-pump* is, in it self, more simple even than that of the water-pump.—The latter supposes two principles, gravity and elasticity likewise: so that the water-pump must first be an *air-pump*, i. e. it must rarify the *air* before it can raise the water.—In effect, water being a dormant unelastic fluid, needs some external agent to make it ascend; whereas *air* ascends in virtue of its own elastic activity: its natural tendency is, to separate and leave a vacuum; and all that remains to art, is to prevent the ambient *air* from supplying the place of what thus spontaneously flies away.

To make water ascend, the force wherewith it is pressed downwards, is either to be diminished or increased in one part, more than another; like a balance in equilibrium, one of whose scales may be made to raise, either by diminishing its own weight, or increasing that of the other: the water, therefore, recedes from the common centre of gravity, by the very power wherewith it tends towards it, indirectly or secondarily applied; for that two similar centripetal forces being made to act contrary to each other, what in the one over-balances the other, must have the effect of a centrifugal force.—Whereas, the principle whereby *air* rarefies or diminishes, does not respect the centre of the earth, but the centres of its own particles; being no other than a certain implanted power, whereby they immediately tend to recede from each other.

The invention of this noble instrument, to which the present age is indebted for so many fine discoveries; is ascribed to Otto de Guericke, the celebrated consul of Magdebourg; who exhibited his first public experiments therewith, before the emperor and the states of Germany, at the breaking up of the imperial diet at Ratibon, in the year 1654.

Dr. Hook and M. du Hamel, indeed, ascribe the invention to Mr. Boyle; but that ingenious author frankly confesses de Guericke to have been beforehand with him. Some attempts, he assures us, he had made upon the same foundation, before he knew any thing of what had been done abroad: but the information he afterwards received from Schottus's *Mechanica Hydraulico-Pneumatica*, published in 1657, wherein was an account of de Guericke's experiments, first enabled him to bring his design to any thing of maturity.—From hence, with the assistance of Dr. Hook, after two or three unsuccessful trials, arose a new *air-pump*; more easy and manageable than the German one: and hence, or rather from the great variety of experiments that illustrious author applied it to, the engine came to be denominated, *Machina Boyleana*.

Structure and use of the AIR-PUMP.—The basis or essential part in the *air-pump*, is a metalline tube, answering to the barrel of a common pump, or syringe; having a valve at the bottom, opening upwards: and a moveable piston or embolus, answering to the fucker of a pump, furnished likewise with a valve opening upwards.—The whole, duly fitted to a vessel, as a recipient.

The rest, being only circumstances chiefly respecting convenience, has been diversified and improved from time to time, according to the several views and address of the makers.—That of Otto de Guericke, being less artful, laboured under several defects, in respect of the force necessary to work it, which was very great; and the progress very slow: beside that it was to be kept under water; and allowed of no change of subjects for experiments.

Mr. Boyle, by degrees, removed several of these inconveniences; and alleviated others: but still the working of his pump was laborious, by reason of the pressure of the atmosphere, a great part of which was to be removed at every extraction, after a vacuum was nearly arrived at.—But this inconvenience has been since removed by Mr. Hawksbee, who by adding a second barrel and piston to the former, to rise as the other fell, and fall as it rose; made the pressure of the atmosphere on the descending one, of as much service as it was of disservice in the ascending one.

Some of the Germans have also brought the *air pump* to do the opposite office of a condenser: but this is not to make the instrument so much the better, as more complex.

The structure of the *air-pump*, as now made among us, with all its advantages, is represented in Tab. *Pneumatica*, fig. 16.

It consists of two brazen barrels or cylinders, represented by *a a a*; which communicate with each other by a canal passing between them at *d d*; and with the receiver *o o o*, by means of the hollow wire *b b*, one end whereof opens into the canal of communication, and the other into a like canal *n n*; which penetrating the plate *i i i*, opens into the receiver.

Within the cylinders are two emboli, or fuckers made of brass, and fitted with cork and leather to the cavities of the barrels, so as exactly to fill the same; each being furnished with its valve, and terminating at top in a rack *c c*, by which it is to be worked.

At the bottom of either barrel is another valve, by which the *air* may pass out of the communicating canal *d d*, and consequently out of the hollow wire and the receiver it self, into the cylinder, below the piston; from whence by the valves of the piston it may proceed into the upper space of the cylinder, and thus into the open *air*.

For the application of this mechanism.—The winch *b b* being turned upward and downward; its spindle *f*, catching by its teeth into the racks, will raise and depress the two pistons, alternately.—Now the consequence of depressing a piston, is, that the *air* before inclosed between it and the bottom of the cylinder, being thus crowded into a less compass, will, by its elastic force, which now exceeds the pressure of the atmosphere, push up the valve of the piston, and thus escape; till what little remains be of the same density with the external *air* incumbent on the valve.

* W. Vream, a late pneumatic operator, made an improvement in Hauksbee's air pump, by reducing the alternate motion of the hand and winch to a circular one. In his method, the winch is turned quite round, yet the pistons are raised and depressed alternately: By which the trouble of shifting the hand backward and forward, as well as the loss of time, and the shaking of the pump, are prevented. See the contrivance for this purpose described in *Clarke's motion of fluids*, p. 154.

This done, and the same piston being again raised in its turn, from the bottom of the cylinder to the top; the little air before left, will of necessity expand itself, so as to possess the whole space of the cylinder thus deserted by the piston: upon which, its force or pressure upon the valve at the bottom of the cylinder, being now inconsiderable; the other, denser air of the receiver, hollow wire, and canal of communication, by their superior elastic force, will lift up the valve, and thus pass into the cylinder of rarefied air, till both be of the same degree of density.

And thus is the air in the receiver diminished at each elevation of the piston, by the quantity of a cylinder-full; abating for what little remained between the depressed piston, and the bottom: so that by thus repeating the operation again and again; the air in the receiver is at length rarefied to such degree, that its density does not exceed the thin air remaining in the cylinder when the piston is raised: which done, the effect of the air-pump is at an end; the valve cannot now be opened, or if it could, no air would pass it; there being a just equilibrium between the air on each side.

To judge of the degree of exhaustion, there is added a gage, *ll*; consisting of a tube, whose upper orifice communicates with the receiver; the lower being immersed in a basin of mercury, *m m*.—Hence, the air in the tube rarefying as fast as it is in the receiver; in proportion as the exhaustion advances, the mercury will be raised by the pressure of the column of external air, prevailing over that of the column of air included; till the column of air, and mercury together, become a balance to that of the external air. When the mercury is thus risen to the same height as it stands in the barometer, which is indicated by the scale of inches added to the gage; the instrument is a just Torricellian tube; and the vacuum may be concluded to be as perfect as that in the upper end of the barometer.

To let air again into the exhausted receiver, the cock *n* is to be turned; which makes a communication with the external air; upon which the air rushing impetuously in, the mercury in the gage immediately subsides into the basin.

To the air-pump belongs a large apparatus of other vessels, accommodated to the divers kinds of experiments.

Laws of Rarefaction in the receiver of an AIR-PUMP.

1^o. For the proportion of air remaining at any time in the receiver, we have the following general theorem.—'In a vessel exhausted by the air-pump, the primitive or natural air contained therein, is to the air remaining, as the aggregate of the capacity of the vessel and of the pump, (*i. e.* the cylinder left vacant in an elevation of the piston, with the wire and other parts between the cylinder and the receiver) raised to a power whose exponent is equal to the number of strokes of the piston, to the capacity of the vessel alone raised to the same power.

M. Varignon gives an algebraical demonstration of this theorem, in the *Mémoires de l'Acad. R. an. 1693. p. 233. seq. It. an. 1705. p. 397. seq.* but it may be also demonstrated pneumatically, thus:—Calling the air remaining after the first stroke, the first residual; that after the second, the second residual, &c. and remembering that the air in the receiver is of the same density as that in the cylinder, when the piston is raised: it is evident, that the quantity of air in the receiver, is to the quantity of air in the cylinder, wire, &c. as the capacity of the receiver to that of the cylinder, &c. and consequently, the aggregate of the air in the receiver and the cylinder, *i. e.* the whole primitive air, is to the air in the vessel alone, *i. e.* to the first residual air, as the aggregate of the capacity of the receiver and the cylinder, to the capacity of the receiver alone.—After the same manner it may be proved, that the quantity of first residual air, is to the second residual, as the aggregate of the capacity of the receiver and cylinder to the capacity of the vessel alone. And the same proportion does the second residual bear to the third, and so of the rest.—Hence, the product of the primitive air into the first, second, third, fourth, &c. residuals, is to the product of the first residual into the second, third, fourth, fifth, &c. as the product of the capacity of the receiver and cylinder together, multiplied as oft into itself as the number of strokes of the piston contains units; is to the factum arising from the capacity of the receiver alone, multiplied so often by itself: that is, as the power of the aggregate of the capacity of the receiver and cylinder together, whose exponent is the number of strokes of the piston, to the capacity of the vessel alone, raised to the same power.—Consequently the primitive air is to the last residual, in the ratio of those powers. *Q. E. D.* 2^o. The number of strokes of the piston, together with the

capacity of the receiver and cylinder with the wire, &c. being given; to find the ratio of the primitive air to the air remaining;

Subtract the logarithm of the capacity of the receiver, from that of the sum of the capacity of the receiver and the cylinder; then, the remainder being multiplied by the number of strokes of the piston, the product will be a logarithm, whose natural number shews how oft the primitive air contains the remainder required.

Thus, if the capacity of the receiver be 460, that of the cylinder 580, and the number of strokes of the piston 6; the primitive air will be found to the remaining air, as 146 $\frac{2}{3}$ to 1.

For, suppose the capacity of the vessel = *v*; that of the cylinder and vessel together, = *a*; the number of strokes of the piston = *n*; and the remaining air = 1. Since the primitive is to the remaining air as *aⁿ* to *vⁿ*; the primitive air will also be to the remaining air, as *aⁿ* : *vⁿ* to 1. Consequently, if the remaining air be 1, the logarithm of the primitive air is $a - v \times n$.

3^o. The capacity of the receiver and the barrel being given; to find the number of strokes of the piston required to rarefy the air to a given degree.

Subtract the logarithm of the remaining air from the logarithm of the primitive air; and the logarithm of the capacity of the receiver, from that of the aggregate of the capacity of the receiver and cylinder; then, dividing the former difference by the latter, the quotient is the number of strokes required.

Thus, if the capacity of the cylinder be supposed 580; that of the receiver 460; and the primitive air to the remaining air, as 1464 to 10: the number of strokes required will be found to be 6.

Besides the effects, and phenomena of the air-pump, recounted under the articles VACUUM, AIR, &c. we may add some others; which related at large, make the substance of Mr. Boyle's *Physico-Mech. Exper. As.*—That the flame of a candle in vacuo usually goes out in a minute, though it sometimes lasts two, but the wick thereof continues ignited after; and even emits a smoke, which ascends upwards.

—That a kindled charcoal is totally extinguished in about five minutes, though in open air it remain alive half an hour, that it goes out by degrees, beginning from the top and the outides.—That red-hot iron is not affected by the absence of the air; and yet that sulphur or gunpowder will not be lighted thereby, but only fused.—That a match, after lying seemingly extinct in vacuo, a long time; revives again upon the re-admission of the air.—That a flint and steel strike sparks of fire as copiously in vacuo as out of it; and that the sparks move in all directions, upwards, downwards, &c. here as in the air.—That magnets and magnetic needles, are the same in vacuo as in air.—That smoke in an exhausted receiver, the luminary being extinct, gradually settles to the bottom in a darkish body, leaving the upper part clear and transparent; and that inclining the vessel sometimes on one side, and sometimes on another, the smoke keeps its surface horizontal, after the nature of other fluids.—That the syphon does not run in vacuo.—That water freezes in vacuo.—That heat may be produced by attrition in the exhausted receiver.—That camphire will not take fire in vacuo; and that gun-powder, though some grains of a heap be kindled by a burning-glass in vacuo, will not give fire to the contiguous grains.—That glow-worms lose their light, in proportion as the air is exhausted; and at length become totally obscure: but upon the re-admission of air, presently recover it all.—That vipers and frogs swell much in vacuo, but will live an hour and half, or two hours; and though seemingly stark dead in that time, come to life again in some hours in the air.—That snails survive ten hours; and efts or slow-worms, two or three days; leeches five or six.—That oysters will remain alive in vacuo 24 hours without harm.—That the heart of an eel taken out of the body, continues to beat in vacuo, more nimbly than in air; and this for a good part of an hour.—That warm blood, milk, gall, &c. undergo a considerable intumescence, and ebullition in vacuo.—That a mouse, or other animal, may be brought, by degrees, to survive longer in a rarefied air, than naturally it does.—That air may retain its usual pressure, after it is become unfit for respiration.—And that silk-worms eggs will hatch in vacuo.

AIRY, or AIRIE, of hawks. See AERY.

AIRY Triplicity, among astrologers, the signs of Gemini, Libra, and Aquarius. See TRIPPLICITY.

ASIAMENTA, in law. See the article EASEMENT.

AJUSTING. See the article ACCOMMODATION.

AJUTAGE, or ADJUTAGE, in hydraulics, part of the apparatus of an artificial fountain, or jet d'eau; being a sort of tube, fitted to the mouth, or aperture of the vessel: through which the water is to be played, and by it determined into this, or that figure.

* The word is French, formed of the verb *ajouter*, to add, adapt, adjust.

It is chiefly the diversity in the *ajutages*, that makes the different kinds of fountains.—And hence, by having several *ajutages*

ajutages to be applied occasionally, one fountain comes to have the effect of many.

Mariotte inquires into the best kind of *ajutages*, or spouts for jets d'eau, affirming from experiment, that an even polished round hole, in the end of the pipe, gives a higher jet than either a cylindric, or a conical *ajutage*; of which yet the latter is the better. *V. Traité du Mouvement des Eaux*, part 4. *Phil. Trans.* N° 181. p. 121.

The various sorts of *ajutages*, their structure, application, &c. See under the article FOUNTAIN.

A KOND, an officer of justice in Persia, who takes cognizance of the causes of orphans, and widows; of contracts, and other civil concerns.—He is the head of the school of law, and gives lectures to all the subaltern officers; he has his deputies in all the courts of the kingdom, who, with the second *sadra*, make all contracts.

A L, an Arabic particle, prefixed to words, to exalt, or give them a more emphatical signification.—As, in *Alkoran*, *Algebra*, &c.

A L, or A L D, in our ancient writings, signifies as much as *old*, *ancient*.—This, being prefixed to the names of places, expresses their antiquity; as Aldborough, Algate, &c.

ALA, a Latin term, literally signifying wing.

ALA is also used, in anatomy, for several parts of the body which bear some resemblance to the figure of a wing.

Thus, the lobes of the liver are sometimes called *Ala*.

The soft, spongy bodies in the pudendum muliebri, usually called the *Nymphæ*, are also denominated *Alæ*.

The two cartilages of the nose which form the nostrils, are also called *Alæ*.

And the same denomination is given to the tip of the auricle. See AURICLE.

A L A is also used in botany, for the angle which the leaves, or the stalks or pedicles of the leaves, form with the stem, or branches of the plant from which they arise. See LEAF, &c. This Angle is usually acute, and always is directed upwards.

A L A is sometimes also applied to the angle formed by the branches themselves, with the stem; which is also observed to be very regular and uniform.

ALABASTER*, in natural history, a kind of stone, softer than marble, yet harder than plaster of Paris: used for the making of figures, and other ornaments of sculpture. See SUPPLEMENT, article ALABASTRITES.

* Some derive the word from the Latin *albus*, because of the whiteness of this stone.—Others, from the Greek *αλαβαστρον*, which they form from the privative *α* and *λαβανον*, *εσθιν*, to take; this stone being too smooth and slippery for the hand to fasten hold of it.

It is found of all colours; some extremely white, and shining, which is the most common; some redish or tawney; and some is called *Oxyx* from its colour, which resembles that of the onyx, though very different from it in its nature.

Alabaster cuts very smooth and easy, and is much used among sculptors, for little statues, vases, and columns.

They sometimes also employ it as plaster of Paris: in order to which, they burn and calcine it; after which, mixing it up with water to a thin consistence; it is cast into a mould, where it readily coagulates into a firm body. See PLASTER.

Alabaster, Mr. Boyle observes, being finely powdered, and thus set in a basin over the fire; will, when hot, assume the appearance of a fluid, by rolling in waves, yielding to the smallest touch, and emitting vapour; all which properties it loses again, on the departure of the heat, and discovers itself a mere incoherent powder. See FLUID, and FLUIDITY.

The *alabaster*-box of precious ointment, mentioned in St. Matthew XXVI. 7. Mark XIV. 3. and Luke VII. 37. has given the critics and interpreters some pain.—To suppose it a vase of *alabaster*, does not seem consistent with its breaking so easily, as is intimated by St. Mark.

F. Kircher, in his *Oedip. Egypt.* notes, that *Alabaster*, *Alabastrum*, was not only used for a vase of odoriferous liquor, but also for an Egyptian measure, containing nine *Kosti*, or Egyptian pounds; amounting, according to his computation, to twenty four Roman sextaries, or pounds.

ALABASTRA, in a plant, are those little herbaceous leaves which encompass the bottoms of flowers, particularly the rose. See CALIX, &c.

ALÆ, in the military art, the two wings, or extremes of an army, ranged in form of battle.

ALÆ *Vespertilionum*. See VESPERTILIONUM.

ALAISSÉE, in heraldry, the same with HUMETTY.

A-LA-MIRE, in music. See NOTE, and GAMMUT.

ALAMODE*, in commerce, a thin, light, glossy black silk, not quilled or crossed; chiefly used for women's hoods, and men's mourning scarves.

* The name is French, though not given in the country to this fabric, for which they have no other name but *tafetair noir lustré*.

ALANORARIUS*, in our ancient customs, a keeper or

manager of spaniels, or setting-dogs, for the sport of hunting, hawking, &c.

* The word is formed from the Gothic, *alan*, a greyhound.

ALARES, in antiquity, are supposed by some authors to have been a kind of militia, or soldiery among the Romans; so called from *ala*, a wing, because of their lightness, and swiftness in the combat.

Others, make them a people of Pannonia: but others with more probability, takes *alares* for an adjective, or epithet; and apply it to the Roman cavalry; because placed in the two wings, or *ala* of the Army; for which reason, a body of horse was called *ala*.

ALARES *Musculi*, in anatomy. See the article PTERYGOTIDEUS.

ALARM*, properly denotes a sudden apprehension, conceived from some noise, or report, which makes men run to their arms, and stand on their guard.

* The word is French, formed from the Italian, *all' arme*, to arms; whence *gidare all' arme*, q. d. to call to arms.

ALARM-Post, is the ground appointed to each regiment, by the quarter-master-general, for them to march to, in case of an alarm.

In a garison, the *alarm-post* is the place where every regiment is ordered to draw up, on ordinary occasions.

ALB, ALBE, ALBA, a robe, or vestment of white linen, hanging down to the feet; wherein the Romish priests perform divine service.

The *alb* corresponds to the surplice among us.—It takes its name from its colour, *albus*, white.

ALBA FIRMA, or ALBUM, was a yearly rent, payable to the chief lord of a hundred; so called, because paid wholly in white money, or silver, and not in corn, which was called *black-mail*.

ALBIGENSES, a sect, or party of reformers about Tholouse, and the Albigeois, in Languedoc; who, in the XIIIth century, became remarkable for their opposition to the discipline, and ceremonies of the church of Rome. See REFORMATION.

They were also known by various other names; as, Petrobrussians, Arnoldists, Cathari, Patarins, Publicans, Tiscrans, Bons-hommes, Passagers, &c.

It is pretended, they received their opinions from Bulgaria; which having been infected by the Paulicians of Armenia, diffused the same into Italy, Germany, &c. and that Peter Bruys was the first that brought them into Languedoc, about the year 1126. See PETROBRUSSIAN.

The Romanists tax the *Albigenses* with abundance of heterodox opinions; as, for instance, that there are two Gods, the one infinitely good, and the other infinitely evil: that the good God made the invisible world, and the evil one that which we live in; with the rest of the Manichean tenets.

But this seems to be one of those pious frauds allowed particularly in that church, which esteems it a kind of merit to blacken heretics.

However this be, the *Albigenses* grew so formidable in a little time, that a holy league, or croizade was agreed upon among the catholics; and war denounced against them, the pope himself raising the first standard.—In 1229, a peace was struck up, and an inquisition established at Tholouse, from which time the *Albigenses* dwindled by little and little, till the times of the reformation; when such of them as were left, fell in with the Vaudois, and became conformable to the doctrine of Zuinglius, and the discipline of Geneva. See WALDENSES.

ALBUGINEA*, in anatomy, the outermost coat, or tegument of the eye; otherwife called *adnata*, and *conjunctiva*.

* It takes the name *albuginea* from its whiteness; it being this that forms what we call the *album*, or, white of the eye. See EYE.

ALBUGINEA is also applied to the membrane immediately encompassing the testicles.

ALBUGO, or ALBUM Oculi, the same with *albuginea*, or the white of the Eye. See EYE, ALBUGINEA, &c.

ALBUGO also denotes a disease of the eye, wherein the horny tunic loses its native colour, and becomes white and opaque. The *albugo* is the same with what is otherwife called *Leucoma*, *λευκωμα*.

See LEUCOMA.

ALBUM *Græcum*, dogs white dung, is a medicinal drug, in the present practice, used with honey, to cleanse and deterge, chiefly in inflammations of the throat; and that principally outwardly, as a plaster; but, as Dr. Quincy observes, seldom to any great purpose.

ALBUMEN Ovi, the white of an egg. See EGG.

It is used in medicine, as being of a glutinous or binding nature, on which account it is often mixed with bole armoniac, &c. to prevent any strained part from rising into a tumour, and restore it to its tone or elasticity.—It is also an ingredient in some mixtures for consolidating fresh wounds, and preventing too great a loss of blood.

ALBURN, or AUBURN Colour, a white brown, or mixt colour, composed of white brown,

ALCAICS, in the ancient poetry, a name common to several kinds

kind of verses; so called from the poet Alcæus, the inventor thereof.

The first species of *Alcæics*, consist of five feet; of which the first may be either spondee, or iambic; the second, is an iambic; the third, a long syllable; the fourth, a dactyl; and the fifth, a dactyl, or amphimacer: as these of Horace,

*Omnis eodem cogitur, omnium
Versatur urna, ferus, ovis*

Sors exitura, —

The second species of *Alcæics*, consists of two dactyls, and two trochees: as,

Exilium impostura cymbæ.

Besides these two kinds of verses, which are properly called *Dactylic Alcæics*, there is a third sort, called simply *Alcæic*; whereof the first is an *Epiroite*, the second and third are *Choriambus*'s, and the fourth a *Bacchius*; as,

Cur times flauum Tiberim tangeret cur oluvm?

The *ALCÆIC Ode* consists of four strophes, each of which contains four verses; the two first are *Alcæic* verses of the first kind; the third an iambic dimeter hypercatalectic, *i. e.* of four feet and a long syllable: as,

Sors exitura, & nos in æternum.

The fourth is an *Alcæic* of the second kind.—The entire *Alcæic* strophe is as follows:

Omnis eodem cogitur, omnium

Versatur urna, ferus, ovis

Sors exitura, & nos in æternum

Exilium impostura cymbæ.

ALCAID*, or **ALCAYDE**, among the Moors, a governor of a city, or castle in Barbary, under the emperor of Morocco.

* The Word is formed of the particle *al*, and the verb *ἵκναι*, *had*, or *akad*, to govern, rule, administer.

The jurisdiction of the *alcáid* is sovereign, both in civil, and criminal concerns; and all fines and punishments lie wholly at his Pleasure.

ALCALDE, or **ALCADE**, in the Spanish policy, a judge, or minister of justice; answering to a provost among the French. See **PROVOST**.

The Spaniards borrow their *alcaldes* from the Saracen *alcáid*.

ALCALI, **ALCALY**, or rather **ALKALY**. See **ALCALY**.

ALCALIZATION, or **ALKALIZATION**. See the article **ALKALIZATION**.

ALCANNA, a cosmetic powder much used in the Levant, made of the leaf of a species of shrub, frequent in Barbary.

ALCANNA, by the Turks called *Knáh*, is greenish in the powder, but by infusion in water yields a red colour.—The Turkish and Jewish women use it to dye the nails of their fingers and toes, and sometimes also their hair. *V. Mem. Acad. R. Scien. an. 1732. p. 426.* See **SUPPLEMENT**, article **ALCANNA**.

ALCANTARA.—*Order of ALCANTARA*, an ancient military order, denominated from a city of that name in province of Estremadura in Spain.

Alphonius IX. having recovered *Alcantara* from the Moors, in the year 1212; committed the Custody and defence thereof, first to the knights of Calatrava; and, two years afterwards, to the knights of the Pear-tree, another military order instituted in 1170, by Gomez Fernandez, and approved by pope Alexander III. under the rule of St. Benedict: upon which they changed their name, and took the denomination of knights of *Alcantara*.

After the expulsion of the Moors, and the taking of Granada; the sovereignty of the order of *Alcantara*, and that of Calatrava, was settled in the crown of Castile, by Ferdinand and Isabella. See **CALATRAVA**.

In 1540, the knights of *Alcantara* sued for leave to marry; which was granted them.

ALCHYMY*, or **ALCHEMY**, a higher, or more refined kind of chymistry, employed in the more mysterious researches of the art. See **CHYMISTRY**.

* The word seems compounded of the Arabic augmentative particle, *al*, and the Latin *chymia*, Egyptian *kemia*, or Greek *χημία*, chymistry. Tho' some object to this origin, and deny the Arabic any share in the composition of the word; urging, that *alchemia* occurs in an author who wrote before the Europeans had any commerce with the Arabians, or the Arabians any learning, *i. e.* before the time of Manomet.

The name *alchymy* however is really of no ancient standing: the first time it occurs, is in Julius Firmicus Maternus, an author who lived under Constantine the great, and who in his *Mathesis*, 3. 55. speaking of the influences of the heavenly bodies, affirms, "that if the moon be in the house of Saturn, at the time a child is born, he shall be skilled in *alchymy*."

The great objects or ends pursued by *alchymy*, are, 1^o, The making of gold; which is attempted three different ways: by separation; by maturation; and by transmutation; which last is to be effected by means of what they call the *philosopher's stone*.

With a view to this end, *alchymy*, in some ancient writers, is also called *πυρρική*, *poëticæ*, and *χημικοποιητική*, *chryso-poëticæ*

q. d. the art of making gold.—And hence also the artists themselves are called *ποιηται*, *makers*, and *χημικοποιηται*, *gold-makers*.

2^o, An universal medicine, adequate to all diseases. See **LIXIR**.

3^o, An universal dissolvent, or alkahest. See **ALKAHEST**.

4^o, An universal ferment; or a matter which being applied to any feed, shall increase its fecundity to infinity; if, *e. gr.* it be applied to gold, it shall change the gold into the philosopher's stone of gold; if to silver into the philosopher's stone of silver, *i. e.* into a matter which transmutes every thing into silver; and if to a tree, the result is the philosopher's stone of the tree, which transmutes every thing it is applied to into trees.

The origin and antiquity of *alchymy* are much controverted.

—If regard may be had to legend and tradition, it must be as old as the flood; nay, Adam himself is represented by the *alchymists* as an adept. A great part, not only of the heathen mythology, but of the Jewish and Christian revelations, are also supposed to refer hereto: thus, Suidas will have the secret of the philosopher's stone couched in the fable of the Argonauts; and others find it in the books of Moses, &c.

But, if the æra of the art be examined by the monuments of history; it will lose a deal of this fancied antiquity.—The learned Dane, Ol. Borrichius, has taken immense pains to prove it known to the ancient Greeks and Egyptians. Her. Conringius, on the contrary, with equal address, undertakes to shew its novelty.

In effect, not one of the ancient poets, philosophers, or physicians, from Homer till four hundred years after Christ, mention any such thing.—The first author who speaks of making gold, is Zosimus the Panopolite, who lived towards the beginning of the fifth century, and who has an express treatise *ὑπὲρ τῆς ἱερᾶς τέχνης τῆς τοῦ χρυσοῦ καὶ τοῦ ἀργύρου ποιήσεως*, *Of the divine art of making gold and silver*, still extant in manuscript in the French king's library. The next is Æneas Gæzus, another Greek writer, towards the close of the same century, in whom we have the following passage: "Such as are skilled in the ways of nature, can take silver and tin, and changing their nature, turn them into gold." The same writer tells us, he was "wont to file himself *χημικῶς*, gold-melter, and *χημικὸν*, chymist."—Hence we may gather, there was a notion some such art in being in that age; but, as neither of these authors relate how long it had been known before, their testimony will not carry us back beyond the age wherein they lived.

We do not find any earlier, plainer traces of the universal medicine: not a syllable of any such thing in all the physicians and naturalists, from Moses to Geber the Arab, who is supposed to have lived in the seventh century. In that author's work, intitled, *The Philosopher's Stone*, mention is made of "a medicine which cures all lepras:" this passage some authors suppose to have given the first hint of the matter; though Geber himself, perhaps, meant no such thing: for, by attending to the Arabic style and diction of this author, which abounds in allegory, it appears highly probable, that by man he means gold, and by lepras or diseases, the other metals, which are all impure in comparison of gold.

Suidas accounts for this total silence of old authors in respect of *alchymy*, by observing, that Diocletian procured all the books of the ancient Egyptians to be burnt; and that it was in these the great mysteries of chymistry were contained.—Conringius calls this history in question, and asks how Suidas, who lived but five hundred years before us, should know what happened eight hundred years before him? to which Borrichius answers, that he had learnt it of Eudemus, Helladius, Zosimus, Pamphilus, &c. as Suidas himself relates.

Kircher asserts, that the theory of the philosopher's stone is delivered at large in the table of Hermes; and that the ancient Egyptians were not ignorant of the art, but declined to prosecute it. They did not need to transmute gold, they had ways of separating it from all kinds of bodies, from the very mud of the Nile, and stones of all kinds. But, he adds, these secrets were never wrote down or made public, but confined to the royal family, and handed down traditionally from father to son.

The chief point advanced by Borrichius, and on which he seems to lay the greatest stress, is the attempt of Caligula, mentioned by Pliny, for procuring gold from ornament. *Hist. Nat. L. XXXIII. c. 4.*—But this, it may be observed, makes very little for that author's pretensions; there being no transmutation, no hint of any philosopher's stone, but only a little gold was extracted or separated from the mineral.

The principal authors in *alchymy*, are Geber, Friar Bacon, Ripley, Lully, John and Isaac Hollandus, Basil Valentine, Paracelsus, Van Zuchten, and Sendivogius.

ALCMANIAN*, in the ancient poetry, a kind of lyric verse, or metre, consisting of two dactyls, and two trochees. Such, *e. gr.* is—*Virginibusque puerisque canto.*

* The word is formed from *Alcman*, the name of an ancient Greek poet, in great esteem for his *erotics*, or amorous compositions.

ALCOHOL*, or **ALKOOL**, in chemistry, an Arabic term, chiefly understood of the purest spirit of wine, raised, or rectified by repeated distillations to its utmost subtilty, and perfection; so that if fire be set thereto, it burns wholly away, without leaving the least phlegm or faeces behind. See **SUPPLEMENT**, article **ALCOHOL**.

* The word is formed from the Arabic or Hebrew **קלל kaal**, to attenuate, subtilize.

ALCOHOL is sometimes also used for a very fine, impalpable powder.

ALCORAN, or **AL KORAN**, the Mahometan gospel; or revelations, doctrine, and prophecies of the pretended prophet Mahomet.

The word *alcoran* is Arabic, and literally denotes either reading, or collection; but it is in the first of these senses that the *alcoran* of Mahomet seems best understood: Mahomet purposing to have his book called *Reading*, by way of eminence; in imitation of the Jews and Christians, who call the New and Old Testament, *Writing*, *Scripture*, **הכרתוב**, *books*, **ספרים**, on the same account.

The Mussulmen also call it **ספרן אלקורן** *Afarkan*; from the verb **פרקן** *Pharaka*, to divide, or distinguish: either by reason it makes the distinction between what is true, and false, or between what is lawful to do, and what not; or else on account of its containing the divisions, or heads of the law: in which, again, they imitate the Hebrews, who give divers books the like name **פרקים** *Perakim*, q. d. *capita*, *capitula*, chapters, heads; e. gr. **פרקי אבות** *Capita Patrum*, chapters, heads; **פרקי אליעזר** *Capitula R. Eliezer*. Lastly, the *alcoran* is also denominated *aldbichr*, advertisement, or remembrance; as serving to retain or retrieve the knowledge of the law.

It is the common opinion among us, that Mahomet, assisted by one Sergius, a monk, composed this book; but the Mussulmen believe it as an article of their faith, that the prophet, who they say was an illiterate man, had no hand in it; but that it was given him by God, who, to that end, made use of the ministry of the angel Gabriel; that however it was communicated to him by little and little, a verse at a time, and in different places, during the course of twenty-three years.—‘And hence, say they, proceeds that disorder and confusion visible in the work;’ which, in truth, is so great, that all their doctors have never been able to adjust it. For Mahomet, or rather his copist, having put all these loose verses promiscuously in a book together, it was impossible ever to retrieve the order wherein they were delivered.

Those twenty-three years which the angel employed in conveying the *alcoran* to Mahomet, are of wonderful service to his followers; inasmuch as they furnish them with an answer to such as tax them with those glaring contradictions wherein the book is full: those contradictions they piously father upon God himself; alledging, that in the course of so long time, he repealed and altered several doctrines and precepts, which the prophet had before received of him.

M. d’Herbelot thinks it probable, that when the heresies of the Nestorians, Eutyrians, &c. had been condemned by eccumenical councils; many bishops, priests, monks, &c. being driven into the deserts of Arabia and Egypt, furnished the impostor with passages, and crude ill-conceived doctrines out of the Scriptures: and that it was hence, that the *alcoran* became so full of the wild and erroneous opinions of those heretics.

The Jews, also, who were very numerous in Arabia, contributed their quota to the *alcoran*; nor is it without some reason that they boast, twelve of their chief doctors to have been the authors of this detestable work.

The *alcoran*, it is to be observed, while Mahomet lived, was only kept in loose sheets: his successor, Abubeker, first collected them into a volume, and committed the keeping thereof to Haphsa, the widow of Mahomet, in order to be consulted as an original. And there being a good deal of diversity between the several copies already dispersed throughout the provinces; Ottoman, successor of Abubeker, procured a great number of copies to be taken from that of Haphsa; at the same time suppressing all the others not conformable thereto.

The chief differences, in the present copies of this book, consist in the points; which were not in use in the time of Mahomet and his immediate successors, but were added since, to ascertain the reading; after the example of the Masoretes, who put the like points to the Hebrew text of Scripture.

The work is divided into *suras*, or chapters; and the *suras* are sub-divided into little verses, which are all composed in a broken interrupted style, resembling prose rather than verse.—The division into *suras* is but of a late standing: the usual number of them is sixty.

There are seven principal editions of the *alcoran*; two at Medina, one at Mecca, one at Coufa, one at Bassora, one in Syria, and the common, or vulgar edition. The first contains 6000 verses; the others surpassing this number by 200, or 236 verses: but the number of words and letters is the same in all, viz. 77639 words, and 323015 letters.

The number of commentaries on the *alcoran*, is so large, that

the bare titles would make a huge volume.—Ben Ofchair has wrote the history thereof, intitled, *Tarikh Ben Ofchair*. The principal among them are Reidhaori Thaalabi, Zamaichchhari, and Bacai.

Beside the *alcoran*, which is the basis of the Mahometan faith, they have also a book containing their traditions, which they call *Sonna*.

The Mahometans have a positive theology, built on the *alcoran* and tradition; as well as a scholastical one, built on reason.—They have likewise their casuists, and a kind of canon law; wherein they distinguish between what is of divine, and what of positive right.

They have their beneficiaries too, chaplains, almoners, and canons, who read a chapter every day out of the *alcoran* in the mosques; and have prebends for so doing.—The habit of the mosque, is what we call the parson of the parish; and the scribes are the preachers, who take their text out of the *alcoran*.

ALCORAN, among the Persians, likewise signifies a kind of tower, or steeple; very high and narrow; surrounded without by two or three galleries, one over another; whence the moravites a sort of priests repeat their prayers thrice a day, with a very loud voice; making the tour of the gallery all the while, that they may be the better heard all around.

ALCOVE*, in building, a part of a chamber, separated from the rest by an estrade, or partition of columns, and other corresponding ornaments; in which is placed a bed of state, and sometimes seats, to entertain company.

* The word is divided from the Spanish *alcoba*; and that from the Arabic *alcuf*, a cabinet, or sleeping place; or from *alcobat*, a tent.

ALCYON. See the article **HALCYON**.

ALDEBARAN, an Arabian name, for a fixed star of the first magnitude, in the eye of the sign, or constellation taurus, or the bull; and hence popularly called *The Bull’s Eye*. Its longitude, latitude, &c. see among the rest of the constellation **TAURUS**.

ALDERMAN, an associate to the mayor, or civil magistrate of a city or town, for the better administration of his office.

The *aldermen* are an order of Magistrates, in our cities, and most of the municipal, or incorporate towns; who form a kind of council, and regulate things relating to the policy of the place.—They sometimes also take cognizance of civil and criminal matters; but that very rarely, and only in certain cases.

Their number is not limited; but in some places is more, in some less, from fix to twenty-fix.

Out of these are annually elected the mayors, or chief magistrates of places; who, at the expiration of their mayoralty, return again into the body of the *aldermen*, whose delegates they were before.

The twenty-six *aldermen* of London, preside over the twenty-six wards of the city.

When any of them die, the wardmote return two, out of which the lord mayor and *aldermen* chuse one. Chamberl.

All the *aldermen* that have been lord mayors, and the three eldest *aldermen* who have not yet arrived at that dignity, are by charter justices of the peace.

Formerly, there were also *aldermen* of the merchants, of hospitals, of hundreds, &c. See **SENATOR**.

ALDERMAN*, among our ancient Saxon ancestors, was the second of the three orders, or degrees of nobility.

* The word in its original, is *Ealdorman*, compounded of *Eal*, old, or *Eldor*, elder, and *man*, q. d. *Elderman*.—A late writer, with some probability, supposes that among the ancient Germans, the chief of each clan, tribe, or branch, was called *Ealderman*, not as denoting him *old*, but as denoting him the representative of the *eldest* brother, according to the scheme of paternal government, which obtained in that nation.—As a village generally consisted but of one tribe or branch of a family, the chief or head of such tribe or branch, who, as such, had a sort of jurisdiction over the village, was called the *Ealderman* of the Village.

Thomas Eliensis, in the life of St. Ethelred, interprets *alderman* by prince, or count; *Egelwinus qui cognominatus est Alderman, quod intelligitur princeps, five comes*.—Matthew Paris, in lieu of *alderman*, uses the word *justiciarius*; and Spelman observes, that it was the Norman kings, who, instead of the Saxon *alderman*, introduced the word *justice*.

Atheling was the first rank of nobility, *alderman* the second and *thane* the lowest. See **ATHELING**, and **THANE**.

The *alderman* was the same as our earl, or count; which appellation, after king Athelstane’s time, took place in lieu of *alderman*.

ALDERMAN, in the time of king Edgar, was also used for a judge or justice.

In this sense, Alwin son of Athelstane, is styled *Aldermanus totius Angliæ*; which Spelman interprets, *Capitalis justiciarius Angliæ*.

ALE, a popular drink, made from malt.

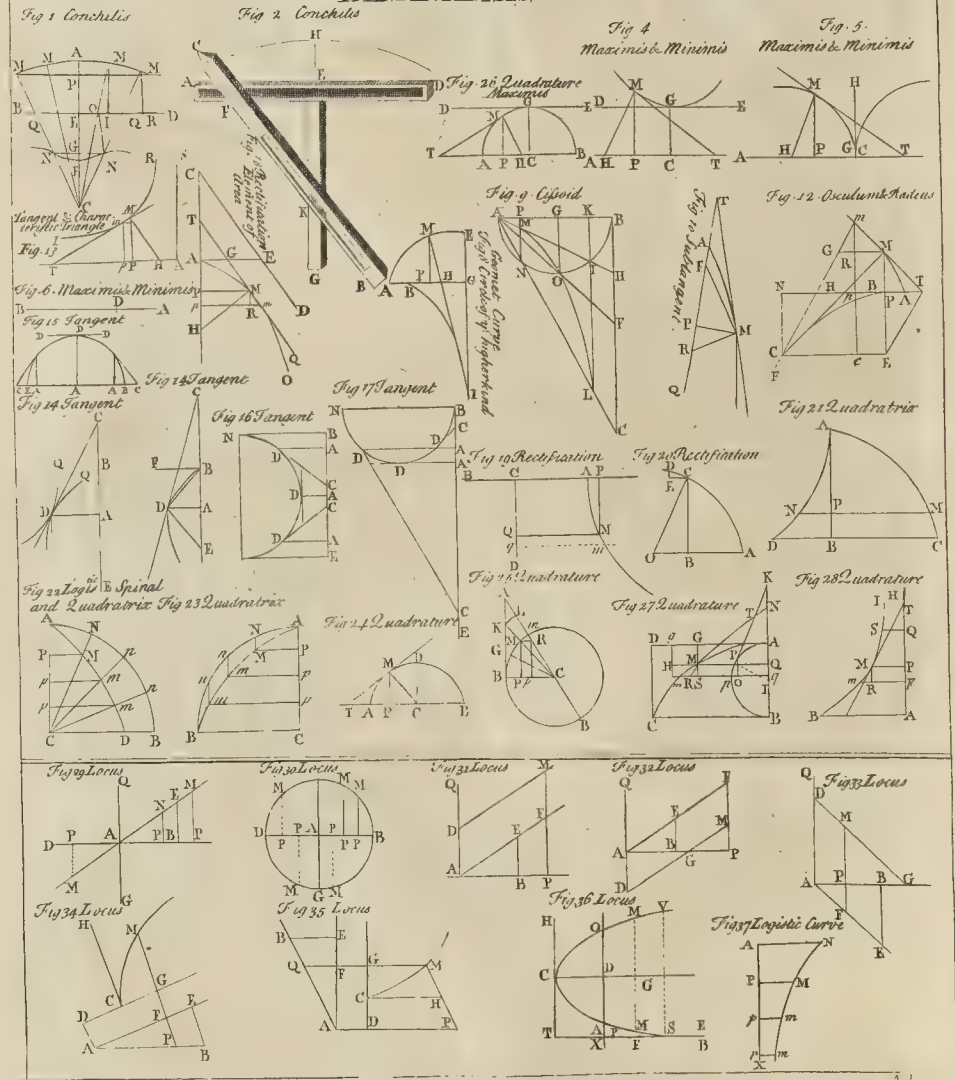

For the method of brewing *ale*, see **BREWING**.

Mr. Williams

TAB. ALGEBRA

TAB. ANALYSIS

Ale is chiefly distinguished from beer, another potable liquor made from the same ingredients, by the quantity of hops used therein; which is greater in beer, and therefore renders the liquor bitter, and fitter to keep.

The brewers also distinguish pale, or fine *ale*, brown *ale*, &c. Their several properties, effects, &c. see under the article *MALT-Liquor*.

The *Zythum*, and *Curmi* mentioned by Tacitus, as the beverage of the ancient Germans, are supposed by Matthiolus, to correspond to our *ale*, and beer.

ALE, *Cerevisia*, is also a denomination given to divers medicated liquors, or diet-drinks, whereof *ale* is the basis, or vehicle. The medicated *ales*, make a large article in our old dispensaries. Such are the *cerevisia oxydrica*, for the eyes; *cerevisia anti-arthritis*, against the gout; *cerevisia cephalica*, for the head; *cerevisia epileptica*, &c.

Gill ALE, is prepared by infusing the dry leaves of *hedera terrestris*, i. e. ground-ivy, in malt-liquor; which hereby becomes impregnated with the virtues of that simple; and is therefore reputed absterive, and vulnerary; good in disorders of the breast, and against obstructions of the viscera. Gill is an English name of ground-ivy.

Dr. Butler's purging **ALE**, is prepared of polypody, fenna, sarsaparilla, aniseeds, scurvygrass, agrimony, and maiden-hair, put up in a bag, and hung in a vessel of *ale*.

We also meet in some dispensaries with *syrup of ale*, made by boiling that liquor to a consistence; this is used against obstructions in the kidneys, and the flur albus.

ALE-BEER. See the article *BEER*.

ALE-BERRY, is *ale* boiled with bread, and mace; sweetened, strained, and drank hot.

ALE-CONNER, an officer in the city of London, whose business is to inspect the measures of the publick houses.—There are four of them, and they are chosen by the common-hall of the city.

ALE-SILVER, a rent, or tribute yearly paid to the lord mayor of London, by those who sell *ale* within the city.

ALE-MEASURE. See the article *MEASURE*.

ALE-TASTER, is an officer appointed, and sworn in every court-leet, to look that there be a due size, and goodness of bread, *ale*, and beer, sold within the jurisdiction of the leet.

ALECTORIA*, in natural history, a stone said to be found in the stomach, liver, or rather gall-bladder of old cocks.

* The word is derived from *αλεκτορ*, a cock.

It is ordinarily of the figure of a lupine, and seldom exceeds the bigness of a bean.—It has abundance of virtues attributed to it, but most of them are fabulous. See *SUPPLEMENT*, article *Alectorius Lapis*.

ALECTOROMANTIA*, an ancient kind of divination, performed by means of a cock.

* The word comes from the Greek *αλεκτορ*, a cock, and *μαντις*, divination.

This art was in use among the Greeks; and the usual manner of it was this.—A circle was made on the ground, and divided into twenty-four equal portions, or spaces: in each of which spaces was written one of the letters of the alphabet, and upon each of these letters was laid a grain of wheat.

This done, a cock was turned loose in the circle, and careful observation was made of the grains he pecked.—The letters corresponding to those grains, were afterwards formed into a word; which word was to be the answer desired.

It was thus that Libanius and Jamblichus sought who should succeed the emperor Valens; and the cock answering to the spaces *ΘΕΟΔ*, they concluded upon Theodore, but by a mistake instead of Theodosius.

ALEMBIC*, or *LIMBEC*, a chemical vessel, consisting of a matrass or body, fitted with a roundish head, terminating in a sloping tube, for the condensed vapours to pass through in distillation.

* The word is formed of the Arabic particle *al*, and the Greek *αμβέ*, a sort of earthen culinary vessel, mentioned by Athenæus, and Hesychius. Though Matthæus Sylvaticus, in his *Pandæa Medicinæ*, asserts the word *alembic* to be Arabic, and that it literally denotes the upper part of a distilling vessel.

Alembic is popularly understood of the whole instrument of distillation with all its apparatus; but in the proper sense of the word, it is only a part hereof, viz. a vessel usually of copper, whereto a concave, globular, metalline head is closely luted; so as to stop the rising vapours, and direct them into its rostrum, or beak.

The heat of the fire raising the volatile parts of the subject exposed in the bottom of the vessel; they are received into its head, where they are condensed, either by the coldness of the ambient air, or by water externally applied; and become a liquor, which runs out at the beak into another vessel called the *recipient*.

The head, or capital of the *alembic*, is sometimes incased with a vessel full of cold water, by way of refrigeratory; though this intention is now more commonly answered by a worm-tub.

There are divers kinds of *alembics*: as an *open alembic*, where the head, and cucurbit are two separate parts; and a *blind alembic*, or blind head, where the capital is sealed hermetically upon the cucurbit.

bie, or blind head, where the capital is sealed hermetically upon the cucurbit.

ALEXANDRIN, or *ALEXANDRIAN*, in poetry, the name of a kind of verse, which consists of twelve, or of twelve and thirteen syllables, alternately; the rest, or pause, being always on the sixth syllable.

It is said to have taken its name from a poem on the life of Alexander, intitled, the *Alexandriad*; written, or at least translated into this kind of verse by some French poets though others will have it so denominated from one of the translators, Alexander Paris.

This verse is thought by some very proper in the epopee, and the more sublime kinds of poetry: for which reason it is also called *Heroic Verse*.

It answers in our language to the hexameters in the Greek, and Latin.—Chapman's translation of Homer, consists wholly of *Alexandrians*.

ALEXIPHARMIC*, in medicine, expresses that property which a remedy, either simple or compound, hath to resist, or destroy every thing of a poisonous, and malignant nature.

* The word is derived from the Greek *αλεξω*, *arceo*, I drive or expel; and *φάρμακον*, *venenum*, poison.

The ancients had a notion that there was a poison in all malignant diseases, and in the generality of those whose cause was unknown. Whence *alexipharmic* became a denomination for all remedies and antidotes against malignant diseases.

Alexiterial, *cardiac*, *antidote*, *alexipharmic*, and *counterpoison*, are all terms nearly of the same signification.

Alexipharmics are ordinarily divided into such as are general; and those more particular, supposed only to combat some particular disease.—But this division is founded more on speculation, than experience.

Alexipharmic medicines in general contain a great number of volatile parts, and such as render the mass of blood fluid. The greatest part of them are aromatic, and pungent to the taste.—Among the rest, it is true, there are some acid plants and juices; but these are only reckoned in the number, on account of their use in malignant, and colliquative fevers.

Alexipharmics chiefly act by exciting, or increasing a diaphoresis, or perspiration; by which the noxious matter is thrown off.

Alexipharmics, whether simple or compound, are also esteemed perservatives against malignant, and peccant fevers: but they are to be used with caution; some of them being only proper in condensations, and others only in colliquations of the blood.

ALEXIPHARMIC Waters, &c. See *WATER*, &c.

ALEXITERIAL*, in medicine, a term of the same import with *alexipharmic*; but chiefly applied to the milk-water of that name.

* It is formed from the Greek *αλεξω*, *arceo*, I drive away; or *opitator*, I assist.

ALFET, anciently signified a large cauldron, in which boiling water was put, for the accused to plunge his hand in up to the elbow, by way of trial or purgation.

ALGAROT, or *ALGAREL*, in the Arabian chemistry, a powder prepared of butter of antimony; being in reality no more than the regulus of that mineral, dissolved in acids, and separated again by means of several lotions with lukewarm water, which imbibes those acids.

This is also called *Mercurius Vitæ*, or simply *Emetic Powder*.—It purges violently both upwards, and downwards. And is more properly called *antimonium mortis*.

By collecting all the lotions, and evaporating two third parts, what remains is a very acid liquor, called *Spirit of philosophical Vitriol*.

ALGEBRA*, a method of resolving problems by means of equations.

* Menage derives the word from the Arabic *aljabran*, which signifies the restitution of any thing broken; supposing that the principal part of *algebra* is the consideration of broken numbers.—Others rather borrow it from the Spanish *algebra*, a person who re-places dislocated bones; adding, that *algebra* has nothing to do with fraction; in that it considers broken numbers as if they were intire, and even expresses its power by letters, which are incapable of fraction.—Some, with M. d'Herbelot, are of opinion; that *algebra* takes its name from Geber, a celebrated philosopher, chemist, and mathematician, whom the Arabs call *Giaber*; and who is supposed to have been the inventor.—Others, from *Geffr*, a kind of parchment, made of the skin of a camel, whereto *Ali* and *Giafar Sadek* wrote in mystic characters the fate of Mahometanism, and the grand events that were to happen till the end of the world.—But others, with more probability, derive it from *Geber*, a word whence, by prefixing the particle *al*, we have formed *algebra*, which is pure Arabic, and properly signifies the reduction of broken numbers to a whole number.—However, the Arabs, it is to be observed, never use the word *Algebra* alone, to express what we mean by it; but always add to it the word *Macabulab*, which signifies *opposition* and *comparison*.—Thus *algebra-almacabulab*, is what we properly call *algebra*.

Some authors define *algebra* the art of solving all problems capable of being solved: but this is rather the idea of analysis, or the analytic art.

The Arabs call it, the *Art of restitution and comparison*; or, the *Art of resolution and equation*.—Lucas de Burgo, the first European who wrote of *algebra*, calls it, the *Rule of restoration, and opposition*.—The Italians call it, *regula rei & census*, that is, the rule of the root and the square; the root with them being called *Res*, and the square *Census*.—Others call it *Specious arithmetic*; others *Universal arithmetic*.

Algebra is a peculiar kind of arithmetic, which takes the quantity sought, whether it be a number, or a line, or any other quantity, as if it were granted; and by means of one or more quantities given, proceeds by consequence, till the quantity at first only supposed to be known, or at least some power thereof, is found to be equal to some quantity or quantities which are known, and consequently itself is known.

Algebra is of two kinds, *numeral*, and *literal*.

Numeral, or *vulgar ALGEBRA*, is that of the ancients, which only had place in the resolution of arithmetical questions.

—In this, the quantity sought is represented by some letter or character; but all the given quantities are expressed by numbers.

Literal, or *specious ALGEBRA*, or the *new ALGEBRA*, is that wherein the given or known quantities, as well as the unknown, are all expressed or represented by their species, or letters of the alphabet.

This eases the memory and imagination of that vast stress or effort, required to keep several matters necessary for the discovery of the truth in hand, present to the mind: for which reason this art may be properly denominated *metaphysical geometry*.

Specious Algebra, is not, like the numeral, confined to certain kinds of problems; but serves universally for the investigation or invention of theorems, as well as the solution and demonstration of all kinds of problems, both arithmetical, and geometrical.

The letters used in *algebra*, do each separately represent either lines or numbers, as the problem is arithmetical or geometrical; and together, they represent planes, solids and powers more or less high, as the letters are in a greater or less number.—For instance, if there be two letters, *a*, *b*, they represent a rectangle, whose two sides are expressed, one by the letter *a*, and the other by *b*; so that by their mutual multiplication, they produce the plane *ab*. Where the same letter is repeated twice, as *a*, *a*, they denote a square.—Three letters *a*, *b*, *c*, represent a solid, or a rectangled parallelepiped, whose three dimensions are expressed by the three letters *a*, *b*, *c*; the length by *a*, the breadth by *b*, and the depth by *c*: so that by their mutual multiplication they produce the solid *abc*.

As the multiplication of dimensions is expressed by the multiplication of letters, and as the number of those may be so great as to become inconvenient; the method is, only to write down the root, and on the right hand to write the index of the power, that is, the number of letters whereof the power to be expressed does consist; as, a^2 , a^3 , a^4 , a^5 : the last of which signifies as much as *a* multiplied five times into itself; and so of the rest.

For the symbols, characters, &c. used in *algebra*, with their application, &c. see the articles CHARACTER, and QUANTITY &c.

For the method of performing the several operations in *algebra*, see ADDITION, SUBTRACTION, and MULTIPLICATION.

As to the origin of this art, we are much in the dark.—The invention is usually attributed to Diophantus, a Greek author, who wrote thirteen books, though only six of them are extant, first published by Xylander, in 1575; and since commented on and improved by Gaspar Bachet, of the French academy; and since by M. Fermat.

And yet *algebra* seems to have been not wholly unknown to the ancient mathematicians, long before the age of Diophantus: we see the traces, the effects of it in many places; though, it looks as if they had designedly concealed it.—Something of it there seems to be in Euclid, or at least in Theon upon Euclid, who observes that Plato had begun to teach it.—And there are other instances of it in Pappus, and more in Archimedes and Apollonius.

But the truth is, the analysis used by those authors is rather geometrical than algebraical; as appears by the examples thereof which we find in their works: so that we make no scruple to say, that Diophantus is the first, and only author among the Greeks who has treated of *algebra* professedly.

This art, however, was in use among the Arabs much earlier than among the Greeks. And it is said that the Arabs too borrowed it from the Persians, and the Persians from the Indians.—It is added, that the Arabs carried it into Spain; whence, some are of opinion, it passed into England, before Diophantus was known among us.

The first who wrote on the subject in this part of the world, was Lucas Paccioli, or Lucas de Burgos, a Cordelier;

whose book, in Italian, was printed at Venice in 1494.—This author makes mention of Leonardus Pisanus, and some others, of whom he had learned the art; but we have none of their writings.—He adds, that *algebra* came originally from the Arabs; and never mentions Diophantus: which makes it probable, that that author was not at that time known in Europe.—His *algebra* goes no further than simple and quadratic equations.

After Paccioli appeared Stifelius, a good author; but neither did he advance any farther.

After him, came Scipio Ferreus, Cardan, Tartaglia, and some others; who reached as far as the solution of some cubic equations.—Bombelli followed these, and went a little farther.—At last came Nunnius, Ramus, Schoner, Salignac, Clavius, &c. who all of them took different courses, but none of them went beyond quadratics.

About the same time, Diophantus was first made public; whose method is very different from that of the Arabs, which had been followed till then.

In 1590, Vieta entered on the stage, and introduced what he called his *Specious arithmetic*, which consists in denoting the quantities, both known and unknown, by symbols or letters.—He also introduced an ingenious method of extracting the roots of equations, by approximations; since much facilitated by Raphson, in his *Analysis Equationum*.

Vieta was followed by Oughtred, who in his *Clavis Mathematica*, printed in 1631, improved Vieta's method; and has invented several compendious characters, to shew the sums, differences, rectangles, squares, cubes, &c.

Mr. Harriot, another Englishman, contemporary with Oughtred, left several treatises at his death; and among the rest, an *Analysis*, or *algebra*, which was printed in 1631; where Vieta's method is brought into a still more commodious form, and this is much esteemed to this day.

In 1657, Des Cartes published his geometry, wherein he made use of the literal calculus and the algebraic rules of Harriot; and as Oughtred in his *Clavis*, Marin Ghetaldus, in his books of *mathematical composition and resolution* published in 1630, applied Vieta's arithmetic to elementary geometry, and gave the construction of simple and quadratic equations; so Des Cartes applied Harriot's method to the higher geometry, explaining the nature of curves by equations, and adding the constructions of cubic, biquadratic, and other higher equations.

Des Cartes's rule for constructing cubic and biquadratic equations, was further improved by Tho. Baker, in his *Clavis Geometrica Catholica*, published in 1684; and the foundation of such constructions, with the application of *algebra* to the quadratures of curves, questions de maximis et minimis, the centrobary method of Guldinus, &c. was given by R. Slusius, in 1668; as also by Fermat, in his *Opera Mathematica*; Roberval, in the *Mém. de Mathem. & de Physique*; and Barrow, in his *Lecl. Geomet.*—In 1708, *algebra* was applied to the laws of chance and gaming, by R. de Montmort; and since by de Moivre, and James Bernoulli.

Thus much for the progress of *algebra*.—The elements of the art were compiled and published by Kerley in 1671; wherein the specious arithmetic, and the nature of equations are largely explained, and illustrated by variety of examples: the whole substance of Diophantus is here delivered; and many things added concerning mathematical composition and resolution, from Ghetaldus. The like has been since done by Prestet in 1694; and by Ozanam in 1703.—But these authors omit the application of *algebra* to geometry; which defect is supplied by Guisnee in a French treatise expressly on the subject, published in 1704; and l'Hôpital in his *Analytical Treatise of the conic Sections*, in 1707.—The rules of *algebra* are also compendiously delivered by Sir I. Newton, in his *Arithmetica Universalis*, first published in 1707; which abounds in select examples, and contains several rules and methods invented by the author.

Algebra has been also applied to the consideration and calculus of infinities; from whence a new and extensive branch of knowledge has arose, called the *Doftrine of Fluxions*, or *Analysis of Infinities*, or the *Calculus Differentialis*. See FLUXIONS.—The authors on this subject, see under the article ANALYSIS.

ALGEBRAICAL, something that relates to *algebra*.

Thus we say, algebraical characters, or symbols, curves, solutions, &c. See CHARACTER.

ALGEBRAICAL Curve, is a curve, wherein the relation of the abscissas to the femiordinates, may be defined by an algebraical equation.

These are also called *geometrical lines*, or *curves*.

Algebraical curves stand contradistinguished to mechanical or transcendental ones. See MECHANICAL, and TRANSCENDENTAL.

ALGEBRAICAL Solution. See the article RESOLUTION.

ALGENEB, or **ALGENIS**, in astronomy, a fixed star of the second magnitude, on the right side of Perseus.—Its longitude, latitude, &c. see among the rest of the constellation PERSEUS.

ALGOL,

ALGOL, or *Medusa's Head*, a fixed star of the third magnitude, in the constellation Perseus.—Its longitude, latitude, &c. See under the article **PERSEUS**.

ALGORITHM, an Arabic term, which some authors, and especially the Spaniards, make use of to signify the practical operation of the several parts of specious arithmetic, or algebra.

Sometimes it is also used for the practice of common arithmetic, by ten numeral figures.

Algorithm is properly the art of numbering truly, and readily; and comprehends the six common rules of arithmetic.—It is sometimes called *Logistica Numeralis*.

We say, the *algorithm* of integers, the *algorithm* of fractions, the *algorithm* of surds, &c.

ALGUAZIL, in the Spanish policy, a serjeant or official of a judge, or magistrate appointed to see his decrees executed.

ALHANDAL*, a term in the Arabian pharmacy, signifying colocyath.—The troches of *Alhandal*, *Trachisci Alhandal*, are a kind of troches, composed of colocyathis, bdellium, and gum tragacanth. See **TROCHE**.

* The word is formed of the Arabic *Handal*, or *Handhal*, a name for colocyathis.

They are esteemed good purgatives, and are used on divers occasions.

ALIBIDADE*, or **ALIDADE**, the index or label of an astronomical, or geometrical instrument, for taking of heights, or distances.

* The word is Arabic, where it signifies the same thing.—In Greek and Latin, it is called *dioptra*, *Dioptra*, and *Linea Fiducie*, fiducial line.

The *alibidade* is a kind of ruler, moveable on the centre of the instrument; and carrying two sights, which are erected perpendicularly at the two extremities of it. See the article **SIGHTS**.

ALICATICA, an ancient Arabian weight.

ALIEN, in law, a stranger; or person born out of the king's allegiance; or under the jurisdiction of some other foreign prince; and not naturalized, or made a denizen.

Of these there are two kinds, *viz. alien friends*, who are of those countries which are at peace and league with us; and *alien enemies*, who are of countries at war with us.

A man born out of the land, so it be within the limits of the king's obedience beyond the seas; or of English parents out of the king's obedience, so the parents at the time of the birth be of such obedience, is no *alien*, but a subject of the king: Stat. 2. 25 Edw. III. commonly* called the Statute *De natis ultra mare*.

Add, that if one born out of the king's allegiance come and dwell in England; his children begotten here are not *aliens*, but denizens.

Scavage, package and balliage, payable to the city of London, are properly *aliens duties*.

On what footing *aliens* are permitted to import foreign commodities into Great Britain. See **DUTY**.

ALIEN PRIORIES, a subordinate kind of monasteries in England, belonging to, and dependant on other monasteries in foreign countries.

ALIENATION, **ALIENATIO**, in law, the act of making a thing another man's; or the altering, and transferring the property, and possession of lands, tenements, or other things, from one man to another.

To *alienate*, or *alien*, in mortmain, is to make over lands or tenements to a religious community, or other body politic. See **MORTMAIN**.

To *alienate* in fee, is to sell the fee-simple of any land, or other incorporeal right.

Crown lands are only *alienable* under a faculty of perpetual redemption.

The council of Lateran, held in 1123, forbids any clerk to *alienate* his benefice, prebend, or the like.

ALIENATIO a familia. See **ABDICATIO**.

ALIENATION-Office, is an office to which all writs of covenants and entry, upon which fines are levied and recoveries suffered; are carried, to have fines for *alienation* set and paid thereon.

ALIFORMES* *Musculi*, a pair of muscles, arising from the pterygoid bone, and ending in the neck of the lower jaw, towards the internal seat of the head.

* They are thus called from the Latin *ala*, wing, and *forma*, shape; as resembling wings.

ALIFORMES Processus, in anatomy, the prominences of the os cuneiforme. See **CUNEIFORME**.

ALIMENT*, **ALIMENTUM**, in a physical sense, is whatever may be dissolved, and turned into chyle, by the liquor of the stomach, or the natural heat; so as to be afterwards converted into blood, for augmenting the body, or repairing the continual expence of parts.

* The word is Latin, formed of the verb *alere*, to nourish.

VOL. I.

ALIMENTARY, **ALIMENTAL**, something that relates to aliment, or food.

The ancient physicians hold that every humour consists of two parts; an *alimentary*, and an excrementitious one.

ALIMENTARY Duct, *Ductus Alimentalis*, is a name given, by Dr. Tyfon and some others, to that part of the body through which the food passes, from its reception into the mouth, to its exit at the anus; including the gula, stomach, and intestines.

Dr. Morgan considers the whole *alimentary* tube, (including the stomach, intestines, and lactals,) as constituting one gland; of the like nature, structure, and use with the other glands of the body.

Every gland has its vasa deferentia, secretoria, and expurgatoria, together with its common ventricle, where the matter, brought thither, is first prepared by digestion, &c.—In this gland, primary concoctive gland, the gula, from the mouth of the oesophagus to its vasa deferens the stomach, is its common receptacle, the lactals are its vasa secretoria, or recipient strainers, and the intestines from the pylorus to the anus constitute its vasa expurgatoria, or common expurgatory duct. The actions therefore of this, as of every other gland, are principally four, *viz.* solution, separation, glandular colature or secretion, and evacuation or expurgation. *V. Mech. Pract. of Phys.* p. 27.

ALIMENTARY Duct is sometimes also understood of the thoracic duct.

ALIMENTARY Law, *Lex Alimentaria*, was an old law among the Romans, whereby children were obliged to find sustenance for their parents.

ALIMENTARI Pueri, &c. were certain children, maintained and educated by the munificence of the emperors, in a sort of public places, not unlike our hospitals.

Trajan was the first that brought up of these *alimentary* boys. He was imitated by Adrian. Antoninus Pius did the same for a number of males, at the solicitation of Faustina; and hence, in some medals of that empress, we read *PVELLAE FAVSTINAE*.—Alexander Severus did the like, at the request of Maximus; and the males thus educated were called *Alimentarii*.

ALIMENTUM, **ALIMONIA**, properly signifies nourishment, or sustenance; but in a more modern sense, in law, it denotes that portion, or allowance which a married woman sues for, upon any occasional separation from her husband, wherein she is not charged with elopement or adultery.

This was anciently called *Rationabile Ejusverium*, reasonable maintenance, and was recoverable only in the spiritual court; but now it is recoverable also in chancery.

ALIQUEANT Part, is that which will not measure or divide any number exactly, but some remainder will still be left.—Or, an aliquant part, is that which being taken any number of times, is always either greater or lesser than the whole. See **PART, MEASURE**, &c.

Thus, 5 is an *aliquant part* of 12; for being taken twice, it falls short, and when taken three times it exceeds 12.

The *aliquant parts* of a pound, or 20s. are

- | | |
|------|---|
| 3s. | an aliquant part composed of a 10th and 20th. |
| 6s. | of a 5th and a 10th. |
| 7s. | of a 4th and a 10th. |
| 8s. | of two 5ths. |
| 9s. | of a 4th and a 5th. |
| 11s. | of a half and a 20th. |
| 12s. | of a half and a 10th. |
| 13s. | of a half, a 10th and 20th. |
| 14s. | of a half and a 5th. |
| 15s. | of a half and a 4th. |
| 16s. | of a half, a 5th, and 10th. |
| 17s. | of a half, a 4th, and 10th. |
| 18s. | of a half and two 5ths. |
| 19s. | of a half, a 4th, and 5th. |

To multiply by *aliquant parts*, see the article **MULTIPLICATION**.

ALIQUEOT* Part, is such part of any number, or quantity, as will exactly measure it, without any remainder.—Or, it is a part, which being taken a certain number of times, becomes equal to the whole, or integer.

* The word is formed of the Latin *aliquoties*, any number of times.

Thus, 3 is an *aliquot part* of 12; because being taken four times, it will just measure it.

The *aliquot parts* of a pound of 20s. are

- | | | | |
|---------|-------------------|---------|-----------------|
| 10s. | make half of 20s. | 2s. 6d. | an eighth. |
| 5s. | a fourth. | 1s. 8d. | a twelfth. |
| 4s. | a fifth. | 1s. 4d. | a fifteenth. |
| 2s. | a tenth. | 1s. 3d. | a sixteenth. |
| 1s. | a twentieth. | 10d. | a twentieth. |
| 6s. 8d. | a third. | 5d. | a forty-eighth. |
| 3s. 4d. | a sixth. | | |

To multiply by the help of *aliquot parts*, see the article **MULTIPLICATION**.

ALKAHEST, or ALCAHEST, in chymistry, a most pure and universal menstruum, or dissolvent, wherewith some chymists have pretended adequately to resolve all bodies into their first matter, and perform other extraordinary and unaccountable operations.

The two eminent adepts, Paracelsus and Helmont, expressly declare, that there is a certain fluid in nature, capable of reducing all sublunary bodies, as well homogeneous as mixed, into their ens primum, or original matter whereof they are composed; or into an uniform equable and potable liquor, that will unite with water and the juices of our bodies, yet will retain its seminal virtues; and if mixed with it self again, will thereby be converted into pure elementary water.—Whence they also imagined, it would at length reduce all things into water.

This declaration, seconded by the asseveration of Helmont, who religiously swears himself possessed of the secret, has excited the succeeding chymists and alchymists to the pursuit of so noble a menstruum. Mr. Boyle was so fond of it, that he frankly acknowledges he had rather have been master thereof than of the philosopher's stone.

Indeed, it is not difficult to conceive, that all bodies might originally arise from some first matter, which was once in a fluid form.—Thus, the primitive matter of gold is, perhaps, nothing more than a ponderous fluid, which from its own nature, or a strong attraction between its parts, afterwards acquires a solid form.—And hence, there does not appear any absurdity in the notion of an universal ens, that resolves all bodies into their ens genitale.

The *alkahest* is a subject that has been canvassed by an infinite number of authors; as Pantaleon, Philalethes, Tachenius, Ludovicus, &c.—Boerhaave says, a library might be collected of them; and Weidenfelt, in his treatise *De Secretis Adeptorum*, has given us all the opinions that have been entertained about it.

The term *alkahest* is not peculiarly found in any language: Helmont declares he first observed it in Paracelsus, as a word that was unknown before the time of that author, who in his second book, *De viribus Membrorum*, treating of the liver, has these words: *Est etiam alkahest liquor, magnam hepatis conferendi & confortandi*, &c. “There is also the liquor *alkahest*, of great efficacy in preserving the liver; as also in curing hydropical and all other diseases arising from disorders of that part. If it have once conquered its like, it becomes superior to all other hepatic medicines; and though the liver itself were broken and dissolved, this medicine should supply its place.”

It is this single passage of Paracelsus, that excited the succeeding chymists to an inquiry after the *alkahest*; there being but one other indirect expression about it in all his works.

Now it being a frequent practice with this author to transcribe the letters of his words, and to make use of abbreviations, and other ways of concealment; as in tartar, which he would write *Subtatar*; for *Nitrum*, *Mutrin*, &c. it is supposed *alkahest* may be a word thus disguised.—Hence some imagine it formed of *alkali est*; and accordingly, that it was the alkaline salt of tartar volatilized. This seems to have been Glauber's opinion; who indeed performed surprizing things with such a menstruum upon subjects of all the three kingdoms.

Others will have it the German word *algeist*, q. d. wholly spirituous, or volatile; others are of opinion, that *alkahest* is taken from *saltz-geist*, which signifies spirit of salt; for the universal menstruum, it is said, is to be wrought from water; and Paracelsus himself calls salt the centre of water, wherein metals ought to die, &c.—In effect, spirit of salt was the great menstruum he used on most occasions.—The commentator on Paracelsus, who gave a Latin edition of his works at Delft, assures that the *alkahest* was mercury, converted into a spirit.—Zwelfer judged it to be a spirit of vinegar rectified from verdigrise.—And Starkey thought he discovered it in his soap.

There have been some synonymous and more significant words used for the *alkahest*.—The elder Helmont mentions the *alkahest* by the compound name of *Ignis-aqua*, fire-water: but he here seems to mean the circulated liquor of Paracelsus; which he terms *fire*, from its property of consuming all things; and *water*, on account of its liquid form.—The same author calls it *Ignis-gehenna*, infernal fire; a word also used by Paracelsus: he also intitles it *Summum & felicissimum omnium salum*, the highest and most successful among salts; which having obtained the supreme degree of simplicity, purity, and subtilty, alone enjoys the faculty of remaining unchanged and unimpaired by the subjects it works on, and of dissolving the most stubborn and untractable bodies, as stones, gems, glass, earth, sulphur, metals, &c. into real salt, equal in weight to the matter dissolved; and this with as much ease as hot water melts down snow.—This salt, continues he, by being several times cohobated with Paracelsus's *Sal circulatum*, loses all its fixedness; and at length

becomes an infid water, equal in quantity to the salt it was made from.

Helmont is express that this menstruum is intirely the product of art, and not of nature.—“Though, says he, a homogeneous part of elementary earth may be artificially converted into water, yet I deny that the same can be done by nature alone; for no natural agent is able to transmute one element into another.” And this he offers as a reason why the elements always remain the same.—It may let some light into this affair, to observe that Helmont, as well as Paracelsus, took water for the universal instrument of chymistry, and natural philosophy; and earth for the unchangeable basis of all things: that fire was designed as the efficient cause of all things: that seminal impressions were lodged in the mechanism of earth; and that water, by dissolving and fermenting with this earth, as it does by means of fire, brings every thing forth; whence originally proceeded the animal, vegetable, and mineral kingdoms; even man himself being thus at first created, agreeably to the account of Moses.

The great character or property of the *alkahest*, we have observed, is to dissolve, and change all sublunary bodies; water alone excepted.—The changes it induces proceed thus: 1^o, The subject exposed to its operation, is converted into its three principles, salt, sulphur, and mercury; and afterwards, into salt alone; which then becomes volatile; and at length is wholly turned into infid water.—The manner of application is by touching the body proposed to be dissolved, e. gr. gold, mercury, sand, or the like, once or twice with the pretended *alkahest*; and if the liquor be genuine, the body will on this be converted into its own quality of salt.

2^o, It does not destroy the seminal virtues of the bodies dissolved thereby.—Thus, gold is, by its action, reduced to a salt of gold; antimony to a salt of antimony; fassiron to a salt of fassiron, &c. of the same seminal virtues, or characters with the original concrete.—By seminal virtues, Helmont understands those virtues which depend upon the structure or mechanism of a body, and which makes it what it is. Hence, an actual and genuine aurum potable might readily be gained by the *alkahest*, as converting the whole body of gold into salt, retaining its seminal virtues, and being withal soluble in water.

3^o, Whatever it dissolves, may be rendered volatile by a sand-heat: and if after volatilizing the solvent, it be distilled therefrom, the body is left pure infid water, equal in quantity to its original self, but deprived of its seminal virtues.—Thus, if gold be dissolved by the *alkahest*, the metal first becomes salt, which is potable gold; but when the menstruum by a further application of fire is distilled therefrom, it is left mere elementary water. Whence it appears, that pure water is the last production or effect of the *alkahest*.

4^o, It suffers no change or diminution of force by dissolving the bodies it works on, and therefore sustains no reaction from them; being the only immutable menstruum in nature.

5^o, It is incapable of mixture, and therefore remains free from fermentation and putrefaction; coming off as pure from the body it has dissolved, as when first put thereon; without leaving the least foulness behind.

ALKALINE, or ALKALIZATE Bodies, among chymists, are such as have their pores naturally so formed, that they are fit to be pierced, and put into motion by the points of an acid poured upon them.

ALKALIZATION, ALKALIZATIO, in chymistry, the act of impregnating a liquor with an alkaline salt.

This is done either to make it a better dissolvent, for some particular purposes; or to load the phlegm, so as it may not rise in distillation, whereby the spirituous parts may go over more pure.

ALKALY, ALKALI, or ALCALY, in chymistry, a name originally given by the Arabians, to a salt extracted from the ashes of a plant called *Kali*: and by us, *glass wort*; because used in the making of glass.

Afterwards, the term *alkali* became a common name for the lixivious salts of all plants; that is, for such salts as are drawn by lotion from their ashes.

And hence, again, in regard the original *alkali* was found to ferment with acids; the name has since become common to all volatile salts, and all terrestrial substances which have that property.

ALKALY, then, in its modern extensive sense, is any substance, which being mixed with an acid, an ebullition and effervescence ensues thereon.

And hence arises the grand division of natural bodies into the two opposite classes of *acids* and *alkalies*.

Boerhaave scarce takes this circumstance to be enough to constitute any determinate class of bodies.—In effect, *alkalies* are not of one similar homogeneous nature: but there are two several sorts of them.

The first are obtained from vegetable and animal substances, by calcination, distillation, putrefaction, &c. such are spirit of urine,

urise, spirit of hartshorn, salt of tartar, &c.—The second are of the terrestrial kind; as shells, chalk, &c.

These two species of alkalies, Boerhaave observes, differ widely from each other; having scarce any thing in common, but their being effervescible with acids.—The one is a class of native, fixed, scentless, insipid, mild, astrigent bodies: the other a set of such as are volatile, odorous, sapid, caustic, aperitive, and are procured by art.

Hence, adds the same author, mere effervescence with acids, must be allowed to be of itself insufficient to determine the nature of an *alkali*: and that such a name, which properly denotes a caustic fiery substance, should not be affixed to any mild and gentle body, as chalk, &c. but other properties and considerations are to be taken in, and particularly their taste, the manner of procuring, and the change of colour they produce in bodies.

With regard to this last circumstance, those liquors which being poured on syrup of violets, change it to a green-colour, are *alkalies*; as those which turn it red, are acids.—

Thus oil of tartar turns it of a kindly green; and oil of vitriol of a carmine red: and if to the syrup thus made red by oil of vitriol, oil of tartar be poured, it turns that part where-with it comes in contact, green; leaving the rest red: and the like holds of oil of vitriol, poured on syrup made green by oil of tartar.

To the like effect M. Homberg observes, that ‘a mere heat, and bubbling arising upon the admixture of a body with an acid, does not seem an adequate criterion of the *alkaline* nature; since distilled oils of all kinds are found to do thus much; and that many of them with more vehemence than *alkalies* themselves; so as sometimes even to take fire, which *alkalies* never do.’

To the definition and character of an *alkali* therefore, M. Homberg adds this circumstance; ‘that after the action, the mixture coalesces and shoots into a salt, or saline matter.’

—This excludes the oils above-mentioned; which do not, after effervescence, unite with the acids into a saline substance, but rather compose a resinous one.

All lixivious salts have these characters of *alkali*.—And not only lixivious, but also all urinous salts, which are constantly found to imbibe acids with great eagerness, and after ebullition, to unite and crystallize with them.

Hence we have two kinds of *alkali* salts, viz. *fixed*, or *lixivious alkalies*; and *volatile*, or *urinous ones*.

But beside *alkali* salts, there are an infinity of other bodies, not saline; which answer to the characters of *alkali*, i. e. which produce much the same effects with acids, as the *alkali* salts above mentioned.—And these *alkaline* matters are in other respects of different natures.

Some, e. gr. are merely earthy; as quick-lime, marble, chalk, &c.—Others are metalline; among which, some have their peculiar and appropriate acids to act on them, as gold, tin, and antimony, which only dissolve with aqua regia; silver, lead, and mercury, with aqua fortis; and the others with other sorts of acids, as iron, copper, zinc, bismuth, &c.—

There are others of the animal class; consisting, 1^o, Of stony matters found in the viscera of certain species; as the calculus humanus, bezoards, crabs eyes, &c.—2^o, Testaceous matters and shells; as pearls, oyster-shells, cuttle-fish bones, the shells or coats of lobsters, crabs, &c.—3^o, The parts of animals, which by length of time, or some other cause, are become stony, or even earthy; as the fossil unicorn's horn, &c.—And lastly, almost all stony marine plants, as coral, &c.

After all, the *alkaline* property in fixed salts does not appear to be native, but rather producible by art.—This opinion seems to have been first started by Helmont: before him, it was the standing opinion, that fixed *alkalies* pre-existed in mixed bodies; and were only separated or extricated from the parts of the compound. Helmont advanced, that they did not thus pre-exist in their *alkaline* form, but were productions of the fire, by whose violent action, part of the salt which in the concrete is all volatile, lays hold of some part of the sulphur of the same body; and both melting together, are fixed into an *alkali*: which fixation he exemplifies, by what happens when salt-petre and arsenic, though both volatile, being exposed to the fire, are fluxed by the operation thereof, and made to fix each other.

Some late chymists, and particularly M. Geoffroy, carry the point something further, and assert, that all *alkali* salts whatever, both fixed and volatile, are wholly the effect of fire; in that before any action of the fire, they did not pre-exist in the mixt wherein they afterwards appeared.

Notwithstanding all the seeming opposition and hostility between acids and *alkalies*, they may be converted into one another; at least, acids are convertible into *alkalies*; as is shewn at large by M. Geoffroy in a discourse express, in the *Mem. de l'Acad.* an. 1717, where the nature, and origin of *alkalies* is ingeniously explained.

Alkali salts, according to this author, are only acids concentrated in little molecules of earth, and united with certain particles of oil, by means of fire.

When an acid, which we conceive in the general as a small, solid, pointed spiculum, happens to be absorbed or concentrated in a proper portion of earth; the whole becomes denominated a *saline*, compound, neutral, or intermediate salt; by reason the acid, thus inclosed in a sheath, cannot excite the same savour as when disengaged therefrom; and yet excites a saline taste: and for this reason is compound, &c.

Now, fire is the only agent capable of disengaging the acid, from the earth it is thus invested withal. Upon this, the acid being lighter than the earth, rises, and evaporates; leaving the earth at the bottom of the vessel; which for this reason is called *fixed*, in contradistinction to the acid, which is *volatile*. This earth, thus bereaved of its acid, is left with its pores open and empty, which before were filled; and withal, in sustaining the action of fire, it necessarily retains some of the particles thereof, which give it an acrimonious taste, that mere earth could never have.—From this taste it is called *salt*; and from its pores being open, and thus disposed to admit and imbibe new acids, it is called *alkali salt*.

Now, it is not to be imagined, that an earth which has once been impregnated with acids, can ever be perfectly divested thereof; there will still remain some, though much less than before. So that an *alkali* may be conceived as only a too small quantity of acid, inclosed in too large a quantity of earth.

The visible and sensible fire is not the only agent capable of separating acids from their earth; fermentation has the same effect, in virtue of that pure active fire produced or concerned therein. *Alkalies*, therefore, are the production, either of the one, or of the other fire; and the same may be said of the acids disengaged therefrom; it being the dis-union of the parts of the same salt occasioned by fire that produces both, the acids as well as the *alkalies*. All the difference is, that the *alkali* imbibes and retains certain corpuscles of the fire, whereas nothing foreign is superadded to the acid.

On this principle every acid is volatile, and every *alkali* should be fixed, if the *alkali* were only earth: but, in regard the little acid still remaining in the *alkali*, may be united with a portion of oil, as well as a portion of earth; and oil is known to be volatile: the compound, that is, the *alkali*, must be volatile, in case the oil prevail therein.

In this case, the *alkali* is found to have a strong, penetrating, urinous taste and smell; and is what we call a *volatile urinous alkali salt*.

These things well considered; it will be easy to assign what must ensue upon the separations, or new unions of the parts of a mixt.

An acid, it is evident, may become an *alkali*, in that after having been separated from its matrix, it may be restored in a small quantity to another matrix, either wholly earthy or earthy and oleaginous.—In the first case, it will become a fixed *alkali*; in the second, it may be, a volatile *alkali*, if in the supposed matrix the proportion of oil prevail over that of earth; and in this case it will be urinous.

Again, what before was a fixed *alkali*, may become volatile and urinous, by depositing or letting go part of its earth, and taking oil in its stead.

These transmutations are not found equally easy and practicable in the three different kinds of mixts, or the three kingdoms; by reason of the diversity of circumstances that must concur thereto.—They are much the most rare and difficult in the mineral realm; by reason, no doubt, that the parts of minerals are more closely tied together, and have, as it were, less play. The only instance chymistry hath hitherto produced, of a mineral acid's being converted into a fixed *alkali*, is in the operation of fixing salt-petre.

The vegetable kingdom, it is observed, furnishes a very large quantity of fixed *alkali* salt; and very little volatile *alkali*: the animal kingdom, on the contrary, affords a deal of volatile *alkali* salt, and but little fixed. The fossil kingdom affords a very little native fixed *alkali* salt, as the Egyptian natrum, and the salts procured by lotion from saline earths about Smyrna and some other places of the East; and the chymists have also found a method of converting nitre into a fixed *alkali*: but no body hath hitherto produced a volatile *alkali* from the acids of the mineral kingdom.—And yet, if acid salts of the vegetable kind be convertible either into fixed or volatile *alkalies*, why may not mineral acids be susceptible of the same change? since vegetable acids are originally no other than mineral ones: for, from whence but the earth should plants derive their acid juice?

In effect, M. Geoffroy has at length shewn the operation feasible, by an actual transformation of the same acid, nitre, into a volatile urinous *alkali*. See the *Mem. de l'Acad.* ubi supra.

By the way, it is to be noted, that the instance of Egyptian natrum or nitre, furnishes an objection against the general assertion of all *alkalies* being artificial, or produced by fire: Mr. Boyle, who had some of this salt sent him by the English ambassador at the Porte; found that vinegar would work briskly on it, even in the cold; “Whence,” says he, it appears, that the Egyptian nitre, acknowledged to be a native salt, and made only by the evaporation of the superfluous water of the Nile, is yet of a lixivious nature, or at least “abounds with particles that are so, though produced with-

"out any precedent incineration, and the matter of it exposed to no violence of the fire, to make it afford an *alkali*." *Produb. of Chym. Princ.*—He adds, "However, it is certain, that any other body in nature, except this, when it is calcined, no properties are produced." *Ibid.*—Aristotle seems to give instances of *alkalis* being made from fossils, and other acids; and thus, "how the *alkali* body, with the addition of any other salt, may be varying the manner of the fire's application, be made either to afford little else than acids, or a greater or less quantity of *alkali*." *Ibid.*

Hypothesis of Boyle and acid.—Tachenius and Sydenham's is the latter, followed by the tribe of vulgar chymists, strenuously assert that *alkali* and oil to be the only universal principles of all bodies; and by means hereof, they account for the qualities of bodies, and the rest of the phenomena of nature; particularly these in the animal economy.—In a word, *alkali* and acid are substituted in the stead of matter and motion.

Mr. Boyle and Jacobus attack this hypothesis with great force of argument.—In effect, it is at best but precarious to affirm, that *alkali* and *acid* are parts of all bodies.

When the chymists see aqua fortis dissolve filings of copper, they conclude, that the acid spirits of the menstruum meet in the metal with an *alkali*, upon which they work; but how unlike a way of arguing this is, appears hence, that spirit of urine, which is allowed a volatile *alkali*, and accordingly makes a great conflict with aqua fortis, readily dissolves filings of copper, and that even more genuinely than the acid liquor.—So, when they see the magnificence of pearl or coral, prepared by dropping oil of tartar into the solution of tartar, as much with spirit of vinegar; they ascribe the precipitation to the fixed *alkali* of the tartar, which mortifies the acidity of the spirit of vinegar: whereas, the precipitation would be the same, if, instead of the *alkalitate* oil of tartar, that from vitriol, oil of sulphur per campanam, were used.

It may also be doubted, whether it be just to suppose, that when an acid is dissolved in a body, the operation of that body on another, abounding with an *alkali*, must be the effect of a conflict between these two principles?—For, an acid body may do many things, not simply as an acid, but on account of a texture or modification, which endows it with other qualities as well as acidity. Thus, when the chymists see an acid menstruum, as aqua fortis, spirit of salt, oil of vitriol, &c. dissolve iron, they presently ascribe the effect to an acidity in the liquors; though well degenerated urinous spirits, which they hold to have great antipathy to acids, will also readily dissolve crude iron even in the cold.

Further, the patrons of this hypothesis, seem arbitrarily to have assigned offices to each of their two principles; as the chymists do to each of their tria prima: and the Feripatetics to each of their four elements.—But it is not enough to say, that an acid, for instance, performs these things, and an *alkali* these; and that they divide the operations and phenomena of natural bodies between them: as actions of face moment cannot not be divided, will not ascribe profits.

Indeed, the very distinction of *alkali* into acids and *alkalis*, has somewhat arbitrary in it; there being not only *alkalis* things when in the acids agree with *alkalis*, but a few things wherein each differs from itself.—To say nothing of the diversity of fixed *alkalis* and volatile *alkalis*; some, as salt of tartar, will precipitate the solution of sulphur into an orange-tawny; others, as spirit of blood and hartshorn, precipitate the same solution into a milky substance; and oil of tartar very slowly operates upon filings of copper, which spirits of urine and hartshorn will readily dissolve on the fire. And among acids themselves the difference is no less; for some of them will dissolve bodies which others will not: and this even where the menstruum that will not dissolve the body, is reputed much stronger than that which does; as degenerated spirit of vinegar will dissolve lead reduced to minute parts in the cold, which is an effect that chymists expect not from spirit of salt. Nay, one acid will often precipitate what another has dissolved, and *alkalis*; as, spirit of salt will precipitate silver out of spirit of nitre. Thus, the precise operation of every particular acid; as that spirit of salt of aqua fortis, dissolves camphire into dust, and coagulates common oil into a consistent substance like tallow; and though it will both corrode silver, copper, lead, and mercury, and keep them dissolved, it quickly loses its fluidity the while, so that it is no wonder that a definition given of acids and *alkalis* should be inaccurate and superficial; since the chemists themselves do not seem to have an exact minute notion or sure marks, whereby to know the difference.—For, to infer, that, because a body undoes another, which is dissolvable by this or that known acid, the solvent must also be acid; or to conclude, that, if a body precipitates a dissolved metal out of a consensually acid menstruum, the precipitant must be an *alkali*, is precarious: since filings of silver will be dissolved by some *alkalis*, viz. spirit of sal ammoniac, &c. as well as by acids; and bodies may be precipitated out of acid menstrua, by other acids, and by other liquors when in there appears not the least *alkali*. Add, that a solution of bismuth

made in aqua fortis, would be precipitated both by spirit of salt, and by common water.—Nor does that other criterion of acids and *alkalis*, viz. the heat, commotion, and bubbles excited upon their being put together, appear more determinate; since almost any thing suited variously and vehemently to mutate the minute parts of a body, will produce heat in it.—Thus, though water be neither an acid nor an *alkali*, it will quickly grow very hot, not only with the highly acid oil of vitriol, but with the *alkalitate* salt of tartar.

Neither is the production of bubbles on the mixture, though accompanied with a hissing noise, a certain sign; such production not being a necessary effect of heat, excited by conflict, but depending on the peculiar disposition of the bodies put together, to extricate, produce, or intercept particles of air.—Hence, as oil of vitriol, mixed in a due proportion with safe water, may be brought to make the water very hot, without exciting bubbles, so Mr. Boyle has found, that *alkalitate* spirit of urine, drawn with some kinds of quick-lime, being mixed with oil of vitriol moderately strong, would afford an intense heat, whilst it produced either no manifest bubbles at all, or scarce any; though the urinous spirit was strong, and in other trials operated like an *alkali*; and though with the spirit of urine made *per se*, in the common way, oil of vitriol will produce a great hissing, and a multitude of conspicuous bubbles. On the other side, some acid spirits, as that of verdegrease, made pure, poured on file of tartar, will frequently make a conflict, and produce a large froth; though not accompanied with any manifest heat.

May make the taste the touchstone whereby to try acids and *alkalis*: but there are a multitude of bodies, wherein we can so little discern by the taste which of the principles is predominant, that one would not suspect there was a grain of either of them therein: such are diamonds, most gems, and many ignobler stones; gold, silver, mercury, &c. There are also bodies abounding with acid or *alkalitate* salts; which either have no taste at all, or a quite different one from that of these chymical principles.—Thus, though glass be in great part composed of a fixed *alkali*, it is insipid on the palate: and crystals of silver and lead, made with aqua fortis, and containing numerous acid particles of the menstruum, manifest nothing of acidity in the mouth; the latter having a saccharine sweetness, and the former an extreme bitterness. And even in vegetable substances of a manifest taste, it is not easy to know by that, whether it be the acid or the *alkaline* principle which predominates in them: as, in the essential oil of spices, and the gross empyreumatical oils of wood; and even in alcohol of wine, which some contend to be an acid, and others, an *alkali*. See *ACTIO Imperfecta* of *Chym. Doctr. Qual.* A. B. C. B. L. A. or ALKIBLA. See the article KEBLA.

ALKERENGIA, a medicinal fruit, or berry, produced by a plant of the same denomination; popularly also called the *whortleberry*: of some use as an abstergent, dissolvent, and diuretic.

The plant is properly a species of folanum, or nightshade; whence it is frequently called in Latin by that name, viz. the addition or epithet of *vesicarium*, to express the bubbles the fruit is contained in.—It is sometimes also called *halicacabum*.

The fruit is celebrated for its lithontriptic quality; and prescribed to cleanse the urinary passages of gravel, and other obstructions. Its detensive quality also recommends it against the jaundice, and other disorders of the viscera.

The *Trochisci Alkekengi*, prepared from it, are but little prescribed in the modern practice.

ALKERMES, in medicine, &c. a term borrowed from the Arabs, denoting a celebrated remedy, of the form and consistence of a confection; whereof the kermes are the basis.

The other ingredients are rose-water, sugar, ambergrease, mastic, cinnamon, aloes wood, pearls, and leaf-gold, &c.—But the sweets are usually omitted.

The *Confectio Alkermes* is chiefly made at Montpellier, which place supplies most parts of Europe therewith. It is said to be better made there than it can be elsewhere; the reason of which doubtless is, that the drug, which gives it the denomination, is no where found so plentifully as there. The manner of preparing the grain for making the confection is described in the *Philos. Transact.* N° 20. p. 362. See also Ray, *Trav.* p. 392.

It is much used as a cordial; especially, says Dr. Quincy, among female prescribers, and in compliance to them: but that author decries its value in that intention, and thinks it ought only to be regarded as a sweetener.

ALKOOL. See the article ALCOHOL.

ALKORAN. See the article ALCORAN.

*ALLANTOIS**, *ALLANTOIDES*, in anatomy, a thin, smooth membranous substance, or vesicle, investing the fetus of divers animals, and replete with urinous liquor conveyed to it from the urachus.

* The word is derived from *allais*, *farcimen*, a gut; and *allōs*, *farma*, shape; because in many brutes, it is in the shape of a gut-shaped, though in some others it is round.

ALL

The *allantois* makes part of the secundine.—It is conceived as an urinary tunic, placed between the amnion and chorion, which by the navel and urachus receives the urine that comes out of the bladder.

It is a point controverted among anatomists, whether the *allantois* be found in the human species?—M. Drelincourt, professor of anatomy at Leiden, in an express dissertation on this membrane, maintains it peculiar to the ruminating kind.

Dr. Hale, on the contrary, has given an accurate description of the human *allantois*; and assigned the reason why even those who believed its existence had not before fully found it out; and also an answer to those who yet deny its reality. See *Philosopb. Transact.* N° 271.

ALLAY. See the article **ALLOY**.

ALLEGATION is used for the producing of acts, or instruments to authorize a thing.

Allegation, in a literary sense, denotes the act of citing, or quoting an author, or passage of some book.

ALLEGIANCE, the legal faith, and obedience, which every subject owes to his prince.

This was anciently called *ligeantia*, or *ligence*; from the Latin *ligare*, and *alligare*, to bind, *q. d. ligamen fidei*.

Oath of ALLEGIANCE is an oath given in England to the king, in quality of a temporal prince or sovereign; to distinguish it from the oath given to him as primate, or supreme head of the church, which is called the *Oath of Supremacy*.

The Quakers are dispensed with not taking the oath of *allegiance*; and in lieu thereof are only enjoined a declaration.

ALLEGORICAL, something containing an *allegory*.

The divines find divers senses in scripture; as a literal, a mystical, and an *allegorical* sense.

The prophecies, in particular, delivered in the Old Testament, are said to be many of them accomplish'd in the new; not in their primary and literal, but in their secondary, or *allegorical* sense. See **PROPHECY**.

The fathers, and other ancient interpreters of scripture, are almost all *allegorists*; as Origen, Clemens Alexandrinus, St. Augustin, Gregory Nazianzen, &c. See further under the article **TYPE**.

ALLEGORY, ALLEGORIA, a figure in rhetoric, whereby we make use of terms which in their proper signification mean something else than what they are brought to denote: or, it is a figure, whereby we say one thing, expecting it shall be understood of another, to which it alludes.

An *allegory* is properly a series, or string of metaphors.

Such is that beautiful *allegory* in Horace, Lib. I. Od. 14.

*O Nevis, referunt in mare te novi
Fluctus, &c.*

Where the *ship* is usually held to stand for the *republic*; *waves*, for civil war; *port*, for peace and concord; *oars*, for soldiers; and *mariners*, for magistrates.

The Old Testament is supposed by many to be a perpetual *allegory*, or typical representation of the mysteries of the New.

In effect, *allegories* have a good share in most religions.—The Jews, we know, abound with them: Philo Judeus has three books, of the *allegories* in the history of the six days.

Nor are the heathens without *allegories* in their religion: it may even be said, that the use hereof is of a much earlier standing in the Gentile, than in the Jewish world.—

Some of their philosophers undertaking to give a rationale of their faith, and to shew the reason and scope of their fables, and the ancient histories of their gods, found it necessary to put another construction on them, and maintain, that they signified something very different from what they seemed to express.—And hence came the word *allegory*: for a discourse that in its natural sense, *allos agoreus*, signifies something other than what seems intended by it, makes what we properly call an *allegory*.

This shift they had recourse to, in order to prevent people from being shocked with those absurdities which the poets had introduced into their religion; and to convince the world, that the gods of Greece had not been those vile persons which their histories represented them to be. By this means, the history, as well as the religion of Greece, was at once converted into *allegory*; and the world left to seek for them both in a heap of fables, few of which have been solved to any purpose to this day.

The Jews finding the advantages of this way of explaining religion; made use of it to interpret the sacred writings, so as to render them more palatable to the Pagans.

The same method was adopted by the primitive writers of Christianity. See **PROPHECY**.

ALLEGRO, in music, a word used by the Italians to denote one of the six distinctions of time. See **TIME**.

Allegro expresses a sprightly, quick motion, the quickest of all excepting presto.

The usual six distinctions succeed each other in the following order: grave, adagio, largo, vivace, *allegro*, and presto.

It is to be observed, that the movements of the same name, as adagio or *allegro*, are swifter in triple than in common time.—The triple $\frac{3}{4}$ is usually *allegro*, or vivace; the triples $\frac{3}{8}$, $\frac{3}{16}$, $\frac{3}{32}$, are most commonly *allegro*.

ALLELUJAH. See the article **HALLELUJAH**.

ALLEMAND, ALMAIN, a kind of grave, solemn music, where the measure is good, and the movement slow.

ALLER good, in our ancient writers.—The word *aller* serves to make the expression of superlative signification.—So, *aller good* is the greatest good. Sometimes it is wrote *alder*.

ALLERION *, or **ALERION**, in heraldry, a sort of eaglet, represented without either beak, or feet.

* The name is French; and is said to have been introduced for the word *Eaglet*: it is added, that the practice of calling eaglet, *allier*, and of representing them spread, without feet and beaks, is not above an hundred years old, and is of French invention, introduced to represent the Imperialists as subdued. Hence, Menage derives the word from *aquilario*, a diminutive of *aquila*.

The *allerion*, represented *Tab. Heraldry Fig. 1.* appears much the same with the martlet, except that the wings of the latter are close, and it is represented, as it were, patient; whereas the *allerion* is spread, and is represented, in pale. Add that, among our heralds, the martlet has a beak, which the *allerion* wants.

ALLEU, or **ALLODE**, in our ancient customs. See **ALLODIAL**, and **ALLODIUM**.

ALLEVIARE, in old records, to levy or pay an accustomed fine or composition. See **LEVY**.

ALLEVIATION * denotes the art of making a thing lighter, and easier to bear or endure.

* The word is originally Latin, compounded of *ad*, to, and *levus*, light.

In which sense *alleviation* is synonymous with *lightening*, and stands opposed to *aggravation*.

ALLEY *, in gardening, a strait parallel walk, bordered or bounded on each hand with trees, shrubs, or the like.

* The word *alley* is derived from the French verb *aller*, to go; the ordinary use of an *alley* being for a walk, passage, or thorough-fare from one place to another.

Alleys are usually laid either with grass or gravel.

An *Alley* is distinguished from a *path*, in this; that in an *alley* there must always be room enough for two persons at least, to walk a-breast: so that it must never be less than five feet in breadth; and there are some who hold that it ought never to have more than fifteen.

Counter-ALLEYS are the little *alleys* by the sides of the great ones.

Front-ALLEY is that which runs strait in the face of a building.

Transverse-ALLEY, that which cuts the former at right angles.

Diagonal-ALLEY is that which cuts a square, thicket, parterre, &c. from angle to angle.

Sloping-ALLEY is that which, either by reason of the lowness of the point of fight, or of the ground, is neither parallel to the front, nor to the transverse *alleys*.

ALLEY in Ziczac is that which has too great a descent, and which, on that account, is liable to be damaged by floods; to prevent the ill effects whereof, it has platbands of turf run across it from space to space, which help to keep up the gravel.

This last name is likewise given to an *alley* in a labyrinth, or wilderness, formed by several returns of angles, in order to render it the more solitary and obscure, and to hide its exit.

ALLEY in Perspective is that which is larger at the entrance than at the exit; to give it a greater appearance of length.

ALLEY of Compartment is that which separates the squares of a parterre.

ALLIANCE *, the union or connection of two persons, or two families, by means of marriage; otherwise called *affinity*.

* The word seems formed of the Latin *adligatio*, *q. d.* a tying together.

The law of the twelve tables forbids all *alliance* between persons of unequal rank and condition.—And, in Portugal, we are told, the daughters of the nobility are prohibited to *ally* with such as have never been in the wars.

ALLIANCE is also extended to the leagues or treaties concluded between sovereign princes and states, for their mutual safety and defence.

The *triple alliance*, between England, Holland, and Sweden, is famous.—So is the *quadruple alliance*, between England, Holland, the Emperor, and the King of France.

In which sense, we say, *allies*, for confederates: the king and his *allies*; the *allies* of the treaty of *Hanover*, &c.

Though the title of *allies, socii*, of the Romans, was a sort of servitude, it was much coveted. Ariarathes, we are told by Poly-

blus, offered a sacrifice to the gods by way of thanksgiving for having obtained this alliance. The reason was, that thence-forwards people were sure not to receive any injuries except from them.

There were divers sorts of *allies*: some only united to them, by a participation of the privileges of Romans, as the Latini and Hernici; others by their very foundation, as the colonies; others by the benefactions they received from them, as Masaniella, Eumenes, and Attalus, who owed their kingdoms to Rome; others by free treaties, which last by a long alliance became subjects, as the kings of Bithynia, Cappadocia, Egypt, and most of the cities of Greece: lastly, others by compulsive treaties, and the law of subjection, as Philip and Antiochus. For they never granted peace to an enemy, without making an alliance with him; that is, they never subdued any people without using it as a means of subduing others. V. *Confid. sur les cauf. de la grand. des Rom. c. 6. p. 62, seq.*

ALLIGATION*, in arithmetic, a rule or operation, whereby questions are resolved, relating to the mixture of divers commodities or ingredients together, with the value, effect, &c. thereof in composition.

* The word is formed of the Latin *alligare*, to tie together, by reason, perhaps, of a fort of vincula, or circular ligatures, ordinarily used to connect the several numbers together.

Alligation is of two kinds, *medial* and *alternate*.

ALLIGATION Medial is, when from the several quantities and rates of divers simples given, we discover the mean rate of a mixture compounded out of them.

The several cases hereof, will come under the following rules.

The quantity of the ingredients, and the prices of each being given; to find the price or value of some part of the mixture. — Multiply the ingredients severally by their own prices, and divide the sum of those products by the sum of the ingredients, and the quotient answers the question.

The prices of the several ingredients, and the sum paid or received for the mixture being given; to find what quantity of each was bought or sold. — Divide the sum paid or received, by the sum of the particular prices; the quotient is the answer.

The ingredients of a mixture being given, to augment or diminish the mixture proportionally. — Sum up the ingredients; then say, as that sum is to the augmentation or diminution, so is the quantity of each parcel of the mixture, to the quantity of the mixture desired.

The nature, quality, &c. of the several ingredients of a mixture being given, to find the temperament or degree of fineness resulting from the whole. — Place the several quantities of the mixture in rows; against which place orderly their several qualities or fineness; and multiply each quantity by its own quality or degree of fineness: then, as the sum of the quantities is to their products, so is unity, to the quality or fineness of the mixture.

The quantities of a mixture being given; to find the particular quantities of any ingredient in any part of the mixture. — If the mixture be of only two things, say, as the total of the ingredients in the composition, is to the part of the mixture proposed; so is the quantity of the ingredient proposed in the whole composition, to the quantity of the ingredient in the part desired. — If the mixture consists of more ingredients, repeat the work for each.

Given the total of a mixture, with the whole value, and the values of the several ingredients; to find the several quantities mixed, though unequally. — Multiply the total of the mixture by the least value, subtract the product from the total value; and the remainder is the first dividend: then take the said least value from the greatest valued ingredient, and the remainder is the first divisor. The quotient of this division shews the quantity of the highest-priced ingredient, and the other is the complement to the whole. And when more ingredients than two are in the composition, the divisors are the several remains of the least value, taken from the other: the dividends are the remains left upon the divisions, till none remain there; which will be one short of the number of ingredients: and this defective ingredient is to be supplied as a complement; and in division, no more must be taken in every quotient, than that there may remain enough for the other divisors; and the last to leave nothing remaining. See **DIVISION**.

ALLIGATION alternate is, when the rates or qualities of divers simples are given; and the quantity of each is required necessary to make a mixture of the given rate or quality.

Alligation alternate shews the due proportion of several ingredients; and counter-changes the places of such excesses or differences as arise between the mean price and the extremes; ascribing that to the greater extreme, which proceeds from the lesser; and contrarily.

The rules which obtain in *alligation alternate* are as follow: Every greater extreme is to be linked with one lesser. If either of the extremes be single, and the other extremes plural; the single extreme is to be linked to all the rest. If both greater and lesser extremes be not plural, they may be linked so diversly, that several differences may be taken,

and a variety of answers be made to the question, yet all true: but if one of the extremes be single, there can be but one answer.

The numbers being linked, take the difference of each from the mean or common price; and place this difference against the number it is linked to, alternately.

Every number, linked with more than one, must have all the differences of the numbers it is linked to, set against it.

These differences resolve the question, when the price of every one of the ingredients is given without their quantities; and the demand is to mix them so as to sell a certain quantity at a mean rate.

But when the quantity of one, with the price of all the ingredients is given; and the demand is to know the quantities of the other ingredients; then, the rule of three is to be used.

And when the price of every ingredient is given, without any of their quantities, and the demand is to make up a certain quantity to be sold at a mean rate; then all the differences added together will be the first number in the rule of three; the whole quantity to be mixed, the second number; and each difference apart, the several third numbers: and so many sorts mixed, so many operations of the rule of three.

We shall add an example, wherein both the kinds of *alligation* have place. — Suppose a mixture of wine of 119 quarts, required to be made of wines of the following prices, 7*d.* 8*d.* 14*d.* and 15*d.* per quart; and so, as that the whole may be afforded at 12*d.* per quart.

Having linked 8 to 14, and 7 to 15, and counterchanged their differences from the common price, 12*d.* the sum of their difference is found to be 14; by which dividing 119, the quotient is 8 $\frac{1}{2}$, or 8 $\frac{1}{2}$, or for convenience in operation $8 \frac{1}{2}$.

	Quarts.
8 $\frac{1}{2}$ 2	$8 \frac{1}{2} \times 2 = 17$
14 $\frac{1}{2}$ 3	$14 \frac{1}{2} \times 3 = 43 \frac{1}{2}$
7 $\frac{1}{2}$ 4	$7 \frac{1}{2} \times 4 = 30$
15 $\frac{1}{2}$ 5	$15 \frac{1}{2} \times 5 = 77 \frac{1}{2}$
14	119

ALLIOTH, in astronomy, a star in the tail of the great bear, whose observation is much used at sea.

The longitude, latitude, &c. of *allioth*, see among the rest of *URSA Major*.

To find the latitude, or elevation of the pole by this star. See **LATITUDE**, and **POLE**.

ALLOCATION, **ALLOCATIO**, the admitting or allowing of an article in an account; and passing it as such. See **ACCOUNT**.

ALLOCATION is also an allowance made upon an account; used in the exchequer. See **ALLOCATIONE**.

ALLOCATIONE Pacienda, a writ directed to the lord treasurer and barons of the exchequer, upon the complaint of some accountant; commanding them to allow him such sums as he hath in execution of his office lawfully expended.

ALLODIAL, in ancient customs. See **ALLODIUM**.

Terra ALLODIA, or **ALLODIAL land**, is that whereof a person has the absolute property; or which he holds without paying any service or acknowledgment to any superior lord.

Such an inheritance is *allodial*, i.e. it is not subject to any charge, service, &c.

In this sense, *allodial* stands opposed to *feudal*, or *beneficiary*.

ALLODIUM*, or **ALLEUD**, land held of a man's own right.

* The origin of the word is infinitely controverted. Casseneuve says, it is almost as obscure as the head of the Nile. Few of the European languages, but one etymologist or other has derived it from: yet some, not improbably, take it for a primitive French word without etymon.

Bollandus explains *allodium*, to be *prædium*, seu *quævis possessio libera juris proprii*, & non in feudum clientelari onere accepta.

After the conquest of the Gauls, the lands were divided in two manners, viz. into benefices, *beneficia*, and *allodia*. Benefices, consisted in lands given by the king to his officers and soldiers; either for life, or for a time fixed.

Allodia, or *allends*, were such lands as were left in property to the ancient possessors. — The sixty-second title of the Salic law, is, *de allodis*; where the word signifies hereditary lands, or those derived from a man's ancestors. Whence, *allodium* and *patrimonium* are frequently used indiscriminately.

In the ancient capitulars of Charlemain and his successors, we find *allodium* constantly opposed to *fee*; but, toward the period of the second race of kings, it lost the prerogative; the feudal lords obliging the proprietors of *allodial* lands to hold of them for the future. The same change also happened in Germany, &c.

The usurpation of the feudal lords over the *allodial* lands went so far, that they were almost all either subjected to them, or converted into fees: whence the maxim, *nulla terra sine domino*, no land without a lord,

ALLOM,

ALLOM. See the article **ALUM**.

ALLONGE *, in fencing, a thrust, or pass at the enemy.

See **PASS**.

* The word is French, formed of the Verb *allonger*, to lengthen out a thing.

ALLOTING, or **ALLOTMENT** of goods, in matters of commerce, is when a ship's cargo is divided into several parts, bought by divers persons, whose names are wrote on as many pieces of paper, which are applied by an indifferent person to the several lots or parcels; by which means the goods are divided without partiality; every man having the parcel which the lot with his name on is appropriated to. See **INCH OF CANDLE**.

ALLOY *, or **ALLAY**, in matters of coinage, &c. a proportion of a baser metal, mingled with a finer, or purer.

* The word seems derived from the French, *loy*, law; in regard the alloy is fixed by law.

Such is the quantity of copper mingled with gold and silver, in the coining of species of those metals. The original intention of alloy was, to give the minted metal a due hardness, that it might not waste with wearing; and to increase its bulk and weight, so as to countervail the charges of coinage.

Gold or silver, that has more of this than it ought to have, is said to be of a coarser or worse alloy, or below standard.

The proportion of alloy for standard gold is two carats in a pound troy of gold—and for sterling silver, 18 pennyweight alloy in a pound troy of silver.

The alloy used in gold-coins is silver and copper; that in silver coins is copper alone.

ALUM *, **ALLOM**, or **ALUM**, a kind of mineral salt, of an austere taste, leaving in the mouth a sense of sweetness, accompanied with a considerable degree of astringency.

* The word *alum* comes from the Greek *ἀλς*, salt; or perhaps from the Latin *lumen*, light; because it gives lustre to colours.

The ancient naturalists allow of two sorts of *alum*; the one *native*, the other *fascitious*.—The *native* was found in the island of Milo, being a kind of whitish salt, very light, friable and porous; and streaked with filaments.

The *fascitious alum* is prepared in different manners, according to the different materials whereof it is made. Hence arise, *red, roman, and citron allums*.—To which add *saccharine, and burnt allums*.

England, Italy, and Flanders, are the countries where *alum* is principally produced.

The English *roche alum*, *alumen rupeum*, is made from a bluish mineral stone, frequent in the hills of Yorkshire and Lancashire. This stone they calcine on a hearth or kiln; then steep it successively in several pits of water: then boil it for about twenty four hours: lastly, letting it stand for about two hours, the impurities subside, and leave a pure liquor; which, removed into a cooler, and some urine being added to it, begins, in three or four days, to gather into a mass; which being roached, *i. e.* taken out, washed, and melted over again, is fit for use.

At Whitty in Yorkshire the process of making *alum* is as follows. The mineral stone, before it is calcined, being exposed to the air, will moulder in pieces, and yield a liquor whereof coppers may be made; but being calcined, it is fit for *alum*.—As long as it continues in the earth, or in water, it remains a hard stone.—Sometimes a liquor will issue out of the side of the ore, which by the heat of the sun is turned into a natural *alum*.

In the *alum-works* at Civita Vecchia, the process, as described by M. Geoffroy, is somewhat different.—The stone, which is of a ruddy hue, being calcined, they boil and dissolve the calx in water; which imbibing, the salt, *i. e.* the *alum*, separates itself from the useless earth. Lastly, leaving the water thus impregnated with salt to stand for some days, it crystallizes of itself, like tartar about a but, and makes what they call *Roche*, or *Roman alum*.

At Solfatara, near Puzzuoli, there is a considerable oval plain, the soil whereof is wholly saline; and so hot, that the hand cannot long endure it.—From the surface hereof, in summer time, there arises a sort of flour, or starchy dust; which being swept up, and cast into pits of water at the bottom of the plain, the heat of the ground, *i. e.* of certain subterraneous spiracles, over which the coppers are placed, without any other fire, evaporates the water, and leaves an *alum* behind.

Alum is made at Cypella in Thrace, by gently calcining the stone, and letting it dissolve afterwards in the air by the dews and rains; then boiling and crystallizing the impregnated waters. *Belon, in Ray's Trav.* t. 2. p. 351.

Alum dissolves in water; what remains undissolved at bottom is a sort of calx, which dissolves readily enough in oil, or spirit of vitriol.—And hence there arises some doubt, whether *alum*, as it does not leave an earth behind, does properly belong to the class of salts?—Mr. Boyle assures us, that

alum ore, robbed of its salt, does in track of time recover it again from the air.

The Swedish *alum* is made of a mineral which contains a great deal of sulphur and vitriol, not to be taken away but by calcination or distillation.—The matter remaining in the iron vessels used in separating the sulphur from the mineral, being exposed to the air for some time, becomes a kind of bluish ashes, which they *liviate*, crystallize, and thus obtain the *alum*.

Alum is of some use in medicine, in quality of an astringent; but, being apt to excite vomiting, is not much used inwardly, and rarely, without some smooth aromatic, as a corrector.—It is used outwardly in astringent lotions, and is an ingredient in several dentifrices, and cosmetics.

It is a principal ingredient in dying and colouring; neither of which can be well performed without it.—It serves to bind the colour upon the stuffs, and has the same uses there, that gum water and glutinous oils have in painting. It likewise disposes stuffs to take the colour, and adds a degree of briskness and delicacy to it; as we see visibly in cochineal, and the *scarlet-grain*.

This effect of *alum* seems also owing to its styptic, or astringent quality, by which it binds the finer parts of colours together, and prevents their exhaling. Hence also it preserves paper that has been dipped in its water, from sinking when wrote upon.

Saccharine ALUM bears a near resemblance to sugar.—It is a composition of common *alum* with rose-water, and whites of eggs, boiled together to the consistence of a paste, and thus moulded at pleasure. As it cools, it grows hard as stone. It is used as a cosmetic.

Burnt ALUM, *alumen ustum*, is *alum* calcined over the fire, and thus rendered whiter, more light, and easily pulverized.

Plume ALUM, *alumen plumeum*, is a sort of saline mineral, of various colours, most commonly white bordering on green; resembling Venetian talc, except that instead of scales, it rises in threads or fibres, resembling those of a feather; whence its name, from *pluma*, feather.

Some will have this to be the *lapis amianthus* of the ancients. See **SUPPLEMENT** articles **ALUMEN** and **AMIANTHUS**.

ALUM-WATER. See the article **WATER**.

ALLUMINOR, in some ancient statutes, one who by trade coloureth, or paints upon paper, or parchment.

ALLUSION *, **ALLUSIO**, in rhetoric, a figure whereby something is applied to, or understood of, another, by reason of some similitude of name, or sound.

* The word is formed of the Latin *ad*, and *ludere*, to play.

Camden defines *allusion* a dalliance, or playing with words like in sound, but unlike in sense; by changing, adding, or subtracting a letter, or two; whence words resembling one another become applicable to different subjects.

Thus the Almighty, if we may use sacred authority, changed Abram, *i. e.* high father, into Abraham, *i. e.* father of many.—Thus the Romans played on their tipting emperor Tiberius Nero, by calling him Biberius Mero: and thus in Quintilian the four fellow Placidus is called Acidus.

Allusions come very near to what we popularly call puns.

ALLUVION *, **ALLUVIO**, in the civil law, a gradual addition or accretion made along the sea-shore, or the banks of large rivers.

* The word is formed of the Latin *adluo*; I wash to; compounded of *ad*, and *luvo*.

The civil law places *alluvion* among the lawful means of acquisition; and defines it to be a latent, imperceptible accretion.—Hence, where any considerable portion of ground is torn away at once, by an inundation; and joined to some neighbouring estate; this is not acquired by right of *alluvion*, but may be claimed again by the former owner.

ALLY. See the article **ALLIANCE**.

ALMACANTARS, **ALMACANTARAS**, or **ALMICANCHARATH**, in astronomy. See **ALMUCANTARS**.

ALMACANTARS Staff. See **ALMUCANTARS Staff**.

ALMAGEST, the name of a celebrated book, composed by Ptolemy; being a collection of many of the observations and problems of the ancients, relating both to geometry and astronomy.

In the original Greek it was called *αὐτοῦ τοῦ πτολεμαίου γ. δ. greatest construction*, or collection; which last word *megiste*, joined to the particle *al*, gave occasion to its being called *almagest* by the Arabians, who translated it into their tongue about the year 800, by order of the caliph *Al Ma'mun*.—The Arabic word is *almagesti*.

Ricciolus has also published a body of astronomy, which he intitles, after Ptolemy, the *New Almagest*; being a collection of ancient and modern observations and discoveries in that science.

ALMANAC, a calendar or table, wherein are set down the days, and feasts of the year, the course of the moon, &c. for each month of the year.

The original of the word is much controverted among Grammarians.—Some derive it from the Arabic particle *al*, and *manah*, to count.—Others, and among them Scaliger, rather derive it from *al*, and *parax*, the course of the months: which is contradicted by Golius, who advances another opinion; he says, that, throughout the east, it is the custom for subjects, at the beginning of the year, to make presents to their princes; and, among the rest, the astrologers present them with their ephemerides for the year ensuing; whence those ephemerides came to be called *almanba*, i. e. handbills, or new-years gifts.—To say no more, Verstegan writes the name *alman-ac*; and makes it of Saxon original: our ancestors, he observes, used to carve the courses of the moon, of the whole year, upon a square stick, or block of wood, which they called *al-managht*, q. d. *al-moon-beed*.

The modern *almanac* answers to the *fusti* of the ancient Romans.

The necessities for making an *almanac*, the reader will find under the article CALENDAR.

Henry III. of France very prudently decreed, by an ordinance of 1579, that 'No *almanac*-maker should presume to give predictions relating to civil affairs, 'either of states or private persons, in terms either express or covert.'

In the *Philosoph. Collect.* we have a perpetual *almanac*, described by Mr. R. Wood.

ALMANDIN, or **ALABANDIN**, a precious stone, of the ruby kind; something softer than the oriental ruby; and, as to colour, partaking more of that of the granat than the ruby.

It is ranked among the richest of stones; and takes its name from Alabanda, a city of Caria, whence Pliny says it was brought. See SUPPLEMENT, article ALMANDINE.

ALMARIA, in our ancient records, the archives of a church, or the like.

ALMERY. See the article AMBRY.

ALMOIN, in law. See the article FRANK-almoim.

ALMOND*, *amygdala*, a kind of medicinal fruit, inclosed in a thick flos, and under a thin skin; the whole being contained under a thick, pulpy, oily husk.

* The word *almond* comes from the French *amande*; which Menage derives from the Latin *amandula*, a term occurring in the capitulars of Charlemagne: others rather derive it from the Greek *αμυγδαλα*, which signifies the same thing.

The *almond* is the produce of a pretty tall tree, of the nut-bearing kind, resembling a peach-tree; frequent in Germany, France, and the neighbouring countries; as also in Barbary, &c.—Its flowers are pentapetalous, and ranged in the rose manner: the pistil becomes a fleshy fruit, containing a seed, which is the *almond*; and which drops out when the fruit is arrived at maturity.

Almonds are chiefly of two kinds, *sweet* and *bitter*.

Sweet ALMONDS, *amygdale dulces*, are of a soft, grateful taste; and are reputed cooling, healing, emollient, and nutritive: they are much prescribed in emulsions, and found of good effect in all disorders from choleric and acrimonious humours.—The oil of *sweet almonds*, drawn without fire, is a safe and useful remedy in nephritic pains. It is also of good repute for costiveness, and for gripes in children.

For the manner of procuring the oil of *sweet almonds*, see the article OIL.

Bitter ALMONDS, *amygdale amaræ*, are held aperient, detensive, and diuretic; and on those accounts they are commended in obstructions of the liver, spleen, uterus, &c.—Some esteem them good to take off the effects of drunkenness. Accordingly, Plutarch relates, that Drusus's physician, a stout drinker, took down at every cup five bitter *almonds*, to allay the heat and fumes of the wine.

The expressed oil of bitter *almonds* is as tasteless as that of the sweet; it is much used to soften and deterge the wax out of the ear.—Some affirm, that bitter *almonds*, bruised, kill or stupify fowl; so that they may be taken with the hands: which, they say, is a secret practised among the Bohemians: and that the husks, remaining after the oil is expressed, have the same effect.

Almonds give the denomination to a great number of preparations in confectionary, cookery, &c. whereof they are the basis; as *almond* cakes, *almond* cream, *crisped almonds*, *almond* milk, *almond* paste, *almond* snow, &c.—With *sweet almonds* blanched (that is, put into warm water a while, which makes them slip their skins) and water, is made *almond* milk, frequently used as a cooler in emulsions, &c. *V. Hought. Collect. N.º 434.*

ALMONDS, *amygdale*, in anatomy, denote two glands of the fauces, more properly called *almonds of the ears*; but ought rather to be denominated *almonds of the throat*.

They are two round glands, placed on the sides of the basis of the tongue, under the common membrane of the fauces, with which they are covered.

Each of them has a large oval sinus, which opens into the fauces; wherein are contained a great number of lesser ones,

which discharge through the great sinus a mucous and slippery matter into the fauces, larynx, and œsophagus, for the moistening and lubricating of those parts.

When the œsophagus muscle acts, it compresses the *almonds*; and as they are subject to inflammation, they frequently are the occasion of what the common people call a *fore throat*.

ALMOND, or **ALMAN-Furnace**, is a peculiar kind of furnace, used in refining; to separate all kinds of metals from cinders, parts of melting-pots, tests, bricks, &c.

The *almond-furnace*, called also the *fivep*, is usually six foot high, four wide, and two thick; it is built of brick, and having a hole in the middle of the top, eight inches over, which grows narrower towards the bottom, where, on the fore-part it ends in a point, encompassed with a semi-circle of iron, to keep in the melted metal.—About the middle of the back there is another hole, to receive the nose of a pair of bellows, which require the continual strength of two men to work.

The matter, then, on which the operation is to be performed, being beat small, they kindle charcoal in the furnace, to anneal it; and when hot, they throw in two or three shovels of coals to one of the forementioned stuff; and so proceed during the whole work, putting lay upon lay of one and the other. After eight or ten hours the metal begins to run; and when the receiver below is pretty full, they lade it out with an iron ladle, and cast it in sows, in cavities or forms made with ashes.

ALMONER, anciently also wrote **AMNER**, an officer in a king's, prince's, or prelate's household, whose business is to distribute alms to the poor.

The *lord almoner*, or *lord high almoner* of England, is an ecclesiastical officer, usually a bishop; who is to visit and relieve the sick, poor widows, prisoners, and others, in necessity; for which purpose he has the forfeiture of all decedents, and the goods of felo's de fe, which he is to dispose of to the poor.

He has likewise, by an ancient custom, a privilege to give the first dish from the royal table, to whatever poor person he pleases, or, instead thereof, an alms, in money.

He also distributes to twenty-four poor men, nominated by the parishioners of the parish adjacent to the king's place of residence, to each, four pence a-day in money, and an alms of bread and small beer; each person first repeating the Creed and the Lord's Prayer, in presence of one of the king's chaplains, deputed by the *lord almoner* to be his *sub-almoner*; who is also to scatter new-coined two-pences in the towns and places through which the king passes in his progress.

He has also the charge of several poor pensioners to the crown, below stairs; consisting of such as have spent their youth, and become superannuated in the king's service; or the widows of such household servants as died poor, and were not able to provide for their wives and children, whom he duly pays.

Under the *lord almoner* besides the *sub-almoner*, there is a yeoman, and two groom of the *almshouse*, chosen by his lordship.

ALMONRY, or **AUMBRY**, the office or lodgings of the *almoner*; also the place where the alms are given. See AMBRY.

ALMS, *elemosyna*, something given out of charity or pity to the poor.

The ecclesiastics were anciently subsisted wholly on *alms*.

The *alms* of the primitive Christians were divided into three parts; one whereof belonged to the bishops, another to the priests, and a third to the deacons and subdeacons.—Sometimes they divided them into four; the last whereof went to the poor, and to the repairing of churches.

Chrodegang, bishop of Metz, in the seventh century, enjoins, in the forty-second chapter of his rule, that a priest to whom any thing was offered for saying of masses, or for confession; or a clerk, for singing of psalms, or hymns; should not receive it on any other condition than as *alms*.

M. Tillemont observes, upon the Theodosian Code, p. 257. that from the time of the fourth century there were women employed to collect *alms* for the prisoners. In all probability these were the deaconesses of the churches.

St. Paul, in his second epistle to the Corinthians, C. IX. explains the manner of collecting *alms* in the assemblies of the primitive Christians.—This practice they had borrowed from the Jewish synagogue, where it still obtains. Leo de Modena describes it in the first book of the *ceremonies and customs* of those of his nation, C. XIV.

The Romanists also extend the term *alms*, to what is given to the church, or to other pious uses.—Hence, what the church holds on this footing is called *tenure in alms*. See AUMONE.

ALMSFECH, or **ALMSFECH**, among our Saxon ancestors, *alms-money*; that is, Peter-pence, anciently paid in England on the first of August; called also *ramsech*, *ramsech*, and *heortþening*. See PETER-pe. ce.

ALMS-HOUSE, a petty hospital; or an edifice built by a person in a private capacity, and endowed with a revenue, for the maintenance of a certain number of poor, aged, or disabled people.

ALMUCANTARS*, in astronomy, are circles parallel to the horizon, imagined to pass through all the degrees of the meridian.

* The word is formed of the Arabic *almucanharat*.

As the meridians pass through the several degrees of the equator; the *almucantars* pass through those of the meridian of any place.

The *almucantars* are the same thing with regard to the azimuths and horizon, that the parallels are with regard to the meridians and horizon.

They serve to shew the height of the sun and stars; and are described on many quadrants, &c. being also called *parallels of altitude*. See *PARALLEL of altitude*.

ALMUCANTARS-Staff, is an instrument usually made of pear-tree or box, having an arch of fifteen degrees; used to take observations of the sun, about the time of its rising and setting; in order to find the amplitude, and consequently the variation of the compass.

ALNAGE*, or **AULNAGE**, *q. d.* ell-measure; the measuring of woollen manufactures with an ell, and the other functions of the *alnager*. See **ALNAGER**.

* The word is French, formed of *aune*, or *aine*, an ell.

All the attempts which our fore-fathers made for regulating of manufactures, when left to the execution of any particular officer, in a short time resolved into a tax on the commodity, without respect to the goodness thereof.—As is most notorious in the case of *alnage*, which was intended for a proof of the goodness of the commodity; and to that purpose a seal was invented, as a signal that the commodity was made according to the statute: which seals, it is said, may now be bought by thousands, and put on what the buyers please.—*Sir Jos. Child. Disc. on Trade, p. 25. seq.*

ALNAGER, **ALNEGER**, or **AULNEGER**, *q. d.* measurer by the ell; signifies a sworn public officer, who by himself or deputy, is to look to the assize of woollen cloth made throughout the land, *i. e.* the length, width, and work thereof; and to the seals for that purpose ordained.

There are now three officers relating to the *alnage*, or regulation of cloth; all which were anciently comprised in one person.—These bear the distinct names of *searcher*, *measurer*, and *alnager*.

A duty being imposed on woollen cloths, for the maintenance of an office to look to that manufacture, and the loyalty, as they call it, of the stuffs produced therein; the *alnager* who had the direction of the whole, is now become only the collector of that duty, or subsidy granted to the king: though he still hold the ancient denomination, because the collection of that subsidy was committed to him.—Nor was he abridged of his measuring and searching, till by his own neglect it was thought proper to separate the two offices. So that there is now a peculiar measurer, distinct from the *alnager*, or collector, to allow the assize of the length and breadth of every cloth made in England and Wales.

ALOE, in medicine and pharmacy, the inspissated juice of a plant of the same name; much used as a purgative remedy.

The *aloe*-plant grows in divers parts of the East and West-Indies; and is also found in some countries of Europe, as Spain, and particularly the mountains of Sierra Morena.—Its leaves are green, very thick, hard, and prickly, yielding a kind of strong threads, whereof laces may be made. Out of the middle of the leaves arises a stem, which bears the flowers, and the fruit, the seed whereof is very light and hemispherical.

Dioscorides, Pliny, and the ancient naturalists, seem only to have been acquainted with one species of *aloe*; which is the *aloe vulgaria* above described: but the late travels into Asia, Africa, and America, have occasioned the discovery of a vast many more sorts, unknown to antiquity. Mr. Bradley assures us, he had in his time seen above sixty several kinds in the physic-garden at Amsterdam; and the number is greatly encreased since. So that the name *aloe* is now become the denomination of a very large genus.—Among the number, however, there are not above twelve that yield the purgative juice above mentioned.

The juice or extract of *aloes*, is usually distinguished into three kinds.—The first, which is called *succotrine*, as being brought from *Succotra*, is the purest and most transparent; being friable, inodorous, black in the lump, but of a beautiful yellow colour when broken.—It is brought in skins from the Levant and East-Indies.

The second is called *hepatic*, because of its liver-colour: it is resinous, smells somewhat like myrrh, has a yellow colour when pounded, and is brought from China.—Some confound this with the following sort; as, in effect, there are but two sorts commonly known in our shops.

The third is the most impure, the blackest, and the strongest.—It was formerly used by the Indians to pitch their vessels withal: and is of little use among us, excepting for horses and cattle; for which reason it is called *caballine*, *i. e.* horse-*aloes*.—It is prepared in Jamaica and Barbadoes, and brought over in large gourds.

Some have imagined, that these differences of *aloes*, were owing only to the greater, or less purification of the juice:

VOL. I.

but this is a mistake; it having been found that no dissolutions, or purifications, how often soever repeated, will change hepatic into succotrine, nor caballine into the true hepatic *aloes*.

The manner of procuring *aloes* is very easy, there being nothing to do but to cut the leaves of the plant, and to expose the juice that oozes out of them either spontaneously or by pressing, to the sun, till it becomes of a proper consistence.

Aloes is extremely bitter, and purgative, whence some have called it *fil naturæ*; externally applied, either in substance or tincture, it prevents putrefaction and gangrene.—Its bitterness makes it so nauseous, that it is rarely used in liquid forms, but it is generally made into pills, whereof half a dram is an ordinary dose.—Scarce any of the officinal purging pills are without this in their composition.

Its cathartic virtue is best employed in watery, cold, and corpulent constitutions, as it heats and attenuates; being bad for thin and hectic constitutions. It is accounted efficacious in promoting the menses; and is also good to destroy worms.—Guy Patin decries *aloes* as a sorry and noxious drug, which heats and dries the liver, disposes towards a dropy, causes the piles, &c. *Leti. Chir. 126.*

Mr. Bouldue, by his analysis of *aloes*, has found that the succotrine contains half the resin or sulphurous part, but one third more of the saline part, than is found in the hepatic. Hence the succotrine comes to be preferable for internal uses, and the hepatic for external.

ALOE Rosata, is a preparation of the succotrine *aloes*, made by dissolving it in juice of damask roses, and evaporating it to the consistence of a paste. Then, more juice is added, and the evaporation repeated, again and again.—This is held a gentler and safer cathartic than the *aloes* alone.

ALOEs also gives the denomination to a kind of fragrant Indian wood; much used in the East as a perfume: thus called from its exceeding bitterness, which resembles that of the *aloes* juice.

The *aloes* wood is infinitely valued; and divers strange fables have been invented as to the origin of the tree that yields it; some feign that it grew in paradise, and was only conveyed to us by means of the rivers overflowing their banks, and sweeping off the trees in their way. Others suppose it to grow on inaccessible mountains; where it is guarded by certain wild beasts, &c.—The Siamese ambassadors to the court of France, in 1686, who brought a present of this wood from their emperor, first gave the Europeans any consistent account of it.

The tree grows in China, Lao, and Cochinchina; and is much about the size and figure of our olive-trees.—The trunk consists of three sorts of wood, very different in colour, and properties: immediately under the bark it is said to be black, compact, and heavy, and this is called by the Portuguese, *pao d'aguias*, *q. d.* eagle-wood.—That next under this, is of a tan-colour, light and veiny, resembling rotten-wood; and called *calambo*.

The heart, or innermost part, is called *tambac*; and is more valued by the Indians than gold itself. It affords a very strong, but agreeable smell; and is used as a perfume; and is withal held a sovereign remedy against the palsy, deliquiums, weaknesses, &c.

It is the *calambo* alone that is known among us.—It is brought in small bits of a very fragrant scent; especially when cast on the fire. The best is of a blackish purple colour, and so light as to swim on water: it is hot and drying; and is esteemed a great strengthener of the nerves.

Some pharmaceutical writers make a distinction between *aloes*, *lignum aloes*, and *xylo aloes*; which may amount to the three orders of the wood above mentioned: though among us they are the same thing, as their names import.

ALOETICS*, medicines wherein *aloes* is the chief, or fundamental ingredient. See **ALOE**s.

* The word is formed of *aloe*, which is by some further derived from *alos*, the sea, that plant being chiefly found near the sea-coasts.

ALOGIANS*, **ALOGI**, or **ALOGIANI**, a sect of ancient heretics, who denied that Jesus Christ was the *logos*, or eternal word; and on this ground also rejected the gospel of St. John, as spurious.

* The word is compounded of the privative *α*, and *λογος*, *q. d.* without *logos*, or word.

Some ascribe the origin of the name, as well as of the sect of *Alogians*, to Theodore of Byzantium, by trade a currier, who having apostatized under the persecution of the emperor Severus, to defend himself against those who reproached him therewith, said, that it was not God he denied, but only man. Whence his followers were called in Greek *αλογος*, in regard they rejected the word. But others, with more probability, suppose the name to have been first given them by Epiphanius in the way of reproach.

Moor **ALONGST**. See the article *MOOR*.

ALOOF, a sea-term, signifying as much as, keep your luff: being a word of command from him that commands, to the man at the helm, to keep the ship near the wind, when she sails upon a quarter-wind.

ALOPECIA, in medicine, a total falling off of the hair from certain parts, occasioned either by the defect of nutritious

juice, or by the vitious quality thereof corroding the roots of it, and leaving the skin rough and colourless.

* The word is formed from *αλωπεξ, vulpes*, a fox; whose urine, it is said, will occasion baldness; or because it is a disease which is common to that creature.

ALPHA *, the name of the first letter of the Greek alphabet.

* The word is originally Hebrew, formed from *aleph*, the name of the first letter in the Hebrew alphabet.

The Greek *alpha* answers to what in English we call simply *A*. See the article *A*.

Alpha, according to Plutarch, was placed at the head of all the letters, by reason in the Phœnician language it denotes an ox; which, with regard to use and service, is the first among beasts.

ALPHA, in composition, denotes, sometimes, *privation*, in the same sense with *αρις*, without; sometimes augmentation, as *αγας*, much; and sometimes union, as *αμα*, together. See *A*.

ALPHA is also used as a letter of order, to denote the *first*; and of number, to signify *one*; but when it was a numerical letter, a little stroke, or an acute accent was drawn above it thus 'Α, to distinguish it from the meer Α, which was a letter of order.

ALPHA and **Omega**, in the divine writings, signify the beginning and the end, or the first and last, (*viz.* before and after all things) and therefore the hieroglyphic of God is formed of these two letters Α and Ω.

ALPHABET *, the several letters of a language, disposed in their natural, or accustomed order.

* The word is formed from the names of the two first letters of the Greek alphabet, *alpha, beta*; which were borrowed from those of the Hebrew, *aleph, bet*.

In the English alphabet we reckon 26 letters, *viz.* *a b c d e f g h i j k l m n o p q r s t u v w x y z*. See each under its proper article, *A, B, C, &c.*

But as there is a much greater number of different sounds in our language; it is not without reason that some grammarians maintain, that there ought to be a greater number of letters: as also, that the double letters, *x, y* and *w*, and the superfluous ones, *k* and *g*, should be retrenched.

The French alphabet only contains 23 letters.—Pauquier indeed maintains it to consist of 25, by reason he adds the two double letters *œ* for *et*, and *9* for *us*; but those are only abbreviations. The abbé d'Angéau, on better grounds, reckons 34 different sounds in the French tongue; and urges, that the alphabet ought of consequence to consist of 34 different characters, setting aside the double letters *x* and *y*, and the superfluous one *q*.

The difference between languages, with respect to the number of letters, in their alphabets, is very considerable: the Hebrew, Chaldee, Syriac, and Samaritan alphabets, have each 22; the Arabic 28; the Persian 31; the Turkish 33; the Georgian 36; the Coptic 32; the Muscovite 43; the Greek 24; the Latin 22; the Slavonic 27; the Dutch 26; the Spanish 27; the Italian 20; the Indians of Bengal 21; the Baxamas 19.

The Æthiopic has no less than 202 letters in its alphabet, there being 7 vowels, which they combine with each of their 26 consonants; to which they add 20 other aspirated syllables.—The like is said of the Tartarian; each of their letters is a syllable; having one of the vowels joined to its consonant; as *la, le, li, &c.*

The Chinese have no alphabet, properly speaking; except we call their whole language their alphabet; their letters are words, or rather hieroglyphics, and are in number about 80,000.

In effect, alphabets were not contrived with design, according to the just rules of reason and analogy; but have been successively framed, altered, &c. as occasion offered.—And hence many grievous complaints as to their deficiencies; and divers attempts to establish new, and more adequate ones in their place. Bishop Wilkins charges all the alphabets extant with great irregularities, with respect both to the order, number, power, figure, &c.—As to the order, it appears inartificial, precarious and confused; in that the vowels and consonants are not reduced into classes, with such order of precedence and subsequence as their natures will bear.—Even the Hebrew order is not free from this imperfection.

As to number, they are both redundant, and deficient: redundant, either by allotting several letters to the same power, and sound; as in the Hebrew *ד* and *ז*, and the ordinary Latin *c* and *k*, *f*, and *ph*: or by reckoning double letters among the simple elements of speech; as in the Hebrew *כּ*, the Greek *ξ* and *ψ*, the Latin *q*, *cu*, *x*, *cz*, and the *j* consonant, or jod.—Deficient in divers respects, especially in regard of vowels, of which there are seven or eight kinds commonly used; though the Latin alphabet only takes notice of five; whereof two, *viz.* *i* and *u*, according to our English pronunciation, are not properly vowels, but diphthongs.

Add, that the difference among vowels in respect of long and short, is not sufficiently provided for: the ancients, we know, used to express a long vowel by doubling its character; as

amaabam, naata, ree, sedes, sanctissimis; though the vowel *i*, instead of being doubled, was frequently prolonged, as *ædilis, plso, vlvus*.—The ways used in English for lengthening and abbreviating vowels, *viz.* by adding *e* quiescent to the end of a word, for prolonging a syllable; and doubling the following consonants, for the shortening of a vowel, as *wane wann, ware warr*, &c. or else by inserting some other vowel, for the lengthening of it, as *meat met, read red*, &c. are all improper; in that the sign ought ever to be where the sound is.

As to their powers, again, those are not always fixed to the same signification: the vowels, for instance, are generally acknowledged to have each of them several sounds: *vocales omnes plurifonæ*, says Lippius; and Vossius assures us, the ancients used their vowels very different ways, *aliquando tenuius exiliusque, nunc crassius, nunc intermedio sono*. Thus the power of the vowel *e* is expressed in writing no less than six several ways, *viz.* by *e*; as in *be, me, she, ye*:—by *æ*, in *thee, free, wæ*:—by *ie*, in *field, yield, shield, chief*:—by *ea*, in *near, dear, hear*; by *eo*, in *people*:—by *i*, in *privilege*. So is the power of the vowel *a*; as in *all, awl, aw, fault, caught*: which are all only various ways of writing the same long vowel; besides the other distinct ways of expressing the same vowel when used short: again, the power of the vowel *o* is written five ways; *o*, as in *to, who, move*:—*oe*, as in *doe*:—*oo*, in *shoo, moon, noon*:—*ou*, in *could, would*:—*uo*, in *two*; and of the rest.—Nor are the consonants of more determinate powers: witness the different pronunciation of the same letter (*c*) in the same word, *circus*; and of *g* in *negligence*.—To say no more, the letters *c, f, t*, are used alike, to denote the same power; and the letter *j*, is commonly used for *z*: and which is yet worse, some letters of the same name and shape, are used at one time for vowels, and at another for consonants; as *j, v, w, y*; which yet differ from one another, says Bishop Wilkins, *fict corpus & anima*.

From this confusion in the power of letters, there arise divers irregularities; as, that some words are distinguished in writing, which are the same in pronunciation, *e. gr. Cessio and Sessio*, &c. and others are distinguished in pronunciation, which are the same in writing; as *give, dare, and give, vinculum, &c.* Hence also the Latin *male*, is a dissyllable, and the English *male*, is a monosyllable.

The names also, in most alphabets, are very improperly expressed by words of divers syllables; as *alpha, beta*, &c. in which respect, the Roman and our English alphabets, which only name the letters by their powers, have a great advantage over the rest.

Lastly, their figures are not well concerted; there being nothing in the characters of the vowels answerable to the different degrees of apertion: nor in the consonants, analogous to the agreements or disagreements thereof.

All these imperfections are demonstrated in the natural alphabet attempted by Dr. Wallis, Dr. Holder, &c. (see NATURAL ALPHABET) and are endeavoured to be obviated in the universal alphabets, or characters of Mr. Lodowick, Bishop Wilkins, &c. See UNIVERSAL CHARACTER.

In the French king's library, is an Arabic work, intitled, *Sephat Alacham*; containing divers sorts of imaginary alphabets, which the author distributes into prophetic, mystical, philosophical, magical, talismanical, &c.

Monsieur Leibnitz had it in view to compose an *Alphabet of Human Thoughts*. *Mém. de l'Acad. R. An. 1716*.

It is no wonder that the number of letters in most languages should be so small, and that of the words so great; since from a calculation made by Mr. Prestet, it appears, that, allowing only twenty-four letters to an alphabet, the different words or combinations that may be made out of those twenty-four letters, taking them first one by one, then two by two, three by three, &c. would amount to the following number, 1391,724,288,887,52,999,425,128,493,402,200.

It may be here observed, that every combination may make a word, even though that combination have not any vowel in it; because the *e* mute or quiescent insinuates itself imperceptibly between the consonants, or after the consonants, where there are but two, the latter of which would not be heard without it.—The use of this silent *e* is very remarkable in the Armenian, Welch, and Dutch languages; wherein the generality of words have several consonants together.

Nor must it be omitted, that every single letter may make a word: which is very apparent, where that letter is a vowel; words of that kind being found in most languages. Thus, *a*, and *u* make words in the Greek; *a, o*, in the Latin; *a, i*, in English; *a, o, y*, in French; *a, e, i, o*, in Italian; *a, y*, in Spanish; *a, o*, in the Portuguese; *a*, in most languages, and even in the Dutch and Swedish. Any consonant also becomes a word, by adding an *e* mute to it in pronunciation.

In fine, though a considerable number of the possible combinations of twenty-four letters were retrenched, yet the number remaining would still be immense, and vastly superior to that of the words in any language known.

Of all known languages, the Greek is looked upon as one of the most copious, the radices of which are only esteemed about

about 3244; but then it abounds exceedingly in compounds, and derivatives. Bishop Wilkins thinks these may be moderately computed at about ten thousand.

Hermannus Hugo, indeed, asserts, that no language has so few as 100000 words; and Varro is frequently quoted by learned men, as if he affirmed that there are in the Latin no less than 500000: but upon inquiring into the scope of the passage, Bishop Wilkins observes, that this number is not intended by him to express the just number of words in the Latin; but the great variety made thereof, by the inflection and composition of verbs.—To this purpose he lays it down, that there are above one thousand radical verbs in the Latin; and that each verb admits of five hundred several varieties: he further supposes, that each of these may be compounded with nine prepositions; as *cessit, recessit, accessit, decessit, praecessit, processit, successit, &c.* which amounts to five millions. See WORD.

ADPHABET, in matter of polygraphy, is a duplicate of the key or cipher, which each of the parties corresponding are to keep by them.

It is properly an *alphabet* of the usual letters disposed in their order; opposite to, or underneath which, are the secret characters corresponding thereto, with the blank or useless letters, and the other signs or symbols serving to obscure, and render it difficult to decipher. See DECIPHERING.

ALPHETA, in astronomy, a fixed star in the northern crown; otherwise called *lucida coronae*.

Its longitude, latitude, &c. see among the rest of the constellation CORONA Septentrionalis.

ALPHONSIN, is the name of a surgeon's instrument, used in the extraction of bullets from the body.

The *alphonsia*, so called from its inventor Alphonsus Ferrer, a physician of Naples, consists of three branches which are closed together by means of a ring.—The instrument, thus closed, being conveyed into the wound to the bullet, the operator draws back the ring towards the handle, upon which the branches opening themselves, lay hold of the ball: after this he pushes the ring again from the haft, whereby the branches grasp the bullet so firmly, that it must needs come out with them. *Bib. Anat. Med. t. i. 517.*

ALPHONSINE Tables. See the article TABLE.

ALPHOS, in medicine a distemper described by Celsus, under the name of *vittiligo*; wherein the skin is rough, and becomes sprinkled as it were with drops of white.

ALPINE. See the article CISALPINE.

ALRAMECH, or ARAMECH, in astronomy, the Arabic name of a star of the first magnitude, otherwise called *Arcturus*. See ARCTURUS.

ALT*, in music. See DIAGRAM, and SCALE.

* The word is formed of the Latin, *altus*, high.

ALTAR, ALTARE, ARA, a place or pile whereon to offer sacrifice to some deity.

The Jews had their brazen altar, for burnt-offerings, and a golden altar, or altar of incense.

Among the Romans, the altar was a kind of pedestal, either square, round, or triangular; adorned with sculpture, with basso relievo's, and inscriptions, whereon were burnt the victims sacrificed to idols.

According to Servius, those altars set apart for the honour of the celestial gods, and gods of the higher class, were placed on some pretty tall pile of building; and for that reason were called *altaria*, from the words *alta* and *ara*, a high elevated altar.—Those appointed for the terrestrial gods, were laid on the surface of the earth, and called *arae*.—And on the contrary, they dug into the earth, and opened a pit for those of the infernal gods, which they called *βεδρεῖ, λακοὶ, scrobiculi*. But this distinction is not every where observed: the best authors frequently use *ara* as a general word, under which are included the altars of the celestial and infernal, as well as those of the terrestrial gods. Witness Virgil, *Ecl. 5.*

En quatuor aras:

Where *aras* plainly includes *altaria*; for whatever we make of Daphnis, Phœbus was certainly a celestial god. So Cicero, pro Quint. *Aras delubrique Hecates in Grecia vidimus.*

The Greeks also distinguished two sorts of altars; that whereon they sacrificed to the gods, was called *βωμὸς*, and was a real altar; different from the other, whereon they sacrificed to the heroes, which was smaller, and called *σέχαρα*. Pollux makes this distinction of altars in his *Onomasticon*: he adds, however, that some poets used the word *σέχαρα*, for the altar whereon sacrifice was offered to the gods.—The septuagint version does sometimes also use the word *σέχαρα*, for a sort of little low altar, which may be expressed in Latin by *craticula*; being a hearth, rather than an altar.

The Jews also gave the name *altars* to a kind of tables, occasionally raised in the country or field, whereon to sacrifice to God.—In such a place, he built an altar to the lord.

ALTAR, is sometimes also used among Christians, for a square table, placed on the eastern side of a church, raised a little above the floor, and set apart for the celebration of the Eucharist.

Its form is not borrowed, either from that of the heathen altars, or even from that of the Jews in the temple; but in regard the Eucharist was instituted by Jesus Christ at supper, and upon a table, the modern altar is made in form of a table; whence it is more usually, and even more significantly denominated *Communion Table*.

In effect, the denomination *altar* is founded on this supposition, that the Eucharist is a proper sacrifice: which, though the standing doctrine of the church of Rome, is utterly denied by most of the Reformed.

In the primitive church, the altars were only of wood; as being frequently to be removed from place to place.—But the council of Paris, in 509, decreed, that no altar should be built but of stone.

At first there was but one altar in each church; but the number soon increased; and from the writings of Gregory the Great, who lived in the sixth century, we learn, that there were sometimes in the same church twelve or thirteen.—In the cathedral of Magdeburg there are no less than 49 altars.

The altar is sometimes sustained on a single column, as in the subterranean chapels of St. Cecilia at Rome, &c. and sometimes, by four columns, as the altar of St. Sebastian of Crypta Arenaria; but the customary form, is, to be a mass of stone-work, sustaining the altar-table.

These altars bear a resemblance to tombs: in effect, we read in church-history, that the primitive Christians chiefly held their meetings at the tombs of the martyrs, and celebrated the mysteries of religion thereon. For which reason, it is a standing rule to this day in the church of Rome, never to build an altar, without inclosing the relics of some saint therein.

In lieu of proper altars, the Greeks in process of time made use of antimenia. See ANTIMENSIUM.

ALTAR of Prothesis, is a name given by the modern Greeks to a smaller, preparatory kind of altar, whereon they bless the bread, before it be carried to the large altar, where the solemn liturgy is performed.

F. Goar maintains, that the table of prothesis was anciently in the sacristy, or vestry; which he makes appear from some Greek copies, where sacrifice is made use of in lieu of prothesis. See SACRISTY.

ALTAR is also used, in church-history, for the oblations, or contingent incomes of a church.

In ancient days, they distinguished between the church and the altar.—The tithes, and other settled revenues, were called the church, *ecclesia*; and the other incidental incomes, the altar.

ALTAR, Ara, in astronomy, one of the constellations of the southern hemisphere; not visible in our climate. It consists of seven stars; whereof five are of the fourth magnitude and two of the fifth.—Some call it the *Censer*.

Ministers of the ALTAR. See the article MINISTERS.

ALTARAGE, includes not only the offerings made upon the altar, but also the profit that arises to the priest on account of the altar.

ALTERANT, or ALTERNATIVE, in medicine, a property, or power in certain remedies, whereby they induce an alteration in the body, and dispose it for health or recovery, by correcting some indisposition, without occasioning any sensible evacuation.

Under alterants, therefore, come all medicines which are not evacuates.

It is a point much questioned by some, whether there really be any such thing as an alterant in this sense; i. e. any thing which tends to cure a disorder otherwise than by eliminating or expelling some peccant matter?

Quincy has made it probable, that remedies usually reputed alterants, act in the same manner on the remoter, and more intimate parts of the habit, as emetics, purgatives, &c. do on the stomach and intestines.

Dr. Morgan denies that there is the least ground from any observations or experiments, to conclude that medicines by any alternative or specific operation on the blood can transform any morbid matter, or præternatural ferment into good blood, and humours: or that any such corrupt virulent matter, being once formed and fixed, there can be any remedy for it, otherwise than by throwing it out of the body by some of the natural evacuations. V. Morg. *Mechan. Pract. Phys.* p. 53.

Alternatives, therefore, are better defined, such medicines as have no immediate sensible operation, but gradually gain upon the constitution, by changing the humours from a state of distemperature to health.

ALTERATE. See the article SESQUIALTERATE.

ALTERATION, ALTERATIO, in physic, the act of changing the circumstances and manner of a thing; its general nature and appearance remaining the same.—Or, it is an accidental, and partial change in a body; without proceeding so far, as to make the subject quite unknown, or to take a new denomination thereupon.—Or, it may be defined, the acquisition or loss of such qualities as are not essential to the form of the body.

Thus,

Thus, a piece of iron, which before was cold, is said to be altered, when it is made hot; since it may still be perceived to be iron, is called by that name, and has all the properties thereof.

By this, *alteration* is distinguished from *generation* and *corruption*; those terms expressing an acquisition or loss of the essential qualities of a thing.

The modern philosophers, after the ancient chymists and corruptularians, hold all *alteration* to be effected by means of local motion: according to them, it always consists either in the emission, accedion, union, separation, or transposition of the component particles.

Aristotle makes a peculiar kind of motion, which he calls the *Motion of Alteration*.

ALTERCATION*, a debate or contest between two friends, or acquaintance.

* The word comes from the Latin *altercari*; which anciently signified to converse or hold discourse together.

Thus, we say they never come to an open quarrel; but there is continually some little *altercation* or other.

ALTERN Base, a term in trigonometry, contradistinguished from *true base*, thus—In an oblique triangle, the true base is either the sum of the sides; in which case, the difference of the sides is called the *altern base*: or, the true base is the difference of the sides; in which case, the sum of the sides is called the *altern base*.

ALTERNATE, or **ALTERNATIVE**, is understood of several things which succeed, or are disposed after each other by turns.

We say, an *alternate* or *alternative* office or trust, which is that discharged by turns: so, two general officers, who command each his day, are said to have the command *alternately*.

In botany, the leaves of a plant are said to be *alternate*, or placed *alternately*, when there is a correspondence between the two sides of a branch; the leaves of the one, standing a little above those of the other, not one opposite to the other.

ALTERNATE, in arithmetic. See **ALLEGATION**.

ALTERNATE Angles, in geometry, are the internal angles made by a line cutting two parallels, and lying on the opposite sides of the cutting line; the one below the first parallel, and the other above the second.

Thus, x and u , and z and y , (*Tab. Geometry, fig. 46.*) are *alternate angles*.

There are also two external angles, *alternately* opposite to the internal ones. See **OPPOSITE**.

Allegation ALTERNATE. See **ALLEGATION**.

ALTERNATE Ratio, or **Proportion**, is where the antecedent of one ratio is to its consequent, as the antecedent of another, to its consequent; the very same ratio, in this case, holding *alternately* in respect of the antecedents to each other, and the consequents to each other.

Thus, if $A:B::C:D$; then, *alternately*, $A:C::B:D$. See **PROPORTION**.

ALTERNATE, in heraldry, is used in respect of the situation of the quarters. See **QUARTER**.

Thus, in quarterly, *coartels*, the first and fourth quarters are *alternate*; and are usually of the same nature. And the like holds of the second and third.

ALTERNATIONS, a term sometimes used to express the divers changes, or alterations of order, in any number of things proposed.

This is also called *permutation*, &c. and is easily found, by a continual multiplication of all the numbers, beginning at unity.

Thus, if it be required to know how many changes or *alternations* can be rung on six bells; multiply the numbers 1, 2, 3, 4, 5, 6, continually one into another; and the last product gives the number of changes.

ALTERNATIVE, is particularly used for the choice of two things proposed.—In this sense, we say, to take the *alternative* of two propositions.

ALTIMETRY*, **ALTIMETRIA**, the art of taking or measuring altitudes or heights; whether accessible or inaccessible. See **ALTITUDE**.

* The word is compounded of the Latin *altus*, high, and *metron*, *metior*, to measure.

Altimetria makes the first part of geometry; including the doctrine and practice of measuring both perpendicular and oblique lines; whether in respect of height, or depth.

ALTITUDE, **ALTITUDO**, in geometry, the third dimension of body; considered with regard to its elevation above the ground—called also *height* or *depth*.

ALTITUDE of a Figure, is the distance of its vertex, from its base, or the length of a perpendicular let fall from the vertex to the base. See **FIGURE**, **BASE**, and **VERTEX**.

Thus, KL (*Tab. Geometry, fig. 19.*) being taken for the base of the rectangle-triangle, KLM : the perpendicular KM , will be the *altitude* of the triangle.

Triangles of equal bases and *altitudes*, are equal; and parallelograms, whose bases and *altitudes* are equal to those of triangles, are just the double thereof.

ALTITUDE, in optics, is usually considered as the angle subtended between a line drawn through the eye, parallel to the horizon, and a visual ray emitted from an object to the eye.

For the laws of the vision of *altitude*, see **VISION**.

If through the two extremes of an object, S and T , (*Tab. Optics, fig. 13.*) two parallels, TV and SQ be drawn; the angle TVS , intercepted between a ray passing through the vertex S , and terminating the shadow thereof in V , makes, with the right line TV , what is called, by some writers, the *Altitude of the Luminary*.

ALTITUDE, in cosmography, is the perpendicular height of an object, or its distance from the horizon, upwards.

Altitudes are divided into accessible and inaccessible. See **ACCESSIBLE**, and **INACCESSIBLE**.

There are three ways of measuring *altitudes*, viz. geometrical, trigonometrically, and optically.—The first is somewhat indirect and unartful; the second is performed by means of instruments for the purpose; and the third by shadows.

The instruments chiefly used in measuring of *altitudes*, are the quadrant, theodolite, geometric quadrat, or line of shadows, &c. the descriptions, applications, &c. whereof, see under their respective articles, **QUADRANT**, **THEODOLITE**, and **QUADRAT**.

To take Accessible ALTITUDES. To measure an accessible altitude, geometrically.—Suppose it required to find the altitude AB , (*Tab. Geometry, fig. 88.*) plant a staff DE perpendicularly in the ground, of such height as may equal the height of the eye. Then, laying prostrate on the ground, with your feet to the staff; if E and B prove in the same right line with the eye C ; the length CA is equal to the altitude AB . If some other lower point, as F , prove in the line with E and the eye; you must remove the staff, &c. nearer to the object: on the contrary, if the line continued from the eye over E , mark out some point above the altitude required; the staff, &c. are to be removed farther off, till the line CE raze the very point required.—Thus, measuring the distance of the eye C from the foot of the object A ; the altitude is had; since $CA=AB$.

Or thus.—At the distance of thirty, forty, or more feet plant a staff DE , (*fig. 89.*) at distance herefrom, in C , plant another shorter one, so as that the eye being in F , E and B may be in the same right line therewith. Measure the distance between the two staves, GF ; and between the shortest staff and the object, HF ; as also, the difference of the heights of the staves, GE .—To GF , GE and HF ; find a fourth proportional BH .—To this add the altitude of the shorter staff, FC . The sum is the altitude required, AB .

To measure an accessible altitude, trigonometrically.—Suppose it required to find the altitude AB , (*Tab. Trigonometry, fig. 23.*) chuse a station in E ; and with a quadrant, theodolite, or other graduated instrument duly placed, find the quantity of the angle of altitude ADC .

Measure the shortest distance of the station from the object, viz. DC , and this of consequence is perpendicular to AC .

Now, C being a right angle, it is easy to find the line AC ; since, in the triangle ACD , we have two angles, viz. C and D , and a side opposite to one of them, CD , to find the side opposite to the other: for which we have this canon.

—As the sine of the angle A , is to the given side opposite thereto, DC ; so is the sine of the other angle D , to the side required CA . See **TRIANGLE**.

To the side thus found, adding BC , the sum is the perpendicular altitude required.

The operation is best performed by logarithms. See **LOGARITHM**.

If there happen an error in taking the quantity of the angle A , (*fig. 24.*) the true altitude BD will be to the false one BC ; as the tangent of the true angle DAB , to the tangent of the erroneous angle CAB .

Hence, such error will be greater in a greater altitude than in a less: and hence also, the error is greater if the angle be lesser, than if it be greater. To avoid the inconveniences of both which, the station is to be pitched on at a moderate distance: so as the angle of altitude, DEB , may be nearly half right.

Again, if the instrument were not horizontally placed, but inclined; *e. gr.* to the horizon in any angle: the true altitude will be to the erroneous one, as the tangent of the true angle, to that of the erroneous one.

To measure an accessible altitude optically, by the shadow of the body. See **SHADOW**.

To measure an accessible altitude by the geometrical quadrat.—Suppose it required to find the altitude AB , (*Tab. Geom. fig. 90.*) chusing a station at pleasure in D , and measuring the distance thereof from the object, DB ; turn the quadrat this and that way, till the top of the tower A , appear through the sights.

If, then, the thread cut the right shadows, say, as the part of the right shadow cut off, is to the side of the quadrat; so is the distance of the station DB , to the part of the altitude AE .—If the thread cut the versed shadows, say, as the

side of the quadrat is to the part of the verfed shadow cut off, fo is the diftance of the ftation DB, to the part of the altitude AE.

AE, therefore, being found in either cafe, by the rule of three; and the part of the altitude BE added thereto; the fum is the altitude required.

To meafure an inaccessible ALTITUDE, geometrically.—Suppofe AB, (fig. 89.) an inaccessible altitude, fo that you cannot meafure to the foot thereof. Find the diftance CA, or FH, as taught under the article DISTANCE: then proceed with the reft as in the article for accessible diftances.

To meafure an inaccessible altitude, trigonometrically.—Chufe two ftations, G and E, (Tab. Trigonomet. fig. 25.) in the fame right line with the required altitude AB, and at fuch diftance from each other, DF, as that neither the angle FAD, be too fmall, nor the other ftation G too near the object, AB.—With a proper inftrument, take the quantity of the angles ADC, AFC, and CFB. See ANGLE.—And alfo meafure the interval FD.

Then, in the triangle AFD, we have the angle D, given by obfervation; and the angle AFD, by fubtracting the obferved altitude AFC, from two right angles; and confequently the third angle DAF, by fubtracting the other two from two right ones: and alfo the fide FD; from whence the fide AF is found by the canon above laid down, in the problem of accessible altitudes: and again, in the triangle AFC, having a right angle C, an obferved angle F, and a fide AF; the fide AC, and the other CF, are found by the fame canon. Laftly, in the triangle FCB, having a right angle C, obferved angle CFB, and a fide CF; the other fide CB, is found by the fame canon.

Adding, therefore, AC, and CB; the fum is the altitude required, AB.

To find an inaccessible altitude, by the shadow, or the geometrical quadrat.—Chufe two ftations in D and H, (Tab. Geom. fig. 90.) and find the diftance DH or CG: obferve what part of either the right or verfed shadow is cut by the thread.

If the right shadows be cut in both ftations, fay, As the difference of the right shadows in the two ftations, is to the fide of the fquare; fo is the diftance of ftations GC to the altitude EA.—If the thread cut the verfed shadow at both ftations, fay, As the difference of the verfed shadows marked at the two ftations, is to the leffer verfed shadow; fo is the diftance of the ftations GC, to the interval GE.—Which being had; the altitude EB is alfo found by means of the verfed shadow in G; as in the problem for accessible altitudes. Laftly, if the thread in the firft ftation G, cut the right shadows; and in the latter, the verfed shadows: fay, As the difference of the product of the right shadow into the verfed, fubtracted from the fquare of the fide of the quadrat, is to the product of the fide of the quadrat into the verfed shadow; fo is the diftance of the ftations GC, to the altitude required AE.

The utmoft diftance at which an object may be feen, being given; to find its altitude.—Suppofe the diftance DB, (Tab. Geography, fig. 9.) turn this into degrees; by which means, you will have the quantity of the angle C: from the fecant of this angle fubtract the whole fine BC; the remainder will be AB, in fuch parts, whereof BC is 1000000.—Then fay, As 1000000 is to the value of AB in fuch parts, fo is the femidiameter of the earth BC 19695539, to the value of the altitude A Bin Paris feet.

Suppofe, e. gr. the altitude be required of a tower AB, whole top is vifible at the diftance of five miles: then will DCB 20°, from whole fecant 10000168, fubtracting the whole fine 10000000; the remainder AB is 168, which will be found 331 Paris feet.

ALTITUDE of the Eye, in perspective, is a right line let fall from the eye, perpendicular to the geometrical plane.

ALTITUDE, in aftronomy, is the diftance of a ftar, or other point in the mundane fphere, from the horizon.

This altitude may either be true or apparent.—If it be taken from the rational, or real horizon; the altitude is faid to be true or real: if from the apparent, or fenfible horizon; the altitude is apparent.—Or rather, the apparent altitude is fuch as it appears to our obfervation; and the true, is that from which the refraction has been fubtracted. See TRUE, APPARENT, &c.

The altitude of a ftar, or other point, is properly an arch of a vertical circle, intercepted between the affigned point and the horizon. See VERTICAL.—Hence,

Meridian ALTITUDE.—The meridian being a vertical circle; a meridian altitude, that is, the altitude of a point in the meridian, is an arch of the meridian intercepted between it and the horizon.

To obferve the meridian altitude of the fun, of a ftar, or other phenomenon, by means of the quadrant, fee MERIDIAN ALTITUDE.

To obferve a meridian altitude by means of a gnomon, fee GNOMON.

The fun's altitude may alfo be found without a quadrant, or

VOL. I.

any the like inftrument, by erecting a pin or wire perpendicularly, as in the point C, (Tab. Aftronomy, fig. 62.) from which point you had defcribed the quadrantal arch AF. Make CE equal to the height of the pin or wire; and through E draw ED parallel to CA, and make it equal to CG, the length of the shadow; then will a ruler, laid from C to D, intercept the quadrant in B; and BA is the arch of the fun's altitude, when meafured on the line of chords.

M. Parent fuggests a new method of taking altitudes at fea, by a common watch.—'Tis obvious, that in an oblique fphere, the difference between the rifing and fetting of two ftars, on the fame meridian, is greater, as they are further diftant from one another.

Now, the aftronomical tables furnifhing us with tables of the right afcensions and declinations of all the fixed ftars; it is eafy, after obferving the difference of time between the rifing of two ftars, to diftinguifh that part of the difference which accrues from their different pofition, from that which arifes from the obliquity of the fphere.—But fuch difference is the precise height of the pole of the place of obfervation.

Indeed, the fhip not being immoveable, but changing place between the two obfervations; feems to lay the method under fome difficulty: but to this Mr. Parent answers, that a fmall alteration either of the fhip's longitude or latitude, will make no fenfible error; and that if the have gone a large diftance between the two obfervations, it is eafy reckoning how much it is, and accordingly, allowing for it. See SAILING.

In taking of altitudes from the vifible horizon, where great exactnefs is required, an allowance is to be made for refraction, and the height of the obferver's eye above the furface of the fea.

ALTITUDE of the Pole, is an arch of the meridian, intercepted between the pole and the horizon.

The altitude of the pole coincides with the latitude of the place.

—To obferve the altitude or elevation of the pole, fee ELEVATION, and POLE.

ALTITUDE of the Equator, is the complement of the altitude of the pole to a quadrant of a circle. See ELEVATION of the Equator.

To find the ALTITUDES of the ftars, &c. by the globe. See GLOBE.

ALTITUDE of the Nonagefimal, is the altitude of the 90th degree of ecliptic, reckoned from the orient, or eaft point. See NONAGESIMAL.

Refraction of ALTITUDE, is an arch of a vertical circle, as S, (Tab. Aftronomy, fig. 28.) whereby the altitude SE, of a ftar or other body, is increafed by means of the refraction.

Parallax of ALTITUDE, is the difference CB, (Tab. Aftron. fig. 27.) between the true and apparent place of a ftar; or, the difference BC, between the true diftance of a ftar AB, and the obferved diftance AC, from the zenith A.

The parallax diminifhes the altitude of a ftar, or increafes its diftance from the zenith.—To find the parallax of altitude, &c. fee PARALLAX.

ALTITUDE of Motion, is a term ufed by Dr. Wallis, for the meafure of any motion, eftimated according to the line of direction of the moving force.

Circles of ALTITUDE. See the article CIRCLES.

Parallels of ALTITUDE. See the article PARALLELS.

Quadrant of ALTITUDE. See the article QUADRANT.

ALTO & BASSO, or in ALTO & in BASSO, in law, fignifies the abfolute reference of all differences, fmall and great, high and low, to fome arbitrator or indifferent perfon.—Pateat univerfis per prefentes quod Willielmus Tylar de Ytton, & Thomas Gouver de Alneftre, pofuerunt fe in ALTO & in BASSO, in arbitrio quatuor Hominum, viz.—de quadam querela pendente inter eos in curia.—Nos & terram nofttram altè & bassè ipfius domini Regis fuppoſuimus voluntati. Du Cang.

ALTO Relievo. See the article RELIEVO.

ALUDELS, in chemistry, fubluming pots, or veffels ufed for the fublimation of mineral flowers.

Aludels, are a range of earthen tubes or pots without bottoms; fitted, one over another, and diminifhing as they advance towards the top.—The loweft is adapted to a pot, placed in the furnace, wherein the matter to be fublimed is lodged.—And at the top is a head, to retain the flowers which afcend higheft.

ALVEARIUM, in anatomy, the bottom of the concha, or hollow of the auricle, or outer ear. See EAR.

The alvearium auriculæ is a cavity, terminating at the meatus auditorius, wherein that bitter, yellowifh excrement is collected, called cerumen, or ear-wax.

ALVEOLI, in anatomy, thofe little fockets in the jaws, wherein the teeth are fet.

The alveoli are lined with a membrane of exquisite fenfe, which feems to be nervous, and is wrapt about the roots of each tooth; from whence, and from the nerve, proceeds that pain called odontalgia, or tooth-ach.

ALVIDUCA*, a term used by some writers for laxative or purgative medicines.

* The word is compounded of *alvus*, and *duco*, I draw.

ALUM, ALUMEN. See the article **ALLUM**.

ALVUS, among anatomists, is sometimes used to express the lower belly, or venter.

ALVUS, is more usually taken among physicians for the state, and condition of the fæces, or excrements contained within that cavity.

Thus, when a person is laxative, it is called *alvus liquida*; and when costive, *alvus adstricta*.

AMABYR, or **AMVABYR**, in some ancient customs, the price of a maidenhead; or a sum of money to be paid the lord upon marrying a maid of his manor.—This custom is said to have anciently obtained in Wales, where *amabyr* was paid to the prince: also in the honour of Clun belonging to the earl of Arundel, till earl Henry in the time of queen Mary, in consideration of sixty pounds, released it to all his tenants by the name of the custom, of *amabyr* and *chevage*.

AMAIN, or **AMAYNE**, a sea-term, used by a man of war, to his enemy; and signifying, *yield*.

Hence, *to strike amain*, is, to lower, or let fall the top-sails.

AMALGAMA*, or **AMALGAM**, in chymistry, a mass of mercury, united and incorporated with a metal. See **MERCURY**, and **METAL**.

* The word *amalgama* is formed of the Greek *αμα*, *simul*, together, and *γανω*, *ungere*, to join.

The *amalgama* of mercury with lead, is a soft, friable substance, of a silver colour.

By washing and grinding this *amalgam* with fair warm water in a glass mortar, the impurities of the metal will mix with the water; and by changing the water, and repeating the lotion again and again, the metal will be further and further purified.—Boerhaave mentions it as one of the greatest secrets in chymistry, to contrive to bring off the liquor at last as clear and unfilied as when first poured on the *amalgama*; which he says might afford a method of making the nobler metals, or procuring them from the baser.

This philosophical way of purifying metals, may be easily applied to all the metals, except iron and copper.

AMALGAMATION, in chymistry, the operation of making an *amalgama*, i. e. of dissolving and incorporating some metal, especially gold, with mercury.

This operation is denoted among chymists by the letters **AAA**.

Amalgamation is performed by fusing, or at least igniting the metal; and in this state adding a proportion of mercury thereto; upon which they mutually attract, and incorporate with each other.

All metals, except iron and copper, spontaneously unite and *amalgamate* with mercury; but gold with the greatest facility; silver the next; then lead, and tin; copper does it with difficulty, and iron scarce at all. See **METAL**, &c.

The *amalgamation* of gold is usually performed by heating the laminae or plates of that metal red hot; after which, quicksilver is to be poured upon them, and the mixture is to be stirred with a little iron rod, till it begins to rise into smoke.—It is then thrown into a vessel full of water, where it coagulates and becomes manageable.

This *amalgamation* is in great use among goldsmiths, and gilders, who by this means render gold fluid and ductile for their purposes.—Such mixture or *amalgama* being laid on any other metal, for instance, copper; and this afterwards placed on the fire to evaporate; the gold will be left alone on the surface of the copper: which makes what we call *gilding*.

The blackness adhering to the *amalgama* may be washed away with water; and a deal of the mercury may be pressed out through a linen cloth: and the rest being evaporated in a crucible, the gold remains behind in an impalpable powder.—Gold retains about thrice its own weight of mercury.

AMATORII Musculi, in anatomy, an appellation sometimes given to those muscles of the eyes which give them a cast sideways, and assist in that particular look by some called *ogling*.

When the *abductor* and *humilis* act together, they give this oblique motion.

AMAUROSIS*, in medicine, a deprivation of sight; the eye remaining fair, and seemingly unaffected.

* The word is Greek, *αμαυρωσις*, q. d. darkness; formed of *αμαυρος*, *obscurus*, I darken.

Amayrosis is the same with what the Latins more usually call *gutta serena*. See **GUTTA SERENA**.

AMAXOBII, or rather **HAMAXOBII**. See the article **HAMAXOBII**.

AMAZON, in antiquity, denotes a bold, courageous woman; capable of daring, hardy achievements.

AMAZONS, in a more peculiar sense, denote an ancient nation of warlike women, who founded an empire in Asia Mi-

nor, near the river Thermodoon, along the coasts of the Black Sea.

The *Amazons* are said to have formed a state out of which men were excluded. What commerce they had with that sex, was only with strangers; they killed all their male children, and cut off the right breasts of their females, to make them more fit for the combat.—From which last circumstance it is that they are supposed to take their name, viz. from the privative *α*, and *μασος*, *mamma*, breast.

It is a point controverted even among ancient writers, whether ever there really were such a nation of *Amazons*?—Strabo, Palaphatus, and others, absolutely deny it: on the contrary, Herodotus, Pausanias, Diodorus Siculus, Trogus Pompeius, Justin, Pliny, Mela, Plutarch, &c. expressly assert it.

Hippocrates mentions a law among the *Amazons*, whereby they were doomed to remain virgins, till such time as they had slain three men of their enemies.—He adds, that the reason of their cutting off the right breast, was to make the right arm the stronger; as supposing this would now receive the whole nutriment, which would otherwise have been divided between both.

Some authors relate, that instead of killing, they only twisted the legs of their male children; to prevent their being able to contend with them for the mastery.

M. Petit, a French physician, published a Latin dissertation in 1685, to prove that there really was a nation of *Amazons*: it contains abundance of curious inquiries, relating to their habit, their arms, the cities built by them, &c.—On medals, the *Amazons* bust is usually armed with a little ax, called *bipennis* or *securis*, borne on the shoulder, and a buckler, in form of a half-moon, by the Latins called *pelta*, on the left arm.—Hence that of the poet:

*Non tibi Amazonia est pro me sumenda securis,
Aut excelsa levi pelta gerenda manu.*

Ov. Ex. Pent.

Some modern geographers and travellers mention *Amazons* still in being.—John de los Sanctos, a Portuguese capuchin, in his description of *Æthiopia*, speaks of a race of *Amazons* in Africa. And *Æneas Sylvius* gives us a very precise account of a republic of real *Amazons*, in Bohemia, which lasted nine years; founded by the courage of a maid named *Valafca*.

AMBAGES, *circumlocution*; an indirect discourse or phrase tending to express or shew something by a compass of words or sentiments fetched from afar.

AMBARVALIA, in antiquity, a feast, or ceremony among the Romans; celebrated annually, to expiate their grounds, and procure of the gods a happy harvest.

At these feasts, they sacrificed a bull, a sow, and a sheep; which, before the sacrifice, were led in procession thrice around the fields; whence the feast is supposed to have taken its name: from the Greek *αμψι*, about; or the Latin *ambis*, I go round, and *arvum*, field.—Though, others write it *ambarbalia*, and *ambarbia*, and deduce it from *ambire urbem*, to go round the city.

From the beasts offered in sacrifice, the ceremony was also called *Suovetaurilia*.

It is not certain whether this feast was fixed, or moveable; nor whether it was celebrated once or twice a year; authors being of different opinions on both those heads.

The *ambarvale carmen*, was a prayer preferred on this occasion; whereof we have the formula preserved in Cato, C. 141. *De Re Rustica*.

The priests who chiefly officiated at the solemnity, were called *Fratres Arvales*.

AMBASSADOR. See the article **EMBASSADOR**.

AMBE, in anatomy, a superficial jutting out of a bone. See **BONE**.

The word is also used as the name of an ancient surgical instrument, with which they reduced dislocated bones.—The *ambe*, or *commander*, is mentioned by Hippocrates, and has its partizans among the moderns, especially for replacing the arm. *V. Bibl. Anat. Med. t. 1. p. 667*.

AMBER*, *Succinum*, or *Karabe*, in natural history, &c. a yellow transparent substance, of a gummy or bituminous form or consistence, of a refinous taste, and a smell like oil of turpentine; chiefly found in the Baltic sea, along the coasts of Prussia, &c. and of use in medicine, and other arts.

* The word is originally Arabic, *ambar*, or *anbar*, which signifies the same.

Naturalists are infinitely divided as to the origin of *amber*, and what class of bodies it belongs to: some referring it to the vegetable, others to the mineral, and some even to the animal kingdom.—Its natural history, and its chemical analysis, afford something in favour of each opinion.

Pliny describes it as “a refinous juice, oozing from aged pines, and firs; (others say, from poplars, whereof there are whole forests on the coasts of Sweden;) and discharged thence into the sea; where undergoing some alteration, it is thrown in this form upon the shores of Prussia; which lie very low: he adds, that it was hence the ancients gave it the denomination *jucinum*; from *jucus* juice.” *Nat. Hist. Lib. XXXVII. c. 3*.

This opinion of the ancient naturalists, seems confirmed by observations of many of the modern ones; particularly of the learned Father Camelli. *Philos. Transact.* N° 290. Some have imagined it a concretion of the urine of a beast; others, the foam of the lake Cepheüs, near the Atlantic; others, a congelation formed in the Baltic sea, and in some fountains where they say it is found swimming like pich. Others suppose it a bitumen, trickling into the sea from subterraneous sources; and there concreted into this form, and thrown ashore by the waves.

This last opinion was a long time the most popular; and seemed to have the best ground: but this, too, is now discarded; as good *amber* having been found in digging at a considerable distance from the sea, as that gathered on the coast.

Others suppose *amber* a compound substance.—Prussia, say they, and the other countries which produce *amber*, are moistened with a bituminous juice, which mixing with the vitriolic salts abounding in those places, the points of those salts fix its fluidity, whence it congeals: and the result of that congelation makes what we call *amber*; which is more or less pure, transparent, and firm, as those parts of salt and bitumen are more or less pure, and are mixed in this, or that proportion.

The chemists are as much divided on this head as the naturalists. *Amber* being found by distillation to yield an acid spirit, which precipitates into a salt; is inferred, by some, to be of a mineral nature; this being a circumstance peculiar to that kingdom, and never found in the distillation of vegetables: to which may be added, that *amber* dissolves in alcohol, not in water; and melts at the fire, and is inflammable; which are characters, that seem to refer it to the class of sulphurs, or bitumens.

Others, on the contrary, argue it to be of the vegetable kind, from its resolving into the same principles with vegetables; viz. water, spirit, salt, and oil.—Boerhaave resembles it to camphire, which is a concrete oil of the aromatic plants of hot countries, elaborated by heat into a crystalline form.

There are several indications which discover where *amber* is to be found.—The surface of the earth is there covered with a soft scaly stone; and vitriol in particular always abounds there, which is sometimes found white, sometimes reduced into a matter like melted glass, and sometimes figured like petrified wood.

Amber assumes all figures in the ground; that of a pear, an almond, a pea, &c. In *amber*, there have been said to be letters found very well formed; and even Hebrew, and Arabic characters.—Within some pieces of *amber*, have likewise been found leaves, insects, &c. included; which seems to indicate either that the *amber* was originally in a fluid state; or that having been exposed to the sun, it was once softened, and rendered susceptible of the leaves, insects, &c. which came in its way. The latter of these seems the more agreeable to the phenomenon, in regard those insects, &c. are never found in the centre of the pieces of *amber*, but always near the surface. It is observed by the inhabitants of the places where *amber* is produced, that all animals, whether terrestrial, aerial, or aquatic, are extremely fond of it; and that they frequently find pieces of it in their excrements, and in their bodies when opened.

The most remarkable property of *amber*, is, that, when rubbed, it draws or attracts other bodies to it; and this, it is observed, it does, even to those bodies which the ancients thought it had an antipathy to; as oily bodies, drops of water, sweat of human bodies, &c.

Add, that by friction it is brought to yield light pretty copiously in the dark; whence it is reckoned among the native phosphori.

Amber is reputed of some medicinal efficacy; being used in suffumigations, to remove defluxions; and in powder, as an alterant, absorbent, sweetener, and astringent.

In times of the plague, those who work in *amber* at Koningberg are said to be never infected; whence it is held a preservative.—It is also esteemed a lithontriptic, diuretic, and promoter of the menses.

Some distinguish *amber* with regard to its colours, into *yellow*, *white*, *grey*, and *black*.—But the two latter are properly of a different nature and denomination; the one called *jet*, the other *ambergris*. See AMBERGRIS, and JET.

The *white* is most valued for medicinal uses, as being best digested, of the most odiferous smell, and containing the greatest quantity of volatile salt.—The *yellow* is most prized by those who work it into beads, and other toys, by reason of its transparency.

Kerkring pretends to be master of the secret of making coffins of *amber*, without destroying its transparency. It is probable he took the hint from the Ethiopians, who bury their dead in glasses. An Ethiopian, tho' black, makes a fine figure in a Venice crystal; much more would he do in a cover of yellow *amber*.

The *amber* gathered on the Prussian coasts, yields that prince a handsome revenue.—Authors make mention of many other places where it is also found, as on the banks of the Po; the coasts of Marfeilles; and divers parts of Asia, Africa, and even America: but Hartman, who has wrote the history

of the Prussian *amber*, *Succini Prussici Hyloria*, &c. treats all these accounts as fables, and denies *amber* to be found any where but in the northern countries of Europe, viz. in Poland, Silesia, and Bohemia, rarely; Jutland, Holstein, Denmark, oftener; more frequently still on the coasts of Samogitia, Courland, Livonia, and Pomerania; but most of all, in Prussia, in the country called Sambia, from Neve Tiff to Uranta Urug. See SUPPLEMENT, articles AMBAR, SUCCINUM, and CARABE.

Spirit of AMBER, is an acid liquor, procured from *amber*, by pulverizing and distilling it with a sand-heat, with or without the addition of tobacco-pipes, bricks, sand, &c.

It is chiefly used externally in rheumatic pains and aches; and internally, in inveterate gleans, &c.

Oil of AMBER, is a fine, transparent, ponderous, yellow oil; procured after the spirit, by increasing the degree of fire.—

This, by rectification, becomes a good antihysteric, and emmenagogue; being very subtle and penetrative.

Volatile Salt of AMBER.—The principal chemical production of *amber*, is a peculiar acid salt; which rises after the oil, and fixes in the neck of the retort, &c.

It is a good cephalic, and detergent: and Quincy says, it extremely attenuates, and cuts, and penetrates the most remote and minute recesses; and thus scours, as it were, the whole nervous system. Its chief tendency, he adds, is to secretion, and what it carries along with it, is by urine. It also contributes, with alexipharmics, to promote a diaphoresis; and is scarce ever omitted in prescription for chronic cases, as epilepsies, palfies, &c.

The great consumption of this medicine, and the small proportion that *amber* yields of it, occasions it to be frequently adulterated with sal ammoniac, nitre, cream of tartar, salt of coral, &c.

Tincture of AMBER, is procured by digestion in spirit of wine with a sand-heat.—It is prescribed with the same intentions as the salt of *amber*.

Black AMBER, *Gagater*. See the article JET.

Liquid AMBER, is a kind of native balsam, or resin, like turpentine; of a pleasant smell, somewhat like ambergris.

It flows liquid, from an incision made in the bark of a fine large tree in New Spain (called, by the natives, *espal*) but it hardens as it grows older, and is brought to us in barrels.

It is reputed an excellent balsam; it mollifies, consolidates, and is good against the sciatica, weakness of the nerves, &c.

Balsam of liquid AMBER. See the article BALSAM.

AMBERGRIS, AMBER-GRASS, AMBRA GRISIA, a fragrant drug, that melts almost like wax; and is commonly of a greyish or ash-colour, and is used both as a perfume and a cordial.

It is found on the sea-coasts, in several countries; as, a long the southern, and eastern parts of Africa, Madagascar, the Maldives, some parts of the Mediterranean; and in the West Indies, about the islands of Bermudas, and Jamaica; also on the coasts of Carolina, and the western coasts of Ireland, &c. It is sometimes, whitish, brownish, and streaked with yellow, blackish, &c.

There is a great variety of opinions among naturalists with regard to its origin and production: to rehearse them all, would make a volume. Klobius recites eighteen; to which we could add half as many more.—The principal may be reduced to these which follow.

1^o, Some take it for the excrement of a bird, called in the Madagascar language *afchibobuch*; which being melted by the heat of the sun, and washed off the shore by the waves, they say is swallowed by whales; who return it back in the condition we find it. Or, as Barbosa relates, from the Moorish inhabitants of the Maldives; the excrements above mentioned are altered and refined by lying on the rocks, exposed to the sun, moon, and air; from whence they are afterwards washed off by the rising sea. They add, that the whales frequently swallow pieces thereof: that those pieces we meet withal of a black colour, took that hue in the stomach of those animals; that the brown are such as have floated long on the water; and the white, such as have only been a short time there, which they value the most. *Ramusio*, Tom. I. fol. 313.—To this opinion does Klobius also adhere.

2^o, Others speak of it as the excrement of a cetaceous fish; because sometimes found in the intestines, and sometimes in the faeces themselves, of such animals.—Justus Klobius, in his history of *amber*, describes the animal; which he says is a whale, and called the *trunk*: adding, that the sperma ceti is taken out of the head of the same creature.—Others, with the Persians, suppose the fish that yields the *ambergris*, a sea-calf; others, with the Africans, make a peculiar species of fish, named *ambracan*; others a crocodile, by reason its flesh is perfumed, &c.

But, to both these hypotheses it is objected, that we have no instance of any excrement capable of melting like wax. Add, that if it were the excrement of a whale, it should rather be found in such places where those animals abound, as about Greenland, &c. than about the Maldivian islands, Soffala, Melinda, Cape Comorin, &c. where no whales are found.

3^o, Others take it for a kind of wax, or gum, which distills from

from trees, and drops into the sea, where it congeals, and becomes *ambergris*.

4°. Others, and particularly many of the orientals, imagine it springs out of the bottom of the sea, as naphtha does out of some fountains.—They add, that the only springs hereof are in the sea of Ormus, between the Arabian and Persian gulphs. Edrisi, who is of this opinion, in the first climate of his geography, mentions pieces of *ambergris*, on those coasts weighing a full quintal.—Paludanus and Linschotten also speak of it as a sort of bitumen, gradually working up from the bottom of the sea, and hardening in the sun.

5°. Others take it for a sea-mushroom, tore up from the bottom by the violence of tempests; it being observed, that *ambergris* is never found but during the southwest monsoons, after storms.

6°. Others assert it a vegetable production, issuing out of the root of a tree, whose roots always shoot toward the sea, and discharge themselves into the same.—This account we have in the Philosophical Transactions, from one of the Dutch factors at Batavia: and the same is confirmed by Mr. Boyle, *Of Tastes and Odors*.

7°. Others suppose it a spongy kind of earth, which the working of the sea washes from off the rocks, where, being lighter than water, it floats.—Others are of opinion, that it is a bituminous matter; that it is at first liquid, and runs into the sea, and that it is there condensed and reduced into a mass.

8°. Others maintain, that *ambergris* is made from the honey-combs which fall into the sea from the rocks, where the bees had formed their nests.—This opinion seems to have something of experience on its side; several persons having seen pieces that were half *ambergris*, and half plain honey-comb: and others, again, having found large pieces of *ambergris*, which when broke, honey-comb, and honey too, were found in the middle. *V. Tredway, Phil. Trans. ap. Lewth. p. 492.*

9°. Dr. Boyleston, and Mr. Dudley in the Philosophical Transactions, assert that the *ambergris* is a true, animal concrete, formed in balls, in the body of the male sperma-ceti whale, and lodged in a large oval bag, over the testicles, at the root of the penis. *V. Phil. Trans. N° 385, and 387.*

It is certain, the whale-catchers in those parts have divers times found *ambergris* in their sperma-ceti whales, and that chiefly in the larger, and older sort: and 'tis from the informations of Mr. Atkins, and other whale-catchers, that Mr. Dudley chiefly drew his account.—But, besides that it is added, that it is not one sperma-ceti whale in 100, that is found to have *ambergris*; Mr. Neumann absolutely denies it to be an animal substance, as not yielding, in the analysis, any one animal principle.—It may indeed he says be found in whales, but it must have been swallowed by them.

Mr. Neumann, chemist to the king of Prussia, after an ample recital of all the different opinions advanced by others, gives us his own; which is, that *ambergris* is a bitumen, issuing out of the earth into the sea; at first of a viscous consistence, but hardening, by its mixture with some liquid naphtha, into the form wherein we find it. *V. Phil. Trans. N° 433. p. 350. N° 434. p. 371. N° 435. p. 417.*

The pieces frequently seem composed of divers strata, laid one over another; with stones and other bodies inclosed therein; and the strata are sometimes full of little shells, which seem a species of concha anatifera: whence it may be conjectured, that the *ambergris* has originally been in a fluid state; or at least, that it has been dissolved; and in that state has formed itself afresh, and involved such bodies as happened to be in its way.

It is of considerable use among perfumers, who melt it over a gentle fire, and make extracts, essences, and tinctures of it.—It would be of more use in physic too, were not its smell apt to occasion vapours.

We have various instances in authors, of vast pieces of this matter: the largest that has been known in Europe, was brought by the Dutch East-India company, toward the close of the last century; and kept in their house for some years. It was almost round; measured two foot in diameter, and weighed an hundred and eighty-two pounds. The great duke of Tuscany offered fifty thousand crowns for it. See SUPPLEMENT, article AMBERGRIS.

AMBER-SEED, or *Musk-seed*, is a seed somewhat like the millet of a bitterish taste, and brought dry to us from Martinico and Egypt.—The Egyptians use it internally, as a cordial, to fortify the heart, stomach, and head, and to provoke lust.—It gives a grateful scent to the breath, after eating; but it is not proper for those who are inclinable to vapours.

AMBIDEXTER*, one who uses both hands alike, the left as well as the right, or in cases where only the use of one is necessary.

* The word is Latin, *ambidextra*, compounded of *ambo*, both; and *dexter*, right-hand; by analogy to the Greek *αμφιδέξιος*, which signifies the same.

Women, according to the observation of Hippocrates, are never *ambidextrous*. But this is denied by some moderns, who give instances of the contrary; though it is owned, they are

but few in comparison of what are found in the other sex.

AMBIDEXTER, in a legal sense, denotes a person who takes money from both of the two contending parties, to further them in their cause.—In this sense the word may be applied to a judge, juror, a solicitor, or the like.—The penalty on a juror in such case, is to forfeit *decies tantum*, ten times as much as he receives.

AMBIENT*, a term applied to such things as encompass others round about.

* The word is formed of the Latin *ambire*, to encompass, go round.

Thus, the bodies situate around any other body, are called *ambient*, and often the *circum-ambient* bodies.—The whole body of air, because it encompasses all things on the face of the earth, is often by physical writers called, by way of eminence, the *ambient*, or *ambient air*. See CIRCUM-AMBIENT.

AMBIGENAL *Hyperbola*, in geometry, is that which has one of infinite legs inscribed, and the other circumscribed. See HYPERBOLA.

AMBIGUOUS*, something dubious, obscure, or which may be taken in different senses. See EQUIVOCAL.

* The word is formed of the Latin *ambo*, both, and *ago*, I drive; *q. d.* that which keeps the mind wavering, or in suspense; not knowing which side to chuse.

The answers of the ancient oracles were always *ambiguous*.

AMBIT, AMBITUS, of a figure, in geometry, denotes the perimeter; or the sum of all the lines, that constitute, or include it.

AMBITUS, among the ancient Romans, the act of soliciting, or making interest for offices, or honours.

The candidates, in this case, went about the city; and into all public places, and assemblies, to beg voices; which was called *Ambitus*; *am*, in the ancient Latin, signifying *circum*, about, or round, and *ire*, to go.

The AMBITUS was the great trade of Rome, and demanded a constant supply of great sums of money. Tully assigns this as the cause of the high rate of interest, and tells us it had raised it from 4 to 8 per cent. *Cit. Ep. 2. ad Quinct. Frat.*—Bribery was come to the pitch of 80729*l.* per tribe: and there being no less than thirty-five tribes, it is obvious, how expensive this corruption was grown.—It is also well known where it ended. *Arbuth. Diff. p. 213.*

AMBLE, AMBLING, in horsemanship, a peculiar kind of pace, wherein a horse's two legs of the same side, move at the same time.

The *ambling* horse changes sides at each remove; two legs of a side being always in the air, and two on the ground, at the same time: an *amble* is usually the first natural pace of young colts; which, as soon as they have strength enough to trot, they quit.—There is no such thing as an *amble*, in the manage; the riding-masters allowing of no other paces, beside walk, trot, and gallop: their reason is, that a horse may be put from a trot to a gallop, without stopping him; but not from an *amble* to a gallop, without such stop; which loses time, and interrupts the justness and cadence of the manage.

There are various practices and methods of discipline, for bringing a young horse to *amble*: some chuse to toil him in his foot-pace through new-ploughed lands; which naturally inures him to the stroke required in the *amble*. But its inconveniences are, the weakness and lameness that such disorderly toil may bring on a young horse.

Others attempt it by sudden stopping, or checking him in the cheeks, when in a gallop; and thus putting him into an amazedness, between gallop and trot; so that losing both, he necessarily stumbles upon an *amble*.—But this is apt to spoil a good mouth and rein; and exposes the horse to the danger of an hoof-reach, or sinew-strain, by over-reaching, &c.

Others prefer *ambling* by weights, as the best way; and to this end, some overload their horse with excessively heavy shoes; which is apt to make him interfere, or strike short with his hind feet.—Others fold leaden weights about the fetlock patterns; which are not only liable to the mischiefs of the former, but put the horse in danger of incurable strains, crushing of the coronet, and breeding of ring-bones, &c.—Others load the horse's back with earth, lead, or the like massy substance; but this may occasion a swaying of the back, overtraining of the fillets, &c.

Some endeavour to make him *amble* in hand, ere they mount his back by means of some wall, smooth post or rail, and by checking him in the mouth with the bridle-hand; and correcting him with a rod on the hinder hoofs, and under the belly, when he treads false. But this is apt to drive a horse to a desperate frenzy, before he can be made to understand what they would have of him; and to rear, sprawl out his legs, and make other antic postures, which are not easily quitted again. Others think to effect it by a pair of hind shoes with long spurs or plates before the toes; and of such length, that if the horse offers to trot, the hind-foot beats the fore-foot. But this occasions wounds of the back sinews, which often bring on an incurable lameness.

Some attempt to procure an *amble*, by folding fine, soft lissis strait about his gambrels, in the place where he is gartered

for a stiffle strain; and turn him thus to grafs for two or three weeks, and afterwards take away the list.—This is a Spanish method, but disapproved; for though a horse cannot then trot but with pain, yet the members must be sufferers; and though the *amble* be gained, it must be slow and unlighty; because attended with a cringing in the hind parts.—In effect, *ambling* by the tramel, as practised by us, appears the nearest to nature, and the best and most assured way.

There are divers errors however usually practised in this method: as, that the tramel is often made too long, and so gives no stroke; but makes a horse hackle and shuffle his feet confusedly; or too short, which makes him volt and twitch up his hind feet so suddenly, that by custom it brings him to a firing-halt; from which he will scarce ever be recovered. Sometimes the tramel is misplaced, and to prevent falling put about the knee, and the hind hoof.—In which case, the beast cannot give any true stroke, nor can the fore-leg compel the hind to follow it: or if, to evade this, the tramel be made short and strait, it will press the mainfinew of the hind-leg, and the fleshy part of the fore-thighs; so that the horse cannot go without halting before, and cringing behind. As to the matter of the tramel; some make it all of leather, which is inconvenient; in that it will either stretch or break, and thus confound the certainty of the operation. In a true tramel, the sides-ropes are to be so firm, as not to yield a hair's breadth; the hofe soft; and to lie so close, as not to move from its first place; and the back-band flat, no matter how light, and to descend from the fillet so as not to gall.

When the horse by being trameled on one side, has attained to *amble* perfectly in the hand; it is to be changed to the other side, and that is so to be likewise brought to rule. When, by this changing from one side to another, with a half tramel, the horse will run and *amble* in the hand readily and swiftly, without snappering and stumbling; which is ordinarily done by two or three hours labour; the whole tramel is to be put on, with the broad, flat, back-band, and both sides trameled alike.

AMBLYGON*, or **AMBLYGONIUM**, in geometry, denotes a triangle, one of whose angles is obtuse, or consisting of more than ninety degrees.

* The word is Greek; composed of ἀμβλῆς, obtuse, and γωνία, angle.

AMBLYOPY*, **AMBLYOPIA**, in medicine, a disease of the eyes, otherwise called, *gutta serena*, and *amaurosis*. See *GUTTA Serena*, &c.

* The word comes from ἀμβλῆς, obtusif, dull, and ὁπτις, vision, I see.

AMBO* or **AMBON**, a kind of pulpit or desk, in the ancient churches, where the priests and deacons stood to read or sing part of the service, and preach to the people: called also *Analogium*.

* The term is derived from ἀνίσταμαι, to mount.—The *ambo* was mounted upon two sides; whence some also derive the appellation from the Latin *ambo*, fove.

The *ambo* was ascended by steps; which occasioned that part of the office performed there to be called the *Gradual*.—The gospel was read at the top of the *ambo*; the epistle a step lower.

AMBROSIA*, in the heathen theology, &c. a delicious kind of food, whereon the gods were supposed to feed.

* The word is compounded of the privative particle α, and βροσις, mortal; in regard it rendered those who fed thereon immortal, or because it was the food of the immortals.

Lucian, rallying the poetical gods, tell us, that *ambrosia* and *nectar*, of which one is the meat and the other the drink of the gods, were not so excellent as the poets describe them; since these deities would leave them for blood and fat, which they come to suck from the altars like flies.

AMBROSIAN Rite, or office, denotes a particular office or formula of worship, used in the church of Milan; which is sometimes also called the *Ambrosian church*.

The denomination takes its rise from St. Ambrose, archbishop of Milan in the fourth century, who is usually supposed to have been the author of this office. Yet some are of opinion the church of Milan had an office different from that of the Roman, and other churches of Italy, before the time of that father. In effect, till the time of Charlemagne, each church had its several office: and when in afterwards the pope took on him to impose the Roman office on all the other churches of the west, that of Milan sheltered itself from the imposition, under the name and authority of St. Ambrose; from which time, the phrase *Ambrosian rite* has obtained, in contradistinction to the Roman rite.

We also meet with the *Ambrosian chant*, or song; which was distinguished from the Roman, in that it was stronger and higher.

The public library of Milan, is also called the *Ambrosian library*.

AMBR Y, the place where the arms, plate, vessels, and every thing belonging to house-keeping were formerly kept. Hence, probably the *ambry* at Westminster, was so called because formerly set apart for that use; or rather, from *ambryner*, a house adjoining to an abbey, in which the charities

Vol. I.

were laid up, and distributed to the poor. See *ALMS*, and *ALMONRY*.

AMBULATION, or walking. See the article *EXERCISE*.

AMBULATION, in physic, is used by some for the spreading of a gangrene or mortification.

AMBULATORY*, a term anciently applied to such courts, &c. as were not fixed to any certain place; but held sometimes in one place, and sometimes in another.—In opposition to sedentary courts.

* The word is formed of the Latin *ambulare*, to walk.

The court of parliament was anciently *ambulatory*; so also were the courts of king's bench, &c.

We sometimes also say, in a moral sense, a man's will is *ambulatory*, to the time of his death; meaning, that he has it always in his power to revoke it.

The Poles, even the nobility and court, find no pleasure but in the *ambulatory* or rambling life. *Dalerac*. T. 2. Op. 76. c. 4.—It is in vain men have pretended to fix themselves in cities: the continual desire in the inhabitants to be travelling out of them, this way or that, shews, that the itinerant or scenetic life is the life of nature.

AMBURBIUM*, or **AMBURBIALE Sacrum**, in antiquity, a religious feast, or ceremony, practised among the Romans; wherein they made processions around their city.

* The word is compounded of *ambio*, I go round; or of *amb*, or *ambu*, an ancient preposition, signifying around, and *urbis*, a city.

Scaliger, in his notes on Festus, followed by many others, maintains the *amburbia* to be the same with *ambarvalia*. See *AMBARVALIA*.

Hence, also, we have *amburbiales victimae*, the victims carried along in the procession; and afterwards sacrificed.

AMBUSCADE, **AMBUSH**, **AMBUSHMENT**, a body of men, who lie hid in a wood, &c. in readiness to rush out upon, or inclose an enemy unawares.—Or, the place wherein in such such a corps hide themselves.

AMBUSTIO, in medicine, a burn. See *BURN*, and *BURNING*.

AMEL, or *Enamel*. See the article *ENAMEL*.

AMEN, a church term, used as the conclusion of all solemn prayers, &c. and signifying, *so be it*, or *fiat*.

The Hebrews had four kinds of *amen*. That just mentioned they called *amen past*; which was accompanied with the greatest attention and devotion: in this sense, the word has passed into almost all languages, without any alteration.

Some authors are of opinion, that the word *amen* is formed of the initial letters of these words, *Adonai, Melech, Neeman, Dominus Rex Fidelis*; an usual expression among the Jews, when they would give weight or sanction to any thing they said. In effect, it is known, that to express the words אֲדֹנָי מֶלֶךְ נֶעְמָן *Adonai Melech Neeman*, in the ordinary way of abbreviations; the rabbins only take the initial letters; which, joined together, are really the letters of the word אָמֵן *amen*.

On the other hand, there are some of their cabbalists, who, according to their usual manner of finding a hidden meaning in words, which they call *notaricon*, out of the letters of the word *amen* form the whole phrase, *Adonai, Melech, Neeman*.

Yet it is certain also, that the word *amen* was in the Hebrew tongue before ever there were any such things as cabballa or cabbalists in the world: as appears from Deuteronomy, Chap. XXVII. ver. 15.

The primitive of the word *amen* is the verb *aman*, which, in the passive voice, signifies to be true, faithful, constant, &c.

—Hence came the noun אָמֵן *amen*, which signifies, *truth*. And, lastly, of this noun *amen* they made a kind of affirmative adverb, which, when placed at the end of any phrase or proposition, signifies, *so be it*, *be it true*, *I acquiesce in it*, &c.

Thus, in the passage above cited from Deuteronomy, Moses ordered the Levites to cry aloud to the people, Cursed is he that makes any graven or molten image, &c. and all the people shall say, *Amen*; i. e. yes, may he be cursed, we desire, we agree to it.—But at the beginning of a phrase, as in several passages of the new testament, it signifies truly, verily.

—When it is redoubled, or repeated twice together, as is always done by St. John, it has the effect of a superlative; agreeably to the genius of the Hebrew tongue, and her two daughters, the Chaldee and Syriac.—In this sense we are to understand *amen, amen, dico vobis*. The evangelists usually preserve the Hebrew word *amen*, in their Greek *amen*; though St. Luke sometimes renders it by *ἀμὲν*, *truly*, or *veritas*, certainly.

AMENABLE, or **AMATNABLE**, is applied in our law-books to a woman, who is supposed to be governable by her husband.

AMEND, or **AMENDE**, in the French customs, a mulct, or pecuniary punishment, imposed by a sentence of the judge; for any crime, false prosecution, or groundless appeal.

AMENDE HONORABLE denotes an infamous kind of punishment, used in France, &c. on traitors, paricides, sacrilegious persons, and other heinous criminals.

of confessions in law, that the offender is delivered up to the commiseration of the court, leaving it to his shirt, and put a rope round his neck, and a wax taper in his hand, leads him to the court, where he is to beg pardon of God, the king, the court, and his country. Sometimes the punishment ends here; and sometimes death or the galleys are added.

The phrase *amende honorable*, is also used by way of allusion; where a person is condemned to come into court, or into the presence of some person injured, and make an open recantation, ask pardon, &c.

AMENDMENT, in law, the correction of an error committed in a process, and copied before judgment.

If the error be committed in giving judgment, viz. if a wrong judgment be given; there, they cannot amend it; but the party aggrieved must bring his writ of error.—However, where the fault appears to be in the clerk who writ the record, it may be amended; chiefly if it be in matter of fact, not in a point of law.

AMERCEMENT, or **AMERCIAMENT**, in law, a pecuniary punishment imposed upon offenders, at the discretion of the court; frequently also called *misericordia*.

There is this stated difference between fines and *amercements*; that fines are punishments certain, and determined by some statutes; but *amercements* are arbitrary impositions, proportioned to the fault, and wholly at the mercy of the court.—Manwood, in his *Purvey-Law*, makes another difference; as if an *amercement* were a more easy and merciful penalty, and a fine a more sharp and grievous one.

In the new terms of the law, *amercement* is said to be properly a penalty inflicted by the peers or equals of the party *amerced*, for an offence done; for which he puts himself upon the mercy of the lord.

Amerciament royal is used by some to denote a pecuniary punishment laid upon a sheriff, coroner, or such like officer of the king, by justices, for some offence or abuse in his office.

AMERICAN Ocean. See the article **OCEAN**.

AMERICAN Weights. See the article **WEIGHTS**.

AMETHYST, in natural history, a precious stone, of a violet colour, bordering on purple.

Plutarch says, the *amethyst* takes its name from its colour; which, according to him, resembles that of wine mixed with water; and not from its preventing drunkenness: which, however, was a common opinion, and gave occasion to its being hung about the necks of great drinkers.—Those who ascribe this virtue to the *amethyst*, derive its name from the privative *α*, and *μυθω* to inebriate. See **GEM**.

There are divers sorts of *amethysts*.—The Oriental, which is the hardest, the rarest, and most valuable, and which is of a deep purple colour; the German, which is of a violet colour; and the Spanish, which has the colour of a pansy.

There are some orientals also of a paler colour, and others white, and like the diamond.—There are also beautiful ones found in the Pyreneans, and in the mountains of Auvergne.

Amethysts are dug in a hill named St. Sigmund, two leagues from Vich in Catalonia.—They find the stones by following a vein of reddish or black earth, or a vein in the rock so coloured. They are all hexangular, and pointed like crystal. There are three sorts: the best are the blackest or deepest violet; others are almost quite white; and some few are tinged with yellow. Sometimes there is a great number found sticking together, like the Bristol diamonds; but these are never good: the best are found loose in the chinks of the rock, in a fatty reddish or yellowish earth. They rake out this earth with long narrow knives which enter the chinks, and then crumble it with their fingers to feel for the stones. V. Ray, *Trav.* p. 402.

The occidental *amethyst* is not extremely hard; but may be cut with a leaden wheel, smeared with emery moistened in water.—It is polished on a pewter wheel with tripoli.—It is easily engraven on, either in creux or rilievo. See **SUPPLEMENT**, article **AMETHYST**.

AMETHYST, in heraldry, signifies the purple colour in the coat of a nobleman, which, in gentlemen's escutcheons below that degree, is called *purple*; and in those of sovereign princes, *mercury*.

AMiable Numbers, denote numbers which are mutually equal to the whole sum of each other's aliquot parts.—Such are the numbers 284 and 220. See **NUMBER**.

AMIANTHUS Lapis, in natural history, the same with asbestos. See **ASBESTOS**.

AMICTUS, in our ancient writers, the uppermost of the six garments worn by priests.—It was tied round the neck, *Ne inde ad linguam transiret mendacium*; and covered the breast and heart, *Ne vanitates cogitet*.

AMISS Drawing, see the article **DRAWING**.

AMISSA Lex. See the article **LEX**.

AMITTERE Legem Terræ, a law-phrase, signifying, the forfeiture of the right of swearing in any court or cause; or the becoming infamous. See **LAW**.

This is the punishment of a champion overcome, or yielding in the combat; of jurors found guilty in a writ of attain; and of persons outlawed.

AMMA, or **HAMMA**, a girdle, or truss used in ruptures; to hinder the intestines from bearing down too much.

AMMI, or **Semen AMMEOS**, a kind of aromatic feed, of some use in medicine; the produce of a plant of the same name, called in English *bishops-weed*.

The feed is brought from the Levant; it is found to contain a great deal of essential oil, and volatile salt; and to be attenuating, aperitive, hyfteric, carminative, cephalic, and alexipharmic; being one of the four lesser hot feeds.—It expels wind, provokes the menses, &c.

According to Lemery, the plant takes its name *ammis* from *ampos*, *arena*; its feed being very like grains of sand.

AMMON, or **HAMMON**, in antiquity, an epithet given to Jupiter in Libya; where was a celebrated temple of that deity under the denomination of *Jupiter Ammon*.

There has been a great dispute about the origin of this name. Some derive it from the Greek *ammos*, sand; in regard the temple was situate in the burning sands of Libya; others borrow it from the Egyptian *anam*, a ram; as having been first discovered by that animal.—Others will have *Ammon* to signify the fun; and the horns wherewith he is represented, the fun-beams.

However this be, *Jupiter Ammon* was usually represented under the figure of a ram; though in some medals he appears of a human shape, having only two rams horns growing out beneath his ears.

Cornu AMMONIS, in natural history. See **CORNU AMMONIS**.

AMMONIAC.—*Gum AMMONIAC*; or, as it is sometimes, though improperly, called *ARMONIAC*, is a kind of gum, brought from the East-Indies; and said to ooze from an umbelliferous plant.

Dioscorides says, it is the juice of a kind of ferula growing in Barbary; and that the plant that produces it was called *agayllis*.

Pliny calls the plant whence it flows, *metopion*; and says, the gum takes its name from the temple of *Jupiter Ammon*, nigh which it grows.

It ought to be in dry drops, white within, yellowish without, easily fusible, resinous, somewhat bitter, and of a very sharp taste and smell, somewhat like garlic.

The good *ammoniac* is of a pale colour, and not mixed with any scrapings of wood, stone, or sand; this by the Greeks was called *σφαγεμα*, fragment.—The other, which is full of stones or sand, was called *σφαγμα*, that is, mixture. Some say, this gum served the ancients for incense in their sacrifices.

It enters several medicinal compositions, as an attenuant and detergent, against disorders arising from vicidities, and grumes.—Outwardly applied, it is resolute and suppurative; and, as some say, will of itself draw out splinters, &c.

Some dissolve the gum in vinegar, and other liquors, and call these *lac ammoniac*; much used in asthma, and obstructions of the lungs. It is frequently also given in Pills.

Sal AMMONIAC is also a kind of salt; more usually wrote *ARMONIAC*. See **ARMONIAC**.

AMMUNITION*, in general, signifies all sorts of warlike stores and provisions, more especially powder and ball.

* The word is formed of the Latin *amoniis*, which, according to Du Cange, was used in the corrupt state of that language for *subsistence*.

AMMUNITION Bread, is what is provided for, and distributed daily to, the soldiers of an army or garrison.

Such an officer has so many rations of *ammunition-bread*, &c.

AMNESTY*, or **AMNISTY**, a kind of general pardon, which a prince grants to his subjects, by a treaty, or edict; wherein he declares, that he forgets and annuls all that is past, and promises not to make any farther inquiry into the same.

* The word is Greek, *αμνηστια*, *amnesia*; which was the name of an ancient law of this kind, passed by Thrasybulus upon the expulsion of the thirty tyrants out of Athens.—Andocides, an Athenian orator, whose life is written by Plutarch, and of whom we have an edition, of the year 1575, gives us, in his oration upon *mysteria*, a formula of the *amnesia*, and the oaths taken thereupon.

Amnesties are usually practised upon reconciliations of the sovereign with his people, after rebellions, general defections, &c.—Such, *e. gr.* was the act of oblivion granted at king Charles's restoration.

AMNIOS*, or **AMNION**, in anatomy, the innermost membrane, wherewith the fetus of the womb is immediately invested.

* The word seems to be derived from the Greek *αμν*, a lamb, *q. d. pellis ovina*, lamb-skin.

The *Amnios* is a white, soft, thin, transparent membrane; making part of the secundine, and lying under the chorion.

It contains a limpid liquor, like a thin jelly-broth; with which

which the stomach of the fetus being always found full, it is supposed to be the matter of its nourishment.

On its outside lies the allantois, or urinary membrane. In some subjects, the urinary membrane and chorion stick so close to one another, that they appear to be but one. The *Amnios* hath all its vessels from the same origin as the chorion.

AMOMUM, in the ancient botany, a small and rich aromatic fruit, growing in bunches like grapes, valued highly for its medicinal virtues.

The commentators on Pliny, and Dioscorides, have never been able to agree upon the ancient *amomum*; the generality of them pitch on fruits different from ours.—Some will have the root of Jericho pails for it.—F. Cancelli is positive he has discovered the real *amomum* of Dioscorides, and that it is the Tugus, or Birao, or Caropi, growing in the Philippine islands; the grains or berries whereof, are worn by the natives about their necks; both on account of their agreeable odour, and of their supposed virtue in preserving from infection, curing the sting of the scolopendra, &c. *Phil. Transact.* N° 248. Scaliger is confident, that the *amomum* of the ancients was not a fruit; but the wood it self, which bore some resemblance to a bunch of grapes, and was particularly used in embalming of bodies; and hence, says he, the term *mummy* was given to the bodies of Egyptians, embalmed with it.

The modern *amomum*, used in the shops, under the denomination of *amomum vulgare*, or *amomum officinarum*, appears to be the seed of the *ssion* or *sum* of the ancients, answering to what in English we call *bestard stone-parley*.

The true *amomum* of the ancients resembles the muscat grape; and grows like it, in clusters; it is about the bigness of a large chick-pea, round, membranous, and divided into three cells, which contain several brown, angular grains; of a very strong aromatic taste, and smell, and is of the cardamom kind.

This fruit is brought from the East-Indies; and makes part of the composition of venice-treacle.—It is of a hot, spicy taste, and smell. *Vid. Rauwolf. Trav.* p. 85.

Besides this, there is likewise another paler seed, which bears the name *amomum*; but neither this nor the former are in much use in physic.

AMORTIZATION*, or **AMORTISEMENT**, in law, the act of turning lands into mortmain, *i. e.* of alienating or transferring them to some corporation, guild, or fraternity, and their successors.

* The word is formed of the French *amortir*, to extinguish, put out, &c. See **EXTINGUISHMENT**.

The term is also used for the licence or privilege which the king or superior lord grants, to enable such corporation, &c. thus to receive lands in mortmain: which otherwise they cannot do.—There is always supposed to be some fine, or acknowledgement paid the king, or the lord, in consideration hereof; to make them satisfaction for several incidental dues and profits, which would have fallen to them in the common way; which are hereby cut off.

This practice was borrowed from the ancient *Lex Papiria*, whereby it was forbidden to consecrate any land to religious uses, without the consent of the people.

AMOVING, the act of removing or expelling another from his place, office or the like.—We have a statute for *amoving* papists out of London and Westminster, and ten miles round the same. *1 W. and M. c. 9.*

AMOVING a guardian, amovendo custode. See **CUSTODE**.

AMPELITES, cannal coal, in natural history, a black, bituminous substance that dissolves in oil; used to blacken the eye-brows, and the hair withal: called also *pharmacitis*. See **SUPPLEMENT**, article **AMPELITES**.

AMPHIARTHROSIS*, in anatomy, a neutral or dubious kind of articulation; distinguished from the diarthrosis, in that it has no conspicuous motion; and from the synarthrosis, in its not being without sensible motion.

* The word is derived from *αμφι*, both, and *arthrosis*, articulation; the *amphiarthrosis* being compounded of both the other sorts.—Whence some also call it *diarthrosi-synarthroidalis*.

Of this kind is the articulation of the ribs, with the vertebrae; and that of the carpus with the metacarpus, &c.

AMPHIBIOUS*, in natural history, a term applied to a sort of animals which live both on land and in the water; that is, which breathe the air, but pass part of their time in the water, as affording them their chief food.

* The word comes from the Greek *αμφι*, utrimque, both ways and *βίω*, vita, life; as living in either place.

Such are the frog, castor, otter, tortoise, sea-calf, crocodile, &c.—Most of the *amphibious* kind, the castor and otter excepted, have peculiar provisions in their structure, to fit them for so various a way of living; particularly in the heart, lungs, foramen ovale, &c.

The term **AMPHIBIOUS**, is sometimes also extended to men, who have the faculty of living a long time under water. We have divers instances of such *amphibious* men; the most remarkable is of a Sicilian, named the *fish-colas*. Kircher relates, that by a long habitude from his youth, he had so accustomed himself to live in water, that his nature seemed to

be quite altered: so that he lived rather after the manner of a fish, than a man. The pearl fishers also arrive at a surprising art of this kind. See **PEARL-FISHING**.

AMPHIBIOUS Plants. See the article **PLANTS**.

AMPHIBLESTROIDES*, in anatomy, a tunic, or coat of the eye, more usually called *retina*.

* The word is Greek, *αμφιβλεστροειδης*, compounded of *αμφιβλεστρον*, *rete*, net, and *ειδης*, form; by reason of its net-like texture: whence the Latins also call it *retiformis*.

AMPHIBOLOGY*, or **AMPHIBOLIA**, in grammar, a fault in language, whereby it is rendered obscure, and liable to be understood in a double sense. See **AMBIGUOUS**.

* The word comes from the Greek, *αμφιβολω*, ambiguous, and *λογος*, discourse.

Amphibology is chiefly used in respect of a phrase; as equivocal is in respect of a word.

Of this kind was that answer which Pyrrhus received from the oracle; *Aio Te, Eacida, Romanos vincere posse*: where the *amphibology* consists in this, that the words *Te* and *Romanos*, may either of them precede, or either of them follow the words *posse vincere*, indifferently. See **ORACLE**.

The English language usually speaks in a more natural manner, and is not capable of any *amphibologies* of this kind: nor is it so liable to *amphibologies* in the articles as the French and most other modern tongues.

AMPHIBRACHYS*, the name of a foot in the Latin and Greek poetry; consisting of three syllables, the first and last whereof are short, and that in the middle long.

* The word comes from *αμφι*, circum, and *βραχυς*, brevis, *g. d.* a foot short at both ends, and long in the middle.—Among the ancients it is also called *janius*, and *solius*. *Diom.* iii. p. 479.

Such are the words *amare*, *abire*, *paterius*, *Quare*, &c.

AMPHICTYONS, **AMPHICTYONES**, in antiquity, the deputies of the cities and people of Greece, who represented their respective nations in a general assembly; having a full power to concert, resolve, and appoint what they should think fit, for the service of the common cause.

The *Amphictyones*, in good measure, were the same with the states general of the United Provinces; or rather, with what in Germany they call the diet of the empire.

The first assembly of this kind was held by the direction of *Amphictyon*, the third king of Athens, who proposed by that means to bind the Greeks more firmly together; so as to render them a terror to the barbarous nations their neighbours.—These met twice a year at Thermopylae, in the temple of Ceres, which was built in a large plain, near the river Asopus; and were called *Amphictyons* from the name of the founder.

Pausanias, in his list of the ten nations which composed that assembly, mentions only the Ionians, Dolopians, Theffalians, Epirotians, Magnesian, Melians, Phthians, Dorians, Phocians, and Locrians. He says nothing of the Achaean, Eleian, Argian, Messenian, &c. *Æschines* also gives an account of the cities admitted into it, in his oration, *De falsa Legatione*.

Acrisius afterwards instituted a new council of *Amphictyones*, on the model of the ancient ones; who met twice a year in the temple of Delphos.—Each kind were indifferently called *αμφικτυονες*, *Πελαγονες*, *ἑκατομνηνιονες*, and their assembly *Πύλαια*. The Romans never thought fit to suppress the meeting of the *Amphictyons*.—Strabo even assures us, that they assembled in his time.

AMPHIDROMIA, in antiquity, a feast celebrated the fifth day after the birth of a child.

AMPHIMACER*, a foot in the ancient poetry, consisting of three syllables; the first and last whereof are long, and that in the middle short. See **FOOT**, &c.

* The word comes from the Greek *αμφι*, circum, and *μακρος*, longus, by reason both extremes are long.

Such are the words *omnium*, *castitas*, *γαρμμου*, &c.—This foot is also called *creticus*, and sometimes *sefermius*. *Diom.* iii. p. 475. *Quintil.* l. 9. c. 4.

AMPHIPOLES, in antiquity, archons, or chief magistrates of the city of Syracuse. See **ARCHON**.

They were first established by Timoleon, after his expulsion of Dionysius the tyrant.—They governed Syracuse for the space of three hundred years; and Diodorus Siculus assures us, they subsisted even in his time.

AMPHIPROSTYLE*, in the ancient architecture, a kind of temple, which had four columns in front, and as many behind.

* The word is derived from the Greek *αμφι*, about, *προ*, before, and *στυλος*, column.

AMPHISCII*, in geography and astronomy, the people who inhabit the torrid zone.

* The word comes from *αμφι*, about, and *σκια*, shadow.

They are thus denominated, as having their shadow turned sometimes one way and sometimes another, *i. e.* at one time of the year to the north, and at another to the south. See **SHADOW**.

The *amphiclii* are called also *afcii*. See ASCII.
AMPHISMILA*, or **AMPHISMELA**, an anatomical knife, edged on both sides.

* The word is formed from *αμφι*, *utrinque*, on both sides, and *σμίλη*, knife.

AMPHITHEATRE*, a spacious building, of an oval figure, having its area or arena inclosed with several rows of seats, rising gradually one over another; with portico's both within and without side.

* The word is derived from the Greek *αμφι*, about; and *θεατρον*, theatre; which comes from *θεαομαι*, *specio*, *contemplan*; so that an *amphitheatre*, strictly speaking, is a place whence a person may see all around him.

Among the ancients, the *amphitheatre* was appointed for the exhibiting of spectacles or shews to the people: as, the combats of gladiators, and those of wild beasts.

Their theatre was built in form of a semicircle, only exceeding a just semicircle by one fourth part of the diameter; and the *amphitheatre* was nothing else but a double theatre, or two theatres joined together: so that the longest diameter of the *amphitheatre* was to the shortest, as $1\frac{1}{2}$ to 1. See THEATRE.

There are *amphitheatres* still standing at Rome, at Pola (1), at Nîmes, &c.—The *amphitheatre* of Vespasian, called the *Coliseum*, and that at Verona in Italy, are the most celebrated now remaining of all antiquity (2). See COLISEUM.
 —Remains of *amphitheatres* are shewn also at Arles, Bourdeaux, &c.

(1) The *amphitheatre* at Pola, an ancient republic of Illyria, is very entire, it consists of two orders of Tuscan pillars, one over the other.—The lower have pedestals, which is extraordinary; this order having scarce ever more than bases to support them. *Vernus, in Ray's Travels*, t. 2. p. 355.

(2) The *amphitheatre* of Titus is computed to have been capable of holding 85,000 spectators.—That of Verona is the best preserved: for, though most of the great and best stones of the outside are picked out; yet the great vault, on which the rows of the seats are laid, is entire: the rows also (which are 44 in number) are entire. Every row is a foot and a half high, and as much in breadth; so that a man fits conveniently in them: and allowing, for a seat, a foot and a half, the whole will hold 23,000 persons.

Pliny mentions an *amphitheatre* built by Curio, which turned on large iron pivots; so that of the same *amphitheatre* two several theatres were occasionally made, whereon different entertainments were sometimes presented at the same time.

AMPHORA, in antiquity, an earthen vessel, which served as a kind of liquid measure, among the ancient Greeks and Romans.*

* It is called in Homer *Αμφιφορεύς*, and by syncope *Αμφορεύς*, on account of its two anse or handles for carriage.—It is the same with the *quadrantal*.

The *amphora* was the twentieth part of the culeus, and contained forty-eight sextaries; amounting to about seven gallons one pint English wine-measure. *Arbuth.*
 Suetonius tells us of a man who stood for the questorship, and who drank an *amphora* of wine at one meal, with the emperor Tiberius.

AMPHORA was sometimes also used as a dry measure, containing three bushels; the standard whereof was kept at Rome in the capitol, to prevent false measures.

AMPHORA is also used to denote the largest liquid measure in use among the Venetians. The *amphora* contains four bigots, seventy-six mustachi, or two boats or muids.

AMPLIFICATION, in rhetoric, part of a discourse or speech, wherein a crime is aggravated, a praise or commendation heightened, or a narration enlarged by an enumeration of circumstances; so as to excite the proper emotions in the souls of the auditors.

Such is that passage in Virgil, where, instead of saying merely that Turnus died, he *amplifies* his death.

—*At illi solvantur frigore membra,
 Vitaque cum gemitu fugit indignata sub umbras.*

Amplification, according to Cicero, is a vehement argumentation; a forcible affirmation, that persuades by moving the passions.

Some authors define *amplification*, after Isocrates, to be a discourse which makes great things of little; or which raises and exaggerates little things so as to make them appear great.—But, in this sense, *amplification* should rather become a sophist or juggler, than an orator.

The masters of eloquence make *amplification* to be the soul of discourse.—Longinus speaks of it as one of the principal means which contribute to the sublime; but he censures those who define it a discourse which magnifies things; this equally agreeing to the sublime, the pathetic, &c.—The same author distinguishes *amplification* from the sublime by this, that the latter consists wholly in the elevation of words and sentiments, whereas the former consists also in their multitude: the sublime is sometimes found in a single thought; but *amplification* cannot subsist, excepting in abundance.

There is likewise a difference between the *amplification*, and the proof; in that the one serves to clear the point, and the other to heighten, and exaggerate it.

There are two general kinds of *amplification*; the one of things, the other of words.—The first is produced in divers manners; as, 1^o, By a multitude of definitions: thus it is Cicero *amplifies* on history: *Historia est testis temporum, lux veritatis, vita memoria, magistra vite, nuntia vetustatis.*—2^o, By a multitude of adjuncts; of which we have a fine instance in Virgil's lamentation for Cæsar's death, by enumerating the many prodigies and monsters that either preceded or succeeded it.—*Pax quoque per lucos vulgo exaudita flentes, ingens & simulacra modis pallentia miris visa sub obscurum noctis; pædusque locustæ, infandum, sistunt amnes, terræque debiscunt, & mæstem illachrymat templis æbur, æraque sudant.*—3^o, By a detail of causes and effects.—4^o, By an enumeration of consequences.—5^o, By comparisons, similitudes, and examples. See COMPARISON, &c.—6^o, By the contrast of antithesis, and by rational inference.

Amplification by words is effected six ways.—1^o, By using metaphors.—2^o, By hyperboles.—3^o, By synonyms.—4^o, By splendid and magnificent terms; as that of Horace; *scandit æratas vitiosa naues, cura nec turnas equitum relinquit, ocyor cervos, & agente nimbo, ocyor curæ.*—5^o, By periphrases, or circumlocutions.—6^o, By repetition.—To which may be added, by gradation.

AMPLITUDE of the range of a projectile, denotes the horizontal line subtending the path in which it moved: See PROJECTILE.

AMPLITUDE, in astronomy, an arch of the horizon, intercepted between the true east or west point thereof, and the centre of the sun, or a star at its rising or setting.

Amplitude is of two kinds; *eastern*, or *ortive*; and *western*, or *occiduous*.

Eastern, or *rising* **AMPLITUDE**, *amplitudo ortiva*, is the distance between the point wherein the star rises, and the true point of east, wherein the equator and horizon intersect.

Western, or *setting* **AMPLITUDE**, *amplitudo occidua*, is the distance between the point wherein the star sets, and the true point of west in the equinoctial.

The eastern and western *amplitude* are also called *northern* and *southern*, as they fall in the northern or southern quarters of the horizon.

The complement of the eastern or western *amplitude* to a quadrant, is called the *azimuth*.

To find the sun's or a star's *amplitude*, either rising or setting, by the globe. See GLOBE.

To find the sun's *amplitude*, trigonometrically; having the latitude, and the sun's declination given.—Say, As the cosine of the latitude is to radius, so is the sine of the present declination to the sine of the *amplitude*.—Suppose, *e. gr.* the latitude $15^{\circ} 30'$, and the common $11^{\circ} 50'$;

Sine comp.	74.30	57.310
Sine of declin.	11.50	9.31184
		9.88494

amplitude required $50^{\circ} 7'$.

Magnetical AMPLITUDE is an arch of the horizon, contained between the sun, at its rising, and the east or west point of the compass; or, it is the difference of the rising or setting of the sun, from the east or west points of the compass.

It is found by observing the sun, at its rising or setting, by an azimuth compass. If the compass has no variation, the *magnetical amplitude* would be the same as the true one.

AMPUTATION, in surgery, the operation of cutting off a limb, or other part of the body, with an instrument of steel.

In cases of mortification, recourse is frequently had to *amputation*.

The usual method of performing it, in the instance of a leg, is as follows.—The proper part for the operation being four or five inches below the knee; the skin and flesh are first to be drawn very tight upwards, and secured from returning by a ligature two or three fingers broad: above this ligature another loose one is passed, for the gripe; which, being twisted by means of a stick, may be strained to any degree at pleasure.

Then, the patient being conveniently situated, and the operator placed to the inside of the limb; which is to be held by one assistant above, and another below the part designed for the operation; and the gripe being sufficiently twisted, to prevent too large an hæmorrhage, the flesh is, with a stroke or two, to be separated from the bone with the dismembering-knife. Then the periosteum being also divided from the bone with the back of the knife, saw the bone asunder with as few strokes as possible.—When two parallel bones are concerned, the flesh that grows between them must likewise be separated before the use of the saw.

This being done, the gripe may be slacken'd; to give an opportunity for searching for the large blood-vessels, and securing the hæmorrhage at their mouths, either by the actual cautery, the ligature, stitching them up, applying virginal buttons, or the like. After this a dry pledget of lint—or one dipped in spirit of wine, and sprinkled with diaphent, may be

be applied to the stump. Then loosen the first ligature, and pull both the skin and flesh, as far as conveniently may be, over the stump, to cover it; and secure them with the cross-stitch, made at the depth of half, or three quarters of an inch in the skin.

It remains, to apply over the whole stump two large pledgets, dipped in oxybate and dried, and afterwards charged with astringents; and over these to apply a plaster of the deminio, or simple diachylon; and over all these, an ox-bladder, wetted in oxybate; and finally, over all, a cross-cloth pretty tight, secured with rollers.

After all this, the grips may be slackened, so as to be made easy to the patient; or even entirely taken away, after he is put to bed; in which he must lie with the stump somewhat raised; an assistant for twelve or fourteen hours keeping fast the dressing with his hand, to prevent any violent hæmorrhage.—In three or four days the dressing may be removed; and proper digestives, mixed with astringents, applied: having an actual cautery, or some powerful styptic, in readiness, in case of a violent hæmorrhage at the first opening. M. Sabourin, surgeon of Geneva, is recorded in the history of the royal academy of sciences, an. 1702, for an improvement in the method of amputation, proposed to that academy.—The whole secret consists in saving a piece of flesh and skin, a little lower than the place where the section is to be; wherewith the stump is to be afterwards covered.—The advantages hereof, are, that in less than two days time, this flesh unites with the extremes of the divided vessels, and so saves the necessity either of binding the ends of those vessels with thread, or of applying caustics or astringents; which are methods very dangerous, or at least very inconvenient. Add, that the bone thus covered up, does not exfoliate.

AMSDORFIANS, in church-history, a sect of Protestants, in the sixteenth century; so denominated from their leader *Amsdorf*.

Saunders, *Her.* 186. represents them as maintaining, that good works were not only unprofitable, but even opposite and pernicious to salvation.—The *Amsdorfians* were rigid confessionists.

AMULET*, **AMULETUM**, a kind of external medication, to be worn about the neck, or other part of the body; to prevent, or remove diseases.

* The word *amulet* is formed of the Latin *amuletum*, *amulmentum*; of *amuliri*, to remove, drive away.

Such are quills of quick-silver, or arsenic, which some hang on the neck, or wear under the shirt against the plague, and other contagious diseases; as also the blood-stones worn by others against hæmorrhages; and that worn by the women of the East-Indies to bring the menses.

Amulets are also frequently no other than a sort of spells, or charms; consisting of quaint words and characters, supposed to have the virtue of warding off ill.—Pliny makes frequent mention of them.

The Greeks called these kind of remedies *φουλαδρια*, phylacteries; *παραματια*, periaptæ; *αποταξια*, paramatias, *σφραγια*, and *σφραγισματα*.—The Latins call them *amuleta*, *appenfa*, *pentacula*, &c.

The council of Laodicea forbids ecclesiastics to wear such *amulets* and phylacteries, on pain of degradation. St. Chrysostom and St. Jerom are likewise zealous against the same practice. *Hoc apud nos*, says this last father, *superstitiosæ mulierculæ, in parvulis Evangelis & in crucis ligno & ipsiusmodi rebus quæ habent quidem xelum Dei sed non juxta scientiam, aque hodie fastidant*. See Kirch. *Oedip. Egypt.*

Amulets are now much fallen from the repute they were anciently in; yet the great Mr. Boyle alleges them as an instance of the ingress of external effluvia into the habit; in order to shew the great porosity of the human body.—He adds, that he is persuaded some of these external medicines do answer; for that he himself having once been subject to bleed at the nose, and reduced to use several remedies to check it, found the mors of a dead man's skull, though only applied so as to touch the skin till the mors was warm thereby, the most effectual of any.

A memorable thing of this kind was communicated to Zwelfer, by the chief physician to the states of Moravia, who having prepared some troches of toads after Helmont's manner, not only found that being worn as *amulets* they preserved him and his domestics and friends from the plague; but being put on the plague-fors of others, they were greatly relieved, and even saved thereby.

The same Mr. Boyle shews how the effluvia even of cold *amulets*, may in tract of time pervade the pores of a living animal; by supposing an agreement between the pores of the skin, and the figure of the corpuscles. Bellini has demonstrated the possibility of the thing in his last propositions, *de Febribus*: and the like is done by Dr. Wainwright. Dr. Keil, &c.

AMULET, in cookery. See the article **OMELET**.

AMURCA, in pharmacy, a medicine made of the refuse or recement of expressed olives.—It is an astringent. See **OLIVE**.

VOL. I.

AMY*, in law, the person next of kin to an orphan, or infant; who is to be intrusted for him: properly called *prochein amy*. See **PROCHÉIN**, &c.

* The word is French, and literally signifies *Friend*.

AMYGDALÆ. See the article **ALMOND**.

AMYGDALATE, an artificial milk, or emulsion, made of blanched almonds, &c.

AMYLUM. See the article **STARCH**.

AMYNTICA emplastrum, in pharmacy, defensive, or strengthening plasters.

ANA, *an*, in medicine, denotes an equal quantity of any things, whether in liquid or dry measure.

Hence *anatica proportio* is used by some writers to signify the ratio, or proportion of equality.

ANA, in matters of literature, a Latin termination, adopted into the titles of several books in other languages.—*Anas* or *books in ana*, are collections of the memorable sayings of persons of learning, and wit; much the same with what we otherwise call *table-talk*.

Wolffius has given the history of books in *ana*, in the preface to the *Casauboniana*: he there observes, that though such titles be new, the thing it self is very old; that Xenophon's books of the deeds and sayings of Socrates, as well as the dialogues of Plato, are *Socratiana*: that the apothegms of the philosophers, collected by Diogenes Laertius; the sentences of Pythagoras, and those of Epictetus; the works of Athenæus, Stobæus, and divers others, are so many *ana's*. Even the *Gemara* of the Jews, with several other oriental writings, according to Wolffius, properly belong to the same class. To this head of *ana* may likewise be referred the *Orphica*, the *Pythagoræa*, *Æsopica*, *Pyrrhonica*, &c.

The *Scaligerana* was the first piece that appeared with a title in *ana*. It was composed by Jan de Vassan, a young Champagnois, recommended to Jos. Scaliger by Casaubon. Being much with Scaliger, who was daily visited by the men of learning at Leyden, de Vassan wrote down whatever things of any moment he heard Scaliger say.—And thus arose the *Scaligerana*, which was not printed till many years after at Geneva in 1666. *Patin. Lett.* 431.—Soon after came the *Perroniana*, *Thuana*, *Naudæana*, *Patriniana*, *Sorberiana*, *Ménagiana*, *Anti-ménagiana*, *Furteriana*, *Chevræana*, *Leibnitiana*, &c. to *Arlequiniana*.

ANABAPTISTON. See the article **ABAPTISTON**.

ANABAPTISTS*, a religious sect, whose distinguishing tenet is, that children are not to be baptized, till they arrive at years of discretion; as holding it requisite, that they give a reason of their faith, before they can receive a regular baptism.

* The word is compounded of *ana*, *denu*, again; and *baptizo*, I baptize; or *bawto*, I wash; it being their practice to re-baptize such as had been baptized in their infancy.

There were *Anabaptists* even in the primitive church; that is, there were heretics who baptized a second time: such were the Novatians, Cataphrygians, and Donatists.

There were also in the third century several catholic bishops in Asia and Africa, who held the baptism of heretics invalid; and therefore re-baptized such as were converted to orthodoxy.—But these ancient re-baptists were not called *Anabaptists*.

In the twelfth century, the Waldenses, Albigenses, and Petrobrussians, are also recorded as of the same belief; but neither was this denomination given them.

Those properly called *Anabaptists*, are a sect of Protestants, who first appeared in the sixteenth century, in some provinces of Germany, particularly in Westphalia, where they committed several outrages.—They taught, that baptism was not to be conferred on children; that it is unlawful to swear, or to bear arms; that a true christian cannot be a magistrate, &c.

It is not known who was the author of this sect: some charge it on Carlstadt; others on Zuinglius. Cochleæus says it was Balthazar Pacimontanus, who began to teach in 1527; and was burnt, at Vienna some time afterwards.—Mezorius affirms it was first broached by Pelargus, in 1522; who was seconded by Stubner, Bodenstein, Carlstadt, Westenberg, Quicou, Didymus, More, &c.

But the common opinion fathers it on Thomas Munster, or rather Munzer, of Zwickau, a city of Misnia; and Nich. Storck or Pelargus, of Stalberg in Saxony; two persons originally disciples of Luther, from whom they took occasion to separate, on pretence that his doctrine was not perfect enough; that he had only carried the reformation half-way; and that, to arrive at the true essential religion of Christ, immediate revelation must be added to the dead letter of scripture: *ex revelationibus divinis judicandum esse dicebat*, & *ex bibliis*, Muncerus.—In effect, if these two persons were not the first inventors of the doctrine; they appear, at least, to have been the first teachers, and propagators thereof.

Sleidan furnishes the best account of the origin of the *Anabaptists*, in his *Historical Commentaries*.—Luther, he observes, had preached up so strenuously for the evangelical liberty, that the peasants of Suabia flocking together, leagued themselves

against the ecclesiastical powers, on pretence of defending the evangelical doctrine, and shaking off the yoke of servitude: *obducta causa quasi evangelii doctrinam tuere, & servitutem ab se prostigare vellent.* Luther wrote them several exhortations to lay down their arms, but in vain: they retorted his own doctrine upon him: maintaining, that having been made free by the blood of Jesus Christ, it was injurious to the name of Christian, that they had hitherto been reputed servants: *quod hac usque sint habiti velut conditione servi.* Accordingly they proclaimed every where, that they only took up arms, by reason they esteemed themselves obliged thereto by the commandment of God.

Luther finding all his exhortations ineffectual, published a book, wherein he invited all the world to take up arms against those fanatics, who thus abused the word of God.—He was obliged to write a second, soon after, to justify his conduct; which to many appeared too severe, and even cruel.

The *Anabaptists*, however, to the number of forty thousand, ravaged all the places wherever they came. John of Leyden, who headed them, declared himself their king; and never stirred out or appeared in public, without a large retinue of principal officers: two young men always rode immediately after him, the one bearing in his hand a crown, and the other a naked sword.—Their pretence was to establish the new reign of Jesus Christ on earth, by force of arms; condemning all use of arms for other purposes.

Calvin wrote a treatise against the *Anabaptists*, still extant in his *Opuscula*.—What they chiefly supported their great doctrine on, was those words of our Saviour, *He that believes and is baptized, shall be saved*, Mark c. xvi. v. 16. As none but adults are capable of believing, they argued, that no others were capable of baptism: especially as there is no passage in all the New Testament, where the baptism of infants is clearly enjoined. Calvin and other writers against them are pretty much embarrassed to answer this argument; and are obliged to have recourse to tradition, and the practice of the primitive church. In this point they have apparently the advantage over them; mention being made of infant-baptism by Origen; the author of the questions attributed to Justin; a council held in Africa, spoke of by St. Cyprian, where the baptism of infants, immediately after they were born, was expressly enjoined; and several other councils, of Autun, of Mafon, of Giron, of London, of Vienna, &c. besides other fathers, as Irenæus, Jerom, Ambrose, Augustin, &c.

It must be added, that very considerable arguments may be drawn against the *Anabaptists* even from scripture: children, we are told, are capable of the kingdom of heaven; Mark x. 14; Luke xviii. 16. and our Saviour made such be brought near him, and blessed them. Yet, he assures us in St. John iii. 5. that unless a man be baptized he cannot enter the kingdom of God. Whence it follows, that children, inasmuch as they are capable of entering into heaven, are also capable of being baptized.—The *Anabaptists* answer, that those here spoken of by our Saviour were grown big, since they could come to him; and consequently were capable of an act of faith; but this is contrary to the express terms of scripture, which in St. Matthew and St. Mark, calls them *maïda*; and in St. Luke, *βρέφ.* little children: The same St. Luke writes, that they were brought to Jesus; which is a presumption that they were not yet able to walk.

Another argument much insisted on is drawn from those words of St. Paul to the Romans, c. V. v. 17. “If by one man’s offence death reigned; much more they who receive abundance of grace and of the gift of righteousness, shall reign in life by one, Jesus Christ.” For, if all become criminal by one; then are children criminal: consequently, if all are justified by one, then are children justified: but this cannot be without faith; and consequently children may have the faith required for the receiving of baptism, i. e. an actual faith, preceding the sacrament, as a disposition requisite thereto. This faith they have, not of themselves, but by others, viz. their parents, or their god-fathers or godmothers, who answer for them. Nor is there any thing in the whole dispensation, but what is very equitable: it being but just, that as they had sinned in the will of another, they might also be justified by the will of another.

The *Anabaptists* adopted several other dogmata from the Gnostics, &c. touching the incarnation, &c. But those who now retain the name have abandoned the greatest part thereof; and, in lieu of the fanatic zeal of the ancient founders of the sect, have given into an exemplary simplicity in their actions, discipline, dress, &c. not much unlike the modern Quakers.

As they multiplied, they divided into a great number of sects; which took particular denominations, either from the leaders thereof or the peculiar opinions which they superadded to the general system of *Anabaptism*.—The principal were the Muncerians, Catharists, Enthusiasts, Siëntes, Adamites, Georgians, Independants, Hurites, Melchiorites, Nudipedians, Nihilites, Bulchidians, Augustinians, Servenians, Molitorians, Libertines, Deceitfuls, Semperparantes, Po-

lygamites, Ambrosians, Clancularians, Manifestarians, Bularians, Pacifators, Pastoricides, Sanguinari, &c.

ANABASII*, in antiquity, the couriers who travelled on horseback, or in chariots, for the greater expedition. See **COURIER** and **POST**.

* The word comes from Greek *αναβασις*, *adventus*, mounting.

ANABASIS*, *Αναβασις*, is a Greek word, signifying ascension.

ANABASIS, in medicine, the state of a disease in its growth.

* *Αναβασις* is derived from *αναβαινω*, to ascend.

ANABIBAZON, in astronomy, the *Dragon’s Tail*; or the southern node of the moon, where she passes the ecliptic from north to south latitude.

ANABROSIS*, in medicine, otherwise called *diabrosis*, the issuing of blood at a hole worn in a vein by corrosion.

* The word is Greek, *αναβροσις*, g. d. *εβροβη*.

ANACALYPTERIA*, *Ανακαλυπτήρια*, in antiquity, feasts celebrated among the heathens, on the day that the bride was permitted to lay aside her veil, and to be seen in public.

* They were thus called from the Greek, *ανακαλυψις*, to discover, uncover.

ANACAMPTIC, signifies as much as *reflecting*; and is frequently used in reference to echoes, which are said to be sounds produced *anacamptonically*, or by reflection.

Hence also *anacamptonics* is by some used for the science of reflected rays; otherwise called *catoptrics*.

ANACARDINA Confessio. See the article **CONFESSION**.

ANACATHARTIC*, is usually understood of a vomit or a purging medicine, that works upwards.

* The word comes from *ανα*, *supra*, upwards; and *καθαίρω*, *purgo*, I purge.

ANACEPHALÆOSIS*, in rhetoric, a recapitulation; or a short and summary repetition of the heads of a discourse.

* The word comes from the Greek *ανα*, which in composition signifies *again*, and *κεφαλη*, *head*.

ANACHORET*, **ANACHORETA**, a hermit, or devout person, living alone in some desert; to be further out of the reach of the temptations of the world, and more at leisure for meditation.

* The word comes from the Greek *αναχωρεω*, I retire into a bye-place.

Such were St. Anthony, St. Hilarion, &c. Paul the hermit was the first of the tribe of *anachorets*.

Anachorets, popularly *anachorets*, are very numerous among the Greeks; consisting principally of monks, who not caring for the fatigues and offices of the monastery, purchase a little spot of ground, with a cell, whither they retreat, and never appear in the monastery again, excepting on solemn days. These are sometimes also called *ascetes*, and *solitaries*. See **ASCETIC**, &c.

The *anachorets* of Syria and Palestine retire into the most obscure and unfrequented places; hiding themselves under rocks and mountains, and living on the spontaneous productions of the earth.

There have also been *anachorets* in the west: Peter Damian, who was of the order of hermits, frequently speaks of them with great praise. He represents them as by far the most perfect sort of monks; holding them in much higher opinion and veneration than the Cœnobites, or monks residing in monasteries.

Many of these retire, with the leave of their abbots, and have an allowance from the monastery.—The people, in regard of their piety, present them with good sums of money, which they carefully hoard up, and at their death, bequeath it to the monastery they had belonged to.

ANACHRONISM*, in matters of chronology, an error in computation of time; whereby an event is placed earlier than it really happened.

* The word is compounded of the Greek *ανα* *sursum*, *supra*, *retrosum*, higher, backwards; and *χρονος*, *tempus*, time.

Such is that of Virgil, who placed Dido in Africa at the time of Æneas; though in reality, she did not come there till 300 years after the taking of Troy.—An error on the other side, whereby a fact is placed later and lower than it should be, is called a *parachronism*.

ANACLATICS, that part of optics which considers refracted light.

Anaclatics are the same with what we more usually call *dioptrics*.

ANACLETERIA*, in antiquity, solemn feasts celebrated in honour of kings and princes, when they came of age: and took upon them the administration of their state, and made a solemn declaration thereof to the people.

* The word is for *ανακλησις*, and *ελευσις*, *adventus*, *adventus*.

ANACREONTIC, in the Greek and Latin poetry, something invented by Anacreon; or in the manner and taste of Anacreon.

Anacreon, a poet of Teios, who lived upwards of 400 years before Christ, was famous for the delicacy of his wit; and

the exquisite, yet easy and natural, turn of his poetry.—We have several of his odes still extant; and few of the modern poets but have written *anacreontics* in imitation thereof. They are most of them composed in verses of seven syllables; or rather, of three feet and an half, spondee and iambus, though sometimes anapaests.

Hence, verses in that measure are usually called *anacreontics*, or *anacreontic verses*.

ANADIPLOSIS, *Ἀναδιπλωσις*, denotes a repetition of the last word of the former verse or member in the beginning of the next: *e. gr.*

*Addit se sociam timidisque supervenit Ægle,
Ægle Naiadum pulcherrima—
—sequitur pulcherrimus after,
—After equo fidens—*

If children then heirs, heirs of God and joint heirs with Christ.

ANADIPLOSIS, in medicine, denotes the redoubling or return of the paroxysm of a fever, chiefly of a semitertian.

This is otherwise called *epanalepsis*, and *epanadiplosis*.

ANAGLYPHICE*, or **ANAGLYPTICE**, denotes that species of sculpture wherein the strokes or figures are prominent or embossed.

* The word comes from the Greek *αναγλυφω*, *exsulpo*.

ANAGOGICAL*, *Transporting*, something that raises the mind to things eternal, and divine; the great objects of the next life.

* The word is derived from the Greek *αναγωγη*, *ravisio*, *carrying away, overturning*; which is formed of the preposition *ana*, *sursum*, upwards, and *αγωγη*, *leading*; of *αγω*, *duco*.

The term is principally used in speaking of the divers senses of scripture.—The literal sense is the first, and natural sense: the mystical sense is founded on the natural sense, from whence it is taken by analogy or comparison, by similitude of resemblance of one thing to another; and is divided into several kinds.

Where it regards the church, and matters of religion, it is called the *allegorical* sense.

Where it regards our morals, it is called the *tropological* sense.

And where it regards eternity, or the life to come, it is called the *anagogical* sense.

ANAGOGY, **ANAGOGE**, a rapture, or elevation of the soul, to things celestial, and eternal.

ANAGRAM*, **ANAGRAMMA**, a transposal of the letters of a name; with a combination thereof in some new manner, so as to exhibit one or more words, either to the advantage, or disadvantage of the person to whom it belongs.

* The word is formed from the Greek *ανα*, *backwards*, and *γραμμα*, *letter*.

Thus, the *anagram* of Galenus is *angelus*; that of Logica, *caligo*; that of Alstedius, *sedulitas*; that of Sir Edmund-Bury Godfrey, *I find murdered by rogues*, or by Rome's rude finger die; that of Loraine, is *alerion*; on which account it was, that the family of Loraine took alerions for their armoury.—Calvin, in the title of his *Institutiones*, printed at Strasburg in 1539, calls himself *Alcuinus*, which is the *anagram* of Calvinus, and the name of an eminently learned person in the time of Charlemagne, who contributed greatly to the restoration of learning in that age. Barclay, in his *Argenis*, *anagrammatizes* Calvinus by a less creditable name, *Ufuscula*; and Rabelais, to be revenged of the fame Calvin, who had made an *anagram* of his name, found in that of Calvin, *Jan. Cal.* Such as keep close to the definition of *anagram*, take the liberty to omit or retain the letter H, and that letter only; but such as stand up for the poetical licence, make bold sometimes to use E for Æ, V for W, S for Z, and C for K; and *vice versa*.

This way of writing was scarce known among the ancients: Daurat, a French poet in the reign of Charles IX. is usually said to be the first that broached it: yet Lycophron, who wrote under Ptolemy Philadelphus, about 280 years before Christ, appears to have been no stranger to the art of making *anagrams*. Canterus, in his *Prolegomena* to Lycophron, gives us two of his pieces in this kind; the first on the name of king Ptolemy, *Πτολεμαϊκος*, in which he found *απο μιλτος*, *of honey*; to insinuate the sweetness and mildness of that prince; the second was on queen Arsinoe, *Ἀρσινω*, of whom he made *ἰο ἡλας*, *June's violet*.

The Cabalists among the Jews are professed *anagrammists*; the third part of their art, which they call *temura*, *i. e.* changing, being nothing but the art of making *anagrams*, or of finding hidden and mystical meanings in names: which they do by changing, transposing, and differently combining the letters of those names.—Thus, of *אב* the letters of Noah's name, they make *אב* *grace*; and of *אשר* the *Assyrian*, they make *אשר* *he shall rejoice*.

There are two manners of making *anagrams*; for, 1^o, some only consist in dividing a single word into several: Thus the enigmas of the god Terminus, mentioned by Aulus Gellius, lib. XII. c. 6. is founded on the *anagram* TER MINUS; and thus Suetonius yields *su* *tinea* *mus*.—This kind alone seems to have been used among the Romans.

The second, is where the order and situation of the letters is changed: such are those above mentioned; and also these, *Roma, Mare, Amor; Julius, Livius; Corpus, Porcus, Proculus, Spurio*.

To find all the *ANAGRAMS* any name will admit of algebraically, see the articles *CHANGES* and *COMBINATION*.

The finest and happiest of all the *anagrams* extant, is that on the question put by Pilate to Jesus Christ; *Quid est veritas?* which *anagrammatically* make, *Est vir qui adest*: the *anagram*, here, is the best, and justest answer that could possibly be given.

Besides the ancient kind of *anagram*, there have been new ones invented; as, the mathematical *anagram*, invented in 1680; by which the abbot Cotelan found, that the letters of the name of Lewis XIV. made *vrai héros*, *i. e.* *true hero*.

We are now likewise furnished with the numerical *anagram* more properly called *chronogram*; where the numeral letters (*i. e.* such as in the Roman ciphering stood for numbers) taken together, according to their numerical values, express some epocha: of which kind is that dithich of Godart on the birth of the late French king, in the year 1638, on a day wherein there was a conjunction of the eagle with the lion's heart:

*eXortens DeLphIn agVILæ CorDIsqVe LeonIs
CongressV gæLLes speLæstIsaqVe refect.*

ANALECTA*, a Greek term, used for a collection of small pieces or compositions.

* The word is formed of *αναλεγω*, *I gather*.

ANALEMMA*, a planisphere, or projection of the sphere, on the plane of the meridian, orthographically made, by straight lines and ellipses; the eye being supposed to be at an infinite distance, and in the east or west points of the horizon.

* The word is derived from the Greek *αναλεμμα* of *αναλαμβάνω*, *resumo*, *I take backwards*.

ANALEMMA, is also used for a gnomon, or astrolabe, consisting of the furniture of the same projection, drawn on a plate of brass, or wood; with an horizon, or cursor fitted to it.

Its use is for finding the time of the sun's rising and setting, the length of the longest day in any latitude, and the hour of the day.

The *analemma* is also of considerable use among diallists, for laying down the signs of the zodiac, with the length of days, and other matters of furniture, upon dials.

ANALEPTICS*, in medicine, restoratives; or remedies proper to restore the body, when wasted or emaciated, either by the continuance of a disease, or by the want of food.

* The word is Greek, *αναλεπτικός*, derived of *αναλαμβάνω*, *I re-establish*, *restore*.

ANALOGICAL Syllogism. See the article *SYLLOGISM*.

ANALOGY*, a certain relation, proportion, or agreement, which several things, in other respects different, bear to each other.—Such is that between the bull in the heavens, and the animal so called on earth.

* The word is Greek, *αναλογία*; which the Latins usually render by *comparatio*, and *proportionalitas*.

Among geometricians, *analogy* is frequently used for a similitude of ratio's; called also *proportion*.

Reasonings by *analogy* may serve to explain and illustrate, but not to prove any thing; yet is a great deal of our philosophizing no better founded.

In matters of language, we say, new words are formed by *analogy*, *i. e.* new names are given to new things, conformably to the established names of other things of the like nature and kind.—The difficulties and obscurities in a language are chiefly to be cleared up by *analogy*.

The schoolmen define *analogy* to be a resemblance, joined with some diversity: its foundation, according to them, is laid in the proportion of several things, considered as that proportion proceeds upon different considerations.

Thus, a found animal, a found food, and a found proposition, agreeing in this, that they have a common denomination, but the reason of quality whereon the denomination is founded, different; are said to have an *analogy*, or to be *analogous*. Accordingly, *analogous* things are defined to be such as have a common name, but the thing immediately signified by that common name, different; yet with some correspondence or relation discernible therein.

Philosophers usually distinguish three kinds of *analogy*, *viz.*—1^o inequality, where the reason of the common denomination is the same in nature, but not in degree or sort; in which sense, animal is *analogous* to man, and brute.—2^o attribution; where though the reason of the common name be the same, there is a difference in its habitude or respect thereto: in which sense, healthy is *analogous* both to a man, and an exercise.—3^o proportionality; where, though the reason

of the common name do really differ, yet they bear some proportion to each other: in this sense, the gills of fishes are said to be *analogous* to the lungs in terrestrial animals: and thus, the eye and the understanding are said to bear an *analogy* to each other.

ANALOGISM, ANALOGISMUS, in logic, denotes an argument from the cause to the effect.

ANALYSIS*, in logic, a method of applying the rules of reasoning, to resolve a discourse into its principles; in order to a discovery of its truth, or falshood.—Or it is an examination of some discourse, proposition, or other matter, by searching into its principles, and separating and opening its parts; in order to consider them more distinctly, and arrive at a more precise knowledge of the whole.

* The word is Greek *αναλυσις*, which literally signifies, *resolution*; formed of *ανα*, and *λυω*, *solvo*, *resolvo*, I loosen, I resolve.

Analysis makes one great branch, or species of method; called also *resolution*.

ANALYSIS, in mathematics, a method of solving, or resolving mathematical problems.

There are two general methods of finding truth in mathematics; *synthesis*, and *analysis*.—*Analysis* is the demonstration, or consideration of the consequences drawn from any proposition; in which a man proceeds till he comes to some known truth, by means whereof, he may be able to give a solution of the problem.

The method of *analysis* consists more in the judgment and readiness of apprehension, than in any particular rules, where pure geometry is made use of, as it was among the ancients; but at present algebra is principally used on this occasion, which furnishes certain rules to perform or arrive at the end proposed.

This method, under its present improvements, must be allowed the apex or height of all human learning; being the great instrument or means whereby so many surprizing discoveries have been of late years made, both in mathematics, and philosophy.—It furnishes the most perfect instances, and examples of the art of reasoning; gives the mind a surprizing readiness at deducing and discovering things unknown, from a few data; and, by using signs for ideas, presents things to the imagination, which otherwise seemed out of its sphere.—By this, geometrical demonstrations may be wonderfully abridged; and a long series of argumentations, wherein the mind cannot without the utmost effort and attention discover the connection of ideas, are hereby converted into sensible signs, and the several operations required therein, effected by the combination of those signs.—But what is yet more extraordinary, by means of this art, a number of truths are frequently expressed by a single line, which in the common way of explaining and demonstrating things, would fill whole volumes.—Thus, by mere contemplation of one single line, whole sciences may sometimes be learnt in a few minutes time; which otherwise could scarce be attained in many years.

ANALYSIS is divided, with regard to its object, into that of *finite*, and that of *infinite*.

ANALYSIS of finite Quantities, is what we otherwise call *specious arithmetic*, or *algebra*. See *Specious ARITHMETIC*.

ANALYSIS of Infinites, called also the *new ANALYSIS*, is particularly used for the *Method of Fluxions*, or the *Differential Calculus*. See *FLUXIONS*.

ANALYSIS, is also used in chymistry, for the decomposing of a mixt body; or the reduction thereof into its principles.

To *analyze* bodies, or resolve them into their component parts, is indeed the chief object of the art of chymistry.—The *analysis* of bodies is principally effected by means of fire.

All bodies, by a chymical *analysis*, resolve into water, earth, salt, sulphur, and mercury; though every body does not afford all these parts; but some more, some fewer of them, according to the kingdom they belong to.

The *analysis* of vegetables is easy; that of fossils, particularly of metals, and semi-metals, difficult.

The many *analyses* that have been made of plants by Bourdelin, and others, have generally proved useless with regard to any discoveries of the properties and virtues of the plants analyzed. The most salutary plants, in this way of treatment, yield much the same principles as the most poisonous. The reason apparently is, that the too great action of the fire in distillation changes the plants and their principles: on this account, instead of distillation, M. Boulduc has made his *analyses* by decoction only. *Vid. Mem. Acad. R. Scienc. an. 1734. p. 139. hist. 63.*

Some bodies of the fossil tribe consist of particles so very minute, and so firmly united, that the corpules thereof need less heat to carry them off, than to separate them into

their principles; so that the *analysis* is impracticable in such bodies.—Hence arises the difficulty of *analyzing* sulphur.

The anatomical dissection of an animal, is also a kind of *analysis*.

ANALYSIS is also used for a kind of syllabus, or table of the principal heads or articles of a continued discourse; disposed in their natural order and dependency.

Analyses are more scientific than alphabetical indexes; but they are less used, as being more intricate.

ANALYTIC, ANALYTICAL, something that belongs to, or partakes of the nature of, *analysis*.

Thus, we say, an *analytical* demonstration; *analytical* enquiry; *analytical* table, or scheme; *analytical* method, &c.

The *analytic* method stands opposed to the *synthetic*.—* As in mathematics, says Sir I. Newton, so in natural philosophy, the investigation of difficult things by the *analytic* method ought to precede the method of composition. This *analysis* consists in making experiments, and observations, and in drawing general conclusions therefrom by induction; and admitting of no objections against the conclusions, but such as are drawn from experiments and other certain truths. And though the arguing from experiments and observations by induction be no demonstration of general conclusions, yet it is the best way of arguing which the nature of the things admits of; and may be esteemed so much the stronger, as the induction is more general. And if no exception occur from phenomena, the conclusion may be pronounced generally. By this way of *analysis*, we may proceed from compounds to their ingredients; from motions to the forces producing them; and, in general, from effects to their causes, and from particular causes to more general ones, till the argument end in the most general.—This is the *analytic* method.

The *synthetic* consists in assuming the causes discovered and established as principles; and by them explaining the phenomena proceeding from them, and proving the explanations. See *SYNTHESIS*.

ANALYTICS, ANALYTICA, the science or doctrine, and use of *analysis*.

The great advantage of the modern mathematics above the ancient is, in point of *analytics*.

The authors on the ancient *analytics* are enumerated by Pappus, in the preface to his seventh book of mathematical collections; being, Euclid, in his *Data*, and *Porismata*; Apollonius, de *Sectione Rationis*; Apollonius, in his *Conics*, *Inclinations*, and *Tacticon*; Aristæus, de *Lociis solidis*; and Eratosthenes, de *modis Proportionalibus*. But the ancient *analytics* were very different from the modern.

To the modern *analytics*, principally, belong algebra; the history of which, with the several authors thereon, see under the article *ALGEBRA*.

The chief writers upon the *analysis* of infinites are, its inventor, Sir Isaac Newton, in his *Analysis per Quantitatum Series, Fluxiones & Differentias, cum enumeratione Linearum tertii ordinis*; and de *Quadratura Curvarum*: and M. Leibnitz, in *Act. Eruditor. an. 1684*: the Marquis de l'Hopital, in his *Analyse des infinites petites*, 1696: Carre in his *Méthode pour la mesure des Surfaces, la dimension des Solides*, &c. par l'application du calcul integral, 1700: G. Manfredi, in a posthumous piece, de *Constructione Equationum differentialium primi gradus*, 1707: Nic. Mercator, in *Logarithmotechnia*, 1668; Cheyne, in *Methodus Fluxionum inversa*, 1703; Craig, in *Methodus figurarum lineis rectis & curvis comprehensarum Quadraturis determinandi*, 1685; and de *Quadraturis figurarum curvilinearum & locis*, &c. 1693: Dav. Gregory, in *Exercitatio Geometrica de dimensione figurarum*, 1684; and Nieuwentijt, in *Considerationes circa Analysis ad quantitates infinitè parvas applicatas, principia*, 1695.—The sum of what is found in l'Hopital, Carre, Cheyne, Gregory, and Craig, is collected into one volume, and very well explained, by C. Haves, under the title of, *A Treatise of Fluxions*, &c. 1704.—And the substance of most of the rest in Pere Reynau's *Analyse démontrée*, 2 vol. 4°. 1728.

ANALYTICS is also used by some for a part of logics, which teaches to decline and contrive reason, as grammar does words. See *LOGIC*.

ANAMORPHOSIS*, in perspective and painting, a monstrous projection; or a representation of some image, either on a plane or curve surface, deformed; which at a certain distance shall appear regular, and in proportion.

* The word is Greek; compounded of *ανα*, and *μορφωσις*, *formatio*, of *μορφη*, *form*.

To make an *anamorphosis*, or monstrous projection on a plane,—Draw the square ABCD, (*Tab Perspective, fig. 19. N.º 1.*) of a signet at pleasure, and subdivide it into a number of areolas, or lesser squares.—In this square, or recticle, called the *craticular prototype*, let the image to be distorted be drawn.—Then draw the line *a b* (*fig. 19. N.º 2.*)=AB; and divide it into the same number of equal parts, as the side

side of the prototype AB; and in E, the middle thereof, erect the perpendicular EV, so much the longer; draw VS perpendicular to EV, so much the shorter, as the image is desired to be more distorted. From each point of division draw right lines to V, and join the points a and S, by the right line aS. Through the points defg draw lines parallel to ab; then will a b c d be the space that the monstrous projection is to be delineated in; called the *cratular ec-type*.

Lastly, in every areola, or small trapezium of the space abcd, draw what appears delineated in the correspondent areola of the square ABCD: by this means you will obtain a deformed image, which yet will appear in just proportion to an eye distant from it the length FV, and raised above the height VS.

It will be diverting to manage it so, that the deformed image do not represent a mere chaos; but some other image: thus, we have seen a river with soldiers, waggons, &c. marching along the side of it; so drawn, that when viewed by an eye in the point S, it appears to be the satyrical face of a man.

An image also may be distorted mechanically, by perforating it here and there with a needle, and placing it against a candle or lamp; and observing where the rays which pass through these little holes fall on a plane or curve superficies; for they will give the correspondent points of the image deformed: by means whereof, the deformation may be completed.

To draw the Anamorphosis, or deformation of an image, upon the convex surface of a cone.—It is manifest from the former case, that all here required is, to make a cratular ec-type on the superficies of the cone, which shall appear, to an eye duly placed over its vertex, equal to the cratular prototype.

Let the base ABCD, therefore, of the cone (fig. 20.) be divided by diameters into any number of equal parts, that is, the periphery thereof; and let some one radius be likewise divided into equal parts; and through each point of division draw concentric circles: thus will the cratular prototype be made.—With double the diameter AB, as a radius, describe the quadrant EFG, (fig. 21.) so as the arch EG be equal to the whole periphery: then this quadrant, folded duly up, will form the superficies of a cone, whose base is the circle ABCD.—Divide the arch AB into the same number of equal parts as the cratular prototype is divided into, and draw radii from each of the points of division. Produce GF to I, so that FI=FG; and from the centre I, with the radius IF, draw the quadrant FKH; and from I to E draw the right line IE. Divide the arch KF into the same number of equal parts as the radius of the cratular prototype is divided into; and draw radii through each of the points of division, from the centre I meeting EF, in 1, 2, 3, &c. Lastly, from the centre F, with the radii, FI, F2, F3, &c. describe the concentric arches.—Thus will the cratular ec-type be formed, the areolæ whereof will appear equal to each other.

Hence, what is delineated in every areola of the cratular prototype, being transferred into the areolæ of the cratular ec-type, the image will be distorted or deformed: yet an eye being duly raised over the vertex of the cone, will perceive it in just proportion.

If the chords of the quadrants be drawn in the cratular prototype, and chords of their fourth part in the cratular ec-type, all things else remaining the same; you will have the cratular ec-type in a quadrangular pyramid.

And hence it will be easy to deform any image, in any other pyramid, whose base is any regular polygon.

Because the eye will be more deceived, if from contiguous objects it cannot judge of the distance of the parts of the deformed image; therefore, these kinds of deformed images are to be viewed through a small hole.

ANANAS, in natural history, by some called *nanas*, by others *jayama*, and by us popularly the *pine-apple*, on account of the resemblance it bears to the cones of pines and firs; is a fine Indian fruit, which grows on an herbaceous plant with leaves like those of the aloë.

The fruit is adorned on the top with a little crown. The pulp is fibrous, but dissolves in the mouth; having the delicious taste of the peach, the quince, and the muscadine grape, all together.

—F. du Tertre describes three kinds of *ananas*: Boerhaave enumerates six. They make a wine from the juice, which is almost equal to Malmsiey sack, and will intoxicate as soon. It is good to strengthen the heart and nerves, against nausea, to refresh the spirits, and it excites urine powerfully; but is apt to occasion abortion in women.—They sometimes make a confection of the *ananas* on the spot, which they bring hither whole; and which is found of good service to restore a decayed or aged constitution.

The *ananas*, or West-India pine-apple, is generally allowed, both for its rich and delicious flavour, and its beautiful colour, to be the king of fruits.—Great endeavours have of late been used to cultivate the plant in Europe; in which they have succeeded, and there are now produced delicious fruits of this kind, in several gardens in England. See SUPPLEMENT, article ANANAS.

ANAPÆST*, ANAPÆSTUS, a foot in the Greek and La-

tin poetry, consisting of two short, and one long syllable. See FOOT.

* The word is derived from *αναπαύω*, *extra ferio*, because in dancing this measure, the ground was *beat* with a contrary order from what it was in the dactyl. Whence also the Greeks called it *ανιπαυεος*. *Dion. lib. p. 474.*

Such are the words *Legerent*, *Sapiens*, *Καὶν*.

Anapestic verses, i. e. verses wholly composed of such feet, were much in vogue among the ancients.

ANAPHORA*, in rhetoric, a figure whereby one or more words are repeated in the beginning of several sentences or verses.

* The word is Greek, *αναφορα*, signifying *relation*, or *repetition*.

Such, e. gr. is this of the psalmist: The voice of the lord is powerful: the voice of the lord is full of majesty: the voice of the lord shaketh the wildernesses.

ANAPLEROTICS*, in medicine, such remedies as incarnate, and fill up ulcers and wounds with new flesh.

* The word comes from the Greek *αναπληρωω*, *I fill up*.

Anaplerotics are the same with what we otherwise call *incarnatives*. See INCARNATIVE.

ANARCHY*, the want of government in a nation, where no supreme authority is lodged, either in the prince or other rulers; but the people live at large, and all things are in confusion.

* The word is derived from the Greek privative *α*, and *αρχη*, *command*, *principality*.

ANASARCA *Ανασάρκα*, in medicine, a sort of universal dropsy, wherein the whole substance of the body is stuffed or bloated with pituitous humours.

The *anasarca* is the same with what is otherwise called *leucophlegmatia*.—It is considered by some as a very great degree of a cachexia.

In an *anasarca*, the legs swell at the beginning, especially towards night, and then pit remarkably: the urine is pale, the appetite decays; at length the swelling rises higher, and appears in the thighs, belly, breast, and arms. The face becomes pale and cadaverous; the flesh soft and lax; and a difficulty in respiration comes on, attended with a flow fever.

See SUPPLEMENT, article ANASARCA.

ANASTOMASIS*, or ANASTOMOSIS, in anatomy, is sometimes used to express such aperture of the mouths of the vessels as lets out their contents.

* The word is formed of the Greek *ανα*, *per*, through, and *στομα*, *or*, mouth.

ANASTOMASIS is more frequently used to denote the opening of two vessels into one another; or the union and juncture of the mouths of two vessels, whereby they come to communicate with one another.

There are various *anastomases* of this kind, e. gr. of an artery with an artery, a vein with a vein, and of a vein with an artery. See ARTERY, and VEIN.

The circulation of the blood in the foetus is effected by means of the *anastomases*, or inosculation of the vena cava with the pulmonary vein; and of the pulmonary artery with the aorta.

The circulation is also performed in adults by the *anastomases*, or continuations of the capillary arteries with the veins.

After the circulation of the blood through the heart, lungs, and large blood-vessels, was demonstrated by Harvey, it was only guessed how the extremities of the arteries transmitted the blood to the veins; till Leewenhoeck's microscopes had discovered the continuations of the extremities of those vessels, in fishes, frogs, &c.—However, there were not wanting those who doubted of the like continuations of the extremities of the arteries and veins in human bodies, and quadrupeds; since those animals it had hitherto been chiefly seen in satisfactorily, were either such fish, or amphibious kinds, as have but one ventricle in their hearts, and whose blood is actually cold; beside that in them it does not circulate with such rapidity, as in animals whose hearts have two ventricles.

This difference in the principal organs of circulation moved Mr. Cowper to make experiments on animals whose organs differ only from the human in their gross figure, and not in their intimate structure.—The result was a plain discovery of the like inosculation of the arteries and veins, in the omentum of a cat.

George Frederic Francus, of Frankennau, a physician of Copenhagen, published, in the year 1705, a learned and copious work, intitled, *Anastomasis Reteila*.

ANASTOMATICS*, or ANASTOMATIC medicines, are such as have the faculty of opening and dilating the cavities of the vessels; and by that means of making the blood circulate the more freely.

* The word comes from the Greek *ανατομω*, *I open*, *dissect*.

ANATHEMA*, in an ecclesiastical sense, denotes an excommunication, attended with execrations and curses. See EXCOMMUNICATION.

* In this sense the word is usually written in Greek, *Αναθήμα*; to distinguish it from an offering to the gods, called *Αναθήμα*: though it is certain several of the Greek fathers do not observe this distinction, but use *Αναθήμα* indifferently for either.

There are two kinds of *anathemas*; the one *judiciary*, the other *abjuration*.

The former can only be pronounced by a council, a pope, bishop, or other qualified person; and differs from a simple excommunication in this, that an excommunication only prohibits the criminal from entering within the church, or from holding communion with the faithful; whereas an *anathema* cuts him off from the body, the society, and even the commerce of the faithful, and delivers him over to the devil.

The latter kind of *anathema* usually makes a part of the ceremony of abjuration; the convert being obliged to *anathematize* the heresy he abjures. See **ABJURATION**.

The critics and commentators are divided about the manner wherein St. Paul wishes to be *anathema* for his brethren, Romans, chap. ix. 3. Some render it by *accursed for*, others by *separated from*, &c.

ANATOCISM*, **ANATOCISMUS**, an usurious contract, wherein the interests arising from the principal sum are added to the principal it self, and interest exacted upon the whole.

* The word is originally Greek, but is used by Cicero in Latin; whence it is descended into most other languages. It comes from the preposition *ana*, which in composition signifies *repetition* or *duplication*, and *tocos*, *usury*.

Anatocism is what we properly call *interest upon interest*, or *compound interest*.

This is the worst kind of usury, and has been severely condemned by the Roman law, as well as by the common laws of most other countries.

ANATOMICAL Injections. } See **INJECTION**.
ANATOMICAL Repertory. } See **REPERTORY**.
ANATOMICAL Theatre. } See **THEATRE**.

ANATOMY*, the art of dissecting, or artificially taking to pieces, the solid parts of animal bodies; in order to an exact discovery of their structure and œconomy.

* The word is Greek, *ανατομή*, q. d. *section*, or *cutting*; formed of *ανα*, *dissecō*, I cut asunder.

Anatomy makes a great branch of that division of medicine called *physiology*.

It is sometimes divided, with regard to its end, into *speculative* and *practical*; a division of very little use and moment.—It is also divided, with regard to its subject, into *human* and *comparative*.

Comparative ANATOMY, is that which considers brutes, and other animals, and even vegetables; chiefly with a view to illustrate the human structure.

Human, which is absolutely and properly denominated **ANATOMY**, is that employed on the human body; by some called also *anthropology*.

The subject of *anatomy*, viz. the body, is variously divided into parts, *organical*, and *inorganical*; *similar*, and *dissimilar*; *spermatic*, &c.

Its more obvious division is into *solids* and *fluids*, or into the containing and contained parts.

Under the solids come the bones, muscles, nerves, arteries, veins, cartilages, ligaments, membranes, &c.—Under the fluids, come chyle, blood, milk, fat, lymph, &c. See each under its proper article.

The ancient writers of *anatomy*, Hippocrates, Democritus, Aristotle, Galen, and others, looked upon this as the most important part of physic, and that, without which the uses of the part of an human fabric, and consequently the causes of diseases incident thereto, could no way be discovered. And yet this art, useful as it is, was intirely discontinued for several ages; till in the sixteenth century it began to flourish afresh.—The dissection of an human body was looked upon as sacrilege before that time; and we have seen a consultation which the emperor Charles V. appointed to be held by the divines of Salamanca, in order to be satisfied, whether or no it were lawful, in point of conscience, to dissect a dead carcase?—We may add, that to this day the use of anatomy and skeletons is forbid in Muscovy; the first as inhuman, the latter as subservient to witchcraft: and Olearius assures us, that one Quirin, a German chirurgurgeon, being found there with a skeleton, hardly escaped with life; and the skeleton, after being solemnly dragged about the streets, was burnt in form. *Boyle's Usefulness of Philosophy*.

Vesalius, a Flemish physician, who died in 1564, was the first who set *anatomy* on any tolerable footing. He was seconded by Carpus, Sylvius, Fernelius, Fallopius, Eustathius, Fabricius, Pareus, Bauhinus, Hoffman, Riolanus, &c.

These were succeeded by others, to whom some of the finest discoveries in *anatomy* are owing.—Aesculius, in the year 1622, discovered the lacteal veins; and in 1628, the immortal Harvey published his admirable discovery of the circulation of the blood.—Pecquet discovered the reservoir of the chyle, and the thoracic duct, in 1651.—Rudbecks, a Swede, and Bartholine, a Dane, found out the lymphatic vessels, in 1650, and 1651. Wharton, in 1655, disco-

vered the lower salival ducts; and Steno the upper salival ducts, those of the palate, the nostrils, and eyes, in 1661. Wirtlingus, in 1642, discovered the pancreatic duct.

—Willis, who came after him, published an *anatomy* of the brain, and nerves, in a manner much more exact than had been done before him; yet he had omitted some considerable things, which were afterwards observed by Vieussens.—In effect, Glisson treated particularly of the liver; Wharton of the glands; Havers of the bones; Graaf of the pancreatic juice, and the parts of generation; Lower of the motion of the heart; Thurstion of respiration; Peyer, of the glands of the intestines; Brown, of the muscles; and Drelincourt, of the conception of the ova in women, the placenta, and the membranes of the fetus.

Malpighi, who died in 1694, is one of those to whom *anatomy* owes the most: he made a great number of discoveries in the lungs, brain, liver, spleen, glands, and lymphatics, by help of the microscope, &c. Nor must it be omitted that Ruyfch, who died in 1727, has let great light into many of the finer and more intricate parts of the human frame, particularly the glands; by means of his injections.

Magnet, and Le Clerc, two physicians of Geneva, have given us a *Bibliotheca Anatomica*; containing all the new discoveries that have been made in this art.—The best systems of the art, as it now stands, are those of Verheyen, Drake, Keil, Heister, Winslow, Albinus, &c.

ANATOMY is sometimes used to denote the subject to be anatomized. Thus (by 39 H. VIII. cap. 22.) the company of barbers and furgeons may have and take yearly four persons condemned, adjudged, and put to death for felony, for *anatomies*; and to make incision of the same dead bodies.

ANATOMY is also used for an artificial representation of the structure and parts of the human body in metal, plaster, wax, or the like.—In this sense we say, the wax-work *anatomy*: R. Dickenfon, statuary, finished a human *anatomy* in plaster of Paris, representing a man standing upright, with his skin flea'd off.

ANATOMY of Plants. See **PLANT**.

ANATRON, or **NATRON**, a kind of native salt-petre, or nitre found in Egypt.

ANATRON, is also used for the salt, and scum of the composition of glass, when in fusion.

When pounded, it yields a kind of powder; which being dissolved in the air, or in a proper liquor, becomes common salt, after coagulation.

ANATRON is likewise the name of a nitrous juice, which condenses in vaults, arches, and other subterraneous places.

ANATRON is also used by some writers for a compound salt, made of quicklime, alum, vitriol, common salt, and nitre; used as a flux to promote the fusion and purification of metals.

ANBURY, or **AMBURY**, a kind of wen, or spungy wart, growing upon any part of a horse, or cow, and being full of blood.

ANCESTORS*, *progenitors*,; or those from whom a person is descended.

* The word is derived from the Latin *antecessor*, wrote, by contraction, for *antecessor*, q. d. *goer before*.

The law distinguishes between *ancestor*, and predecessor; the former being applied to a natural person, as such an one, and his *ancestor*; and the latter to a body politic or corporate, as a bishop, and his predecessors.

Disability by the act of ANCESTOR. See **DISABILITY**.

ANCESTREL, in law, something relating to a man's ancestors.—Thus,

Homage ANCESTREL, signifies homage that hath been done or performed by one's ancestors.

Action ANCESTREL. See **ACTION**.

ANCHILOPS, in medicine, denotes an abscess, or collection of matter between the great angle of the eye, and the nose.

The same abscess when broken is no longer denominated *anchilops*, but *ægilops*. See **ÆGILOPS**.

ANCHOR*, **ANCHORA**, an instrument used at sea, and in rivers, to retain and fasten a vessel by.

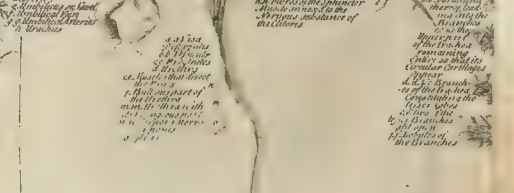

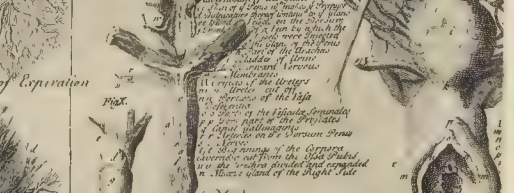

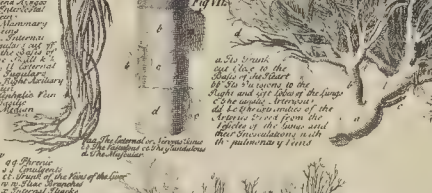

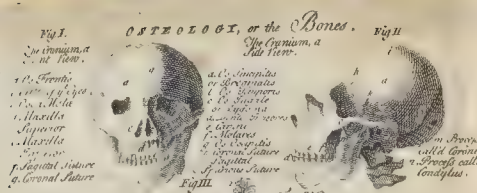

* The word comes from the Latin *ancora*, or *anchora*, of the Greek *αγκυρα* which comes from *αγκυρα*, *incruavi*, crooked.

An *anchor* is a large, strong piece of iron, crooked at one end, and formed into two bars, resembling a double hook; and fastened at the other end by a cable.

The goodness of the *anchor* is a point of great importance; the safety and conservation of the vessel depending principally thereon.—Great care is to be taken, that the metal it is made of be neither too soft nor too brittle; the latter rendering it liable to break, and the former to fraitren.

Travellers tell us of people in the Indies who make use of wooden *anchors* in their navigation.—The inhabitants of the island of Ceylon, in lieu of *anchors*, use huge round stones; and, in other places, their *anchors* are a kind of machines of wood, loaden with stones.

Fig IX

E. Rooker scalp

The parts of an *anchor*, are 1°. The *ring*, into which the cable is fastened: 2°. The *beam*, or *shank*, which is the longest part of the *anchor*: 3°. The *arm*, which is that which runs down into the ground: at the end of which is, 4°. The *fluke*, or *flukes*, by some called the *palm*; being that broad and picked part, with its barbs, like an arrow-head, which fastens into the ground: 5°. The *stock*, a piece of wood fastened to the beam, near the ring, serving to guide the fluke, so that it may fall right, and fix in the ground. There are three kinds of *anchors* commonly used: the *kedger*, the *grapnel*, and the *stream-anchor*. See *STREAM-ANCHOR*, and *KEDGING*.

Aubin in his dictionary of sea-affairs, printed at Amsterdam in 1702, observes, that the *anchor* of a large heavy vessel is smaller, in proportion, than that of a lesser and lighter one. The reason he gives, is, that though the sea employs an equal force against a small vessel as against a great one, supposing the extent of wood upon which the water acts to be equal in both; yet the little vessel, by reason of its superior lightness, does not make so much resistance as the greater; the defect whereof must be supplied by the weight of the *anchor*. But the validity of this reason we will not be answerable for.

Weighing ANCHOR. See the article *WEIGHING*.

ANCHOR, in architecture and sculpture, denotes an ornament in form of an *anchor*, or arrow's-head; frequently carved on the echinus, or quarter-round, in the Tuscan, Doric, and Ionic capitals, as well as in the bed-moulding of the Doric, Ionic, and Corinthian corniches.—See *Tab. Archit. fig. 10*.

The *anchors* are usually intermixed with representations of eggs; whence the echinus itself is popularly called *eggs and anchors*. See *ECHINUS*, and *QUARTER-ROUND*.

ANCHOR, a measure. See *ANKER*.

ANCHORAGE, ground fit to hold a ship's *anchor*, so that she may ride safely.

The best ground for a ship to anchor in is stiff clay, or hard sand; and the best riding at anchor is when a ship is land-locked, and out of the tide.

ANCHORAGE, in law, denotes a duty taken of ships for the pool of the haven, where they cast anchor.

The ground in all ports and havens being the king's, no man can let an anchor fall in any port, without paying for it to the king's officer appointed by patent.

ANCHORED, or *ANKERD*, or in heraldry.—A cross *anchored*, or *ancres*, is a form of cross, so called, because the four extremities resemble the flukes of an anchor.

This cross is so like the cross moline, that the resemblance has occasioned many mistakes in heraldry. See *CROSS*.

*ANCHOVY**, in matters of commerce, &c. a little fish, much used by way of sauce, or seasoning.

* The word is derived from the Spanish *anchova*, or rather from the Italian, *anchior*, which signifies the same.

Scaliger describes the *anchovy* as of the herring kind, about the length of a finger, having a pointed snout, a wide mouth, and no teeth, but gums as rough as a saw.—Others make it a sort of sardine, or pilchard: but others, with better reason, hold it a peculiar species, very different from either.

The *anchovy* is caught in the months of May, June, and July, on the coasts of Catalonia, Provence, &c. at which season, it constantly repairs up the straits of Gibraltar, into the Mediterranean. Collins says, they are also found in plenty on the western coasts of England and Wales. *Coll. Salt. and Fish. p. 101*.

The fishing for them is chiefly in the night-time; when a light being put out on the stern of their little fishing-vessels, the *anchovies* flock round, and are caught in the nets.

When the fishery is over, they cut off the heads, take out their gall and guts; and then lay them in barrels and salt them.

—The common way of eating *anchovies* is with oil, vinegar, &c. in order to which they are first boned, and the tails, fins, &c. slipped off.—Being put on the fire, they dissolve in almost any liquor. Or they are made into sauce by mincing them with pepper, &c. *V. Hought. Collect. N° 550. t. 2. p. 309*.

ANCHYLOPS, in medicine. See *ANCHILOPS*.

*ANCIENT**, or *ANTIENT*, in its usual sense, denotes a thing, which existed in times long ago.

* The word comes from the French *ancien*, of the Italian *anciano*, and that of the Latin *antiquus*, which denotes the same.

In this sense *ancient* stands opposed to *modern*. See *MODERN*. *Ancient* differs from *antique* as the genus from its species. See *ANTIQUE*.

We say *ancient* nations, *ancient* architecture, sculpture, philosophy, &c. *ancient* manners, ceremonies, poets, physicians, and the like.

ANCIENT Academy. See the article *ACADEMY*.

ANCIENT Astronomy. See the article *ASTRONOMY*.

ANCIENT Character. See the article *HEBREW*.

ANCIENT Coins. See the article *COINS*.

ANCIENT Comedy. See the article *COMEDY*.

ANCIENT Hours. See the article *HOURS*.

ANCIENT Medals, &c. See the article *MEDALS*, &c.

ANCIENT Money. See the article *MONEY*.

ANCIENT Roman Year. See the article *YEAR*.

ANCIENT Tenure.—Barons by *ancient* tenure. See *BARON*.

ANCIENT Weights. See the article *WEIGHT*.

ANCIENT is sometimes also opposed to *young*, or *new*.—The French say, the *ancient* bishop of such a city, when he has resigned his see, and a new one is put in his place: the *ancient* bishop of Frejus, now cardinal de Fleury.

ANCIENTS in church-discipline. See the article *ELDERS*.

ANCIENTS, in Inns of court, imports a distinction of a certain degree. Thus,—The society of Gray's-inn consists of benchers, *ancients*, barristers, and students under the bar: Here the *ancients* are the elder barristers.

In the Inns of chancery there are only *ancients*, and students or clerks; and among the *ancients*, one is yearly the principal, or treasurer.—In the Middle-temple, *ancients* are such as have gone through, or are past their reading.

ANCIENT is sometimes also used in a military sense, for the colours, or an ensign.

ANCIENT, in the naval armament, is the flag, or streamer, borne in the stern of a ship.

ANCIENT Demesne, or *Demain*, in law, is a tenure, whereby all manors belonging to the crown in William the conqueror's and St. Edward's time, were held. See *TENURE*.

The numbers, names, &c. heretofore entered by the conqueror, in a book called *domesday-book*, yet remaining in the exchequer; so that such lands as by that book appeared to have belonged to the crown at that time are called *ancient demesne*. See *DOMESDAY*.

The tenants in *ancient Demesne* are of two sorts; one who hold their lands frankly by charter; the other by copy of court-roll, or by the verge, at the will of the lord, according to the custom of the manor.

The advantages of this tenure are, 1. That tenants holding by charter cannot be rightfully impleaded out of their manor; and, when they are, they may abate the writ, by pleading the tenure. 2. They are free from toll for all things relating to their livelihood, and husbandry; nor can be impanelled on any inquest.

These tenants held originally by plowing the king's land, plashing his hedges, and the like services, for the maintenance of his household; and it was on this account that such liberties were given them, for which they may have writs of *monstraverunt* to such as take the duties of toll, &c.

No lands are to be accounted *ancient demesne*, but such as are held in focage.

ANCIENTY, in some ancient statutes, is used for eldership or seniority.

The eldest sister can demand no more than, her other sisters, beside the chief mesne by reason of her *ancienty*.

ANCON, *Anyon*, in anatomy, denotes the curvature or flexure of the arm whereon we rest in leaning.

This is otherwise called *olecranon*. See *OLECRANON*.

ANCON, in architecture, is used to denote the corners or quoins of walls, cross beams, or rafters.

ANCONÆUS Musculus, in anatomy, the sixth muscle of the elbow; so called, as being situate behind the folds of the *ancon*, or elbow.—See *Tab. Anat. (Myol.) fig. 7. n. 46*.

It arises from the back part of the extremities of the humerus, passes over the elbow, and is inserted into the lateral and internal part of the cubitus about three or four fingers breadth above the olecranon.—Its use is to assist in extending the arm.

ANCONY, in the iron mines, a bloom wrought into the figure of a flat iron bar, about three foot long, with two square rough knobs, one at each end. See *IRON*.

ANCREE, in heraldry, the same with *anchored*. See *ANCHORED*.

*ANCYLE**, in antiquity, denotes a small kind of brazen shield, said to have fallen from heaven into the hands of Numa Pompilius, at the same time that a voice was heard, that Rome should be mistress of the world, while the preserved that shield.

* Authors are divided as to the orthography and origin of the word: Camerarius and Muretus will have it Greek, and suppose it formed from *αγκυλον*, crooked: agreeably to this system, they write *ancyle*, and *ancylia*, with a y. It is certain we find *αγκυλον* in Plutarch; and Juba in his history will absolutely have the word to be of Greek extraction: but this orthography seems overturned both by medals and manuscripts, where the word is written *ANCILIA*. Varro derives the name *ancilia*, *ab ancisa*, and supposes this denomination given to a kind of shields, because cut in, or indented on both sides, after the manner of the Thracian *pelta*. Plutarch himself gives this figure to the *ancilia*, but he differs from Varro, in this, that he pretends the *pelta* were not in this shape, but quite round, and without indenting. Ovid seems also to say, that the *ancile* was round, and that it came hence to be denominated *ancile*, *g. d. ancilum*, of *ans*, and *caelo*, cut equally round. Other etymons are also mentioned by Plutarch; one from *αγκυλον*, elbow, by reason the *ancile* was borne on the elbow.

Though there was but one *anyle* that fell from heaven; yet were there twelve preferred: Numa, by the advice, as it is said, of the nymph Egeria, having ordered eleven others perfectly like the first, to be made by Veturius Mamurius: that if any should attempt to steal it, as Ulysses did the Palladium, they might not be able to distinguish the true *anyle* from the false ones.

These *anyles* were preserved in the temple of Mars; and were committed to the care of twelve priests or *Salii*, instituted for that purpose.

They were carried every year, in the month of March, in procession all around Rome; and the thirtieth day of that month they were again deposited in their place.

ANCYLE, is also used in anatomy, for the contraction of the ham.

ANCYLOBLEPHARON, *Inviscatio*, or *Adglutinatio Palpebrarum*, a disease wherein the eye-lids are stuck fast, or glued together.—The cure, is by manual operation. *V. Bibl. Anat. Med. T. 2. p. 278.*

ANCYLOGLOSSUS, *Αγκυλογλωσσος*, one that is tongued, or has an impediment in his speech, arising from a contraction of the frenum of the tongue.

ANCYLOSIS*, a disease in the junctures of a human body; where the nervous liquor that should lubricate the bones, and make their motions easy, growing too thick, clogs up, and as it were cements the bones, and contracts the joint.

* The word is derived from the Greek *αγκυλωσις*, which comes from *αγκυρα*, a hardsnel, or contraction of a joint.

ANCYROIDES, *Αγκυροειδης*, is used by some writers in anatomy for the process or shooting forth of the shoulder-bone, in form of a beak; otherwise called *coracoides*.

ANDABATÆ, in antiquity, a kind of gladiators, who fought hood-winked; having on a sort of helmet that covered the eyes, and even the face. See **GLADIATOR**.

They were called, *andabate*, *quasi ambupati*, *ascensores*, because they fought mounted on horseback, or out of chariots.

ANDREW.—Knights of St. Andrew, or the thistle. See **THISTLE**.

ANDREW'S CROST, is a badge wore in the hat, by the people of Scotland, on the day of the feast of that saint.

It consists of blue and white ribbands, disposed into a cross, or saltire; and is intended as a commemoration of the crucifixion of St. Andrew, the tutelary saint of Scotland.

ANDROGYNUS*, or **ANDROGYNOUS**, an hermaphrodite, or one born with two sexes, being male and female in the same person. See **HERMAPHRODITE**.

* The word comes from the Greek *ανδρογυνος*, a compound of *ανρ*, man, and *γυν*, woman, *g. d.* man-woman.

Many of the rabbins are of opinion, that Adam was created *androgynous*; that he was male on one side, and female on the other; and that he had even two bodies, the one of a man, and the other of a woman: so that God to create Eve, only separated those two from each other. *V. Manass. Ben-Israel, Maimonid. &c. ap. Heidegg. Hist. Patriarch. tom. 1. p. 128.*

Plato tells us, that in the beginning certain people were born double, and with both sexes; but that this duplicity of members giving them too much strength and vigour, they became insolent, and even declared war against the gods.—Upon which, Jupiter, to tame their pride, split each of them into two; but so as that each moiety still retained a strong passion to be reunited: and hence that philosopher derives the natural love between the two sexes. *Conviv. p. 1185. ed. 1602.*

The astrologers also give the appellation *androgynous* to such of the planets as are sometimes hot, and sometimes cold; as mercury, which is reputed hot and dry when near the sun, and cold and moist when near the moon.

ANDROIDES*, an automaton, in the figure of a man; which, by virtue of certain springs, &c. duly contrived, walks, speaks, and performs other external functions of a man. See **AUTOMATON**.

* The word is compounded of the Greek *ανρ*, *ανδρως*, man, and *ειδης*, form.

Albertus Magnus is recorded as having made a famous *androides*. **ANDROLEPSY***, **ANDROLEPSIA**, in antiquity.—If an Athenian were killed by a citizen of some other place; and such city refused to deliver up the criminal to punishment; it was held lawful to take three inhabitants of that city, and punish the homicide in them.—This the Greeks, called *androlepsia*, and the Romans *clarigatio*. See **CLARIGATIO**.

* The word is formed of *ανρ*, man, and *ληψια*, *capio*, I take.

Some authors also use *androlepsia* for reprisals. See **REPRIZAL**.

ANDROMACHI Theriaca, or *Treacle of ANDROMACHUS*, in pharmacy, is a capital alexipharmic composition; called also *Venice Treacle*. See **THERIACA**.

ANDROTOMY, or **ANDROTOMY**, the anatomy or dissection of human bodies. See **DISSECTION**.

It is thus called in opposition to *zootomy*, which is used to denote that of brutes.

Anatomy is the genus, and comprehends all dissections in general, whether of men, beasts, or plants: and *androtomy*, and *zootomy* are the species. See **ANATOMY**.

ANECDOTES*, **ANECDOTA**, a term used by some authors, for the titles of *Secret Histories*; that is, of such as relate the secret affairs and transactions of princes; speaking with too much freedom, or too much sincerity, of the manners and conduct of persons in authority, to allow of being made public.

* The word is Greek, *ανεκδοτα*, *g. d.* things not yet known, or hitherto kept secret.

Procopius gives this title to a book which he published against Justinian and his wife Theodora; and he seems to be the only person among the ancients, who has represented princes such as they are in their domestic relation.—Varillas has published *anecdotes* of the house of Medicis.

ANECDOTES is also an appellation given to such works of the ancients as have not yet been published.

In which sense, M. Muratori gives the name *Anecdota Græca* to several writings of the Greek fathers, found in the libraries, and first published by him.—F. Martene has given a *Theaurus Anecdotarum Novus*, in folio, 5 vol.

ANELE, or **ANIL**, the fame with *indigo*. 23 El. c. 9.

ANEMIUS* *Furnus*, among chemists, a wind-furnace; used to make fierce fires for melting, &c.

* The word is formed of the Greek *ανμος*, wind.

ANEMOMETER*, a machine wherewith to measure the strength of the wind.

* The word is compounded of the Greek *ανμος*, wind, and *μετρον*, measure.

The *anemometer* is variously contrived. In the Philosophical Transactions we have one described, wherein the wind being supposed to blow directly against a flat side or board which moves along the graduated limb of a quadrant, the number of degrees it advances shews the comparative force of the wind.

Wolffius gives the structure of another, which is moved by means of sails, ABCD (*Tab. Pneumaticæ, fig. 17.*) like those of a wind-mill; which raise a weight, L, that, still the higher it goes, receding farther from the centre of motion, by sliding along a hollow arm KM, fitted on to the axis of the sails, becomes heavier and heavier, and presses more and more on the arm, till being a counterpoise to the force of the wind on the sails, it stops the motion thereof. An index, then, MN, fitted upon the same axis at right angles with the arm, by its rising or falling points out the strength of the wind, on a plane divided like a dial-plate into degrees.

M. d'Ons en Bray, has invented a new *anemometer*, which of itself expresses on paper, not only the several winds that have blown during the space of twenty-four hours, and at what hour each began, and ended, but also the different strengths, or velocities of each. *V. Mem. Acad. Scienc. an. 1734. p. 169.*

ANEMOSCOPE*, is sometimes used for a machine invented to foretell the changes of the wind.

* The word is derived from the Greek *ανμος*, wind, and *σκοπεωμαι*, I look, or consider.

It has been observed, that hygroscopes made of cat's-gut, &c. prove very good *anemoscopes*; seldom failing, by the turning of the index about, to foretell the shifting of the wind. See **HYGROSCOPE**.

The *anemoscope* used by the ancients seems, by Vitruvius's description of it, to have been intended rather to shew which way the wind actually blew, than to foretell into which quarter it would change.

Otto de Gueric also gave the title *anemoscope* to a machine invented by him, to foretell the change of the weather, as to fair and rain.

It consisted of a little wooden man, who rose and fell in a glass tube, as the atmosphere was more or less heavy.—Accordingly, M. Comiers has shewn, that this *anemoscope* was only an application of the common barometer. See **BAROMETER**. *V. Merc. gal. 1683. Aa. erud. 1684. p. 26.*

ANEURYSM*, **ANEURYSMA**, in medicine, a soft, throbbing, ruddy tumour, occasioned by a dilatation, or by a wound of an artery.

* The word comes from the Greek *ανευρυσμ*, *dilate*, I dilate.

Aneurysm is a disease of the arteries, in which, either by a preternatural weakness of any part of them, they become excessively dilated; or, by a wound through their coats, the blood is extravasated among the adjacent cavities.

Aneurysms usually proceed from an artery being accidentally cut, or pricked in bleeding; or from some preternatural distention, or obstruction, or a corrosion of its coats, &c. *V. Mem. Acad. R. Scienc. an. 1732. p. 592.*

If an artery happen to be cut, the blood gushes out impetuously, by starts, and is not easily stopped; and an inflammation and discolouration of the part succeeds, with a tumour, and inability to move the part. The symptoms are nearly the

the same in case of a corrosion of the coats of the artery, only in this case they are less violent.

If the blood cease to flow from the wounded artery, and pour itself between the interstices of the muscles; recourse is had to manual operation; which being neglected, the extirpation of the limb frequently becomes unavoidable.—An *Aneurysm*, from a distention of the canal, is seldom fatal; though reckoned, when large, incurable; the chief inconveniences are, the magnitude of the tumour, and the pulsation.

M. Littré gives us the history of an *aneurysm* of this kind, in the aorta; the cause whereof he attributes to an extraordinary diminution of the cavity of the axillary and subclavian arteries. *Hist. de l'Acad. R. an. 1712.*—Another history of an *aneurysm* of the same part we have, by Mr. Lafage, in the Philosoph. Transactions. It was occasioned by some violent shocks the patient received on the breast, which threw him into spitting of blood, and soon after formed the tumour, whereof he died. Upon dissection, the *aneurysm* was found so big, that it filled the whole cavity of the thorax on the right side. N° 265.

ANGARIA is used, in a general sense, for any burthen, or incumbrance forcibly imposed on persons.

Some define *angariae*, by personal services, which a party is compelled to discharge in his own person, or to serve at his own expence.—Or, such services imposed on lands, whereby a person is obliged to work for another, either with his horse, his ass, or the like.

ANGEOGRAPHIA *, the knowledge, or description of all kinds of ancient instruments, vessels, and utensils, both domestic, military, and nautical.

* The word is compounded of *αγγειον*, *vas*, vessel, and *γραφω*, *scribo*, I describe.

Angiography also includes the consideration of the weights, measures, &c. used by the several nations. See MEASURE, WEIGHT, VESSEL, &c.

ANGEOLOGY *, ANGIOLOGIA, in anatomy, the history, or description of the vessels in a human body; *e. gr.* the nerves, veins, and lymphatics.—See *Tab. Anat. Part II.* See also the article VESSEL.

* The word is derived from *αγγειον*, a vessel, and *λογος*, speech, or discourse.

Angiology is a branch of farcology. See SARCOLOGY.

ANGEL, a spiritual, intelligent substance; the first in rank and dignity among created beings.

The word *angel* is not properly a denomination of nature, but of office; denoting as much as *nuntius*, messenger, a person employed to carry one's orders, or declare his will.—Thus it is St. Paul represents *angels*, Heb. I. 14. where he calls them *ministering spirits*: and for the same reason the name is given, in the prophet Malachi, c. II. 7. to priests; and by St. Matthew, c. XI. 10. to St. John Baptist. Jesus Christ himself, according to the septuagint, is called in Isaiah, c. IX. 6. the *angel* of the mighty council; a name, says Tertullian, *De Carne Christi*, c. IV. which speaks his office, not his nature.—So the Hebrew word used in scripture, for *angel*, is also a name of office, and not of nature (N) *q. d.* legate, envoy, minister: and yet custom has prevailed inasmuch, that *angel* is now commonly taken for the denomination of a particular nature.

* And, in the opinion of most commentators, we are to understand this denomination to belong to Christ, in several other places of scripture; Ravanel says, 30. See Gen. XLVIII. 16. Exod. XXIII. 20. Jud. II. 1. Dan. X. 13. XII. 1. Mal. III. 1. Jude 9. Rev. XII. 7.

The existence of *angels* is supposed in all religions, though it is incapable of being proved *a priori*.—Indeed, the ancient Sadduces are represented as denying all spirits; and yet the Samaritans and Caraites, who are reputed Sadduces, openly allow them: witness Abulaid, the author of an Arabic Version of the Pentateuch; and Aaron, a Caraité Jew, in his comment on the Pentateuch; both extant in manuscript in the king of France's library.

In the Alcoran, we find frequent mention of *angels*.—The Musselmans believe them of different orders or degrees, and to be defined for different employments, both in heaven, and on earth. They attribute exceeding great power to the *angel* Gabriel; as, to be able to descend in the space of an hour from heaven to earth; to overturn a mountain with a single feather of his wing, &c. The *angel* Ahræ, they suppose, appointed to take the souls of such as die; and another *angel*, named Efraphil, they say, stands with a trumpet ready in his mouth to proclaim the day of judgment.

The heathen philosophers and poets were also agreed as to the existence of intelligent beings, superior to man; as is shewn by St. Cyprian, in his treatise of the vanity of idols, from the testimonies of Plato, Socrates, Trismegistus, &c.

Some Christian writers, after Lactantius, *Instit. lib. I. c. xv.* alledge the enigmatical, and the operations of magic, as convincing proofs thereof. St. Thomas produces other con-

VOL. I.

siderations, in behalf of the opinion. *lib. II. contra gentes*, c. xlv.

Authors are not so unanimous about the nature as about the existence of *angels*.—Clemens Alexandrinus believed they had bodies; which was also the opinion of Origen, Cæcilius, Tertullian, and several others. Athanasius, St. Basil, St. Gregory Nicene, St. Cyril, St. Chrysostom, &c. hold them to be mere spirits.

Ecclesiastical writers make an hierarchy of nine orders of *angels*. See HIERARCHY.

ANGEL is more particularly understood of a spirit of the ninth and lowest class, or order of the hierarchy, or heavenly choir.

The scripture makes mention of the devil and his *angels*.—We also say, the fallen *angels*, guardian *angels*, &c.

In the apocalypse, the denomination *angel* is also given to the pastors of several churches; who are called, The *angel* of the church of Ephesus; the *angel* of the church of Smyrna, &c.

Du Cange adds, that the same name was anciently given to certain popes, and bishops; by reason of their singular sanctity, &c.

ANGEL is also used in commerce, for an ancient gold coin struck in England; so called from the figure of an *angel* impressed upon it.

Its value in 1 Hen. VI. was 6s. 8d. in 1 Hen. VIII. 7s. 6d. in 34 Hen. VIII. 8s. in 6 Edw. VI. it was 10s. in 2 Eliz. it was 10s. and in 23 Eliz. the same.—And the half *angel*, or, as it was sometimes called, the *angelot*, was the moiety of this; and the quarter *angelot*, proportionable. V. Lownd. *Ess. Amend. Silv. Coin*, p. 38. *feqq.*

The *angel* now subsists no otherwise than as a money of account: denoting 20s.

The French have also had their *angels*, *semi-angels*, and *angelots*; but they are now disused.

ANGELIC, or ANGELICAL, something belonging to, or that partakes of, the nature of *angels*. See ANGEL.

We say an *angelical* life, &c.—St. Thomas is styled the *angelical doctor*.—The *angelical* salutation is called by the Romanists *Ave Maria*; sometimes simply *angelus*, or the *pardon*.

The Greeks distinguish two kinds of monks: those who profess the most perfect rule of life are called *monks of the great* or *angelical habit*.—The see of Rome has been sometimes denominated the *angelical see*.

ANGELIC Art. See the article ART.

ANGELIC Garment, ANGELICA Vestis, among our ancestors, was a monkish garment, which laymen put on a little before their death, that they might have the benefit of the prayers of the monks.

It was from them called *angelical*, because they were called *angeli*, who by these prayers *animæ salutem succurrebant*.—Hence, where we read the phrase *monachus ad succurrendum* in our old books, it must be understood of one who had put on the habit when he was at the point of death.

ANGELICA, a medicinal plant, thus named, on account of its great virtue as an alexipharmic, or counterpoison.

It is of a sweet smell, and aromatic taste; and is loaded with a highly exalted oil, and volatile salt.—It is reputed cordial, stomachic, cephalic, aperitive, sudorific, vulnerary, rescues poison, &c. though the chief intention wherein it is now prescribed among us, is, as a carminative.—Its root is in the most esteem; though the leaves are also used in distillation, &c.

The feeds have the same virtue with the root, and are of a more agreeable taste.

ANGELICA-WATER is one of the compound waters of the shops; thus called from the *angelica* roots, which are the basis thereof.

ANGELICA, *Αγγελικη*, was also a celebrated dance among the ancient Greeks, performed at their feasts.

It was thus called, from the Greek *αγγελος*, *nuntius*, messenger; by reason, as Pollux affirms us, the dancers were dressed in the habit of messengers.

ANGELICI, an ancient order of knights, instituted in 1191, by Hæcius Angelus Flavius Comnenus, emperor of Constantinople.

They divided into three classes; but all under the direction of one grand master.—The first, were called *Torquati*, from a collar which they wore, and these were fifty in number.—The second were called the *Knights of Justice*, and were ecclesiastics.—And the third were called *Knights Senators*.

Justiniani will have this order to have been instituted in the year 313, by Constantine; and supposes the occasion thereof to have been the appearance of an *angel* to that emperor, with the sign of a cross and these words, *In hoc signo vinces*: but, that there was such a thing as any military order in those days, is a mere fable.

ANGELICI were also a sect of ancient heretics.—St. Augustine supposes them thus called from their yielding an extravagant worship to angels, and such as tended to weaken their Epiphanius derives the name from their holding, that the world was created by angels.

ANGERONALIA, in antiquity, solemn feasts, held by the Romans, the 21st of December, in honour of Angerona, or Angeronia, the goddess of silence and silence.

Festus and Julius Modestus, quoted by Macrobius, *Saturn.* l. iii. c. 10. derive the name from *angina*, quinancy; and suppose the goddess to have been thus denominated, by reason of the pained over that disease.—Others suppose it formed from *angor*, grief, pain; to intimate that the gave relief to those afflicted therewith. Others deduce it from *angos*, I press, I close; as being reputed the goddess of silence, &c.

ANGINA*, in medicine, an inflammation about the muscles of the larynx, or pharynx, attended with an acute fever, difficulty of swallowing, and danger of suffocation.

* The word is derived immediately from the Latin *ango*, I vex, formed of the Greek *αγχο*, *suffoco*, *strangulo*.

The *angina* is the fame with what we popularly call *quinzy*, or *quinancy*. See **QUINZY**.

ANGLE, **ANGULUS**, in geometry, the aperture or mutual inclination of two lines, which meet, and form an *angle* in their point of intersection.

Such is the *angle* BAC, (*Tab. Geometry*, fig. 91) formed by the lines AB, and AC, meeting in the point A.—The lines AB and AC, are called the *legs* of the *angle*; and the point of intersection, the *vertex*.

Angles are sometimes denoted by a single letter affixed to the vertex, or angular point, as A; and sometimes by three letters, that of the vertex being in the middle, as BAC.

The measure of an *angle*, whereby its quantity is expressed, is as arch, DE, described from its vertex A, with any radius at pleasure, between its legs, AC and AB. See **ARCH**, and **MEASURE**.

Hence *angles* are distinguished by the ratio of the arches which they thus subtend, to the circumference of the whole circle. See **CIRCLE** and **CIRCUMFERENCE**.—And thus, an *angle* is said to be of so many degrees, as are the degrees of the arch DE.

Hence also, since similar arches, AB and DE, fig. 87. have the same ratio to their respective circumferences; and the circumferences contain each the same number of degrees; the arches AB, and DE, which are the measures of the two *angles* ACB, and DCE, are equal; and therefore the *angles* themselves must be so too.—Hence, again, as the quantity of an *angle* is estimated by the ratio of the arch, subtended by it to the periphery; it does not matter what radius that arch is described withal: but the measures of equal *angles* are always either equal arches or similar ones; and contrarily.

It follows, therefore, that the quantity of the *angle* remains still the same, though the legs be either produced or diminished.—And thus similar *angles*, and in similar figures, the homologous or corresponding *angles* are also equal.

The taking of *angles* is an operation of great use and extent in surveying, navigation, geography, astronomy, &c.

The instruments chiefly used for this purpose are quadrants, theodolites, circumferentors, &c.

Mr. Hadley has invented a new and excellent instrument for taking *angles*, useful where the motion of the object, or any circumstance causing an unsteadiness in the common instruments, renders the making observations difficult or uncertain. *V. Phil. Transf.* N° 420. p. 147. item. N° 425. p. 341.

To measure the Quantity of an *ANGLE*.—1°. On paper.—Apply the centre of a protractor on the vertex of the *angle* O; (*Tab. Surveying*, fig. 29) so that the radius O p lie on one of the legs: the degree shewn in the arch, by the other leg of the *angle*, will give the *angle* required.—To do the same with a line of chords, see **CHORD**.

2°. On the ground.—Place a surveying instrument, e. gr. a semi-circle, (*fig. 16.*) in such manner as that a radius thereof CG may lie over one leg of the *angle*, and the centre C over the vertex.—The first is obtained by looking through the sights F and G, towards a mark fixed at the end of the leg; and the latter, by letting fall a plummet from the centre of the instrument.—Then, the moveable index HI being turned this way and that, till through its sights you discover a mark placed at the extreme of the other leg of the *angle*: the degree it cuts in the limb of the instrument shews the quantity of the *angle*.

To take the *angle* with a quadrant, theodolite, plain table, circumferentor, compass, &c.

To plot or lay down, any given *angle*; i. e. the quantity of the *angle* being given, to describe it on paper. See **PLOTTING**.

To bisect a given *angle*, as HIK, (*fig. 92.*) from the centre I, with any radius at pleasure, describe an arch LM. From L and M, with an aperture greater than LM, strike two arches, mutually intersecting each other in N. Then, drawing the right line IN, we have HIN=NIK.

To trisect an *angle*. See **TRISECTION**.

ANGLES are of various kinds, and denominations.—

With regard to the form of their legs, they are divided into *Rectilinear*, *Curvilinear*, and *Mixed*.

Rectilinear, or *right-lined* *ANGLE*, is that whose legs are both right lines: as BAC (*Tab. Geometry*, fig. 91.)

Curvilinear *ANGLE* is that whose legs are both of them curves.

Mixed, or *Mixtilinear* *ANGLE*, is that, one of whose sides is a right line, and the other a curve.

With regard to their quantity, *angles* are again divided into *right*, *acute*, *obtuse*, and *oblique*.

Right *ANGLE* is that formed by a line falling perpendicularly on another; or that which subtends an arch of 90 degrees.

—Such is the *angle* KLM, (*fig. 93.*)

The measure of a *right* *angle*, therefore, is a quadrant of a circle; and consequently all *right* *angles* are equal to each other.

Acute *ANGLE* is that which is less than a *right* *angle*, or than 90°—as AEC, (*fig. 86.*)

Obtuse *ANGLE*, is that greater than a *right* *angle*, or whose measure exceeds 90°—as AED.

Oblique *ANGLE* is a common name both for *acute* and *obtuse* *angles*.

With regard to their situation in respect of each other, *angles* are divided into *contiguous*, *adjacent*, *vertical*, *alternate*, and *opposite*.

Contiguous *ANGLES*, are such as have the same vertex, and one leg common to both.—Such are FGH, and HGI, (*fig. 94.*)

Adjacent *ANGLE* is that made by producing one of the legs of another *angle*.—Such is the *angle* AEC, (*fig. 86.*) made by producing a leg ED, of the *angle* AED, to C.

Two *adjacent* *angles*, *x* and *y*, or any other number of *angles* made on the same point E, over the same right line CD, are together equal to two *right* ones; and consequently, to 180°.—And hence, one of two *contiguous* *angles* being given, the other is likewise given: as being the complement of the former to 180°.

Hence also, to measure an inaccessible *angle* in a field; taking an adjacent accessible *angle*, and subtracting the quantity thereof from 180°, the remainder is the *angle* required.

Again, all the *angles* *x*, *y*, *o*, E, &c. made around a given point E, are equal to four *right* ones; and therefore all make 360°.

Vertical *ANGLES* are those whose legs are continuations of each other.—Such are the *angles* *o* and *x*, (*fig. 86.*)

If a right line AB, cut another, CD, in E, the *vertical* *angles* *x* and *o*, as also *y*, and E, are equal.—And hence, if it be required to measure, in a field, or any other place, an inaccessible *angle*, *x*; and the other *vertical* *angle*, *o*, be accessible: this latter may be taken in lieu of the former.

Alternate *ANGLES*.—See **ALTERNATE**.—Such are the *angles* *x* and *y*; (*fig. 36.*)

The *alternate* *angles* *y* and *x* are equal. See **OPPOSITE** *angles*.

Opposite *ANGLES*. See **OPPOSITE**.—Such are *u* and *y*, and also *z* and *y*.

External *ANGLES* are the *angles* of any right-lined figure made without it, by producing all the sides severally.

All the *external* *angles* of any figure, taken together, are equal to four *right* *angles*: and the *external* *angle* of a triangle is equal to both the *internal* and *opposite* ones, as is demonstrated by Euclid, lib. 1. prop. 32.

Internal *ANGLES* are the *angles* made by the sides of any right-lined figure within.

The sum of all the *internal* *angles* of any right-lined figure is equal to twice as many *right* *angles* as the figure hath sides, excepting four. This is easily demonstrated from Euclid, prop. 32. lib. 1.

The *external* *angle* is demonstrated to be equal to the *internal* *opposite* one; and the two *internal* *opposite* ones are equal to two *right* ones.

Homologous *ANGLES* are such *angles* in two figures, as retain the same order from the first, in both figures.

ANGLE at the Periphery is an *angle* whose vertex and legs do all terminate in the periphery of a circle.—Such is the *angle* EFG, (*fig. 95.*)

Angle in the Segment is the same with that at the periphery.

It is demonstrated by Euclid, that all the *angles* in the same segment are equal to one another; that is, any *angle* EHG, is equal to any *angle* EFG in the same segment EFG.

The *angle* at the periphery, or in the segment, is comprehended between two chords EF and FD, and stands on the arch ED. See **CHORD**, &c.

The measure of an *angle* without the periphery G, (*fig. 96.*) is the difference between half the concave arch LM, whereon it

It stands, and half the convex arch NO intercepted between its legs.

ANGLE in a Semi-circle is an angle in a segment of a circle, whose base is a diameter thereof.

It is demonstrated by Euclid, that the angle in a semi-circle is a right one; in a segment greater than a semi-circle, it is less than a right one; and in a segment less than a semi-circle, it is greater than a right one.

Since an angle in a semi-circle stands on a semi-circle, its measure is a quadrant of a circle; and therefore is a right angle.

ANGLE at the centre is an angle whose vertex is in the centre of a circle, and its legs terminated in the periphery thereof.—Such is the angle CAB (fig. 95.)

The angle at the centre is comprehended between two radii, and its measure is the arch BC.

Euclid demonstrates, that the angle at the centre BAC is double of the angle BDC, standing on the same arch BC.—And hence, half of the arch BC is the measure of the angle at the periphery.

Hence also, two or more angles HLL, and HMI (fig. 97.) standing on the same or equal arches, are always equal.

ANGLE without the centre, HIK, is that whose vertex K is not in the centre, but its legs HK and IK are terminated in the periphery.

The measure of an angle without the centre is half of the arches HI and LM, whereon it and its vertical K do stand.

ANGLE of Contact is that made by the arch of a circle and a tangent in the point of contact.—Such is the angle HLM, (fig. 43.) See CONTACT.

The angle of contact, in a circle, is proved by Euclid to be less than any right-lined angle: But from hence it does not follow, that the angle of contact is of no quantity, as Peletarius, Wallis, and some others have imagined. *V. Wall. Algeb. p. 71—105.*—Sir Isaac Newton shews, that if the curve HAE (fig. 98.) be a cubic parabola, the angle of contact, where the ordinate DF is in the subtriple ratio of the abscissa AD, the angle BAF, contained under the tangent AB in its vertex, and the curve, is infinitely greater than the circular angle of contact BAC; and that, if other parabolas of higher kinds be described to the same axis and vertex, whose abscissas AD are as the ordinate DFs, DFs, &c. you will have a series of angles of contact going on infinitely, of which any one is infinitely greater than that next before it.

ANGLE of a Segment is that made by a chord with a tangent, in the point of contact.—Such is the angle MLH (fig. 43.)

It is demonstrated by Euclid, that the angle MLC is equal to any angle MAL in the alternate segment MAL.

For the Effects, Properties, Relations, &c. of ANGLES, when combined into Triangles, Quadrangles, and polygonous Figures, see TRIANGLE, QUADRANGLE, SQUARE, PARALLELOGRAM, POLYGON, FIGURE, &c.

Equal ANGLES } see the articles } **EQUAL.**
Similar ANGLES } **SIMILAR.**

ANGLES are again divided into plane, spherical, and solid.

Plane ANGLES are those we have hitherto been speaking of: which are defined by the inclination of two lines in a plane, meeting in a point.

Spherical ANGLE is the inclination of the planes of two great circles of the sphere.

The measure of a spherical angle is the arch of a great circle at right angles to the planes of the great circles forming the angle intercepted between them.—For the properties of spherical angles, see SPHERICAL ANGLE.

Solid ANGLE is the mutual inclination of more than two planes, or plane angles, meeting in a point, and not contained in the same plane.—For the measure, properties, &c. of solid angles, see SOLID ANGLE.

We also meet with other less usual sorts of angles among some geometers; as,

Horned ANGLE, *angulus cornutus*, that made by a right line, whether a tangent or secant, with the periphery of a circle.

Lunular ANGLE, *angulus lunularis*, is that formed by the intersection of two curve lines; the one concave, and the other convex. See LUNE.

Cuspid ANGLE, *angulus cissoides*, is the inner angle made by two spherical convex lines intersecting each other. See CUSPID.

Sistruid ANGLE, *angulus sistruides*, is that in figure of a sistrum. See SISTRUM.

Pelecid ANGLE, *angulus pelecoides*, is that in figure of a hatchet. See PELECIDES.

ANGLE, in trigonometry. See TRIANGLE and TRIGONOMETRY.

For the sines, tangents, and secants of angles. See SINE, TANGENT, and SECANT.

ANGLE, in mechanics.—**Angle of Direction**, is that comprehended between the lines of direction of two conspiring forces. See DIRECTION.

Angle of Elevation is that comprehended between the line of

direction of a projectile, and a horizontal line.—Such is the angle ARB, (Tab. Mechanics, fig. 47.) which is comprehended between the line of direction of the projectile AR, and the horizontal line AB.

ANGLE of Incidence is that made by the line of direction of an impinging body, in the point of contact.—Such is the angle DCA, (fig. 63.)

ANGLE of Reflection is that made by the line of direction of the reflected body, in the point of contact from which it rebounds.—Such is the angle ECF.

ANGLE, in optics.—**Visual or Optic angle**, is the angle included between the two rays drawn from the two extreme points of an object to the centre of the pupil.—Such is the angle ABC, (Tab. Optics, fig. 69.) comprehended between the rays AB, and BC.

Objects seen under the same, or an equal angle, must always appear equal.

ANGLE of the Interval, of two places, is the angle subtended by two lines directed from the eye to those places.

ANGLE of Incidence, in catoptrics, is the lesser angle, made by an incident ray of light, with the plane of a speculum; or, if the speculum be concave or convex, with a tangent in the point of incidence.—Such is the angle ABD (fig. 26.)

Every incident ray, AB, makes two angles, the one acute, ABD, the other obtuse, ABE; though sometimes both right.—The lesser of such angles is the angle of incidence.

ANGLE of Incidence, in dioptrics, is the angle ABI, (fig. 56.) made by an incident ray, AB, with a lens or other refracting surface, HI.

ANGLE of Inclination is the angle ABD, contained between an incident ray, AB, and the axis of incidence, DB. See Axis, &c.

ANGLE of Reflection, } in catoptrics. See REFLECTION.
Reflected ANGLE, }

ANGLE of Refraction, } in dioptrics. See REFRACTION.
Refracted ANGLE, }

ANGLE, in astronomy.—**ANGLE of commutation**. See COMMUTATION.

ANGLE of Elongation, or, **ANGLE at the earth**.

Parallactic ANGLE. See PARALLACTIC ANGLE.

ANGLE at the Sun, the **Inclination** is the Angle RSP, (Tab. Astronomy, fig. 25.) under which the distance of a planet P, from the ecliptic PR, is seen from the sun.

ANGLE of the East. See NONAGESIMAL.

ANGLE of Obliquity, of the ecliptic. See OBLIQUITY, and ECLIPTIC.

The angle of inclination of the axis of the earth, to the axis of the ecliptic, is 23°, 30'; and remains inviolably the same in all points of the earth's annual orbit. By means of this inclination, such inhabitants of the earth as live beyond 45° of latitude have more of the sun's heat, taking all the year round; and those who live within 45° have less of his heat, than if the earth always moved in the equinoctial.

ANGLE of Longitude is the angle which the circle of a star's longitude makes with the meridian, at the pole of the ecliptic.

ANGLE of right Ascension is the angle which the circle of a star's right ascension makes with the meridian at the pole of the world. See RIGHT ASCENSION.

ANGLE, in navigation.—**ANGLE of the Rhumb**, or **Loxodromic ANGLE**. See RHUMB and LOXODROMY.

ANGLES, in fortification, are understood of those formed by the several lines used in fortifying, or making a place defensible.

These are of two sorts; *real*, and *imaginary*.—*Real angles* are those which actually subsist and appear in the works.—Such are the *flanked angle*, the *angle of the epaule*, *angle of the flank*, and the *re-entering angle of the counterescarp*.—*Imaginary or occult angles* are those which are only subservient to the construction, and which subsist no more after the fortification is drawn.—Such are the *angle of the centre*, *angle of the polygon*, *flanking angle*, *salient angle of the counterescarp*, &c. Savin. Nouv. Ecol. milit. p. 36, and 38.

ANGLE of, or at, the Centre is the angle formed at the centre of the polygon, by two semi-diameters drawn thither from the two nearest extremities of the polygon.—Such is the angle CKF (Tab. Fortificat. fig. 1.)

ANGLE of the Circumference is the mixt angle made by the arch drawn from one gorge to the other.

ANGLE of the Counterescarp is that made by the two sides of the counterescarp, meeting before the middle of the curtain.

ANGLE of the Curtin, or *of the Flank*, is that made by, or contained between, the curtain and the flank; such is the angle BAE.

ANGLE of the Complement of the Line of Defence, is the angle arising from the intersection of the two complements one with another.

Diminished ANGLE is the angle which is made by the meeting of the exterior side of the polygon with the face of the bastion.—Such is the angle BCF.

ANGLE, *the Polygon* is the *angle* GHM, intercepted between the two internal sides GH, and HM, or the two external sides.

ANGLE of the Epurde, or Shoulder, is that formed by the flank and the face of the bastion.—Such is the *angle* ABC.

ANGLE of the Figure is the *angle* GHM, made in H, between the two sides, by the meeting of the innermost lines of the figure GH and HM.

Flank of the outward, or ANGLE of the Tenaille, is that made by the two lines of defence, i. e. the two faces of the bastion, when prolonged.

ANGLE of the Curtin is the *angle* CDE, made by the flank and the curtin.

ANGLE flank is by some called the *ANGLE of the Bastion*, is the *angle* BCS, made by the two faces of the bastion, BC, CS; being the cutaneous part of the bastion, and that most exposed to the enemy's batteries, and therefore by some called the *part of the bastion*.

ANGLE of the Flank is that formed by the flank and the curtin.

ANGLE forming the Flank is that consisting of one flank, and one demi-voie.

ANGLE forming the Face is that composed of one flank and one face.

ANGLE of the Triangle, in fortification, is half the *angle* of the polygon.

ANGLE of the Moat is that made before the curtin, where it is flanked.

Re-entering, or Re-entrant ANGLE, is that whose vertex is turned inwards, towards the place.

Salient ANGLE is that which advances its point toward the field.

ANGLE of the Tenaille, or the outward flanking angle, called also the *angle of the moat, or the dead angle*, is made by the two lines flanking in the faces of the two bastions, extended till they meet in an *angle* towards the curtin.—This always turns its point in towards the work.

ANGLE of a wall, in architecture, is the point or corner where two walls, or faces of a wall meet.

ANGLE of a Battalion, is the military art, are those following, where the ranks and files terminate. See *BATTALION*.

The *angles* of a battalion are said to be *blunted*, when the soldiers at the four corners are removed, so that the square battalion becomes octagonal: This was an evolution very common among the ancients, though now disused.

ANGLES, in anatomy, are understood of the canthi, or corners of the eye, where the upper eye-lid meets with the under.

That next the nose is called the *great or internal*, and that towards the temples, the *less or external angle or canthus*. See *CANTHUS*.

ANGLES, in astrology, denote certain houses of a figure, or scheme of the heavens.—Thus the horoscope of the first house is termed the *angle of the east*.

ANGLICANÆ Guttae. See the article *GUTTAE*.

ANGLICANUS Sudor. See the article *SUDOR*.

ANGLICISM, a word or phrase in the English idiom; or a manner of speech peculiar to the English tongue. See *IDIOm* and *ENGLISH*.

ANGLING, the art of catching fish by means of a rod, with a line, hook and bait fitted thereto.

There are several prudential rules observed by thorough anglers; such as, not to wear any white or shining apparel, but be clothed in a dark sky-colour: to invite the fish to the place intended for *angling*, by casting in from time to time proper foods, as boiled corn, worms, and garbage: to keep them together in the time of *angling*, by throwing in grains of ground malt; or sinking a box of worms, with small holes for them to creep slowly out at, &c. To draw salmon or trout together, they use a composition of fine clay incorporated with blood, and malt ground.

To learn what bait is best for any fish at any time; after having caught one, they fit his gills, and take out the stomach; and thus find what he last fed on.

The best methods of *angling* for salmon, trout, carp, tench, pike, perch, dace, gudgeon, roach, flounder, &c. See under the article *FISHING, Trout-FISHING, &c.*

ANGLING Fly. See the article *FISHING Fly*.

ANGLING Hook. See the article *FISHING Hook*.

ANGLING Line is either made of hair, twisted; or of silk; or the Indian weed.—The best colours are the forrel, whitish, and grey; the two last for clear waters, the first for muddy ones. Nor is the pale watery green despicable: this colour is given artificially, by steeping the hair in a liquor made of alum, foot, and the juice of walnut-leaves boiled together.

ANGLING Rod. See *FISHING Rod*.

In *angling*, they observe, after having struck a large fish, to keep the *rod bent*; which will hinder him from running to the utmost length of the rod line, by which he would be enabled to break his hold, or the hook.

ANGUINEAL Hyperbola. See *HYPERBOLA* and *CURVE*.

ANGULAR, something that relates to, or hath, *angles*. See *ANGLE*.

Angular objects at a distance appear round; the little inequalities disappearing at a much less distance than the bulk of the body.

ANGULAR Motion is a compound kind of motion, wherein the moveable both slides and revolves at the same time.

Such is the motion of the wheel of a coach, or other vehicle.

The phenomena, &c. of such motion, see accounted for under the article *ROTA Aristotelica*.

ANGULAR Capital.

ANGULAR Column.

ANGULAR Niche.

Acute ANGULAR Section.

ANGULAR Motion, in astronomy, is the increase of the distance between any two planets, revolving round any body as the common centre of their motion.

The quantity of this motion is expressed by two right lines, drawn from the said centre to the revolving bodies; which will open wider, and consequently the angle will grow greater, as the revolving bodies part farther and farther from one another.

ANGUSTICLAVIA*, or *ANGUSTUS CLAVUS*, in antiquity, a tunica, embroidered with little purple studs, worn by the knights.

* The word is compounded of *angustus*, narrow, small; and *clavi*, nail or stud: in regard those ornaments were smaller in this garment than in the *Laticlavia*, which was worn by the senators.

ANHELITUS* signifies a shortness and thickness of breath: as in an asthma. See *RESPIRATION*, and *ASTHMA*.

The word is Latin, formed of the verb *anheo*, I puff and blow.

ANIL, in natural history, the shrub from whose leaves and stalks indigo is prepared. See *INDIGO*.

ANIMA*, a soul; whether rational, sensitive or vegetative. See *SOUL*.

* The word is pure Latin, formed of the Greek *anima*, ventus, wind, or breath.

ANIMA Articulatorum is a denomination sometimes given to hermodactyls; on account of their efficacy in disorders of the joints. See *HERMODACTYL*.

ANIMA Hepatis, soul of the liver; a term applied by the chymists to the *sal martis*, salt of iron or steel; on account of its use in distempers of that part.

It is more usually prescribed under the name of *vitriolum martis*.

ANIMA Mundi, q. d. soul of the world, or of the universe, denotes a certain pure, ethereal substance or spirit, diffused, according to many of the ancient philosophers, through the mass of the world, informing, actuating, and uniting the divers parts thereof into one great, perfect, organical, and vital body or animal.

Plato treats at large of the *ψυχὴ τοῦ κόσμου*, in his *Timæus*; and is even supposed to be the author of the dogma: yet are interpreters much at a loss about his meaning. Aristotle, however, taking it in the common and obvious sense, strenuously opposes it.

Seranus, on Plato's *Timæus*, explains this doctrine thus: 'Our philosopher will have the universe *ζῶον ἐκφυγὸν πᾶσι*, consisting of body and spirit; the spirit he makes to be that analogy, or symmetry, whereby things of different nature are amicably associated in the grand compages of all things.'

In which sense the *anima mundi* signifies as much as the 'form of the universe'.

Others will have the *anima mundi* to signify I know not what ignific virtue, or vivific heat, infused into the chaos, and disseminated through its whole frame; for the conservation, nutrition, and vivification thereof.

Hence that of the poet:

Ignem est ollis vigor et cælestis origo—Virg. *Æn.* 4. 730.

Others suppose Plato, by his *anima mundi*, to have meant God, or the spirit of God; and to have taken the hint from Moses, who, in his account of the first day's creation, says, *The spirit of God moved on the face of the deep*.

The modern Platonists explain their master's *anima mundi* by a certain universal, ethereal spirit, which in the heavens exists perfectly pure, as retaining its proper nature; but on earth, pervading elementary bodies, and intimately mixing with all the minute atoms thereof, it assumes somewhat of their nature; and becomes of a peculiar kind.—

So the poet:

*Spiritus intus alit, totosque infusa per artus
Mens agit atq; molem, et magno se corpore miscet.*

They add, that this *anima mundi*, which more immediately resides in the celestial regions as its proper seat, moves and governs the heavens in such manner, as that the heavens themselves

themselves first received their existence from the fecundity of the same spirit: for that this *anima*, being the primary source of life, every where breathed a spirit-like itself, by virtue whereof various kinds of things were framed conformable to the divine ideas.

The notion of an *anima mundi* is rejected by most of the modern philosophers; though M. du Hamel thinks, without any great reason; for the generality of them admit something very much like it. Thus the Peripatetics have recourse to celestial influxes, in order to account for the origin of forms, and the secret powers of bodies.

The Cartesians have their subtle matter, which answers to most of the uses and intentions of Plato's *anima mundi*; being supposed to flow from the sun and the other heavenly bodies, and to be diffused through all the parts of the world, to be the source or principle of all motion, &c.

Some later philosophers in the place of these substitute fire; and others a subtle elastic spirit or medium diffused through all the parts of space.

The principal thing objected, on the Christian scheme, against Plato's doctrine of the *anima mundi*, is, that it mingles the deity too much with the creatures; confounds, in some measure, the workman with his work, making this, as it were, a part of that, and the several portions of the universe for many parts of the Godhead.—

Yet is the same principle asserted by Seneca, Epist. 92. *Totum hoc quo continemur, & animus est, & Deus. Et sciti ejus sumus, & membra*—

ANIMA Pulmonum, was used for crocus, or saffron; by reason of its supposed great use in diseases of the lungs.

ANIMADVERSION * sometimes signifies *correction*; and sometimes remarks or observations made on a book, &c. and sometimes, a serious consideration and reflection on any subject, by way of criticism.

* The word is formed of the Latin *animadvertere*, to animadvert; of *animus*, the mind, and *adverto*, I turn to, or toward.

ANIMAL *, a being, which, besides the power of growing, increasing, and producing its like, which vegetables likewise have, is further endowed with sensation, and spontaneous loco-motion.

* The word is derived from the Latin *anima*, soul; and literally denotes something endued with a soul.

An *animal*, respect being only had to the body, not the soul, may be defined with Boerhaave to be an organic body, consisting of vessels and juices, and taking in the matter of its nutriment, by a part called a *mouth*; whence it is conveyed into another called the *intestines*, into which it has roots implanted, whereby it draws in its nourishment, after the manner of plants.

According to this definition, an *animal* is distinguished from a fossil, in that it is an organic body; and from a vegetable by this, that it has its roots within itself, whereas a plant has them without itself.

In effect, the intestines of an *animal* are, in reality, no more than its earth, or the body it adheres to; into which it sends forth its roots, that is, the lacteal vessels, which thence draw the matter of its life and increase.

An *animal* is better defined from its mouth than its heart; since we do not know whether the whole tribe have such a part; for as several have sixteen hearts, particularly the silk-worm, and some even sixty: so it is possible, others may have none at all.

Nor can any general character of an *animal* be taken from the brains, the lungs, or the like; since we know of many quite destitute thereof.

The genuine characteristic, then, of an *animal* is to be free and at large with respect to the subject it derives its nourishment from: for every thing is taken in by the mouth; and the mouth does not adhere to anything: whereas all plants are connected, in some manner or other, to the body which furnishes them food.

Hence it follows, that a *fœtus*, while it remains in the mother's womb, is a real plant; as being connected by the funicular umbilicalis to the placenta, and by the placenta to the uterus, from whence it receives its nutriment.—If it did not derive its food by the said funiculus, but by its mouth, it were an *animal*; and if it drew it by both, it would be a zoophyte, or plant-animal.

Some have defined *animals* from their loco-motion, as being capable of shifting from place to place; and plants, from their sticking fast to the same subject: but on this principle, oysters, mussels, cockles, &c. would be almost excluded from the class of *animals*, in as much, as they usually adhere, or grow to rocks, &c. yet it is certain, that those creatures are real *animals*, as they have mouths and stomachs to take in their food, and lacteal and mesenteric veins to receive it, and sometimes can even move from place to place on occasion.—Indeed, mussels seem an exception from the former definition. If, as is said, that anomalous creature breathes, and receives its nourishment, not at the mouth, but by the anus: the part which we account its head, though without either eyes, ears, or tongue, or any other apparatus, save a hole, which we

may call its mouth, is an immoveable part; being fastened to one of the shells, so that it cannot seek for food, but the food must come to seek it. This food is water, which, as the shells open, enters in at the anus of the mussel, which opens at the same time; and passing thence into certain canals, between the inner surface of the shell and the outer surface of the *animal*, is said to be conveyed thence into its mouth, by a certain motion, which the *animal* can produce at pleasure.

We chuse therefore with Dr. Tyson, to fix the criterion of an *animal* in a ductus alimentalis, i. e. a gula, stomach, and intestines: all which make but one continued canal.

All *animals*, according to the most probable and received opinion, come from eggs, and are there inclosed, as it were in epitome, till the seed of the male penetrate their covering, and stretch them, so as they become ready for hatching.

There then enters into their vessels a chylous juice; which, being pushed forwards by the spirits, circulates through the whole habit of the little body, nourishes and dilates it by little and little, and thus produces what we call *growth*.

This circulation, repeated several times, refines and attenuates the juices, till at length they become of a red colour, and are converted into what we call *blood*.—This natural operation bears a great resemblance to several chymical processes, by which, in attenuating and dissolving oily or sulphureous substances, they assume a red colour.

The philosophers comprehend man under the species of *animals* *; and define him, a reasonable *animal*: though among naturalists, &c. the term *animal* is usually restrained to irrationals.

* Man, says Lister, is as very an animal as any quadruped of them all: and most of his actions are resolvable into instinct, notwithstanding the principles which custom and education have superinduced. *Journ. to Paris.*

St. Augustin relates, that a great many scrupulous persons in his time extended that prohibition of the law, *Thou shalt not kill*, to all *animals*: they grounded their opinion on some passages of scripture wherein God speaks of *animals* as if they had some principle of reason: declaring that he will require the blood of man at the hand of beasts, Gen. c. ix. Adding in the same place, that he makes a covenant not only with man, but with every living creature.

Pliny relates, that in Africa the species of *animals* are various and changeable; for that the great scarcity of water bringing all sorts of beasts to the same pools to drink, the males often mix with the females of other species: inasmuch that it was become a proverb in Greece, that *Africa was always producing some new monster*.—Hist. Nat. l. 8. c. 16.—But this is no ways warranted by the observations of modern naturalists; according to Dr. Shaw, the ordinary course of things is much the same in Barbary as elsewhere; each species, as far as ever he could be informed, keeping inviolably to itself. If we except the mule and the kumzah, which are procreated from animals under the direction of mankind, and not properly left to themselves, few, if any, instances can be produced in favour of the ancient proverb, *Semper aliquod novi Africam afferre*.—V. Shaw. Trav. p. 261.

ANIMALS are ordinarily divided into *terrestrial, aquatic, volatile, amphibious, insects*, &c.

Terrestrial animals, are either *quadrupeds*, or *reptiles*.—Quadrupeds have either the feet cloven, as the bullock; or entire, as the horse; or divided into several toes or claws, as the dog, lion, &c. The other divisions will be found under the words *FISH, BIRD, &c.*

For a general account of the various kinds of *animals*, we shall here subjoin Mr. Ray's scheme.

Animals are either,

- Sanguineous*, that is, such as have blood, which breathe either by
 - Lungs, having either
 - Two ventricles in their heart, and those either
 - Viviparous.
 - Aquatic, as the whale kind. See *WHALE*.
 - Terrestrial, as quadrupeds.
 - Oviparous, as birds.
 - But one ventricle in the heart, as frogs, tortoises and serpents.
 - Gills, as all sanguineous fishes, except the whale kind.
- Exanguineous*, or without blood, which may be divided into
 - Greater; and those either
 - Naked.
 - Terrestrial, as naked snails.
 - Aquatic, as the poulp, cuttle-fish, &c.
 - Covered with a tegument, either
 - Crustaceous, as lobsters and craw-fish.
 - Testaceous, either
 - Univalve, as limpets.
 - Bivalve, as oysters, mussels, cockles, &c.
 - Turbinate, as periwinkles, snails, &c.
 - Lesser, as insects of all sorts.

Ichthyarous hairy animals, or quadrupeds, are either hoefed, which are either

- { Whole-footed, or hoofed, as the horfe and afs :
- { Cloven-footed, having the hoof divided into
 - { Two principal parts, called *bifcula*, either
 - { Such as chew not the cud, as fwine.
 - { Ruminant, or fuch as chew the cud, divided into
 - { Such as have perpetual and hollow horns :
 - { Beef-kind,
 - { Sheep-kind,
 - { Goat-kind.
 - { Such as have folid, branched, and deciduous horns, as the deer kind.
- { Four parts, or *quadrifcula*, as the rhinoceros and hippopotamus.
- { Claw'd, or digitate, having the foot divided into
 - { Two parts or toes, having two nails, as the camel-kind.
 - { Many toes or claws, either
 - { Undivided, as the elephant
 - { Divided, which have either
 - { Broad nails and an human fhape, as apes.
 - { Narrower and more pointed nails, which in refpect of their teeth, are divided into fuch as have
 - { Many fore-teeth or cutters in each jaw :
 - { The greater, which have
 - { A fhorter fnout and rounder head, as the cat-kind.
 - { A longer fnout and head, as the dog-kind.
 - { The lower, the veimin or weazel kind.
 - { Only two large and remarkable fore-teeth, all which are phy-tivorous, and are called the hare-kind.

For particulars relating to animals, their number, analogous ftructure, fagacity, inftinct, &c. See CREATION, ARK, HEAD, NECK, TAIL, FOOT, HORN, HOOF, STORGE, INSTINCT, &c.

ANIMALS confift of *folids*, or firm parts, as flefh, bones, membranes, &c. and *fluids*, as blood, &c.—Of an intermediate kind may perhaps be reckoned fat, &c.

The *folids* are mere earth, bound together by fome oily humour ; and accordingly they are reducible by fire into fuch earth again.

Thus a bone being perfectly purged of all its moiſture, by calcination, is found a mere earth, which the leaft force will crumble into duſt, for want of the natural gluten : yet the fame bone, by immerging it in water or oil, becomes firm and ſtrong again ; and more fo in oil than in water. And thus cups are made of animal earth, which will ſustain the utmoſt effect of fire.

The fluid parts of animals are the cruder as they are leſs diſtant from the lacteals, and abſorbent veſſels.—Thus chyle is little elſe but a vegetable juice ; but in its farther progreſs, it gradually lays aſide its vegetable characters, till after a number of circulations it becomes a perfect animal juice under the denomination of blood, from whence the other humours are all derived.

Animal ſubſtances are diſtinguiſhed from thoſe of vegetables by two circumſtances: the firſt, that when burnt they are found perfectly inſipid ; all animal ſalts being volatile and flying off with heat : the contrary of which is found in vegetables, which conſtantly retain ſome fixed ſalt in all their aſhes.

The ſecond, that no ſincere acid is contained in any animal juice ; nor can any acid ſalt be extracted from the ſame : the contrary of which is found in all vegetables.

Yet are animals reconverted into their vegetable nature, by putrefaction.

Oviparous ANIMALS. } See the articles { OVIPAROUS.
Rapiacious ANIMALS. } RAPACIOUS.
Generation of ANIMALS. } GENERATION.

ANIMALS make the ſubject of that branch of natural hiſtory called *Zoology*.

The ſtructure of animals, with their diſorders, remedies, &c. make the ſubject of anatomy, medicine, &c.

ANIMALS make the principal matter of heraldry ; both as bearings, and as ſupporters, &c.

It is an eſtabliſhed rule among the heralds, that in blazoning, animals are always to be interpreted in the beſt ſenſe ; that is, according to their moſt noble and generous qualities, and ſo as may redound moſt to the honour of the bearers.

Thus the fox, being repeated witty, and wiſhal given to filching for his prey ; if this be the charge of an eſcutcheon, we are to conceive the quality repreſented to be his wit and cunning, not his theft.

Guillim adds, that all ſavage beaſts are to be figured in their fierceſt action ; as, a lion erected, his mouth wide open, his claws extended, &c. Thus formed, he is ſaid to be *rampant*.—A leopard, or wolf is to be portrayed going, as it were, pedetentim : which form of action, ſaith Chafflaneus, fits their natural diſpoſition, and is termed *paſſant*.—The gentler kinds are to be ſet forth in their nobleſt and moſt advantageous action ; as, a horſe, running or vaulting, a grey-hound cour-

ing, a deer tripping, a lamb going with ſmooth and eaſy pace, &c.

Every animal is to be moving, or looking, to the right ſide of the ſhield ; and it is a general rule, that the right foot be placed foremoſt, becauſe the right ſide is reckoned the beginning of motion : add, that the upper part is nobler than the lower ; ſo that things conſtrained either to look up or down, ought rather to be deſigned looking upwards.—It muſt be noted, that notwithstanding theſe ſolemn precepts of Guillim, and the other maſters of armory, we find by experience, that there are lions paſſant, couchant, and dormant, as well as rampant, and that moſt animals in arms look down, and not up.

ANIMAL is alſo uſed adjectively, to denote ſomething that belongs to, or partakes of, the nature of an animal body.

Thus we ſay animal food, animal oeconomy, &c.

ANIMAL Actions are thoſe peculiar to animals ; or which belong to animals, as ſuch.

Such are ſenſation, and muſcular motion. See SENSATION, &c.

ANIMAL Motion is the ſame with what we call muſcular motion.

It is divided into two branches ; natural or involuntary, and ſpontaneous.

ANIMAL Functions, among phyſicians. See FUNCTION.

Moralifts frequently oppoſe the animal part, which is the ſenſible, fleſhy part of man, to the rational part, which is the underſtanding.

ANIMAL Secretion is the act whereby the divers juices of the body are ſecreted or ſeparated from the common maſs of blood, by means of the glands.

The theory of animal ſecretion is one of the improvements in phyſic, for which we are indebted to geometrical reaſoning.—The ſum of what our late writers on this ſubject have ſhewn, may be reduced to the following heads :

1. Different juices may be ſeparated from the common maſs of blood, by means of the different diameters of the oriſices of the ſecretory ducts. For all particles, whole diameters are leſs than thoſe of the ducts, will paſs through them ; ſo that any matter may be evacuated by any of the glands, provided the diameters of its particles be made leſſer than thoſe of the ſecretory duct, either by a comminution of the matter to be ſeparated, or by an enlargement of the ſeparating paſſage.

2. By the different angle which the ſecretory duct makes with the trunk of the artery. For all fluids prefs the ſides of the containing veſſels in a direction perpendicular to its ſides ; which is evident in the pulſation of the arteries, it being to that preſſure that the pulſation is wholly owing. It is likewiſe evident, that the blood is urged forward by the force of the heart ; ſo that the motion of ſecretion is compounded of both theſe motions. Now the lateral preſſure is greater when the direct velocity is ſo, but yet not in proportion to ſuch velocity : for the lateral preſſure is conſiderable, even when the fluid is at reſt ; being then in proportion to the ſpecific gravity of the fluid : and in a fluid like the blood in the arteries, which is thrown in a right direction, or a direction parallel to the axis of the veſſel, the lateral preſſure will be in a proportion compounded of both : from whence it will follow, that if two particles of equal diameters, but of unequal ſpecific gravities, arrive, with the ſame velocity, at an oriſice capable of admitting them, yet they will not both enter it and paſs, becauſe their motion of direction will be different : ſo that the diverſity of the angles which the ducts make with the trunk of the artery, is altogether neceſſary to account for all the poſſible diverſity of ſecreted fluids, even ſuppoſing their diameters and figures to be the ſame.

3. By the different velocities with which the blood arrives at the oriſices of the ſecretory ducts.—For ſince the ſecretions are made in a fluid form ; no poſſible reaſons can be aſſigned, why ſome animals have a ſoft looſe texture of the ſolid parts, and why one part of the body is of an eaſily ſeparated texture, and others of a firmer, but this different velocity of the blood at the oriſices of the ſecretory ducts, whereby the particles ſecreted for nourishment, and accretion, are dove or impacted into the vacuola that receive them, with a greater or leſs force ; it being difficult to imagine that ſuch a diverſity in texture can altogether proceed from the different ſolidities and conſtacts of the conſtituent parts. See further under the article SECRETION.

ANIMAL Spirits are a fine ſubtile juice or humour, in animal bodies ; ſuppoſed by many to be the great inſtrument of muſcular motion, ſenſation, &c.

The ancients diſtinguiſhed ſpirits into three kinds, viz. animal, vital, and vegetative ; but the moderns have reduced them to one fort, viz. animal ; about the nature of which, and the matter whence they are formed, great diſputes have ariſen among anatomifts, though their very exiſtence has never been fairly proved.

As it is hard to define what could never yet be brought under the judgment of our ſenſes, all that we ſhall here offer concerning them, is, that they muſt needs be extremely ſubtile bodies, which

which escape all manner of examination by the senses; though ever so well assisted; and pervade the tracts of the nerves, which yet have no discoverable cavity or perforation; nor could ever by any experiment be collected; yet are constantly moving in vast quantities, as they must of necessity be, to perform all those mighty operations which are ascribed to them.—However, the antiquity of the opinion claims some reverence.

By the help of these, we are furnished with a vast number of precarious solutions of great phenomena; and without them we must leave a great chasm in the philosophical history of animal bodies.

They are supposed to be separated in the brain, from the subtiler parts of the blood: and thence carried, by the nerves, to all parts of the body, for the performance of all animal and vital functions.

ANIMAL Hunger.

ANIMAL Oeconomy.

ANIMAL Oil.

See the articles { HUNGER.
OECONOMY.
OIL.

ANIMALCULE, ANIMALCULUM, a diminutive of animal; expressing such a minute creature as is either scarce, or not at all, discernable by the naked eye.

Such are those numerous insects which croud the water in the summer months; changing it sometimes of a deep or pale red colour, sometimes of a yellow, &c. These often seem to be of the slimp kind, and the most common one is called by Swammerdam, *Pulex aquaticus arborefcens*. The cause of their concurrence at this time, Mr. Denham observes, is to perform their coit. He adds, that they afford a comfortable food to many water animals.—The green scum, on the top of stagnant waters, is often nothing else but prodigious numbers of another smaller order of animalcules; which in all probability serve for food to the pulices aquatici.

The microscope discovers legions of animalcules in most liquors, as water, wine, vinegar, beer, dew, &c. In the Philosophy. Tranfact. we have observations of the animalcules in rain-water, in several chalybeate waters, infusions of pepper, bay-berries, oats, barley, wheat, &c. See MICROSCOPE.

The human seed has been observed by divers authors to contain great numbers of animalcules; which gave occasion to the fable of generation *ab animalculo*.

ANIMATE, ANIMATED, something endued with life, or a living soul.

In mechanics, *animate power* is used to denote a man, or brute; in contradistinction to *inanimate powers*, as springs, weights, &c.

ANIMATED Mercury, among chymists, signifies quicksilver impregnated with some subtle and spirituous particles, so as to render it capable of growing hot when mingled with gold.

ANIMATED Needle, a needle touched with a load-stone. See NEEDLE, MAGNET, &c.

ANIMATION signifies the informing of an animal body with a soul.

Thus the fetus of the womb is said to come to its *animation*, when it begins to act as a true animal; or after the female that bears it is *quick*, as the common way of expression is.

The common opinion is, that this happens about forty days after conception. But Jer. Florentinus, in a Latin treatise entitled, *Homo dubius, sive de baptismo abortivorum*, shows this to be very precarious.

ANIME, or Gum ANIMÆ, in pharmacy, a kind of gum, or resin; whereof there are two kinds, the *western*, and *eastern*.

The western flows from an incision of a tree in New Spain, called *courbaril*; it is transparent, and of a colour like that of frankincense: its smell is very agreeable, and it easily consumes in the fire.

The eastern gum *anime* is distinguished into three kinds: the first is white; the second blackish, in smell like myrrh; the third pale, resinous, and dry.

All the several kinds of *anime* are used in perfumes, by reason of their agreeable smell; they are also applied externally in cold disorders of the head and nerves, and in palsies and catarrhs; but they are little known among us; inasmuch that our apothecaries usually sell bdellium for gum *anime*.

ANISCALPTOR, in anatomy, a muscle, otherwise called *latissimus dorsi*. See LATISSIMUS DORSI.

ANISE-SEED, a medicinal seed, produced by an umbelliferous plant of the same name, common in some gardens.

It has a sweetish taste, intermixed with something pungent and bitter, is reputed an aromatic, and prescribed not barely as a carminative against wind, but also as a pectoral, stomachic, and digestive.

It yields, by distillation, a white cordial oil, called *essence of anised*, of a very strong penetrating smell, and efficacious in its medicinal operation; it being also used by the confectioners to scent their pomatums, &c.

In distilling the *anise-seed* for the oil, there is produced a limpid water called *anise-feed water*, which has much the same virtues with the oil.

ANKER, ANCHOR, a liquid measure chiefly used at Amsterdam, &c.

The *anker* is the fourth part of the awm, and contains two stekans: each stekan consists of sixteen mingles; the mingle being equal to two Paris pints.

ANNALES, ANNALES, an historical account of the affairs of a state, digested in the order of years.

The difference between *annals* and history is variously assigned by various authors.—Some say that history is properly a recital of things which the author has seen, or been a by-stander to. What they build upon is, the etymology of the word; history in the Greek, signifying the knowledge of things present, and in effect, *isopieus* properly signifies to *see*. On the contrary, *annals*, say they, relate to the transactions of others, and such as the writer never saw.

Of this opinion the great *annalist*, Tacitus himself, seems to have been; in regard the first part of his work, which treats of former times, he calls *annals*; whereas, when he comes down to his own times, he changes his title, and calls it *history*.

Aulus Gellius is of a different opinion; and pretends, that history and *annals* only differ from one another as the genus does from the species; that history is the genus, and implies a narration or recital of things passed; and that *annals* are the species, and are also a recital of things passed, but with this difference, that these last are digested into certain periods, or years.

The same author gives us another opinion, which he says he borrows from Sempronius Asellio: according to that writer, *annals* are a bare relation of what passes each year; whereas history relates not only the transactions themselves, but also the causes, motives, and springs thereof. The *annalist* has nothing to do but to lay down his facts, but the historian reasons and descants on them.

Of this last opinion seems Cicero to be, when speaking of *annalists*, he says, *Unam dicendi laudem putant esse brevitate, non exornatores rerum, sed tantum narratores*. He adds; that history, in its original, was the composition of *annals*.

The same Cicero relates the origin of *annals*: to preserve the memory of transactions, the *pontifex maximus*, says he, wrote what passed each year; and exposed it on a table, in his own house, where every one was at liberty to read it.—This they called *annales maximi*; and this custom was kept up till the year of Rome 620.

Several other writers, in imitation hereof, took to this simple and naked way of relating facts; and were hence denominated *annalists*.—Such were Cato, Pictor, Piso, Antipater, &c.

The *annals of Grotius* is a book finely wrote, and contains very good things. It is not so particular as Strada, but it is more profound, and comes much nearer to Tacitus. *Patin. Lett. Chiof.* 120.

Lucas Holstenius, canon of St. John de Lateran, assured Naudé, that he was able to shew 8000 falsehoods in Baronius's *annals*, and prove them from MSS. in the Vatican library, of which he had the custody. *Patin. Lett. Chiof.* 165.

ANNATES, ANNATA, in ecclesiastical writers, denotes a year's income, due anciently to the pope upon the death of any bishop, abbot, or parish-priest; and to be paid by his successor.

Annates are so called from the Latin *annus*, year, because their rate is after the value of one year's purchase.

Annates are the same with what of latter days are called *primities*, or first fruits.—With this only difference, that first-fruits with us are paid to the king.

The first pope that imposed *annates* in England seems to have been Clement V. who, according to Matthew of Westminster, exacted *annates* of all the vacant benefices in the kingdom for the space of two years, or, according to Walsingham, for three years. His successor John XXII. introduced the like in France.

Yet Polydore Virgil, and some others, take *annates* to be of a much elder standing; and to have obtained long before they were paid to the pope.—'Tis certain at least, that from the twelfth century there were bishops and abbots, who, by some peculiar custom or privilege, took *annates* of the benefices depending on their diocese or abbey.

Matthew Paris, in his history of England, for the year 746, relates, that the archbishop of Canterbury, in virtue of a grant or concession of the pope, received *annates* of all the benefices that became vacant in England.—But in after-times the holy see thought fit to take these away from the bishops and archbishops, and appropriate them to themselves.—And from the popes, the parliament under Henry VIII. took them and gave them to the crown, 25 H. 8. c. 20. Finally Queen Anne restored them to the church, by appropriating them to the augmentation of poor livings.

ANNEALING; or, as it is popularly called, *Nealing*. See the article **NEALING**.

One fine use of silver, says Mr. Boyle, was only discovered since the art of *annealing* upon glass came to be practised.—For prepared silver, or even the crude metal, being burnt on a glass plate, will tinge it of a fine yellow, or golden colour. And there are several mineral earths, and other coarse matters, of use in this art, which, by means of fire, impart transparent colours to glass, and sometimes very different ones from those of the bodies themselves.

ANNEALING Furnace. See the article **FURNACE**.

ANNEXATION, in a legal sense, the act of joining or uniting some less considerable thing to a greater.

ANNEXED, something joined to or dependant on another.

—Thus we say, such a farm, such an advowson, is *annexed* to such a fee, such a manor, &c. Charles VIII. in the year 1486, *annexed* Provence to the crown of France.

ANNIENTED*, or rather **ANNIENTED**, a term sometimes used in law-books, in the sense of frustrated, or annulled.

* It is of French original; being formed of the verb *anéantir*, to bring to nothing, or to annihilate.

ANNIHILATION*, the act of reducing a substance into nothing; or of totally destroying and taking away its existence.

* The word is compounded of *ad* to, and *nihil* nothing.

Annihilation stands opposed to creation: the one supposes something made out of nothing, the other nothing made out of something.

All *annihilation* must be metaphysical or supernatural: bodies naturally admit of changes and alterations in their form; but not of *annihilation*.

Some philosophers object against this notion of *annihilation*; in that it supposes an act required thereto: whereas, according to them, *annihilation* must ensue upon God's merely ceasing to act, or to create a thing. For, if the conservation of a thing be a continued creation thereof, as is almost universally allowed; it is evident: a thing can no longer endure, than while God continues thus to create.

ANNIHILATION is also used in a moral sense.—The capital of the South Sea is reduced to one half; and unless care be taken to prevent male-practices of factors, &c. another *annihilation* will soon become necessary: especially as the dividend on the stock is reduced from six to three per cent. which is one per cent. less than is paid the company by the government.

ANNI Nubiles, among law-writers, the legal age, at which a maid becomes fit for marriage; which is at twelve years.

ANNIS communibus. See the article **COMMUNIBUS**.

ANNISEED. See the article **ANISE-SEED**.

ANNIVERSARY* is properly the yearly return of any remarkable day: anciently also called a *year-day*, or *mind-day*, that is, a memorial-day.

* The word is formed from *annus* and *verso*, in regard of its returning every year.

ANNIVERSARY Days, *dies anniversarii*, among our ancestors more particularly denote those days wherein the martyrdoms of the saints were yearly celebrated in the church; as also days whereon, at every year's end, men were wont to pray for the souls of their deceased friends.—*Anniversaria dies ideo repetitur defunctis, quantum nescimus qualiter eorum causa habeatur in alia vita*.—This was the reason given by Alcuinus in his divine offices.

ANNO Domini, q. d. in the year of our lord; the computation of time from the epocha of the incarnation of Jesus Christ.

ANNOISANCE, or *Nusance*, in law, a hurt or offence, either to a public place, as a high-way, bridge, or common river; or to a private one, by laying any thing that may breed infection, by incroaching, or by the like means. See **NUSANCE**.

ANNOISANCE is also used for a writ brought upon this transgression. See **NUSANCE**.

ANNOTATION*, a succinct commentary, or remark on a book, or writing; in order to clear up some passage, or to draw some induction, or consequence from it.

* The word is formed of the Latin *adnotatio*; of *ad* and *nota*, note.—The critics of the last age have made learned annotations on the scriptures, classics, &c.

ANNUAL, something which returns every year, or closes at the end of the year.

Thus we say, an *annual*, or yearly feast, office, commission, rent, revenue, income, &c.

The *annual* motion of the earth, see proved under the article **EARTH**.

ANNUAL is sometimes used for the yearly rent, or income of a prebendary, &c.

ANNUAL Argument of Longitude. See **ARGUMENT**.

ANNUAL Epactis. See the article **EPACT**.

ANNUAL Equation of the mean motion of the sun and moon, and of the moon's apogee and nodes.

The *annual equation* of the mean motion of the sun depends on the eccentricity of the earth's orbit; and is $16\frac{1}{2}$ of those parts, whereof the mean distance between the sun and the earth is 1000: whence by some, it is called the *equation of the centre*, and when greatest, is 1 degree $56'$, $20''$.

The greatest *annual equation* of the moon's mean motion is $11'$, $40''$ of its apogee $20'$, and of its node $9'$, $30''$.

These four *annual equations* are always proportionable; so that when any of them is at the greatest, the three others are also greatest; and *vice versa*.—Hence the *annual equation* of the centre (of the sun) being given, the other three corresponding *equations* will be given; so that one table (that is, of the central *equation*) may serve for all.

ANNUAL Leaves, are such *leaves* of plants, as come up afresh in the spring, and perish in winter.—These stand opposed to *ever-greens*.

ANNUAL plants, called also simply *annuals*, are such as only live their year, i. e. come up in the spring, and die again in autumn: and accordingly are to be recruited every year.

ANNUALIA, yearly oblations anciently made by the relations of deceased persons, on the day of their death.

This day they called *year-day*, &c. and on it, mass was celebrated with great solemnity.

ANNUENTES* *Musculi* in anatomy, a pair of transverse muscles, at the root of the vertebrae of the back, called also by Mr. Cowper, *Recti interni minores*, because they lie under the *Recti majores*. See **RECTI**.

* They are called *annuentes*, from *annuere*, to nod towards, because they help to nod the head, or draw it directly downwards and forwards. See **HEAD**, **MUSCLE**, &c.

ANNUITY, a yearly rent or revenue, paid either for term of life, or of years, or in fee and for ever.

In common law, the difference between a rent, and an *annuity* consists in this, that rent is payable out of land; whereas an *annuity* charges only the person of the grantor: and that, for the recovery of a rent, an action lies; whereas for that of an *annuity*, there only lies a writ of *annuity* against the grantor, his heirs and successors. Add, that *annuities* are never taken for assets; as being no free-holds in law.

The computation of the value of *annuities* on lives, &c. belongs to political arithmetic. See **POLITICAL arithmetic**.

Dr. Halley, in his observations on the Breslaw bills of mortality (Phil. Trans. ap. Lowth. 3. p. 669.) shews, that it is 80 to 1, a person of 25 years of age does not die in a year.—That it is 5 to 1, a man of 40 lives 7 years; and that one of 30 may reasonably expect to live 27 or 28 years. So great a difference is there between the life of man at different ages, that it is 100 to 1, one of 20 lives out a year; and but 38 to 1, that one of 50 doth so.

Whence, and from some other observations, he constructed the following table; shewing the value of *annuities* for every fifth year of life to the 70th.

Age.	Years Purchase.	Age.	Years Purchase.
1	10,28	40	10,57
5	13,40	45	9,91
10	13,44	50	9,21
15	13,33	55	8,51
20	12,78	60	7,60
25	12,27	65	6,54
30	11,72	70	5,32
35	11,12		

ANNULAR, **ANNULARIS**, something that relates to, or resembles a ring, by the Latins called *annulus*.

ANNULAR Cartilage, or **ANNULARIS**, is the second cartilage of the larynx, being round, and investing the whole larynx; called also *cricoides*.

ANNULAR Ligament, **Ligamentum ANNULARE**, is a strong ligament, encompassing the carpus or wrist; after the manner of a bracelet.

Its use is to connect or bind the two bones of the arm together; and also to restrain the tendons of the several muscles of the hand and fingers, and prevent their flying out of their places, when in action.

The ligament of the tarsus is also denominated *annular ligament*. See **TARSUS**.

Add, that the sphincter muscle of the anus is also called *annularis*, or *annular* muscle; from its figure.

ANNULAR Process or *Protuberance*, is a process of the medulla oblongata; thus called by Dr. Willis, in regard it surrounds the same, much like a ring. See **MEUDLLA Oblongata**.

ANNULAR is also an epithet given the fourth finger; popularly called the *ring finger*. See **FINGER**.

ANNULET, *little ring*; in heraldry, is a difference or mark

of distinction, which the fifth brother of any family ought to bear in his coat of arms. See DIFFERENCE.

Annulets are also part of the coat-armour of several families: they were anciently reputed a mark of nobility, and jurisdiction; it being the custom of prelates to receive their investiture *per baculum & annulum*.

ANNULETS, in architecture, are small square members, in the Doric capital; placed under the quarter round.—See *Tab. Archit. fig. 28. lit. q. and fig. 24. lit. n. and fig. 1.*

They are also called *Fillets, Lifels, &c.*

ANNULET is also used for a narrow flat moulding, common to other parts of a column, viz. the bases, &c. as well as the capital; so called, because it encompasses the column round.—In which sense *annulet* is frequently used for *baguette* or little astragal.

ANNULLING*, the abolishing of an act, procedure, sentence, or the like.

* The word is compounded of *ad* and *nullus*, none; *q. d.* undoing.

ANNUNCIATE, **ANNUNTIADA**, or **ANNUNTIATA**, a denomination common to several orders, both religious and military; instituted with a view to the annunciation.

The first religious order of this kind was instituted in 1232, by seven Florentine merchants.—These are also called *Servites, q. d. Servants*.

The second was a nunnery at Bourges, founded by Joan queen of France, after her divorce from Lewis XII.

The third was also a nunnery, founded by a Genoese lady in 1600.—The fourth was a friary, founded by cardinal Torrecremata, at Rome; which last are grown so very rich, that they give fortunes of fifty Roman crowns to above 400 girls, on the anniversary of the annunciation.

Knights of the ANNUNCIATA, or **ANNUNTIADA**, was a military order, instituted in 1409, by Amadeus, duke of Savoy.

It was at first called the order of the true lovers knots; in memory of a bracelet of hair presented to the founder by a lady: but, upon the election of Amadeus VIII. to the pontificate, it changed its name for that of the *annunciate*.

ANNUNCIATION*, the tidings which the angel Gabriel brought to the holy virgin, of the mystery of the incarnation.

* The word is compounded of the Latin *ad* and *nuncio*, I tell; I declare; of *nuntius*, messenger.—The Greeks call it *Εὐαγγελισμός*, good tidings; and *Χαρισμός*, salutation.

ANNUNCIATION is also the name of a feast, celebrated annually on the 25th of March, popularly called *Lady-day*, in commemoration of that wonderful event.

This feast appears to be of great antiquity in the Latin church. Among the sermons of St. Augustine, who died in 430, we have two on the *annunciation*, viz. the 17th and 18th de *sanctis*: and yet there are much earlier testimonies of its use in the Greek church. Proclus, who died in 446; Chrysostom, in 407; and even Gregory Thaumaturgus, in 295; have all of them discoursed on the *annunciation*. Rivet, Perkins, and some other Protestant writers after them, have indeed questioned the authentickness of the two homilies of Gregory Thaumaturgus, on the *annunciation*; but Vossius acknowledges them the genuine productions of that father.

Add, that some authors are of opinion, that the feast was originally solemnized in honour of our Saviour; and that the holding it in the name and honour of the virgin is of a much later standing.

Several of the eastern churches celebrate the *annunciation* at a different season from those of the west.—The Syrians call it *bascharach, q. d.* search, inquiry; and mark it in their calendar, for the first day of December. The Armenians hold it on the 5th of January; thus anticipating the time, to prevent its falling in Lent: but the Greeks make no scruple of celebrating the festival even in Lent.

The Jews also give the title *annunciation* to part of the ceremony of their passover, viz. that, wherein they explain the origin and occasion of that solemnity.—This explanation they call *הגדה*, Haggada, *q. d.* the *annunciation*.

ANNULUS, a ring. See the article RING.

ANODYNE*, in physic, is understood of such remedies, as calm and alluage pain.

* The word is derived from the privative *a* and *odov*, doles, to be in pain.

Anodynes are of two kinds, the first, *proper*, called also *paregorics*.

The second *spurious*, or improper, which rather stupefy than alleviate; acting only by inducing a stupor, drowsiness or sleep.

These are more properly called *narcotics, hypnotics, or opiates*.

The true *anodynes* are applied externally, to the part affected.—Such among the class of simples are the onion, lily, root of mallows, leaves of violets, elder, &c.

VOL. I.
I

We have also certain compound medicines in the shops, prepared with this intention, and called by this name.—Such is the *anodyne balsam*, made of Castile soap, camphor, saffron, and spirit of wine; digested in a sand-bath. It is recommended not only for procuring ease in the most racking extremities of pain, but also for assisting in discharging the peccant matter that occasioned it. This balsam is much the same with the modern *opodeldoc*.

ANointed, See the articles CHRIST, and MESSIAH.

Lord's-ANointed.

ANOMALISTICAL Year, in astronomy, called also *periodical year*, is the space of time wherein the earth passes through her orbit.

The *anomalistical*, or common year, is somewhat greater than the tropical year; by reason of the precession of the equinox. See PRECESSION.

ANOMALOUS*, *irregular*; something that deviates from the ordinary rule and method of other things of the same kind.

* The word is not compounded of the privative *a*, and *nomos*, law, as is usually imagined: for whence, on such supposition, should the last syllable *al*, arise? but it comes from the Greek *ανωμαλος*, uneven, rough, irregular, formed of the privative *a*, and *hmos*, plain, even.

ANOMALOUS verbs, in grammar, are such as are irregular in their conjugations; deviating from the rules or formula's observed by others.

There are *anomalous verbs*, or irregular inflexions of verbs, in all languages.—In the English, all the irregularity in our *anomalous verbs* lies in the formation of the preter tense, and passive participle; though this only holds of the native Teutonic or Saxon words, and not of the foreign words, borrowed from the Latin, French, &c.

The principal irregularity arises from the quickness of our pronunciation, whereby we change the consonant *d* into *t*, cutting off the regular ending *ed*.

Thus for *mixed*, we write *mixt* or *mix'd*, for *dwelt dwelt* or *dwell'd*; for *snatched snatcht*, &c.—But this properly is rather of the nature of a contraction than an irregularity; and is complained of by some of our politer writers as an abuse much to the disadvantage of our language, tending to disfigure it, and turn a tenth part of our smoothest words into clusters of consonants: which is the more inexcusable, in that our want of vowels has been the general complaint of the best writers.

Another irregularity relates to the preter tense, and passive participle.—Thus *give*, if it were regular, or formed according to the rule, would make *gived* in the preter tense, and the passive participle; whereas it makes *gave* in the preter tense, and *given* in the passive participle.

ANOMALY, in grammar, denotes an irregularity in the accidents of a word, whereby it deviates from the common rules or paradigms, whereby other words of the like kind are governed.

ANOMALY, in astronomy, is the distance of a planet from the aphelion or apogee: or it is an irregularity in the motion of a planet, whereby it deviates from the aphelion or apogee.

Kepler distinguishes three kinds of these *anomalies*; mean, eccentric, and true.

Mean or Simple ANOMALY, in the ancient astronomy, is the distance of a planet's mean place from the apogee.

In the modern astronomy, it is the time wherein the planet moves from its aphelion A, to the mean place or point of its orbit I. (*Tab. Astron. fig. 1.*)

Hence, as the arch, or the angle, or the elliptic area ASI, is proportional to the time wherein the planet describes the arch AI; that area may represent the mean *anomaly*. Or thus, the area SKA found by drawing a line LK, through the planet's place, perpendicular to the line of the apices PA, till it cuts the circle DA, and drawing the line SK; may represent the mean *anomaly*; for this area is every where proportional to the former area SIA, as is demonstrated by Dr. Gregory, lib. 3. *Elem. Astron. Physic. Math.*—V. Phil. Trans. N° 447. p. 218.

ANOMALY of the eccentric, or of the centre, in the new astronomy, is an arch of the excentric circle AK, (*fig. 1.*) included between the aphelium A, and a right line KL, drawn through the centre of the planet I, perpendicularly to the line of the apices AP. See EXCENTRIC.

In the ancient astronomy, it is an arch of the zodiac, terminated by the line of the apices, and the line of the mean motion of the centre.—See the methods of finding the *anomaly of the excentric*, in Phil. Trans. N° 447. p. 218.

True or equated ANOMALY is the angle at the sun, ASI, which a planet's distance from the aphellum AI, appears under; or it is the angle or area, taken proportional to the time in which the planet moves from the mean place I, to its aphelion A.

And hence, in the sun's motion, it will be the distance of his true place from the apogee.

The true *anomaly* being given, the mean one is easily found: but it is difficult to find the true *anomaly* from the mean one given.

The geometrical methods of Wallis and Newton, by the protracted cycloid, are not fit for calculation; nor yet the method

thod of series, as being too laborious. Hence astronomers are forced to have recourse to approximation. Ward, in his *Astronomia Geometrica*, takes the angle ASI, at the focus where the sun is not, for the mean anomaly; which will nearly represent it, if the orbit of the planet be not very excentric; and thus easily solves the problem. But this method does not hold of the orbit of Mars, as being more excentric than those of the other planets.

Sir Isaac Newton shews how to effect even this; and when his correction is made, and the problem solved according to Ward's hypothesis, Sir Isaac affirms, that even in the orbit of Mars, there will scarce ever be an error of above a second.

ANOMOEANS*, **ANOMOEI**, in church history, ancient heretics, who denied any similitude between the essence of the father and that of the son. See **TRINITY**.

* The word is Greek, composed of the privative *α*, and *νόμος*, similar, resembling, *q. d.* different, dissimilar.

Anomœans was the name whereby the pure Arians were distinguished in the fourth century, in regard that they not only denied the consubstantiality of the word, but even asserted, that he was of a nature different from that of the father: In contradistinction to the Semi-Arians, who indeed denied the consubstantiality of the word, but who owned at the same time, that he was like the father.

The Semi-Arians condemned the *Anomœans* in the council of Seleucia, and the *Anomœans* condemned the Semi-Arians in their turn, in the councils of Constantinople and Antioch; erasing the word *νόμος* out of the formula of Rimini, and that of Constantinople, and protesting that the Word had not only a different substance, but also a will different from that of the father. Whence they came to be called *ανωμοιοι*.

ANONYMOUS*, something that is nameless; or to which no name is affixed.

* It is derived from the Greek *ανωνυμος*, without name, formed of the privative *α*, and *ωνομα*, *nomen*, name.

The term is chiefly applied to books which do not express their author's name, and to authors whose names are unknown. Decker, advocate of the imperial chamber of Spire; and Placcius of Hamburg, have given treatises of *anonymous* books. —Burr. Goth. Struvius, treats of learned men who have endeavoured to divine the authors of *anonymous* books.

ANOREXY, **ANOREXIA***, in medicine, an inappetency, or loss of appetite.

* The word is compounded of the privative *α*, and *ορεσθαι*, *appeto*, I desire.

Anorexia is properly a longer continuance than is natural, without a desire to eat.

If the thought or the sight of proper food create a sickness in the stomach, or a tendency to vomit; the case is more properly called a *nausea*.

Anorexia is chiefly considered as a symptom of some other disorder, from which the curative indications are to be taken, and afterwards stomachics used.

ANSÆ*, **ANSÆS**, in astronomy, those apparently prominent parts of the planet Saturn's ring, discovered in its opening, and appearing like handles to the body of that planet.

* The word is Latin; and literally signifies *handles*, or *ears*, of divers utensils.

ANSCOTÉ, in our ancient law books, the same with *anblote*. See **SCOT**.

ANSEL *Weight*. See **AUNSEL** *Weight*.

ANSELM's *Art*. See the article **ART**.

ANSES. See **ANSÆ**.

ANSPESSADES, or **LANSPESSADES**, a kind of inferior officers in the foot, below the corporals, and yet above the common centinels.

* The word is formed of the Italian *lancia spezzata*, *q. d.* broken lance; which was occasioned hence, that they were originally disbanded gendarmes, who, for want of other subsistence, sued for a place of some distinction in the infantry.

There are usually four or five in each company.

ANSWER, in a law sense, &c. See **REJOINDER**.

Foreign ANSWER. See the article **FOREIGN**.

ANTA*, in the ancient architecture, a square column, or pilaster, placed at the corners of the walls of temples, and other edifices.

* These took their name, according to Mr. Perrault, from the preposition *ante*, before; because placed before the walls and coins of buildings to secure, or strengthen them.

The *antæ* stood out of the wall, with a projecture equal to one eighth of their face, provided there were no ornament that had a greater projecture; but it was a rule that the projecture of the *antæ* should always equal that of the ornaments.

ANTAGONIST*, **ANTAGONISTA**, among the ancients denotes an adversary in battle.

* The word is formed from the Greek *αντι*, *contra*, against, and *αγωνισα*, I contend, or struggle.

In this sense the word is rather used in speaking of sportive combats, or games, than in serious fighting.

ANTAGONIST also denotes one of the parties in literary combats or disputes.

ANTAGONIST Muscles, in anatomy, are those which have opposite functions.

Such are the flexor and extensor of any limb, the one whereof contracts it, and the other stretches it out.

We have some solitary muscles, without any *antagonists*; as the heart, &c.

ANTANACLASIS*, a figure in rhetoric; whereby the same word is repeated, but in a different and sometimes doubtful signification.—As, Let the dead bury the dead.

* The word comes from the Greek *αντι*, and *αντακλαν*, *repercuto*, I strike again.

ANTANAGOGE, *αντανωγωνια*, a figure in rhetoric, when not being able to answer the accusation of the adversary, we return the charge, by loading him with the same or other crimes.

ANTARCTIC* *Pole*, denotes the southern pole, or end of the earth's axis.

* The word is composed of *αντι*, *contra*, and *αρκτος*, *ursa*, bear, as being opposite to the *arctic pole*.

The stars near the *antarctic* pole never appear above our horizon.

ANTARCTIC Circle is one of the lesser circles of the sphere, parallel to the equator, at the distance of 29 deg. 30. min. from the fourth pole.

It takes its name from its being opposite to another circle, parallel likewise to the equator, and at the same distance from the north pole, called the *arctic circle*. See **ARCTIC Circle**.

ANTARES, in astronomy, the scorpion's heart; a fixed star of the first magnitude, in the constellation scorpion.—Its longitude, latitude, &c. see among the rest of the constellation **SCORPIO**.

ANTECEDENT*, in the schools, something that precedes, or goes before another, in respect of time.

* The word is compounded of the Latin preposition *ante*, before; and *cedens*, of *cedere*, to go.—In which sense it stands opposed to *subsequent*.

ANTECEDENT Decree is a decree preceding some other decree, or some action of the creature, or the provision of action.—It is a point much controverted, whether predestination be a decree antecedent to faith, or subsequent thereto.

ANTECEDENT Will, or *Desire*, is that which precedes some other will or desire, or some knowledge or provision.—Thus we say, God by a sincere, but antecedent desire, wills all men to be saved: that is, this sincere desire of God precedes, and does not suppose, the knowledge of their faith and repentance.

By the way it must be noted, that the term *antecedent* is only applied to God in respect of the order of nature, not of an order of succession; for that God, by reason of his infinite perfections, sees and foresees both at the same time: after the same manner he also wills, and that not successively, one thing after another.—Yet does not this hinder, but that God may will one thing on occasion of another, or have such a desire on occasion of such a provision; which divines call the *order of nature*, in contradistinction to that of time.

ANTECEDENT Necessity. See the article **NECESSITY**.

ANTECEDENT, in logic, denotes the first proposition of enthymeme, or of an argument which only consists of two members.

In opposition hereto, the latter is called the *consequent*. See **CONSEQUENT**, **CONCLUSION**, &c.

Thus in the argument *cogito, ergo sum*, I think, and therefore I exist, *cogito* is the antecedent; being thus called because it precedes the *ergo*, or the *copula* of the argument.

ANTECEDENT of a Ratio denotes the first term, or that which is compared with the other. See **RATIO** and **TERM**.

Thus, if the ratio be *a: b*, or of *a* to *b*; *a* is said to be the antecedent.

ANTECEDENT Signs are such symptoms of disorder as appear before a distemper is so formed as to be reducible to any particular class, or proper denomination.

ANTECEDENT in grammar, the word which a relative refers to.

ANTECEDENCY, **ANTECEDENCE**. See **ANTECEDENT** and **ANTECEDENTIA**.

ANTECEDENTIA, among astronomers.—When a planet appears to move westward, contrary to the order or course of the signs; as from Taurus towards Aries; it is said to move in *antecedentia*.

On the contrary, when it goes eastward or forward, from Aries towards Taurus; it is said to move in *consequentia*. See **PRECESSION of the equinox**.

ANTECESSOR, one that goes before, or that leads another. See **PRECURSOR**, **PREDECESSOR**, &c.

The term is particularly used in some universities for a public professor, who teaches, or lectures the civil law.

ANTE-

ANTECHAMBER*, or **ANTICHAMBER**, an outer chamber, before the principal chamber of an apartment; where the servants wait, and where strangers stay, till the person to be spoken with is at leisure, &c.

* The word is formed of the Latin *ante camera*. See **CHAMBER**.

ANTECHRIST. See the article **ANTICHRIST**.

ANTEDATE, a spurious date, prior to the true date of a writing, instrument, act, deed, or the like. See **DATE**.

ANTEDILUVIAN, or **ANTIDILUVIAN**, something that existed or happened before the deluge.

In this sense, those generations from Adam, till Noah's flood, are called *antediluvians*; and those since defended from Noah, to the present time, are called *postdiluvians*.

Dr. Burnet, and Dr. Woodward differ very widely about the *antediluvian* world; the former imagines its face and appearance to have been smooth, equable, and in all respects different from what we now find it to be.

The latter, on the contrary, endeavours to prove, that the face of the terraqueous globe before the deluge was the same as it is now, *viz.* unequal, distinguished into mountains, and dales, and having likewise a sea, lakes, and rivers; that this sea was salt as ours is; was subject to tides, and possessed nearly the same space and extent that it now does, and that the *antediluvian* world was stock'd with animals, vegetables, metals, minerals, &c. that it had the same position, in respect of the sun, which ours now hath, its axis not being parallel, but inclined, as at present, to the plane of the ecliptic; consequently, that there were then the same succession of weather, and the same vicissitudes of seasons, as now.

ANTEJURAMENTUM, or **PRÆJURAMENTUM**, by our ancestors also called *juramentum calumnie*; an oath which both the accuser and accused were anciently obliged to make before any trial or purgation.

The accuser was to swear, that he would prosecute the criminal; and the accused was to make oath, on the very day that he was to undergo the ordeal, &c. that he was innocent of the fact with which he was charged.

If the accuser failed, the criminal was discharged; if the accused, he was understood to be guilty, and was not to be admitted to purge himself by the ordeal.

ANTEPAGMENTA, or **ANTIPAGMENTA**, in the ancient architecture, the jambs of a door, or lintels of a window.

The word is also used for the entire *chambrane*, *i. e.* the door-case, or window-frame.

ANTEPENULTIMA*, or **ANTEPENULTIMATE**; in grammar, the third syllable of a word, reckoning from the latter end; or the last syllable except two.

* The word is compounded of the preposition *ante*, before; and *penultimate*, last but one.

It was upon this syllable, that the Greeks placed their acute accents.—The *anteepenultimate* of a dactyle is always long.

ANTEPREDICAMENTA, **ANTEPRÆDICAMENTA**, in logic, certain previous matters, requisite to a more easy and clear apprehension of the doctrine of predicaments or categories. See **PREDICAMENT**.

Such are definitions of common terms; as equivocals, univocals, &c. See **DEFINITION**, **DIVISION**, &c.

They are thus called, because treated by Aristotle, before the predicaments; that the thread of the discourse might not afterwards be interrupted.

ANTERIOR*, or **ANTERIOUR**, something before another, chiefly in respect of place.

* The word is Latin, formed of the preposition *ante*, before.

In which sense the term amounts to the same with *prior*, and stands opposed to *posterior*.

ANTERIOR RAMUS. See the article **RAMUS**.

ANTESTATURE, in fortification, a small retrenchment, made of palisades, or facks of earth, set up in haste, to dispute with the enemy the remainder of a piece of ground, part whereof hath been already gained.

ANTHELIX, in anatomy, the inner circuit of the auricle; thus called from its opposition to the outer circuit, called the *helix*.

ANTHELMINTICS*, medicines good to destroy worms.

* The word is compounded of *anti*, contra, against, and *helmin*, worms.

ANTHEM, a church song, performed in cathedral and other service, by the chorists, divided for that purpose into choruses, who sing alternately.

The word was originally used both for psalms, and hymns, when thus performed.

Socrates represents St. Ignatius as the author of this way of singing among the Greeks; and St. Ambrose among the Latins.—Theodoret attributes it to Diodorus and Flavian.

Amalaricus Fortunatus has wrote expressly of the order of *antihemi*, *de antiphonarum ordine*.

At present the term is used in a somewhat narrower sense, being applied to certain passages taken out of the Psalms, &c. and often accommodated to the particular solemnity in hand.

ANTHERÆ, in pharmacy, a term used by some authors for the yellow, or ruddy globules in the middle of certain flowers, as of lilies, tulips, &c.

Some confine the *anthera* to the yellowish globules in the middle of roses.—These are held more affecting than the rest of the plant.

Others apply the name *ANTHERÆ* to those little tufts or knobs which grow on the tops of the stamina, of all other flowers; more usually called *epices*. See **APICES**.

ANTHESPHORIA*, in antiquity, a feast celebrated in Sicily, in honour of Proserpine.

* The word is derived from the Greek *ανθεσφωρα*, flower, and *φορη*, I carry, in regard that goddess was forced away by Pluto, when she was gathering flowers in the fields. Yet Festus does not ascribe the feast to Proserpine; but says it was thus called, by reason ears of corn were carried on this day to the temples.

Anthesphoria seems to be the same thing with the *floriferum* of the Latins; and answers to the harvest-home among us.

ANTHESTERIA*, in antiquity, was a feast celebrated by the Athenians, in honour of Bacchus.

* The most natural derivation of the word is from *ανθεσφωρα*, flower; it being the custom at this feast to offer garlands of flowers to Bacchus.

Some are of opinion it took its name from the month *anthestirion*, wherein it was celebrated.—Others pretend, that this was not the name of any particular feast, but that all the feasts of Bacchus were called *anthestiria*.

The *anthestiria* lasted three days, the eleventh, twelfth, and thirteenth day of the month; each of which days had a name suited to the proper office of the day.—The first day of the feast was called *ανθιστια*, *i. e.* an opening of the vessels, in regard on this day they tapped the vessels, and tasted the wine.—The second they called *ανθισφωρα*, *congi*, the name of a measure, containing the weight of about ten pounds: on this day they drank the wine prepared the day before.—The third day they called *ανθισφωρα*, *kettles*: on this day they boiled all sorts of pulse in kettles; which, however, they were not allowed to taste, as being all to be offered to Mercury.

ANTHOLOGION*, a church book in use among the Greeks. See **GREEK**.

* It was called *ανθολογιον*, *q. d.* *florigium*, or a collection of flowers. See **ANTHOLOGY**.

The *anthologion* is a sort of breviary or mass-book, containing the daily offices addressed to our Saviour, the virgin, and the principal saints; with other common offices of prophets, apostles, martyrs, pontiffs, and confessors, according to the Greek rite. See **BREVIARY**, **MASS**, and **OFFICE**.

ANTHOLOGY*, **ANTHOLOGIA**, a discourse or treatise of flowers; or of beautiful passages from any authors.

* Thus called from *ανθος*, *flor*, a flower; and *λογος*, *sermo*, discourse.—Though others chuse rather to derive *anthology* from *ανθος*, *flor*, a flower, and *αγω*, I gather; and use it to signify a collection of flowers.

ANTHOLOGY is frequently used for a collection of epigrams of divers Greek poets.

ANTHONY—Knights of St. *Anthony*, an order of Knighthood, established in 1382, by Albert of Bavaria, &c. who had then taken a resolution to make war against the Turks.

The knights of this order wore a collar of gold, with a hermit's girdle, to which hung a crutch and a little bell.

Some authors mention another order of St. *Anthony* in Ethiopia, instituted in 370.

St. *ANTHONY'S FIRE*. See **ERYSIPELAS**.

ANTHORA*, a medicinal plant, of the aconite kind, having yellow flowers, resembling helmets; growing chiefly on the mountains in Switzerland and Savoy.

* This is otherwise called *antithora*, as being reputed an antidote against the thora; sometimes *aconitum salustiferum*, in English the *helmet flower*. See **ACONITE**.

The root is chiefly in use. It is of a warm bitterish taste, and is reputed a cardiac and alexipharmic, much of the same qualities with *contrayerva* root; on which account some also denominate it the *German contrayerva*, though it now only obtains in few official compositions.

ANTHOS, *ανθος*, in its original Greek, signifies flower; but by way of excellency is appropriated to rosmary, so as to express only that plant.

ANTHOSATUM Acetum. See **ACETUM**.

ANTHRACOSIS*, a disease of the eyes, occasioned by a corrosive ulcer, either in the bulb of the eye, or the eyelids, covered with skin, and attended with a general swelling of the parts adjoining.

* The word is Greek *ανθρακωσις*, and denotes an inflammation resembling a coal; *ανθραξ* signifying a coal. See **ANTHRAX**.

ANTHRAX,

ANTHRAX*, *ἄνθραξ*, literally signifies a coal; and figuratively, a scab, or blotch, made by a corrosive humour, which, as it were, burns the skin, and occasions sharp pricking pains.

* The *anthrax* is the same with what is otherwise denominated *carbunculus* and *carbunculus*.

ANTHROPOLOGY*, *ANTHROPOLOGIA*, a discourse, or treatise upon man, or human nature; considered as in a sound, or healthy state.

* The word is compounded of *ἄνθρωπος*, man, and *λογία*, discourse.

Anthropology includes the consideration both of the human body and soul, with the laws of their union, and the effects thereof, as sensation, motion, &c.

ANTHROPOLOGY is particularly used in theology, for a way of speaking of God, after the manner of men; by attributing human parts and passions to him; as eyes, hands, ears, anger, joy, &c.

We have frequent instances of *anthropology* in holy Scripture, by which we are only to understand the effect, or the thing which God does, as if he had hands, &c.

ANTHROPOMANCY*, *ANTHROPOMANTIA*, a method of divination, performed by inspecting the viscera of a person deceased.

* The word is compounded of *ἄνθρωπος*, man, and *μαντιμ*, divination.

ANTHROPOMORPHITE*, in a general sense, one who attributes to God the figure of a man.

* The word comes from the Greek *ἄνθρωπος*, man, and *μορφή*, shape.

ANTHROPOMORPHITES were a sect of ancient heretics, who, taking every thing spoken of God in the Scriptures in a literal sense, imagined he had real hands, feet, &c.—They also held, that the patriarchs saw God in his proper divine substance, with their natural eyes.

The passage they chiefly insisted on was that in Genesis, where it is said, that God made man after his own image.—The orthodox, who held the contrary, *viz.* that God is incorporeal and without any bodily form, the Anthropomorphites branded by the name of *Origenists*, by reason Origen taught how to allegorize those expressions.

Epiphanius calls the Anthropomorphites *Audiani*, or *Odiani*, from Audius the supposed founder of the sect, who lived about the time of Arius, in Mesopotamia. St. Augustin calls them *Vadiani*.

ANTHROPOPATHY*, a figure, expression or discourse, whereby some passion is attributed to God, which properly belongs only to man.

* The word is compounded of *ἄνθρωπος*, man, and *πάθος*, passion.

Anthropopathy is frequently used promiscuously with *anthropology*; yet in strictness they ought to be distinguished, as the genus from the species.—*Anthropology* may be understood of any thing human attributed to God; but *anthropopathy*, only of human affections, passions, sensations, &c.

ANTHROPOPHAGI*, people who feed on human flesh.

* The word is compounded of the Greek *ἄνθρωπος*, man, and *φάγναι*, *edere*, to eat.

The Cyclopes, the Lestrygons, and Scylla, are all represented in Homer as anthropophagi, or man-eaters: and the female phantoms, Circe and the Syrens, first bewitched with a shew of pleasure, and then destroyed.—This, like the other parts of Homer's poetry, had a foundation in the manners of the times preceding his own. It was still in many places, the age spoken of by Orpheus,

*When men devour'd each other like the beasts,
Gorging on human flesh.*

Some remains of the usage subsisted much longer, even among the most civilized nations, in the practice of offering human sacrifices.

The primitive christians were accused of *anthropophagia* by the heathens: of celebrating Thyeesta epula, and allowing Oedipodei concubitus; as appears from Tatian, Tertullian in his *Apologeticis*, cap. VII. and Salvia de *Provid.* lib. IV. They affirmed, that, in the mysteries of their religion, the christians killed a child, and feasted on its flesh. This calumny was grounded on their misunderstanding what they had heard of the Eucharist, and the Communion.

ANTHROPOPHAGIA, the act or habit of eating human flesh.

Some authors trace the original of this barbarous custom as high as the deluge; and attribute it to the giants.—Pliny mentions Scythians and Saurometans; Solinus, Ethiopians; and Juvenal, Egyptians; who accustomed themselves to this horrible repast. *Vid. Plin. hist. nat. l. 4. c. 12. l. 6. c. 17. 30. l. 7. c. 2. Solin. Polyb. c. 33.*—Livy tells us, that Hannibal made his soldiers eat human flesh, to render them more fierce and daring in battle.—In the southern parts of Africa, and in some parts of America, this horrid practice is said still to obtain.

ANTHROPOPHAGY, in effect, seems not to have been the vice of any country, or nation, but of the age. Before the arts of

life had reached and softened them, most nations practised it. Orpheus is said to have been the first who drew men from this savage custom; which gave rise to the fable of his taming lions, and tigers.

Sylvestres homines, sacer, interpresque deorum

Credibus & victu fœdo deterruit Orpheus.

Didit ob hoc lenire tygres, rapidisque leones. Hor.

Some physicians vainly think they have discovered the principle of *anthropophagy*; and that it consists in an acrid atrabiliary humour, which, being lodged in the coats of the ventricle, produces this voracity. And they give several instances of this inhuman hunger, even among their own patients.—M. Petit has disputed the question, whether or no *anthropophagy* be contrary to nature?

ANTI, *ἄντι*, is a preposition used in composition with several words both in Greek, Latin, English, &c. in different senses. In English, it sometimes signifies before; as in antichamber, a place before the chamber.—In which case it has the same meaning with the Latin *ante*, before.

Sometimes again it signifies contrary, or opposite: and is then derived from the Greek *ἄντι*, *contra*, against.

In this latter sense, the word makes part of the name of various medicines, to denote some peculiar or specific virtue in them against certain diseases; such *a. gr.* are antivenereals, antiscorbutics, antinephritics, &c.

* Patin speaks of a quack in his time, at Paris, who made no scruple to sell anti-eclyptic, and anti-cometic medicines; preservatives, forsooth, against the noxious effects of eclipses, and comets. *Let. Chir. 344.*

The preposition is frequently however omitted on these occasions, without any alteration of the sense; as in nephritics, arthritics, asthmatics, &c.

ANTI, in matters of literature, is a title given to divers pieces written by way of answer, to others, whose names are usually annexed to the *Anti*.

See the *Anti* of M. Baillet; and the *Anti-Baillet* of M. Menage; there are also *Anti-Menagiana*, &c. Cæsar the dictator wrote two books by way of answer to what had been objected to him by Cato; which he called *Anti-Catonæ*; these are mentioned by Juvenal, Cicero, &c.—Vives assures us, he had seen Cæsar's *Anti-Catonæ* in an ancient library.

ANTIADÆS, a term used by some writers for the glandules, and kernels, more commonly called *tonsils* and *almonds of the ears*. See **TONSIL**.

ANTIADIAPHORISTS*, *ANTIADIAPHORISTÆ*, opposite to the *adiaphorists*. See **ADIAPHORIST**.

* The word is compounded of the Greek *ἄντι*, *contra*, against, and *ἀδιαφορεῖν*, indifferent.

This name was given, in the fourteenth century, to the rigid Lutherans, who disavowed the episcopal jurisdiction, and many of the church ceremonies, retained by the moderate Lutherans. See **LUTHERAN**.

ANTIBACCHUS, in the ancient poetry, a foot, consisting of three syllables; the two first whereof are long, and the third short.

Such are the words *cantare*, *virtute*, *ἔδναμι*, &c.

It is so called as being contrary to the *Bacchius*, the first syllable whereof is short, and the two last long. See **BACCHUS**. Among the ancients, this foot is also denominated *palimbacchius*, and *saturinus*; and by some *proponticus*, and *thesiellus*. *Diom. iii. p. 475.*

ANTICARDIUM*, in anatomy, &c. that hollow part under the breast, just against the heart, commonly called the *pit of the stomach*: called also *scrobiculus cordis*.

* The word is compounded of *ἄντι*, *contra*, against, and *καρδία*, *cor*, heart.

ANTICHRESIS, in the civil law, a covenant or convention, whereby a person borrowing money of another engages, or makes over his lands or goods to the creditor, with the use and occupation thereof, for the interest of the money lent. This covenant was allowed of by the Romans; among whom usury was prohibited: it was afterwards called *mortgage*, to distinguish it from a simple engagement, where the fruits of the ground were not alienated, which was called *vif gage*.

ANTICHRIST*, in a general sense, denotes an adversary of Christ, or one who denies that the Messiah is come.

* The word is compounded of the Greek *ἄντι*, *contra*, against, and *χριστός*, Christ.

In this sense, Jews, Infidels, &c. may be said to be *antichrists*.

ANTICHRIST is more particularly used for a tyrant who is to reign on earth, toward the end of the world; to make the ultimate proof of the elect; and to give a shining instance of the divine vengeance, before the last judgment.

The bible and the fathers all speak of *antichrisť* as a single man; though they assure withal, that he is to have divers precursors or fore-runners.—Yet many protestant writers apply to the Romish church, and the pope who is at the head of it, the several marks and signatures of *antichrisť* enumerated in the Apocalypse; which would rather imply *antichrisť* to be a corrupt society, or a long series of persecuting pontiffs, than a single person.

However, the point having been maturely debated at the council of Gap, held in 1603, a resolution was taken thereupon, to

has also its own peculiar mines; particularly in Hungary, Transylvania and Germany, and in several provinces of France; as also, with us in some parts of Cornwall.

Antimony is found in clods of several sizes, bearing a near resemblance to black lead; only that it is lighter and harder: whence also it is called *marcasite of lead*; and its metalline part has been by some supposed to be of that species.

Its texture is somewhat particular, being full of little shining veins or threads, like needles; brittle as glass.—Sometimes there are veins of a red or golden colour intermixed, from which it is called *male antimony*; that without them being denominated *female*.—It fuses in the fire, though with some difficulty.

When dug out of the earth, it is put into large crucibles, fused by a violent fire, and then poured into cones, or antimonial horns, which make the common or crude *antimony* of the shops; the apex whereof is always the best and purest part, as the basis or broadest part is the foulest.

Antimony is supposed by many of the chymists to contain the feminal principles of all kind of metals; and accordingly the character whereby it is denoted in their writings is the same with the character of the earth; to denote that *antimony* is a kind of microcosm.

The uses of *antimony* are very numerous, and important.—It is a common ingredient in specula, or burning concaves, serving to give the composition a finer texture.—It makes a part in bell-metal; and renders the found more clear.—It is mingled with tin to make it more hard, white and founding; and with lead, in the casting of printers letters, to render them more smooth and firm. It is also a general help in the melting of metals, and especially in casting of cannon balls.

Antimony, is particularly used in pharmacy, under various forms, and with various intentions, chiefly as an emetic.—Its medicinal virtue is supposed to arise from the sulphurous part in its composition, which being dissolved by any proper menstruum, sets at liberty an active volatile salt, or some other unknown principle, to which its operation is chiefly owing.

Before the fourteenth century, *antimony* had no place in medicine; otherwise than as an ingredient in some cosmetics for blackening the eye-brows: but about that time Basil Valentine, having found a method of preparing and correcting the dangerous qualities of its sulphur, published a book, intitled, *Curus triumphalis antimonii*, wherein he maintained it a sure remedy for all diseases.—But, in spite of all he could say in its behalf, though confirmed by experience, *antimony* remained in a general neglect, upwards of an hundred years; till about the beginning of the sixteenth century, when it was brought into vogue by Paracelsus.—The parliament of Paris, immediately upon this reformation, condemned the use of it in form; and a physician named Besnier, having been found delinquent herein, was expelled the faculty. It seems, a great deal of mischief had been done by it, for want of knowing the proper ways of giving it; so that the arrest of parliament represents it as a mere poison, incapable of being corrected by any method of preparation, and not to be taken inwardly, without the utmost damage.

Several learned men complained of so severe and unjust a prohibition; and by a course of happy experiments at length brought it into esteem again; whence in spite of all the invectives made against *antimony*, by divers authors, it was at length replaced, in the year 1637, by publick authority, among the number of purgative drugs; and was inserted accordingly in the pharmacopœia, published by the faculty the same year.

Patin did all he could to decry *antimony*: in his letters we find an unusual vehemence expressed against it.—He had even compiled a large register of persons whom the physicians had killed by it; which he called the *Martyrology of antimony*.

Butter of Antimony, is a white, and thick liquor; otherwise called *icy oil of antimony*. It is usually prepared of crude (though sometimes of regulus of) *antimony*, and corrosive sublimate, by pulverizing, mixing, and distilling them by a gentle heat: upon which the butter rises into the neck of the retort; from which, when full, it is to be melted down into a receiver, by the application of live coals.

It is of a very fiery, corrosive nature, so as to be a poison when used internally. Externally it is applied as a caustic, to stop gangrenes, and cure caries, cancers, &c.

This butter may be converted into an oil, called also *rectified butter of antimony*; by gently distilling it a second time; which renders it more fluid, subtle, volatile, and efficacious.

—This digested with thrice its weight of alcohol, makes the purple tincture of *antimony*, a secret highly valued by Mr. Boyle, as an excellent vomit.

The same butter precipitates, by warm water, into a white, ponderous powder, or calx, called *mercurius vitæ*, and powder of *algarot*: which is a very violent emetic.

Of butter of *antimony* is also prepared the bezoar mineral; by dissolving the rectified butter with spirit of nitre: then drying the solution, and applying more spirit of nitre, and re-

peating this a third time. The white powder remaining at last, kept nearly red-hot for half an hour, is the bezoardicum minerale.

Ceruss, or Calx of Antimony, is the regulus distilled with spirit of nitre, in a sand-furnace; what remains after the fumes are all spent is a white powder; which, being washed sweet, is the ceruss required.—It is diaphoretic; and by many is set on a footing with the mineral bezoar.

Cinnabar of Antimony is prepared of mercury, sulphur, and *antimony* mixed and sublimed in a luted bolt-head, and a naked fire.—It is a good diaphoretic and alterative.

There is also a cinnabar of *antimony* procured after the butter of *antimony* has done rising, by increasing the degree of fire.—This sublimed a second time, makes a yet better cinnabar.

Clyssus of Antimony. See the article *CLYSSUS*.

Crocus, or liver of Antimony, is the same with what we otherwise call *crocus metallorum*; excepting that this latter is more mild and less emetic; being made by repeated lotions of the former, in warm water, and then drying it again to a powder. See *Crocus Metallorum*.

It is also called *apaline magnesia, terra sancta Rulanâ, terra aurea, terra rubra, &c.*

Crude Antimony, or *antimony in substance*, is the native mineral antimony, melted down and cast in cones, as above mentioned.—It is much used in diet-drinks and decoctions of the woods, and in compositions against the scurvy, as a diaphoretic, and deobstruent.

Diaphoretic Antimony is prepared of *antimony* powdered and mixed with three times the quantity of nitre; and the mixture thrown at several times into an ignited crucible: upon which, a detonation ensues. What remains being kept in fusion a quarter of an hour, turns into a white mass called *antimonium diaphoreticum nitratum*, or *diaphoretic antimony with nitre*; the *antimony* being hereby bereaved of its emetic and purgative virtue, and rendered only diaphoretic.

If the air have access to it, it will again become emetic.

There is also a kind of sweet diaphoretic *antimony*, made of the former, by pulverizing, boiling it in water, and filtrating the decoction: upon which a white powder will be left in the filtre; which being washed by repeated affusions of warm water, and dried, is the *dulcified diaphoretic antimony*.

—This is given as an alexipharmic in malignant fevers, small pox, &c. particularly in case of deliriums. It is also applied in scorbutic and venereal disorders: but the learned Boerhaave absolutely decries it, as a mere metalline calx, destitute of all medicinal virtue, and only fit to load and choke up the body, by its inactivity and weight.

Diaphoretic nitre of Antimony is made by exhaling the solution of the preceding preparation over a gentle fire to a dryness; upon which, there remains a salt composed of nitre, and the sulphur of the *antimony*, called *nitrum antimoniatum*.—It is no other than a sort of sal prunellæ, or sal polychrestum; and accordingly is found aperitive, cooling, diuretic; and good in inflammatory fevers, &c.

Flower of Antimony, is *antimony* pulverized, and sublimed in an aludel; the volatile parts whereof then stick to the subliming pot.

This also is a powerful vomitive; and is of singular efficacy in maniac cases; being the Herculean remedy by which some have gained so much reputation.

Another sort of flowers are made of the regulus of *antimony* with sal-ammoniac sublimed as before; which make a remedy somewhat gentler than the former.—Helmont also gives us a preparation of purging flowers of *antimony*.

Glass of Antimony, vitrum antimonii, is crude *antimony*, ground and calcined by a vehement fire, in an earthen crucible; till it cease to fume, which is a proof that its sulphur is evaporated.—The calx is then vitrified in a wind furnace; upon which it becomes transparent, ruddy, and shining.

This is the strongest emetic of any preparation of *antimony*. See *EMETIC*.—Yet, if dissolved in spirit of urine, it ceases to be either emetic or cathartic; even though the menstruum be afterwards drawn from it.

Magistery of Antimony is crude *antimony*, digested with aqua regia eight or ten days; to which, water is then put, but poured off again ere it settle: this to be repeated till there remain nothing behind but a yellowish powder; which, being suffered to settle, and the water decanted off, becomes by repeated ablutions, an insipid magistery. Its operation is rather cathartic than emetic, though sometimes only sudorific.

Regulus of Antimony, or purification of *antimony*. See *REGULUS of antimony*.

Of this are made the pillulæ perpetuæ, vinum emeticum, &c.

Golden sulphur of Antimony is made of the scoria which arise in preparing the regulus; by boiling it, filtrating the hot decoction, and adding distilled vinegar: upon which the whole coagulates, changes into a brown colour, emits a stercoraceous

teous odor, and precipitates a red powder. The whole mass being washed by repeated affusions of water, till the liquor come away senseless and insipid, and then dried, it becomes a red powder, called the *golden sulphur*, or *precipitate of antimony*; either on account of its own colour, or the yellow one it gives to glass, metals, &c.—It either proves emetic, cathartic, diuretic, or sudorific, as its force happens to be determined.

Prepared ANTIMONY is either crude *antimony* levigated, or that which has undergone some chymical process, whereby its nature and powers are altered or abated; and this differently, according to the circumstances of the preparation.

Antimony, says Mr. Boyle, alone, or associated with one or two other ingredients, by a variety of operations and compositions, might be brought to furnish a whole apothecary's shop: It will answer the physician's intention, whether he wants to employ a cathartic, or an emetic, a diuretic, diaphoretic, deobstruent, bezoardic, or cordial.

Revised ANTIMONY, *antimonium resuscitatum*, is prepared of flowers of *antimony* and sal-ammoniac, digested in distilled vinegar; then exhaled, and the remainder sweetened by ablation.—It is emetic, and sometimes also sudorific; and is good in maniacal cases, &c.

All these preparations of *antimony*, how severe soever alone, may yet be so managed, as to operate little or nothing at all in the prime viæ, nor be perceived till they are got into the smallest vessels.—And then it is they are qualified to combat the gout, pox, evil, &c.

ANTINOMY*, **ANTINOMIA**, a contradiction between two laws, or between two articles of the same law. See **LAW**.

* The word is derived from the Greek *anti*, *contra*, and *nomos*, *lex*, *law*.

ANTINOMY sometimes also signifies an opposition to all law.

Whence a sect of enthusiasts, who are for carrying gospel-liberty above all moral regards, and who slight the motives of virtue as insufficient to salvation, are called *Antinomians*; and sometimes *Anomians*.

ANTINOUS, in astronomy, a part of the constellation *aquila*, or the eagle. See **AQUILA**.

ANTIPAGMENTS, *Antipagmenta* See **ANTEPAGMENTS**.

ANTIPATHY*, **ANTIPATHIA**, a natural enmity or aversion of one body to another.—In which sense the word stands opposed to *sympathy*.

* The word is compounded of the Greek *anti*, *contra*, against, and *πάθος*, *passion*.

Such an aversion is commonly said to be between the salamander and the tortoise, the vine and the elm, the toad and the weazel, the sheep and the wolf, the olive and the oak, &c.

Porta (*Mag. natur.* 20. 7.) and Merfenne (*Quæst. Comment. in Genes.*) give other more extraordinary, not to say ridiculous instances; as, that a drum made of a wolf-skin, will break another made of a sheep-skin: that hens will fly at the sound of a harp strung with fox-gut strings, &c. See other matters relating to this head, under the articles **SOUND**, **MUSIC**, **TUNE**, **TARANTULA**, &c.

Mr. Boyle mentions "a lady, who having a strange antipathy to honey; and her physician conceiving it in great measure imaginary, mixed a little honey in a medicine applied to her foot: but he soon repented his curiosity; for it caused a strange disorder in her, which ceased however upon removing of the medicine. *Useful. Philosoph.*"—Dr. Mather relates, that "a gentlewoman in New-England swooned upon seeing any one cut their nails with a knife; but was not the least affected, if the same was done with a pair of scissars." *Phil. Transact.* N°. 339.

The Peripatetics account for antipathies, from certain occult qualities inherent in the bodies.

Some think that the term *antipathy*, can only be applied to any certain purpose, when used with the restriction of modern philosophers; among whom it signifies no more than a vis centrifuga, or repelling power. See **SUPPLEMENT**, article **ANTIPATHY**.

ANTIPERISTALTIC*, in anatomy, a motion of the intestines contrary to the peristaltic motion. See **PERISTALTIC**.

* The word is derived from the Greek *anti*, against, *περι*, about, and *σπαστικός*, that which hath the power of compressing.

As the peristaltic motion is a contraction of the fibres of two intestines from above, downwards; the *antiperistaltic* motion is their contraction from below, upwards.

ANTIPERISTASIS*, in philosophy, the action of two contrary qualities; one whereof, by its opposition, excites and heightens the force of the other.

* The word is Greek, *ἀντιπεριστάσις*; formed of *anti*, *contra*, against, and *περιστάσις*, to stand round: *q. d.* circumspiciantia, or the renitency against any thing that surrounds or belets another.

Antiperistasis, is usually defined, "the opposition of a contrary quality, whereby the quality it opposes becomes heightened, or intended: or the action whereby a body, attacked by another, collects itself, and becomes stronger

"by such opposition: or it is an intention of the activity of one quality, caused by the opposition of another." Thus cold, say the school-philosophers, on many occasions, exalts the degree of heat, and dryness that of moisture.

Thus it is, that quick-lime is set on fire by the affusion of cold water: and so water becomes warmer in winter than in summer, by *antiperistasis*: and to the same cause it is owing, that thunder and lightning are excited in the middle region of the air, which is continually cold.

This *antiperistasis* was a principle of great use and extent in the Peripatetic philosophy.—"This necessary," according to the authors of that class, "that cold and heat be both of them endued with a self-invigorating power, which each may exert when surrounded by its contrary; and thereby prevent their mutual destruction. Thus it is supposed, that in summer the cold, expelled from the earth and water by the sun's scorching beams, retires to the middle region of the air, and there defends itself against the heat of the superior and inferior air. And thus, also, in summer, when the air about us is sultry hot, we find that cellars and vaults have the opposite quality: so in winter, when the external air freezes the lakes and rivers, the internal air, in the same vaults and cellars, becomes the sanctuary of heat; and water, fresh drawn out of deep wells and springs, in a cold season, not only feels warm, but manifestly smokes."

Mr. Boyle has canvassed this doctrine thoroughly, in his history of cold.—It is certain, that *a priori*, or considering the reason of the thing abstracted from the experiments alledged to prove an *antiperistasis*, it appears highly absurd: since, according to the course of nature, one contrary ought to destroy, not to strengthen another: beside, that it is an axiom, that natural causes act as much as they can; which, as to inanimate creatures, must be allowed physically demonstrative; in regard that these act not by choice, but by a necessary impulse.

It is commonly indeed alledged, as a proof of a power nature has given bodies of flying their contraries, that drops of water, falling on a table, collect into little globules, to avoid the contrary quality in the table, and keep themselves from being swallowed up by the dry wood: but this we can account for on more intelligible principles, *viz.* the power of attraction, and repulsion. As to the *antiperistasis* of cold and heat, the Peripatetics talk of those qualities being surrounded by their opposites; as if each of them had an understanding and foresight, that in case it did not gather up its spirits, and guard against its antagonist, it must infallibly perish: but this is to transform physical agents into moral ones.

In effect, not only reason, but experiment also, concludes against the notion of an *antiperistasis*: the leading argument urged in behalf of it is, the heating of quick lime in cold water: now, who can sufficiently admire at the laziness and credulity of mankind, who have so long and generally acquiesced in what they might so easily have found to be false; for if, instead of cold water, the lime be quenched with hot water, the ebullition will always be far greater than if the liquor were cold.

Again, in freezing a basin to a joint stool, with a mixture of snow and salt, by the fire-side, it is pretended, that the fire so intends the cold, as to enable it to congeal the water that stagnated upon the surface of the stool, betwixt that and the bottom of the vessel. But how little need there is of an *antiperistasis* in this experiment, appears hence, that Mr. Boyle has purposely made it with good success, in a place where there neither was, nor ever probably had been a fire.

The patrons of an *antiperistasis* usually plead that aphoristical saying of Hippocrates, "The viscera are hottest in winter," in behalf of their opinion: but the only proof usually brought of such greater heat, is, that men then have a greater appetite; so that the aphorism supposes digestion to be made in the stomach by heat, which is easily refuted.

Another argument, urged in favour of an *antiperistasis*, is borrowed from the production of hail, which is presumed to be generated in summer only, not in winter; and, according to the schools, is made in the lowest region of the air, by the cold of the falling drops of rain being so highly intended by the warmth they meet with in the air near the earth, as to congeal into a solid form.

As to the refreshing coldness which subterraneous places afford in summer, it may be denied that they are then really colder than in winter; though, if the contrary were allowed, it would not necessarily infer an *antiperistasis*.—It is certain, the smoking of waters, drawn from deep places in frosty weather, does not necessarily infer such water to be warmer than at other times when it does not smoke; since that effect may proceed, not from the greater warmth of the water, but from the greater coldness of the air. For a man's breath in a cool summer, or in mild winter weather, becomes very visible; the

cold ambient air suddenly condensing the fuliginous steams discharged by the lungs; which, in warmer weather, are readily diffused in imperceptible particles through the air. See the articles, COLD and EFFLUVIA.

ANTIPHONY, **ANTIPHONA**, the answer made by one choir to another, when the psalm or anthem is sung between two.

Among the number of ecclesiastical books, formerly used in the church, and abolished by parliament at the reformation, we meet with *antiphoners*, or *antiphonaries*. 3 & 4 Ed. VI. c. 10.

ANTIPHRAISIS*, a sort of figurative expression, which has a contrary meaning to what it carries in appearance.—Or, a kind of irony, wherein we say any thing and mean the contrary.

* The word is derived from the Greek *αντι*, and *φρασις*, of *επος*, *1 speech*.

Sanctius defines *antiphrasis* to be a form of irony, whereby we say a thing, by denying what we ought rather to affirm it to be: *antiphrasis est ironia quedam forma, cum dicimus negando id quod debuit affirmari*.—As when we say it did not displease me, or, he is no fool; meaning, I was pleased with it, or he is a man of sense.—On this principle, the *antiphrases* ought to be ranked among the figures of sentences, and not among those of words.

It is a common error, to make *antiphrases* consist in single words; as when we say, that the *Parcae* are thus called by *antiphrasis*, because they spare no body, *parca quia nemini parcunt*.—St. Jerom. in his epistle to Riparius against Vigilantius, says, he ought rather to be called *dormitantiis per antiphrasin*, than *vigilantiis*, because he opposed the Christians holding wakes at the tombs of the martyrs.

Sanctius holds it improper to call these *antiphrases*; by reason phrase is not applicable to a single word, but signifies *orationem*, *aut loquendi modum*.

ANTIPODES*, in geography, a relative term, understood of such inhabitants of the earth as live diametrically opposite to one another.

* The word comes from the Greek *αντι*, against, and *πους*, *an*, a foot.

The *Antipodes* are those who live in parallels of latitude equally distant from the equator, the one toward the north, the other to the south; and under the same meridian, though 180°, or just half of that meridian, distant from one another.

The *Antipodes* have the same degree of heat and cold; and the same length of night and day; but at contrary times: it being midnight with one, when it is noon with the other; and the longest day with one, when shortest with the other.

Again, as the horizon of any place is 90° distant from the zenith thereof, *Antipodes* have the same horizon. See **HORIZON**.—And hence when the sun rises to one, he sets to the other.

Plato is said to have first started the notion of *Antipodes*; and likewise to have given them the name: as he conceived the earth to be of a spherical figure, it was easy for him to infer that there must be *Antipodes*.

Many of the ancients, and particularly Lactantius and Augustin, laughed at the notion.—The latter of those fathers is strangely perplexed to think how men and trees should hang pendulous in the air, their feet uppermost, as he thought they must do in the other hemisphere.

And if we may believe Aventine, Boniface archbishop of Mentz and legate of pope Zachary, in the eighth century, declared a bishop of that time, called Virgilius, heretic, for maintaining that there was such a thing as *Antipodes*.

But this piece of history is controverted by the authors of the *Mem. de Trevoux*; as having been made use of, it seems, by some persons, to shew, that the church has been mistaken in its decisions.—The only account extant of the matter, upon which the tradition is founded, is a letter of pope Zachary to Boniface; wherein he says, “If it be proved that he maintaining, that there is another world, and other men under the earth; another sun, and another moon; expel him the church, in a council; after first divesting him of the priest-hood, &c.” The authors above cited endeavour to prove that this threatening was never executed; and that Boniface and Virgilius afterwards lived together in good understanding; and that Virgilius was even canonized by the same pope. *Mem. de Trev. an 1708*.

They farther assert, that, were the story true, the pope had done nothing contrary to truth and equity: in regard the notion of *antipodes* was very different in those days, from what it is now.—For besides the demonstrations of the mathematicians, say they, the philosophers too added their consent; and asserted, that the sea made two great circles around the earth, which divided it into four parts; that the vast extent of this ocean, and the burning heats of the sun, prevented any communication between those four parts of the earth, so that men could not be all of the same kind, nor proceed from the same original: and this,” say our authors, “was what was meant by the word *Antipodes* in those times.”

As to the sentiments of the primitive Christians with regard to *Antipodes*; some, rather than admit the conclusions of the philosophers, absolutely denied the whole, even the demonstrations of the geometricians relating to the sphericity of the earth: which is Lactantius's way. *Instit. lib. iii. c. 24*.—Others only called in question the conjectures of the philosophers: which is St. Augustin's method, *de civit. dei, lib. xvi. c. 9*.—After putting the question, whether there ever were nations of cyclopes, or pigmies, or of people whose feet stood outward, &c. he comes to the point of *Antipodes*, and asks, “whether the lower part of our earth be inhabited by *Antipodes*?”—He made no doubt of the earth's being round, nor of their being a part diametrically opposite to ours; but only disputes its being really inhabited. And the considerations he suggests for that purpose are just enough: As, that they who asserted *Antipodes*, had no history for it; that the lower part of the earth may be covered with water; and that to place *Antipodes* there, of a different origin from us, (as must have been the opinion of the ancients, since they thought it impossible to go from our world to theirs) is to contradict scripture, which teaches, that the whole race descended from one man.—Such are the sentiments of that father.

It may be added, that the Christian fathers were not the only persons who disputed the truth of the *Antipodes*. Lucrætiûs had done it before them at the end of his first book, v. 10, 63, &c. See also Plutarch, *lib. de facie in orbe lunæ*; and Pliny, who refutes the opinion, *lib. ii. c. 65*.

ANTIPREDICAMENTS, in logic. See **ANTEPREDICAMENT**.

ANTIPTOSIS*, a figure in grammar, whereby one tale is put for another. See **CASE**.

* The word comes from the Greek *αντι*, *pro*, and *πτωσις*, *expos*.

ANTIQUARY, **ANTIQUARIUS**, a person who studies and searches after monuments and remains of the ancients; as, old medals, books, statues, sculptures, and inscriptions; and, in general, all curious pieces that may afford any light into antiquity.

Formerly there were several other kinds of *antiquaries*. The librarii or copists, i. e. those who transcribed in fair legible characters what had been before written in notes, were called by this name. See **LIBRARI**.—They were also denominated *calligraphi*.

In the chief cities of Greece and Italy, there were other persons of distinction, called *antiquaries*, whose business it was to shew strangers the antiquities of the place, to explain the ancient inscriptions, and to give them all the assistance they could in this way of learning.

This was doubtless a very curious and useful institution; and might well deserve to be re-established.—Pausanias calls these *antiquaries*, *εργηται*; the Sicilians called them *mythagogi*.

ANTIQUATED, **ANTIQUATUS**, something obsolete, or grown out of date, or use.

ANTIQUÉ, **ANTIQUUS**, in a general sense, something that is ancient.

ANTIQUÉ is chiefly used among architects, sculptors, and painters; who apply it to such pieces of buildings, sculpture, painting, &c. as were made at the time when the arts were in their greatest perfection, among the ancient Greeks and Romans, viz. from the age of Alexander the great to the time of the emperor Phocas, about the year of Christ 600, when Italy became over-run by the Goths and Vandals.

In this sense the word stands opposed to modern.—Thus we say, an *antique* building, or a building after the *antique*; an *antique* bust, or bas-relievo; the *antique* manner, taste, &c.

ANTIQUÉ is sometimes also contradistinguished from *ancient*, which denotes the lesser degree of antiquity, when the art was not in its utmost purity.

Thus, *antique* architecture is frequently distinguished from ancient architecture.

Some writers also use the compound, **ANTIQUO-MODERN**, in respect of old Gothic churches, and other buildings; to distinguish them from those of the Greeks and Romans.

ANTIQUITY, **ANTIQUITAS**, is used to denote the times or ages past long ago.

Thus we say, the heroes of *antiquity*, the marks, or footsteps, of *antiquity*, monuments of *antiquity*, &c.

ANTIQUITY is also used to denote the works or remains of ancient times. See **MONUMENT**, **REMAINS**, **RUINS**, &c. Thus we say, a fine, curious piece of *antiquity*; Italy, France, and England, famous in *antiquities*.

ANTIQUITY is also used to denote the great age of a thing, or its duration from times of old.

In this sense we say, the *antiquity* of a kingdom, a custom, or the like: most nations lay claim to an *antiquity* much greater than they can truly warrant. The *antiquity* of the world is said to be the *antiquity* of the world; which was but a new thing in what are commonly called the ancient days. Plato tells us of an account which an Egyptian priest gave to Solon, in which the Athenians were said to be 9000 years old, and those of Sais 8000. Pomponius Mela makes a still larger account out of Herodotus, viz. of 320 kings before Atlantis, and upwards of 13000 years. Diodorus Siculus tells us of

from the equator; the one towards the north, and the other to the south. See EARTH.

* The word is formed of the Greek *antē*, contra; and *opos*, I dwell, inhabit.—The *Antæci* are contradistinguished from the *Periæci*.

Hence, the *Antæci* have the same longitude and the same latitude, only of a different denomination. They lie in the same femicircle of the meridian, but in opposite parallels.

The inhabitants of Peloponnesus are *Antæci* to the Hottentots of the cape of Good hope.—*Antæci* are frequently confounded with *Antiscii*. See ANTISCII.

The *Antæci* have precisely the same hours of the day and night; but exactly opposite seasons: when it is 12 a-clock in the longest summer day with one; it is 12 a-clock of the shortest winter's day with the other: and hence the night of the one is always equal to the day of the other.

Hence also those stars which never rise to any given place, to the *Antæci* and Antipodes thereof never set; and *vice versa*.—And if the *Antæci* turn their faces toward each other, or the Antipodes look both toward the equator, the stars will rise to the one on the right hand, and to the other on the left.

ANTONINE Column. See the article COLUMN.

ANTONOMASIA *, a figure in rhetoric, whereby a noun appellative is used instead of a proper name, or *vice versa*.

* The word is compounded of the Greek *anti*, for, and *onomā*, name.

Thus we say, the philosopher, instead of Aristotle; the orator, for Cicero; the apostle, for St. Paul; the prophet, for Moses, &c.—Thus also we call a voluptuous person, a Sardanapalus, &c. And thus the French say Henry the great, meaning Henry IV. of France.

ANTRUM *Higromarium* is a cavity discovered within the sinus of each maxillary bone.

Surgeons sometimes mistake this for a caries of the bone; finding they can penetrate so deep into it with a probe. *Reysch. ap. Bibl. Anat. Med. t. 3. p. 204.*

ANTRUM *Pylori*, a large cavity at the bottom of the pylorus. See PYLORUS.

ANVIL, a smith's utensil, serving to place the work on, to be hammered or forged.

The face or uppermost surface of the *anvil* must be very flat and smooth, without flaws; and so hard that a file will not touch it.—At one end there is sometimes a pike, bickern or beak-iron, for the rounding of hollow work.—The whole is usually mounted on a firm wooden block. *Max. Mechan. Exerc. p. 3.*

ANUS, in anatomy, the lower extremity of the intestine rectum; or the orifice of the fundament.—See *Tab. Anat. (Splanchn.) fig. 9. lit. u.*

The Gabionites sent golden emeralds back with the ark, to be cured of a disease which afflicted them in the anus. *1 Sam. c. 6.*

Muscles of the ANUS are the sphincter, levator, and scalptor, or latissimus dorsi.

Diseases of the ANUS are fistula's, and the proccidentia, or prolapsus ani; to which may be added the hemorrhoids or piles.

Speculum ANI. See the article SPECULUM.

ANUS is also used for a small hole in the third ventricle of the brain, which leads into the fourth ventricle of the cerebellum.

AONIDES, in mythology. See the article MUSE.

AORISTUS *, *Ἀορίστος*, in the Greek grammar, an indefinite or indeterminate kind of tense, which sometimes expresses the present, sometimes the future, but most frequently the past time.

* The word is compounded of *α*, privative; and *ἄριστος*, to bound or limit.

The Greeks have two *aoristus*'s; the Latins have none.

AORTA *, in anatomy, an artery, which rises immediately out of the left ventricle of the heart; and is distributed thence through all the parts of the body.—V. *Tab. Anat. (Angiol.) fig. 1. n. 1. and fig. 3. (Splanchn.) fig. 12. lit. r. and o. and fig. 1. lit. n. and Angiol. fig. 1. n. 28.*

* The word is formed of the Greek *aorō*, which signifies a vessel, bag, chel, &c.

The *aorta* is divided into two grand trunks, called the ascending and descending; *aorta ascendens* and *descendens*.

The *aorta* is otherwise called the great artery; as being the trunk, out of which the other arteries all spring; and the great conduit or canal whereby the blood is conveyed throughout the body.

Obstructions, or petrifications of the coats of the *aorta* as it rises from the heart, are so frequent, that some think it a constant case:—Mr. Cowper, however, has an express discourse, to shew, that whenever such ossification happens in man, it is a disease, and incommodes the part in the due execution of its office.

Of this he gives us several instances; one, in which an intermission of pulse was produced; in another a cold-

ness of the extremities, with a gangrene, &c. *Phil. Transact. N.º 299.*

APAGMA, a term used by some writers in chirurgery, for the thrusting of a bone or other part out of its proper place.

APAGOGE *, *Ἀπαγωγή*. See ABDUCTION.

* The word is compounded of *απο*, from; and *αγω*, to bring or draw.

APAGOGICAL *Demonstration* is such as does not prove the thing directly, but shews the impossibility and absurdity which arises from denying it.

Hence it is also called *reductio ad impossibile*, or *ad absurdum*.

APANAGE *, APFENAGE, APPANAGE, APANNAGE, or APENNAGE, in the French laws, the fortune of a king's younger son: or a settled portion of lands, &c. assigned for the subsistence of the cadets, or younger sons of a sovereign prince.

* Nicod and Menage derive the word from the Latin *panis*, bread, which frequently includes all other sorts of provision necessary for subsistence. Du Cange takes it to have been formed of the base Latin, *apanare*, *apanamentum*, and *apanagium*, which amounts to the same thing; those words, being apparently formed of *panis*.

Some will have the *apanages*, at their first institution, to have been only pensions, or annual payments of a certain sum of money.—The younger sons of England have no certain *apanages*, as in France; but only what the good pleasure of the king bestows upon them.

Even in France, during the first and second races of kings, the right of primogeniture and *apanages* were unknown; but the domains were divided pretty equally among all the children.

Great inconveniences arising hence; it was at length found proper to put off the younger born with counties, dutchies, or other districts; on condition of their paying homage and fealty for the same, and of their reverting, in defect of heirs male, to the crown.

This has happened accordingly to the first and second branch of the dukes of Burgundy.—The dutchy of Orleans is the *apanage* of the second son of France.

APARTMENT *, a portion of a large house, wherein a person may lodge separately; having all the conveniences requisite to make a complete habitation.

* The word comes from the Latin *apartimentum*, of the verb *partiri*, to divide; or, as some imagine, *a parte mansuæ*, making part of the dwelling.

A complete apartment must consist of a hall, a chamber, an antichamber, a closet, and a cabinet or wardrobe.

APATHY *, in a moral sense, denotes an insensibility; or a privation of all passion, all emotion, or perturbation of mind.

* The word is formed of the privative particle *a*, and *πάθος*, passion.

The Stoics affected an entire *apathy*: their wisdom was to enjoy a perfect calmness or tranquillity of mind, incapable of being ruffled, and above the reach of any sense either of pleasure or pain.

In the first ages of the church, the Christians adopted the term *apathy*, to express a contempt of all earthly concerns; a state of mortification, such as the gospel prescribes. And hence we find the word often used among the devout writers: Clemens Alexandrinus, in particular, brought it exceedingly in vogue; thinking hereby to draw the philosophers to Christianity, who aspired after such a sublime pitch of virtue.

Quietism, is only *apathy* disguised under the appearance of devotion.

APATURIA *, in antiquity, a solemn feast celebrated by the Athenians in honour of Bacchus.

* The word is usually derived from the Greek *ἀπάτης*, fraud.

It is said to have been instituted in memory of a fraudulent victory, obtained by Melanthus king of Athens over Xanthus king of Bœotia, in a single combat, which they agreed upon, to put an end to a debate between them relating to the frontiers of their countries.—Hence Budeus calls it *sestium deceptionis*, the feast of deceit.

Other authors give a different etymology of this feast, from what we have now related: they tell us, that the young Athenians were not admitted into the tribes on the third day of the *apaturia*, till their fathers had first sworn, that they were their own children; and that, till that time, they were spitted, in some measure, to be without fathers, *ἀπατέρων*; whence the feast, say they, took its name.

Xenophon, on the other hand, informs us, that the relations and friends met on this occasion, and joined with the fathers of the young people who were to be received into the tribes; and that from this assembly the feast took its name: that in *απαταρία*, the *a*, far from being a privative, being here a conjunctive, and signifies the same thing with *καί*, together.

This feast lasted four days: the first day, those of the same tribe made merry together; and this they called *δρυπία*. The second day, which they called *αναθήρσις*, they sacrificed to Jupiter and Minerva. The third day, which they called

κορητις,

αἰματι, such of their young men and maids as were of age were admitted into their tribes. The fourth day they called *εὐρίβη*.

APECHEMA, *Απεχέμα*, in medicine, the same with *Contraffissure*. See **CONTRAFFISSURE**.

APELLITÆ, heretics in the primitive church, who taught, that Christ left his body dissolved in the air; and so ascended into heaven without it.

APENNAGE. See the article **APANAGE**.

APERPSY*, *Απερψία*, in medicine, denotes crudity, or a want of digestion.

* The word is formed from the privative particle *α* and *εἰς*, *cogno*, I concoct.

Απερψία may be defined a defect in the stomach, which prevents the aliment taken in from affording a proper chyle for supplying the blood, and nourishing the body.

APERIENS*, *Απεριέν*, or *Απεριτίς*, in medicine. See **APERIENTS**.

* The word is Latin; being the participle of the verb *aperire*, to open; *g. d.* opening.

Circus maris **APERIENS**, opening saliron of iron, is a preparation of iron-plates or filings, made by exposing them to the rain or dew, till they contract a rust; which is the medicine required. See also **AIR**, &c.—It is a good *aperient*.

APERIENS palpebram rectus, in anatomy, is a muscle, which, rising in the orbit of the eye, near the entrance of the optic nerve, passes over the atollent muscle of the eye, and is at last inserted into the whole superior part of the upper eye-lid, which it serves to open.

APERIENTS, or *Απεριτίς*, in medicine, are such as open the obstructed passages of the small vessels, glands, and pores; and by that means promote a due circulation of the contained juices.

Aperients, then, coincide with what we otherwise call *openers*, *anastomatics*, and *deobstruents*. See **DEOBSTRUENT**, &c.

The five lesser *aperient*, or opening roots, are *grafs*, *madder*, *eryngo*, *capers*, and *chamomoc*.

The greater *aperient*, or opening roots, are *smallage*, *fennel*, *aparus*, *parily*, and *butcher's broom*.

APERTA Toga. See the article **TOGA**.

APERTIONS, in architecture, are the openings in a building; as doors, windows, stair-cases, chimneys, outlets and inlets for light, smoke, &c.

The *apertions* should be as few as may be; it being a rule that all openings are weakenings.

APERTURE*, *Απερтура*, the opening of any thing; or a hole, cleft, or vacant place, in some otherwise solid or continuous subject.

* The word comes from the Latin *apertura* of *aperire*, to open.

In geometry, *aperture* is used for the space left between two lines which mutually incline towards each other to form an angle.

In optics, *aperture* is the hole next the object-glass of a telescope, or microscope; through which the light and image of the object come into the tube, and are thence carried to the eye.

APERTURE is also understood of that part of the object-glass itself which covers the former, and which is left pervious to the rays. See **TELESCOPE**.

A great deal depends on having a just *aperture*.—To find it experimentally; apply several circles of black smutted paper, each bigger than other, upon the face of the glass, from the breadth of a straw to such as leave only a small hole in the glass; and with each of these, separately, view several distinct objects; as the moon, stars, &c. That through which they appear the most distinctly, is to be pitched upon.

M. Auzout affirms, that he found that the *apertures* of telescopes ought to be nearly in the subduplicate ratio of their lengths: but Huygens, who first introduced the use of *apertures*, assures us he found by experience, that the *aperture* of an object-glass, *e. gr.* of 30 foot, is to be determined by this proportion: as 30 to 3, that is, as 10 to 1, so is the root of the distance of the focus of any glass multiplied by 30, to its *aperture*: and the focal distances of the eye-glasses are to be proportional to the *apertures*.—A table of *apertures* for telescopes of various lengths, &c. see under the article **TELESCOPE**.

The greater or less *aperture* of an object-glass, it is to be noted, does not increase or diminish the visible area of the object; all that is effected by this is, the admittance of more or fewer rays, and consequently the more bright or obscure appearance of the object.

Hence, in viewing Venus through a telescope, a much less *aperture* is to be used than for the Moon, Jupiter, or Saturn, because her light is so vivid and glaring.—Which consideration does a little invalidate and disturb M. Auzout's proportion, as is shewn by Dr. Hook, Phil. Transact. No 41.

APERTURA Testamentum, in ancient law-books, signifies the breaking open a last will and testament. See **WILL** and **TESTAMENT**.

APERTURA Feudi denotes the loss of a feudal tenure, by default of issue to him to whom the feud or fee was first granted. See **FEU**.

APETALOUS*, in botany, something without petala or flower-leaves. See **PETALA**, and **LEAF**.

* The word comes from the privative particle *α*, and *πέταλον*, *folium*, a leaf.

APEX, the vertex or summit of any thing. See **VERTEX**, **APICES**, &c.

APHÆRESIS, *Αφαίρεσις*, in grammar, a figure; whereby something is taken away from the beginning of a word.

Thus *ciconia*, by *aphæresis* is wrote *conia*; *contemnere*, *temnere*; *omittere*, *mittere*, &c.

A like retrenchment at the end of a word is called *apocope*. See **APOCOPE**.

APHELION*, or *Αφελιον*, in astronomy, that point of the earth's or a planet's orbit, in which it is the farthest distant from the sun that it can be.

* The word comes from the Greek *απο*, from; and *ήλιος*, sun.

Thus a planet being in *A*, (*Tab. Astron. Fig. 1.*) its utmost distance from the sun *S*; is said to be in its *aphelion*.

In the system or supposition of the sun's moving round the earth; the same point is called *apogee*. The *aphelion* stands opposed to the *perihelion*.

The *aphelia* of all the primary planets are at rest; excepting that those planets nearest the sun, *viz.* Mercury, Venus, the Earth, and Mars, being acted upon by Jupiter and Saturn, their *aphelia* move a small matter in consequentia with respect to the fixed stars, and this in the sesquialterate ratio of the distances of those planets from the sun.

Hence, if the *aphelion* of Mars move 35 minutes in consequentia in respect of the fixed stars in 100 years; the *aphelia* of the Earth, Venus and Mercury, will move in 100 years, 18 min. 36 sec. 11 min. 27 sec. and 4 min. 29 sec.

The method of finding the place of the *aphelion* is, by observing several of the greater digressions of the planet from the sun; till by two or three repeated observations it be found to remain at a stand.—In the Philof. Transact. No. 128. we have a geometrical method of finding the *aphelia* of the planets, given by Dr. Halley.

Kepler places the *aphelion* of Saturn for the year 1700, in 28°. 3'. 44". of Sagittarius: De la Hire, in 28°. 14'. 41". —The *aphelion* of Jupiter in 8°. 18'. 40". of Libra: De la Hire in 10°. 17'. 14". —The *aphelion* of Mars in 0°. 51'. 29". of Virgo: De la Hire in 0°. 35'. 25". —The *aphelion* of the Earth in 8°. 25'. 30". of Cancer. —The *aphelion* of Venus in 3°. 24'. 27". of Aquarius: De la Hire in 6°. 56'. 10". —And the *aphelion* of Mercury in 15°. 44'. 29". of Sagittarius: De la Hire in 13°. 3'. 40".

The annual motion, according to Kepler, of the *aphelion* of Saturn, is 1°. 10". of Jupiter, 47". of Mars, 1°. 7". —Of Venus, 1°. 18". and of Mercury, 1°. 45". According to de la Hire, that of Saturn is 1°. 22". of Jupiter 1°. 34". of Mars 1°. 7". —Of Venus 1°. 26". and of Mercury 1°. 39".

APHONIA*, *Αφονία*, in medicine, the state of a person who is dumb, or destitute of speech. See **DUMBNESS**.

* The word is compounded of the privative particle *α* and *φωνή*, *vox*, voice; *g. d.* a loss of speech, or voice.

Menjotius has a dissertation exprès de *Aphonia*.

APHORISM*, a maxim, general rule, or principle of a science; or a brief sentence, comprehending a great deal of matter in a few words.

* The word comes from the Greek *απορρίζω*, of *απορίω*, *separe*, *selego*, I separate, I chuse, *g. d.* a choice or select sentence.

The term is chiefly used in medicine and law.—We say the *aphorisms* of Hippocrates, of Sanctorius, of Boerhaave, &c. *aphorisms* of the civil law, &c.

APHRONITRE*, *Αφρονιτρίτις*, a kind of nitre, mentioned by the ancients; supposed to be the spume, or the lightest and subtlest part thereof, emerging to the top.

* The word is compounded of the Greek *αφρός*, froth; and *νίτρον*, nitre.

Some modern naturalists rather take the ancient *aphronitre* to have been a native salt-petre, gathering like an effluence on old walls, &c. now called *salt-petre of the rocks*. See **SUPPLEMENT**, Article **APHRONITRUM**.

APHTHÆ*, in medicine, little ulcers or pimples rising in the mouth, the palate, gums, and at the root of the tongue; attended with inflammation, and a difficulty of swallowing.

* The word seems derived from the Greek *αφθίς*, I corrupt; or from *αἵωμι*, *accendo*, I kindle.

Sucking children are particularly subject to *aphthæ*, when either the nurse's milk is corrupted, or the child's stomach becomes unfit for digestion: for, in these cases, the sharp acrimonious parts of the milk rising up, easily exulcerate those tender and delicate parts.

There are some *aphthæ* white, others red, others livid and blackish: the white and red sorts are the least dangerous, and the most easily cured; the livid and black often prove mortal.

When

When they happen in grown persons, they are owing to thin, ferous, and sharp humours returned from the several parts of the body to the mouth.—A liniment of mel rosatum and oil of vitriol is esteemed a good remedy for the *apthæ*: plantane-water is also in use on the same occasion.

APHTHARTODOCETÆ*, *Ἀφθαρτοδοκῆται*, a sect of heretics, sworn enemies of the council of Chalcedon.

- * The word is derived from the Greek *αφθαρτος*, incorruptible; and *δοκω*, I opine, I imagine; and was given them, because they imagined the body of Jesus Christ was incorruptible and impassible, and not capable of death.

They arose among the Eutychians, and made their first appearance in the year 535.

APIARY*, *bee-house*; a place where bees are kept; and furnished with all the apparatus necessary for that purpose.

- * The word comes from the Latin *apis*, a bee.

The *apiary* should be screened from high winds on every side, either naturally or artificially; and well defended from poultry, &c. whose dung is offensive to bees.

APICES*, *summits*, in botany, little knobs growing on the tops of the stamens, or chives in the middle of flowers.

- * The word is Latin; being the nominative plural of *apex*, the top or summit of any thing.

They are commonly of a roundish figure.—By the microscope they have been discovered to be, as it were, a sort of capsule females, or seed-vessels, containing in them small globular, and often oval particles of various colours, and exquisitely formed; called the *farina fecundans*. See *FARINA Fecundans*.

These particles are a kind of male sperm, which, falling down into the flower, fecundates and ripens the seed. See further under the article *Generation of PLANTS*.

APOBATERION, *Ἀποβάτηριον*, among the ancients, a farewell speech, or poem, made by a person on his departure out of his own country, or some other place where he had been kindly received, and entertained.

Such is that of Æneas to Helenus and Andromache, *Æn. Lib. III.*—The *apobaterion* stands opposed to the *epibaterion*. See *EPIBATERION*.

APOCALYPSE*, *ΑΠΟΚΑΛΥΨΙΣ*, *revelation*; the name of the last book in the canon of scripture.

- * The word is formed of the Greek *αποκαλυπτω*, I reveal, I discover.

The *Apocalypse* contains discoveries, or revelations relating to many important mysteries of the christian faith, made to the apostle St. John, in the isle of Pathmos, during his banishment there under the persecution of Domitian.

This, of all the books of the New Testament, is that, about which the ancient fathers, and the practice of the church, were the most, and the longest divided.—When it was first universally received as canonical, is not easy to decide.—St. Jerom relates, that the Greek church doubted of its authenticity even in his days: St. Basil and Gregory Nazianzen absolutely reject it; and the council of Laodicea never mention it in their canon of the sacred writings. Some attributed it to the heretic Cerinthus; and others, to another John, disciple of St. John.—Dionysius Alexandrinus censures it as written in bad Greek, and even finds solecisms and barbarisms in it, in abundance: though he allows it to contain a mystic sense, which, he says, he admires even where he does not understand it.

On the other hand, St. Justin, Irenæus, Theophilus Antiochenus, Melito, Apollonius, Clemens Alexandrinus, and Tertullian, make no doubt of its being canonical. The third council of Carthage, held in 397, placed it in the canon of the New Testament; and the churches both of the east and west have acknowledged it ever since.

The Alogians are represented by ecclesiastical writers, as great declaimers against the *Apocalypse*, many of the flights whereof they turned into ridicule; particularly the visions of the seven trumpets, the four angels bound on the river Euphrates, &c.—St. Epiphanius defends it against them: the book, he observes, is not a mere history, but a prophecy; so that it is no wonder the author should express himself after the manner of the prophets, whose style is usually figurative.

Of all their objections against the authority of this book, that seems the best grounded which is drawn from those words in cap. ii. ver. 18. *Write to the angel of the church of Thyatira*: there was not, say they, any christian church at Thyatira at that time.—St. Epiphanius, who grants them this point, is forced to have recourse to the prophetic spirit; as if St. John had foreseen there would be a church there in course of time.

Some late authors have made a good amendment to St. Epiphanius's answer: it is probable, in the time of that father, the catalogue of the bishops, with other acts, which shew that there had been a church established there from the time of the apostles, might not be known. Grotius adds,

that though there was not, indeed, any church of Gentile converts at Thyatira when St. John wrote; yet there was one of Jews, as there had been another at Thessalonica before St. Paul preached there.

Several orthodox writers have rejected the *Apocalypse* as a book which countenanced the reveries of Cerinthus, touching the carnal reign of Christ on earth. See *CERINTHIAN*.

Though Dionysius Alexandrinus (*op. Euseb. Hist. Eccl. 7. 25.*) allowed the *Apocalypse* for an inspired writing; yet he took it for the work of another John, different from St. John the Evangelist; which he endeavours to make appear from the diversity of style.—But we all know how precarious the arguments are, which are drawn from the mere consideration of style.—It is true, in most of the ancient Greek copies, both printed and manuscript, we find the name *John the Divine*, at the head thereof; but they who put this title meant no more thereby than to denote the apostle St. John, whom the Greek fathers call the *Divine*, by way of eminence, to distinguish him from the other Evangelists.

There have been several other works published under the title of *Apocalypse*.—Sozomen mentions a book used in the churches of Palestine, called the *Apocalypse*, or *Revelation of St. Peter*. He also mentions an *Apocalypse* of St. Paul; which the Coptæ retain to this day.—Eusebius also speaks of both these *Apocalypses*.—St. Epiphanius mentions an *Apocalypse* of Adam: Nicéphorus, an *Apocalypse* of Eudras: Gratian and Cedrenus, an *Apocalypse* of Moses, another of St. Thomas, and another of St. Stephen: St. Jerom, an *Apocalypse* of Elias.

Porphyry, in his life of Plotin, makes mention of the *Apocalypses* or revelations of Zoroaster, Zostrian, Nicothæus, Alogenes, &c.

APOCHYLISMA, in pharmacy, denotes an inspissated vegetable juice; answering to what the shops call a *Rob*. See *Rob*.

APOCOPE*, a figure in grammar, wherein part of the end of a word is cut off; as in *dic* for *dice*, *fac* for *face*, *nil* for *nihil*, *hyp* or *hyppo* for *hypochondriacal*.

- * The word is derived from the Greek *αποκοπιω*, to cut off; which is compounded of the preposition *απο*, and the verb *κοπιω*, I cut.

A like retrenchment at the beginning of a word is called *aphæresis*.

When the *apocope* is marked with a superior comma, (called an *apostrophus*) the word is said to be *apostrophated*: as *thre'* for *through*.

APOCRISIARIUS*, in antiquity, an officer appointed to carry or deliver the messages, orders, and answers of a prince or emperor.

- * The word is formed from the Greek *αποκρισις*, *responsum*, answer.—Hence he is usually called in Latin, *responfalis*, q. d. answerer.

The *apocrisarius* afterwards became the emperor's chancellor, and kept the seal.—In the barbarous Latin we sometimes meet with *apocrata*, secretary, for *apocrisarius*. Zosimus defines *apocrisarius*, secretary for foreign affairs; being the same with what Vopiscus in the life of Aurelian calls *notarius secretorum*.

The title of *apocrisarius*, became at length appropriated, as it were, to the pope's deputy or agent, who resided at Constantinople to receive the pope's orders, and the emperor's answer.

St. Gregory was *apocrisarius* of pope Pelagius, at the time when he composed his morals on Job.—The *apocrisarius* did the office of the modern nuncio's. See *NUNTIO*—Sometimes, however, he had the rank and quality of the pope's legate.

The heresy of the Monothelites, and afterwards that of the Iconoclasts, broke off the custom of having a papal *apocrisarius* at Constantinople.

APOCRUSTICS*, *Ἀποκρυστικαί*, in medicine, remedies induced with a repelling and astringent power, whereby they prevent the too great afflux of humours to a part diseased.

- * The word is derived from *αποκρυσσω*, *pulso*, *pello*, I drive.

Apocrustics are usually cold and astringent, and consist of large particles, wherein they differ from drawing medicines, which are hot, and consist of more subtile parts.

APOCYPHAL, something dubious; or that comes from an uncertain author, whereon much credit cannot be reposed.

We say, an *apocryphal* book, passage, history, &c. meanings, such as are of suspected authority.—In matters of doctrine, the writings of heretics, schismatics, &c. are all held *apocryphal*.

Vossius observes, that, with regard to the sacred books, none are to be accounted *apocryphal*, except such as have neither been admitted into the synagogue, nor the church, so as to be added to the canon, and read in public.

For this reason also, the books of Sibyls were anciently called

apocryphal, as being committed to the trust of the decemviri alone: and for the like reason the annals of the Egyptians and Tyrians were called by the same name.

Before the septuagint version, the books of the Old Testament were all *apocryphal* in this sense.—But in process of time, the sense of the word was changed, and those books alone were called *apocryphal*, which were of doubtful or suspected authority.

In the original meaning of the word, all the writings deposited in the temple were called *apocryphal*; by reason they were kept secret from the people.

When the Jews published their sacred books, they only gave the appellations of *canonical* and *divine* to such as they thus made public; and such as were still retained in their archives they called *apocryphal*, for no other reason, but because they were not public; so that they might be really sacred and divine, though not promulged as such.

Thus, in respect of the Bible, all books were called *apocryphal*, which were not inserted in the Jewish canon of Scripture; and it is in this sense that St. Epiphanius is to be understood, when he says, that the *apocryphal* books are not put in the ark among the other inspired writings.

There has been a great dispute between the Romanists and the Reformed, about the authority of those books, now called, by the latter, *apocryphal*; as Judith, Tobit, Efdras, Macabees, &c. the one having the opinions of many of the primitive fathers for their vouchers, and the others, the tradition of their church.

* The word is derived from the Greek *αποκρυφειν*, to hide; because the origin of such books was unknown, or because they contain some myseries not fit to be known.

M. Simon contends, that they must have been read in Greek, even by the apostles themselves; which he infers from divers passages in their writings.—He adds, that the church received them with the other books of Scripture, from the Hellenist Jews; and that if the churches of Palestine never admitted them, it was not for their accounting them *apocryphal* in the sense the word is now used, but because they read none but what were writ in Hebrew.

To this may be opposed the authority of the greatest part of writers in all ages, till the council of Trent; which makes a precise distinction between the books now called *apocryphal*, and those contained in the Jewish canon.

APODICTICAL * *Argument*, or *syllogism*, signifies a clear, convincing proof, or demonstration of a thing.

* The word is formed of the Greek *αποδιδικναι*, I demonstrate, I shew clearly.

APOGEE *, *ΑΡΟΓΕΙΟΝ*, in astronomy, that point in the orbit of the sun, or a planet, which is furthest distant from the earth.

* The word is formed of the Greek *απο*, ab, from; and *γη*, or *γαια*, earth.—In the corrupt Latin, *apogee* sometimes signifies a grotto, or subterraneous vault.

The *apogee* is a point in the heavens, at the extreme of the line of the apides; in which the sun, or a planet, is at the greatest distance that it can be at, from the earth, in its whole revolution.

The opposite point hereto is called the *perigee*. See **P E R I G E E**.

The ancient astronomers, regarding the earth as the centre of the system, chiefly considered the *apogee* and *perigee*: the moderns, making the sun the centre, change the *apogee* and *perigee* for *aphelion* and *perihelion*. See **APHELION**, and **PERIHELION**. See also **S Y S T E M**.

The quantity of the motion of the *apogee* may be found by comparing two observations thereof made at a great distance of time; converting the difference into minutes, and dividing it by the number of years elapsed between the two observations. The quotient gives the annual motion of the *apogee*.—Thus, from an observation made by Hipparchus in the year before Christ 140, whereby the sun's *apogee* was found 50°, 30' of 11; and another made by Ricciolus, in the year of Christ 1646, wherein it was found 79°, 26', of 22; the annual motion of the *apogee* is found to be 1°. 2'.

Apogee of the Moon. See the article **M O O N**.

Apogee of the Equant is its farthest distance from the earth; or that point where the circumference of the equant is intersected by the line of the apides, in the remotest part of the diameter.

So the perigee of the equant is the opposite point, or the nearest part of the diameter.

The mean *apogee* of the epicycle, is a point where the epicycle is cut above, by a right line drawn from its centre, to the centre of the equant, or the point of the epicycle most remote from the earth.

APOGRAPH *, *ΑΠΟΓΡΑΦΗ*, a copy or transcript of some book or writing.

* The word is formed of *απο*, ab, from; and *γραφεω*, scribe, to write.

In this sense, *apograph* stands opposed to *autograph*; as a copy to an original.

APOLLINARISTS, *ΑΠΟΛΛΙΝΑΡΙΟΙ*, ancient heretics,

VOL. I.

who denied that Jesus Christ assumed true flesh, or a rational human soul.

Apollinaris of Laodicea, their leader, invested Christ with I know not what fanciful kind of flesh, which he supposed to have existed with the sun from all eternity.—He also distinguished between the soul of Christ, and what the Greeks call *νοη*, mind or understanding; and from this distinction he took occasion to assert, that Christ assumed a soul without its understanding, and that this defect was supplied by the Word *: though some of his followers held that Christ had no human soul at all.

* Apollinaris distinguished between the soul and the mind, the *ψυχη* and the *νοη*; acknowledging, that the word assumed the body, and the soul, *ψυχη*, of man, but not *νοη*, the mind or spirit; but that the Word it self supplied the place thereof.—This then, according to Bp. Pearson, was the difference between the Arian and Apollinarian heresies; that the latter asserted, that God assumed the nature both of the flesh and soul of man; but the former, that only of the flesh. So that there are two things observable in the Apollinarian heresy: their philosophy, whereby they make man consist of three distinct parts, body, soul, and spirit or mind; and their divinity, whereby they only make the human nature of Christ consist of two of those, viz. body and soul.—But the Bishop, it is to be noted, seems to depart a little from the current of ecclesiastical writers, in supposing, that Apollinaris allowed Christ to have assumed a true body. *Vid. Niceph. Hist. Eccl. l. 2. c. 12.* Vincent Lirin. &c.

Apollinaris further taught, that the souls of men were propagated by other souls, as well as their bodies.—Theodoret charges him with confounding the persons of the Godhead; and with giving into the errors of Sabellius; and Basil accuses him of abandoning the literal sense of scripture, and taking up wholly with the allegorical sense.

This heresy was very subtle, and overspread most of the churches of the east; it was condemned in a synod of Alexandria, under St. Athanasius, in the Year 362. It was subdivided into several different heresies, the chief whereof were the Dimocrites.

APOLLINARIAN Games, *Απολλινάριες Λυδς*, in antiquity, games at Rome, celebrated yearly in honour of Apollo, on the fifth day of July, under the direction of the prætor, in the Circus maximus.

The tradition goes, that, at the first celebration hereof, the people were suddenly invaded by the enemy, and obliged to take to their arms: upon which occasion a cloud of darts and arrows falling upon their enemies, the Romans soon returned victors to their sports.

APOLLONIAN Hyperbola, and *Parabola*. See **HYPERBOLA** and **PARABOLA**.

APOLOGETIC, *ΑΠΟΛΟΓΗΤΙΚΗ*, something said or written, by way of excuse or *apology*, for any action or person.

The *Apologetic* of Tertullian is a work full of strength and spirit; such as in all respects became the character of that father.—He there vindicates the Christians from all that had been objected to them, particularly from the abominable crimes said to be perpetrated at their meetings, and their want of love and fidelity to their country. The ground of this last accusation was, their refusing to take the accustomed oaths, and swear by the tutelary gods of the empire.—Tertullian addresses his *apologetic* to the magistrates of Rome; the emperor Severus being then absent.

APOLOGUE *, *ΑΠΟΛΟΓΟΣ*, a moral fable; or a feigned relation, intended to inform and amend the manners. See **F A B L E**.

* Jul. Scaliger derives the name *απολογος*, inasmuch as the *apologue* means something more than what at first sight it expresses.

Such are the fables of *Æsop*; whence, moral fables are usually denominated *Æsopic Fables*.

Father de Colonia makes it essential to the *apologue*, that it contain what passes among brutes; and distinguishes it from the *parable* by this, that the latter, though feigned, might possibly be true, which the former cannot; since brutes cannot speak.

APOLOGY *, *ΑΠΟΛΟΓΙΑ*, defence; a discourse or writing in vindication of a person.

* The word is formed of the Greek *απολογειν*, to refute, or repel with words.

APONEUROSIS *, *Απνευρωσις*, among anatomists, the spreading or expansion of a nerve, or tendon, breadth-wise; in manner of a membrane.

* The word is compounded of the Greek *απο*, ab, from; and *νευρον*, a nerve.

APONEUROSIS sometimes also signifies the cutting off a nerve, or tendon.—And in some writers we find it used for the tendon itself.

APOPHLEGMATIZANTS * denote medicines proper to purge the head and brain of superfluous phlegm or ferous humours.

* These are also, by many writers, denominated *apophlegmatizans*.—The word is compounded of *απο*, from; and *φλεγμα*, phlegm.

APOPHYGE*, in architecture, that part of a column where it begins to spring out of its base, and shoot upwards.

* The word in its original Greek signifies *flight*; whence the French also call it *éclat*, *éclat*, &c. and we, sometimes, the *spring* of the column.

The *apophyses*, in its original, was no more than the ring or ferril heretofore fastened at the extremities of wooden pillars, to keep them from splitting; which afterwards was imitated in stone-work.

APOPHYSIS*, in anatomy, a protuberance of a bone; or a part eminent, and jutting out beyond the rest.

* The word is Greek, *αποφύσις*, and literally denotes a production outwards: formed *απο τῆς ἀποφύσεως*, to arise from, or out of.

APOPHYSES Mammillares are the beginnings of the olfactory nerves, as far as the os cribrosum, where they divide into little fibres, which pass through those bones, and spread themselves throughout the upper part of the nose.

ΑΠΟΦΥΣΕΙΣ Mammillares, or Mastoidea, also denotes one of the external eminences of the os petrosum.

APOPLECTIC, relating to an apoplexy.—Thus we say, an *apoplectic* fit, an *apoplectic* water, &c.

APOPLEXY* in medicine, a sudden privation of all the senses, and all the sensible motions of the body, excepting those of the heart and lungs; attended with a great depravation, or suspension of the principal faculties of the soul.

* The word comes from the Greek *αποπληξίς*, to strike, or astonish; this distemper striking suddenly, and, as it were, like a thunder-bolt.

Apoplexy differs from *corus*, *lithargy*, and *coma*, in regard, that in those three distempers the stupor is not so profound, nor is all sensation quite destroyed.

It differs from *syncope*, in that there is no sensible pulse in this last; whereas in an *apoplexy*, the pulse is perceptible almost till death.

It differs from an *epilepsy*, in regard all motion is not abolished in that, as in this: and it differs from the *palsy*, inasmuch as the palsy is not attended with any stupor, nor does it deprive the patient of sense and perception.

The *apoplexy* may be occasioned by an interruption of the passage of the blood towards the brain; or by any thing that hinders the influx of the animal spirits into the organs of sense, and the parts of voluntary motion: sometimes it is owing to an abundance of phlegm, and sometimes to a viscid pituita, wherewith the brain is oppressed; as is observable in winter *apoplexies*, and in those of old people. It sometimes also comes from a melancholic acid humour that coagulates the blood, or from too gross a lymph, which stops up the nerves; or a plethora, which oppresses them; or excrecencies within hide the cranium, pressing the vessels; or from a polypus, blocking up the carotids, &c. *V. Bayle, de Apopl.* See **BRAIN**.

In dissecting persons dead hereof, clotted extravasated blood is usually found in one or both ventricles of the brain. See *Philos. Transact.* N° 173, 313, &c.

Hippocrates distinguishes two kinds of *apoplexies*, the one *strong*, the other *weak*; only differing in the greater, or less difficulty of respiration, and pulsation: in the former the pulse and breath seem almost entirely stopped, in the latter there are considerable remains of them.

The more modern authors distinguish *apoplexies*, from their cause, into *sanguineous* and *pituitous*; to which may be added *hæmiplegic*, *polypus*, *serous*, *atrial*, &c.

The fit of an *apoplexy* is usually preceded by a violent pain in the head, a dimness and loss of sight or memory: sometimes by a universal indolence; and sometimes by a flux of pituitous matter by the nose and mouth.—It is attended with a snoring and difficulty of breathing: sometimes with a fever, rarely with a foaming at the mouth, frequently with a sweat, hæmorrhoids, or diarrhœa.

To prevent an *apoplexy*, wine and hard labour are to be avoided; there is to be no eating to excess; nor no sleeping after dinner: exercise is to be kept up, and care and chagrin to be kept under. To cure an *apoplexy*, medicines must be used that occasion large evacuations; and nothing of opiate or assenting kinds meddled withal.—During the fit, copious bleeding in the jugulars is to be used, and the patient laid on his back; applying strong volatiles to the nose; also blow up strong sternutories, and rub the temples with cephalic mixtures.—A hot iron may also be applied near the vertex or occiput; and an epispastic to the neck; to which are to be added powerful purgatives, clysters, &c.—Cupping and scarification on the head are commended by some in lieu of venesection.

The disease sometimes degenerates into a paralysis.—And sometimes only half the head is affected; in which case the disease is called simply a hæmiplegia. See **SUPPLEMENT. Article Apoplexy.**

APORON*, or **APORIME**, a problem difficult to resolve; and which has never been resolved, though it be not, in itself, impossible.

* The word is derived from the Greek *ἀπορον*, which signifies something very difficult, and impracticable; being formed from the privative *α*, and *πορον*, passage.

Such we conceive the quadrature of the circle; the duplicature of the cube; the trisection of an angle, &c.

When a question was proposed to any of the Greek philosophers, especially of the sect of academists; if he could not give a solution, his answer was, *απορον*, *q. d.* I do not conceive it, I cannot see through it, I am not able to clear it up.

APORRHOEA*, **APORRHOES**, in philosophy, sulphurous effluvia or exhalations, emitted from the earth, and subterraneous bodies.

* The word is formed from the Greek *απορροια*, *deflus*, to flow from. See **MEPHITES**, &c.

APOSCERNISMUS, *Αποσκορνισμός*, a species of fracture of the skull, or other bone, wherein a piece is taken clearly off, as if cut out with a hatchet: from the Greek *σκορνισμός*, an ax, or hatchet. *V. Bibl. Anat. Med. T. 1. p. 559, & 581.*

APOSIOPESIS*, in rhetoric, otherwise called *reticency*, and *suppression*: a figure, by which a person really speaks of a thing, at the same time that he makes a shew as if he would say nothing of it. See **PRETERITION**.

* The word comes from the Greek *αποσιωπασθαι*, to hold one's peace.

APOSTACY*, a deserting, or abandoning of the true religion.

* The word is borrowed from the Latin *apostatare*, or *apostare*, to despoil, or violate any thing.—Hence, *apostatare* is anciently signified to transgress the laws.—*Qui leges apostatant terre sue reus sit apud regem.* LL. Edw. Confess. The Latin *apostatare*, again, comes from the Greek *αποστα*, from; and *στασις*, *sto*, to stand.

Among the Romanists, *apostacy* also signifies the forsaking of a religious order, whereof a man had made profession; without a lawful dispensation.

The ancients distinguished three kinds of *apostacy*; the first, a *supererogation*, is committed by a priest or religious, who abandons his profession, and returns to his lay state; the second, a *mandatis Dei*, by a person of any condition, who abandons the commands of God, though he retains his faith; the third, a *fide*, by him who not only abandons good works, but also the faith.

There is this difference betwixt an *apostate*, and a *heretic*; that the latter only abandons a part of the faith, whereas the former renounces the whole.

A late writer charges the English clergy with an *apostacy*, or falling away from the doctrines of the reformation.

APOSTATA Capienda, a writ which anciently lay against one, who, having entered and professed some order of religion, broke out again, and wandered the country, contrary to the rules of the order.

APOSTHUME*, or **APOSTEM**, **APOSTEMA**, in medicine, a preternatural tumor; called also *abscess*, and *impitibum*. See **ABSCESS**.

* The word is formed of the Greek *αποστημα*; which comes from the verb *αποστυμι*, *absterdo*, I deprive from one place and fix in another; alluding to the manner wherein the tumor is usually formed of a translated humor.

A POSTERIORI—Demonstration a *posteriori*. See **DEMONSTRATION**.

APOSTLE*, **ΑΠΟΣΤΟΛΟΣ**, one of the twelve disciples of Jesus Christ, commissioned by him to preach his Gospel, and propagate it to all the parts of the earth.

* The word *apostle*, *αποστολος*, originally signifies a person *delegated*, or *sent*; from the verb *αποστέλλω*, *mitti*: in which sense it occurs in Herodotus, and other prophane authors.—Hence, in the New Testament, the term is applied to divers sorts of delegates; and to the twelve disciples by way of eminence.

Certain false preachers of the Gospel anciently disputed with St. Paul his quality of *apostle*; by reason none but those who had seen Jesus, and been witnesses of his actions, could be said to be sent by him.—In answer to these sophistical doctors, who had seduced the churches of Galatia; he begins his epistle to them with these words, *Paul an apostle, not of men nor by man, but by Jesus Christ and God the father*: by which he signified that he had his mission immediately from God; and of consequence was a true *apostle*.

St. Paul is frequently called the *apostle*, by way of eminence; and the *apostle of the Gentiles*, by reason his ministry was chiefly made use of for the conversion of the Gentile world, as that of St. Peter, was for the Jews.—The several *apostles* are usually represented with their respective badges or attributes: St. Peter, with the keys; St. Paul, with a sword; St. Andrew, with a cross or saltire; St. James minor, with a fuller's pole; St. John, with a cup and winged serpent flying from it; St. Bartholomew, with a knife; St. Philip, with a long staff, whose upper end is formed into a cross; St. Thomas, with a lance; St. Matthew, with a hatchet; St. Matthias, with a battle-ax; St. James major, with a pilgrim's staff and a gourd bottle; St. Simon, with a saw; and St. Thaddeus, with a club.

APOSTLE was also an appellation given to the ordinary travelling ministers of the church.—Thus St. Paul, in the epistle to the Romans, xvi. 7. says, *Salute Andronicus and Junia, my kinsmen and fellow prisoners, who are of note among the apostles.*

APOSTLE was also a title given to those sent by the churches to carry their alms to the poor of other churches.—This usage they borrowed from the synagogues, who called those whom they sent on this message, by the same name; and the function or office itself *ἀποστολή*, *apostle*, *g. d. mission*.—Thus St. Paul, writing to the Philippians, tells them, that Euphroditus their *apostle* had ministered to his wants, chap. II. 25.

APOSTLE is also used for a person who first planted the Christian faith in any place.

Thus St. Dionysius of Corinth is called the *apostle of France*; St. Xavier the *apostle of the Indies*, &c.—In the East-Indies, the Jesuit missionaries are also called *apostles*.

In some ages of the church, the pope was peculiarly denominated the *apostle*. V. Siden. *apollin*. Lib. VI. Ep. 4.

APOSTLE, in the Greek liturgy, is particularly used for a book containing the epistles of St. Paul, printed in the order wherein they are to be read in churches, through the course of the year.—Another book of the like kind, containing the gospels, is called *Evangelium*, Gospel.

The *apostle*, of late days, has also contained the other canonical epistles, the acts of the *apostles*, and the revelations. Hence it is also called, *Acts of the Apostles*, *Παράκλητος*; that being the first book in it.

APOSTLE, is also used among the Jews, for a kind of officer: anciently sent into the several parts and provinces in their jurisdiction, by way of visitor, or commissary; to see that the laws were duly observed, and to receive the moneys collected for the reparation of the temple, and the tribute payable to the Romans.

The Theodosian Code, Lib. XIV. De *Judeis*, calls those *apostoli*, *qui ad exigendum aurum atque argentum a patriarcha ceteris tempore diriguntur*. The Jews call them *מִשְׁפָּטִים*, *Schilbim*, *g. d. envoys*, or messengers.—Julian the apostate remitted the Jews the *apostole*, *ἀποστολή*; that is, as he himself explains it, the tribute they had been accustomed to send him.

These *apostles* were a degree below the officers of the synagogues called *patriarchs*, and received their commissions from them.—Some authors observe that St. Paul had bore this office; and that it is this he alludes to in the beginning of the epistle to the Galatians: as if he had said, Paul, no longer an *apostle* of the synagogue, nor sent thereby to maintain the law of Moses, but now an *apostle* and envoy of Jesus Christ, &c.—St. Jerom, though he does not believe that St. Paul had been an *apostle* of this kind; yet imagines, that he alludes thereto, in the passage just cited.

In the arsenal of Bremen, there are twelve, sees of cannon called the *twelve apostles*, on a supposition that the whole world must be convinced, and acquiesce in the preaching of such *apostles*.

APOSTOLIC, **APOSTOLICAL**, something that relates to the *apostles*, or descends from them. See **APOSTLE**.—Thus we say, the *apostolical* age, *apostolical* doctrine, *apostolical* character, constitutions, traditions, &c.—The Romanists call their church, the *catholic and apostolic church*; and thus appropriate a title to Rome, which anciently was held in common with it by several other churches.

APOSTOLIC, in the primitive church, was an appellation given to all such churches as were founded by the *apostles*; and even to the bishops of those churches, as being the reputed successors of the *apostles*.—These were confined to four, *viz.* Rome, Alexandria, Antioch, and Jerusalem.

In after-times, other churches assumed the same quality, on account, principally, of the conformity of their doctrine with that of the churches which were *apostolical* by foundation, and because all bishops held themselves successors of the *apostles*, or acted in their dioceses with the authority of *apostles*.

The first time the term *apostolical* is attributed to bishops, as such, is in a letter of Clovis, to the council of Orleans, held in 511; though that king does not there expressly denominate them *apostolical*, but (*apostolica sede dignissimi*) highly worthy of the *apostolical* see. In 581 Guntram calls the bishops met at the council of Maçon, *apostolical* pontiffs, *apostolici pontifices*.

In progress of time, the bishop of Rome growing in power above the rest; and the three patriarchates of Alexandria, Antioch and Jerusalem falling into the hands of the Saracens; the title *apostolical* became restrained to the pope, and his church alone.—Though some of the popes, as St. Gregory the great, not contented to hold the title by this tenure, began, at length, to insist, that it belonged to them by another and peculiar right, as being the successors of St. Peter.

And hence a legion of *apostolicals*; *apostolical* see, *apostolical*

nuncio, *apostolical* notary, *apostolical* brief, *apostolical* chamber, *apostolical* vicar, &c.

APOSTOLICAL Constitutions, } See { CONSTITUTION.
APOSTOLICAL Tradition. } See { TRADITION.

APOSTOLICI, **APOSTOLI**, or **APOSTLES**, was a name assumed by two different sects of heretics, on account of their pretending to imitate the manners and practice of the *apostles*.

The first *Apostolici*, otherwise called *Apotactitæ* and *Apotactici*, rose out of the Encratitæ, and Cathari, in the third century. They made profession of abstaining from marriage, and the use of wine, flesh, money, &c.

The other branch of *Apostolici* were of the twelfth century. These also condemned marriage, but allowed of concubinage; they set aside the use of baptism; and in many things imitated the Manichees.—St. Bernard wrote against this sect of *Apostolici*.

APOSTOLORUM Unguentum, the *Apostles* ointment, in pharmacy, is a kind of detergent, or cleansing unguent, composed of twelve drugs; the number of the *Apostles*, whence its name.

It was invented by Avicenna, and is otherwise called *unguentum veneris*.—The principal ingredients are turpentine, resin, wax, gum ammoniac, birth-wort roots, olibanum, bellium, myrrh, and galbanum, opopanax, verdigrise, litharge, oil of olives, and vinegar.

APOSTROPHE*, in rhetoric, a figure, whereby the orator, in an extraordinary commotion, turns his discourse from the audience, and directs it to some other person, or thing.

* The word is Greek *ἀποτροπή*, *avertio*; formed of *ἀπο*, *ab*, from, and *τροπή*, *verto*, to turn.

Thus Cicero, in his oration for Milo, addresses himself to the great patriots who had shed their blood for the public; and calls them to the defence of his client. So the same orator in his first *Catilinarian* directs himself to Jupiter the protector of the city and empire, and beseeches him to repel the parricide, &c.

The *apostrophe* is frequently also addressed to inanimates, as tombs, monuments, dead, &c.—Cicero's *apostrophe* to Tullio, in his oration for Ligarius, is judged one of the finest passages in his works.

That *apostrophe* of Demosthenes, wherein he addresses himself to the Greeks slain at the battle of Marathon, is also famous.

Cardinal Perron says, it has procured the orator as much glory, as if he had raised them from the dead.

APOSTROPHE, or **APOSTROPHUS**, in grammar, also denotes a note or character placed over a letter, in lieu of a vowel, to denote that the vowel is cut off, and not to be pronounced.

As *ev'n* for *even*; *th' angelic host*, for *the angelic*, &c.—The affectation of frequent *apostrophes*, so usual among some late English writers, is a great abuse.

APOTACTITÆ*, or **APOTACTICI**, an ancient sect, who affecting to follow the evangelical counsels of poverty, and the examples of the *Apostles*, and primitive Christians, renounced all their effects and possessions.

* The word is Greek, formed from *ἀποτρέπειν*, *avertio*, or *avertio*, to renounce.

It does not appear that they gave into any errors during their first state: some ecclesiastical writers assure us, they had divers holy virgins, and martyrs under the persecution of Dioclesian, in the fourth century: but they afterwards fell into the heresy of the Encratitæ, and taught, that the renouncing of all riches was not only a matter of counsel and advice, but of precept and necessity.—And hence the sixth law in the Theodosian Code joins the *Apotactitæ* with the Eunomians and Arians.

APOTHECARY*, a person who professes the practice of pharmacy, or that part of physic which consists in the preparation and compulsion of medicines.

* The word is derived from the Greek *ἀποθήκη*, *shop*, the place where he makes up, and exposes his medicines to sale.

Nich. Langius has a large volume expressly against the *apothecaries*, their quid pro quo's, their ignorance in the materia medica, and suffering themselves to be so easily imposed on by foreign merchants, druggists, &c. who supply them with adulterated drugs, one sort for another, old effete exhausted ones for new ones just imported from the Levant, &c.

The *apothecaries* in England are obliged to make up their medicines according to the formula's prescribed in the college dispensatory.

Their shops are subject to the visitation of the censors of the college; who are empowered to destroy such medicines as they think not good.

To his Majesty belong two *apothecaries*: the salary, to the first, 320 l. to the second, 275 l.—To the household belong also two.

Bartholin complains of the too great number of *apothecaries* in Denmark: though there are but two allowed in all Copenhagen, and one in every other considerable town.—What would

would he have said of London, where there are said to be upwards of 2000.

Whether the people of London be gainers in point of health by this army of *apothecaries*, is much to be doubted: but we find many complaints of the too great influence of the *apothecaries*: physicians seem generally of opinion, that it is in the power of the *apothecaries* either to introduce them into families, or to keep them out. Hence it is, that the doctor looks on the *apothecary*, either as the person by whom he was first recommended, or as the man whose kind word is necessary to continue him in the good opinion of the family he is called to: in order therefore to shew his gratitude for the past favours, or to engage the future services of this worthy gentleman, the doctor thinks himself obliged to prescribe ten times more physic than his patient has really occasion for.—If a conscientious physician offers to leave a sick man's chamber without putting pen to paper, the *apothecary* commonly informs the patient, by way of friendship, that whenever his physician does not prescribe he need not give him any fee. A patient who loves his money is apt enough to take such an hint; and, if the doctor is not a man of a very dull apprehension, he takes care not to commit the same fault a second time.—Happy would it be for the miserable patients here in town, if the load of unneccessary physic which they swallow down, though it does them no good, did them no harm; it would be no great matter if their pockets alone smarted for their folly; but, alas! this is not the case; their lives, or at least their constitutions, often pay for it. To confess the truth, a physician who would do good must always follow nature, but never run before it. And whenever he gives his patient two or three unneccessary doses of physic, from that time he no longer sees those symptoms of nature, which in all cases are our surest guides: he sees no other symptoms but such as chiefly result from his own drugs; and then I need not tell you what must be the consequence; he goes on in a fort of circle, creating distempers one day, and applying remedies to them the next. It is strange, to what a height *apothecaries* have found means to carry their favourite polypharmacy, considering what a few simple easy medicines will answer all the purpose of their vast shops. The physicians of Paris, towards the beginning of the 17th century, began to oppose the growing evil. Patin was one of the warmest. They went so far, as at length to exclude the ministry of the *apothecaries* in almost all cases. A valet, or a chambermaid, prepared and administered the purges, clysters, &c. The bookseller of the *Medicin Charitable*, (which they had procured to be wrote for the purpose) made up and sold most of the medicines directed in it; and even the physicians, when they wanted, sent to him for them. Patin, lett. 17. à Belin.

If you would keep the *apothecaries* under, says Guy Patin, (writing to M. Falconet, a physician of Lyons) you need only put them in mind of the *Medicin Charitable*, with which, when it was only worth two sous, we ruin'd the *apothecaries* of Paris.—Give 'em to understand, that cassia, rhubarb, and syrup of pale roses, are to be had at the grocer's, with which remedies alone we can do without their assistance. Mess. Marecot, Pietre, Duret, &c. introduced into the families in Paris a facile, parable physic, which has delivered them from the tyranny of those *cuisiniers arabesques*. Pat. Lett. Christ. 21.

APOTHEOSIS*, in antiquity, a heathen ceremony, whereby their emperors and great men were placed among the Gods.

* The word is derived from the preposition *apo*, and *θεο*, *Deus*, God.

After the *apotheosis*, which they also called *deification* and *consecration*, temples, altars, and images*, were erected to the new deity; sacrifices, &c. were offered, and colleges of priests instituted, *Dio* 47, 56, 59. *Suet. Aug.* 5. *Tib.* 40. *Patere.* 1. *Ovid. Pont.* 4.

* Images were erected to them with the attributes of divinity, (*Lucan* 7. *Dio* 53. *Capitolin. Antonin.*) And to demolish them was deemed treason, (*Pens.* 1. 6. D. ad leg. *Jul. maj.*) And even the senate decreed that oaths should be taken in their Names, (*Dio* 44, 59, 60. *Tac. Ann.* 1.) Vid. *Kirchm. de fun. Rom.* 4. 14.

It was one of the doctrines of Pythagoras, which he had borrowed from the Chaldees; that virtuous persons, after their death, were raised into the order of the Gods.

And hence the ancients deified all the inventors of things useful to mankind; and those who had done any important service to the commonwealth.—Tiberius proposed to the Roman senate the *apotheosis* of Jesus Christ, as is related by Eusebius, Tertullian, and St. Chrysostom. Juvenal rallying the frequent *apotheosis*, introduces poor Atlas, complaining that he was ready to sink under the burthen of so many new Gods as were every day added to the heavens.

Seneca ridicules the *apotheosis* of Claudius with admirable humour.—Herodian, l. 4. in speaking of the *apotheosis* of Severus, gives us a very curious description of the cere-

monies used in the *apotheosis* of the Roman emperors.—After the body of the deceased emperor, says he, had been burnt with the usual solemnities, they placed an image of wax, perfectly like him, but of a sickly aspect, on a large bed of ivory, covered with cloth of gold, in the vestibule of the palace. The greatest part of the day, the senate sat ranged on the left side of the bed, dressed in robes of mourning; the ladies of the first rank sitting on the right side, in plain and white robes, without any ornaments.—This lasted for seven days successively, during which, the physicians came from time to time to visit the sick, always making their report that he grew worse; till at length they published it, that he was dead.

This done, the young senators and Roman knights took the bed of state upon their shoulders, carrying it through the *via sacra*, to the old forum, where the magistrates were used to divest themselves of their offices. There, they set it down between two kind of amphitheatres, in the one whereof were the youth, and in the other the maidens of the first families in Rome, singing hymns set to solemn airs, in praise of the deceased. These hymns ended, the bed was carried out of the city into the *campus martius*, in the middle of which place was erected a kind of square pavilion, the inside whereof was full of combustible matters, and the outside hung with cloth of gold, and adorn'd with figures of ivory, and various paintings.

Over this edifice were several others, like the first in form and decoration, but less; always diminishing and growing slenderer towards the top.—On the second of these was placed the bed of state, and a great quantity of aromatic perfumes, and odoriferous fruits and herbs were thrown all around; after which, the knights made a procession or cavalcade in solemn measures around the pile; several chariots also run round it, those who conducted them being clad in purple robes, and bearing the images of the greatest Roman emperors and generals.

This ceremony ended, the new emperor came to the catafalco or pile, with a torch in his hand; and at the same time fire was set to it, on all sides; the spices and other combustibles kindling all at once.

While this was doing, they let fly from the top of the building, an eagle, which mounting into the air with a fire-brand, carried the soul of the dead emperor along with it into heaven, as the Romans believed; and thenceforward he was ranked among the gods.—It is for this reason, that the medals, wherein *apotheosis* are represented, have usually an altar with fire upon it; or else an eagle taking its flight into the air, and sometimes two eagles.

APOTOME*, in mathematics, the remainder or difference of two incommensurable quantities.

* The word is derived from the Greek verb *ἀποτμήω*, *abscindo*, I cut off.

A An *apotome* in geometry is an irrational residue, as CB, arising, when from a rational line AC, called *a*, you cut off a rational part AB, called *b*, only commensurable in power to the whole line AC.—It may be expressed thus, $a - \sqrt{b}$.

C **APOTOME**, in music, is the part remaining of an entire tone, after a greater semi-tone has been taken from it. The proportion in numbers of the *apotome* is, that of 2048 to 2187.

The Greeks thought that the greater tone could not be divided into two equal parts; for which reason they called the first part *σύνθετον*, and the other *διήγημα*; in this imitating Pythagoras and Plato.

APOZEM*, *Ἀποζέμα*, in medicine, a form of remedy, otherwise called a *decoction*. See **DECOCTION**.

* The word is derived from the Greek *ἀποζέω*, *σφραγίζω*, I make hot.

Apozems are a class of liquid medicines, composed of the juices of divers plants, roots, woods, flowers, leaves, fruits, and seeds, drawn out by boiling in water, and sweetened and clarified. An *apozem* differs from a *syrup*, in thickness and consistence; the *syrup* being more dense and viscous than the *apozem*, from the quantity of sugar.

It differs from a *julep*, in that it is thicker and more viscous; and is not made with distilled waters, as *juleps* are, but only with common water.

There are purging *apozems*, cephalic *apozems*, hepatic *apozems*, antarthritic, diuretic, atypic, &c. *apozems*.

APPANAGE, or **APPENAGE**. See **APANAGE**.

APPARATOR. See the article **APPARITOR**.

APPARATUS properly signifies a formal preparation for some public and solemn action.

We say, the *apparatus* of a feast, coronation, &c. The prince made his entry with great *apparatus* and magnificence.

APPARATUS is also used for the utensils, and appendages belonging to some more considerable machine.—As, the furniture or *apparatus* of an air-pump, microscope, &c.

APPARATUS is sometimes also used in chirurgery, for the bandages, medicaments and dressings of a part; or the several

Several matters applied for the cure of a wound, ulcer, or the like.

There is no judging of the quality of a hurt, till after taking off the first apparatus, or coverings.

APPARATUS is frequently used for the operation of cutting for the stone.

For this there are three sorts of apparatus; viz. the *small* (1), *great* (2), and *high apparatus* (3): which see described under the article LITHOTOMY.

(1) *The Small APPARATUS*, thus called from the few instruments it requires, was invented and described by Celsus.—Here, the two forefingers are thrust up the fundament till they come against the stone, and drive it to the neck of the bladder; from which it is extracted through an incision in the perineum.

(2) *The Great APPARATUS*, invented by John de Romaine, a physician of Cremona, in the year 1500; is performed also by making an incision in the perineum. This is denominated *great*, from the number of instruments used in it.

(3) *The High APPARATUS*, said to have been invented by Peter Franco, a surgeon of Provence in 1560, has been little used among us till of late.—In this method an incision is made above the os pubis, along the linea alba, into the fund of the bladder; through which the stone is extracted.

To these may be added the lateral operation, invented by Friar Jacques. *Vid. Hist. Acad. R. Science. an. 1699. p. 34.*

APPARATUS is also used as a title of several books composed in form of catalogues, bibliothecæ, dictionaries, &c. for the ease, and convenience of study.

The *Apparatus* to Cicero, is a kind of concordance, or collection of Ciceroian phrases, &c.—The *apparatus sacer* of Possevin, is a collection of all kinds of ecclesiastical authors printed in 1611, in three volumes.—Glossaries, comments, &c. are also frequently called *Apparatus*.

APPARENT, that which is visible, or evident to the eye, or the understanding.

APPARENT *Altitude*. See the article ALTITUDE.

APPARENT *Conjunction* of the planets is, when a right line, supposed to be drawn through the centre of two planets, does not pass through the centre of the earth, but through the eye of the spectator.

Hair APPARENT. See HAIR APPARENT.

APPARENT, or *sensible Horizon*, is that great circle which limits our sight; or the place where the heavens and the earth seem to meet.

This may be conceived as a cone, whose vertex is the eye, and its base the circular plain which terminates our prospect.—It determines the rising and the setting of the sun, moon, and stars.

APPARENT *Magnitude* of an object is the magnitude thereof such as it appears to the eye.

The *apparent* or seeming magnitude is measured by the optic angle.

Thus the *apparent* magnitude of an object is said to be so many degrees as the optic or visual angle subtends.

The *apparent* magnitudes of distant objects are usually said to be as their distances, reciprocally.

In strictness, however, it may be demonstrated, that the *apparent* magnitudes of the same object AC, (*Tab. Optics. fig. 69.*) seen at different distances, viz. at the places D and B; that is, the angles ADC and ABC are in a ratio less than the reciprocal ratio of the distances DG and BG; but when the object is very remote, viz. when the optic angles ADC and ABC are not above one or two degrees, they are nearly in that ratio reciprocally.

APPARENT *Magnitude* or *Diameter* of the sun, moon, or any planet, is the quantity of the angle that their diameters appear under, to an observer on the surface of the earth.

The *apparent* diameters of the celestial luminaries are subject to some diversity.—That of the sun is observed to be least when he is in cancer, and greatest when in capricorn.

In the moon there is a twofold increase and decrease of the *apparent* diameter; the one, when he is in conjunction with the sun; and the other when in her quadratures.

The greatest *apparent* diameter of the sun, according to Cassini, is 32', 10"; and the least 31', 38".—According to de la Hire, the greatest is 32', 43"; and the least 31', 38".—The greatest *apparent* diameter of the moon, according to Kepler, is 32', 44"; and the least 30', 00".—And according to de la Hire, the one is 33', 30"; and the other 29', 30". See SUN and MOON.

The *apparent* diameter of Saturn's ring, according to Huygens, is 1', 8", when least.

The *apparent* diameters of the other planets, see under the article DIAMETER.

If the distances of any two very remote objects, for example, two planets, be equal, their true diameters are proportional to the *apparent* ones; and if the *apparent* diameters be equal, the true diameters will be as the distances from the eye.—Hence, when neither the distances nor the *apparent* diameters are equal,

VOL. I.

the true diameter will be in a ratio compounded of the direct ratio of the distances, and of the direct ratio of the *apparent* diameters.

There is a farther very observable difference between the *apparent* magnitudes or diameters of the sun and moon when in the horizon, from what they are in the meridian; the reason whereof has long perplexed the philosophers. See MOON.

APPARENT *Motion*, *Time*, &c. See MOTION, TIME, &c. APPARENT *Place* of any object, in optics, is that wherein it appears, when seen through one or more glasses.

The *apparent place* is different from the *real* one; for when, by refraction through glasses, that parcel of rays which falls on the pupil of the eye, from each point of any near object, is made to flow as close together as that which comes from a distant one; or when, by the same means, the rays coming from distant objects are made to diverge as much as if they flowed from near ones; then the eye must necessarily see the place of the object changed: which change is its *apparent place*.

If an object be placed nearer to a convex glass than is the distance of its focus, its *apparent place* may be determined: but if the object be in the focus of the glass, the *locus apparentis* of the object cannot be determined; only that it will appear vastly remote.

Nor can the *locus apparentis* be determined, if the object be beyond the focus of a convex glass: but if the object be further distant from a convex glass, than its focus, and the eye lie beyond the distinct base, its *apparent place* will be in the distinct base. See the article LENS.

APPARENT *place* of a star, &c. is a point in the surface of the sphere, determined by a line drawn from the eye through the centre of the star.

The true or real place is determined by a line drawn from the centre of the earth, through the star or planet.

APPARITION, in astronomy, denotes a star's or other luminary's becoming visible, which before was hid.

In which sense the word stands opposed to occultation.

The heliacal rising is rather an apparition than a proper rising. See HELIACAL.

Circle of perpetual APPARITION. See CIRCLE of perpetual Apparition.

APPARITOR, or APPARITOUR, or APPARATOR, a beadle in an university, who carries the mace before the masters, and the faculties. See BRADLE, and UNIVERSITY.

APPARITORS also denote messengers, who cite men to appear in the ecclesiastical courts.

Among the Romans, *apparitores* were the same with sergeants or tip-staffs among us; or rather *apparitor* was a general term, and comprized under it all the ministers and attendants of the judges and magistrates, appointed to receive and execute their orders.—And hence, they say, the name was derived, viz. from *apparere*, to be present, to be in waiting.

Under the name *apparitores* were comprehended the *scribæ*, *accensii*, *interpretes*, *præcones*, *viatores*, *libertores*, *stateres*, and even the *carifices* or hangmen.

They were usually chosen out of the freed-men of the magistrates; and their condition was held in so much contempt, that, as a mark of ignominy, the senate appointed a city that had revolted from them to furnish them with *apparitores*.

There were also a kind of *apparitors* of cohorts, called *cohortales*, or *conditionales*, as being attached to a cohort, and doomed to that condition.—The *apparitors* of the prætors, *prætoriani*, were those who attended the prætors, or governors of provinces; and who, on their master's birth-day, were always changed, and preferred to better posts.—Add, that the pontifices had also their *apparitors*, as appears from an inscription of an ancient marble in the via appia:

APPARITORI
PONTIFICVM
PARVVLARIO.

APPEAL in law, signifies the removal of a cause from an inferior judge to a superior; or the having recourse to a superior judge to rectify what is amiss in a sentence passed by an inferior.

Appeals lie from all the ordinary courts of justice to the house of lords, who judge on *demurrer* *reſort*; i. e. no appeal lies from them.

There are *appeals* from ecclesiastical justice to secular.—The first instance of this is that of Paulus Samosatenus; who, being condemned and deposed by the second council of Antioch, refused to surrender the episcopal house to Domnus, who had been elected his successor; and *appealed* to the emperor.

APPEAL is also used in common law in the same sense with *accusatio* among the civilians. For as, in the civil law, cognizance of criminal cases is taken either upon inquisition, accusation, or denunciation; so, in ours, it is taken either upon indictment, or *appeal*.

Indictment comprehends both inquisition and denunciation.—*Appeal* or *reſtutatio* is a lawful declaration of another man's crime (which, by Bracton, must be felony at the least) be-

fore a competent judge, by one that setteth his name to the declaration, and undertakes to make it good on the penalty that may otherwise ensue.
An *appeal* is commenced two ways; either *by Writ*, or *by Bill*.

APPEAL by Writ is, when a writ is purchased out of chancery by one to another; to this end, that he *appeal* a third of some felony committed by him, finding pledges that he shall do it, and deliver this writ to the sheriff to be recorded.

APPEAL by Bill is, when a man of himself gives up his accusation in writing to the sheriff or coroner; offering to undergo the burden of *appealing* the person therein named.

This practice is drawn from the Normans, as appears from the grand customary, wherein is a solemn discourse both of the effects of this *appeal*, viz. the order of the combat, or the trial by inquest; which, by our law, was in the choice of the defendant.

APPEAL of Mayhem is an accusing of one that hath maimed another.—But this being heretofore no felony, the *appeal* thereof was but in manner of an action of trespass; so that there was nothing recovered but the damages.

Bracon calls this, *appellum de plagis mahemio*, and has a whole chapter of it.—In king John's time, there is recorded an *appeal* against a Jew, *qui fecit ementulari quandam nepotem suum*.

APPEAL of wrong imprisonment is used by Bracon for an action of wrong or false imprisonment.

APPEAL is more particularly used for a private accusation of a murderer, by one who had interest in the murder'd party; or of any felon by one of his accomplices in the fact.

If an appeal of murder or felony be used by any common person against a peer; he shall be tried by Commoners, and not by his peers.

The person who brings an *appeal* is called the *appellant*; and the person appealed, the *appellee*.

APPEARANCE, the exterior surface of a thing; or that which first strikes the sense, or the imagination.

The academics maintain, that the sensible qualities of bodies are only *appearances*; and the like doctrine is held by some later philosophers.

Our errors arise chiefly from a too hasty and precipitate assent of the will, which acquiesces too easily in the *appearances* of truth.

APPEARANCES in physiology. See PHASMATA.

APPEARANCE, in perspective, is the representation or projection of a figure, body, or the like object, upon the perspective plane.

The *appearance* of an objective right line is always a right line. See PERSPECTIVE.—The *appearance* of an opaque body and a luminary being given, to find the *appearance* of the shadow; see SHADOW.

APPEARANCE of a star or planet. See APPARITION.

APPEARANCES, in astronomy, &c. are more usually called *phenomena* and *phases*.

In optics we use the term *direct appearance* for the view or sight of an object by direct rays; without either refraction or reflection.

To *save APPEARANCES* is to discharge one's duty seemingly, or acquit himself of the formalities and externals thereof; so as to save his character, and avoid giving scandal or offence.

APPEARANCE, in law, is the defendant's engaging to answer a cause or action entered against him in some court of judicature.

Appearance, in the king's-bench, is the defendant's filing either of common or special bail, if the action be by bill.

—If it be by original, the appearance must be with the philazer of the county where the arrest was.

Appearance, in the common-pleas, must be entered with the philazer there; but if it be by bill, with the prothonotary.

APPELLATIVE*, or *Noun APPELLATIVE*, in grammar, a common name; or a name which belongs or is applicable to all things of a certain kind.

* The word is formed of the Latin, *appellare*, to call, or name a thing.

Such are the names, *man, angel, horse, plant, tree*, &c.

Appellatives stand opposed to *proper* names, which belong only to individuals; as *Peter, Gabriel, Bucephalus*, &c.

See PROPER Name.

APPENAGE. See the article APANAGE.

APPENDANT, in law, is understood of such things as by time of prescription have belonged, appertained, and been joined, to some other principal thing.

Thus an hospital may be *appendant* to a manor; a common of fishing, to a freehold; a seat in a church, to a house; or the like.

Advowson APPENDANT. } See the articles } ADVOWSON.
Common APPENDANT. } COMMON.

APPENDIX, or APPENDAGE, a thing accessory to, or dependant on another.

The term is chiefly used in matters of literature, for an additional discourse, placed at the end of any piece, or writing; to explain or prosecute something there left deficient, or to draw conclusions therefrom.—In which sense the word coincides with *supplement*.

APPENDIX, in anatomy, is a part, in some measure, detached from another part to which however it adheres, or is contiguous.

There are membranous *appendices*, of various figures, in most of the inner parts of the body.

The cœcum is by some writers called *appendix*, or *appendicula vermiformis*.

APPENDIX is more particularly used in the same sense with *epiphysis*.

APPENSA*, or *APPENDED Remedies*, such as are outwardly applied, by hanging about the neck.

* The word comes from the Latin *ad* and *pendo*, I hang to.

Such are divers amulets, necklaces, phylacteries, &c.

APPURTINANCES, or *APPURTENANCES*, See APPURTENANCES.

APPETITE*, *APPETITUS*, *APPETENCY*, in philosophy, a desire of enjoying something wanted; or a complacency in the fruition of a thing present.

* The word comes from the Latin verb *appetere*, to desire, to covet; formed of *ad*, to; and *peto*, I draw.

Some philosophers define *appetite* more generally, an inclination of the soul, towards some object considered as good; or a propensity to an object, in respect of the good that is apprehended in it.

The schoolmen distinguish *appetite* into *voluntary* and *natural*.—The first is the will it self, acting under a competent knowledge or information of the thing in hand: such is the *appetite* or desire of being happy.—The second is a kind of instinct, whereby we are mechanically driven to consult our own preservation.

Natural *appetite* is subdivided into *concupiscible* and *irascible*.

APPETITE, in medicine, is more particularly used to denote a natural periodical call or desire to eat and drink, in order to repair what had been wasted by the several excretions of the body.

A loss or prostration of *appetite* is called *anorexia*. See ANOREXIA.—A preposterous *appetency* of things not proper for food is called *pica*. See PICA.

An immoderate *appetite* is called *bulimia*, or *fames canina*. See BULIMIA.—Some, however, distinguish between the *bulimia*, and canine *appetite*; making it the distinguishing character of the latter, that it is attended with a lientery, or other colicual flux.

APPLAUSE*, properly signifies an approbation of some thing, witnessed by clapping of hands.

* The word is formed of the Latin *applausus*, or *plausus*, of the verb *plaudere*, to clap the hands.

The ancient way of *applauding* by clapping the hands is scarce retained any where but in colleges and theatres.—Such a tragedy was acted with great *applause*; such a student maintained a thesis with *applause*, &c.

APPLES, *Poma*. See the articles FRUIT, CIDER, ORCHARD, &c.

Dwarf APPLES. See the article DWARF.

Adam's APPLE, *Pomum Adami*. See POMUM.

APPLE of the Eye. See the article PUPIL.

APPLICATE, *APPLICATA*, *Ordinate APPLICATE*, in geometry, is a right line drawn a-crośs a curve, so as to bisect the diameter thereof.

Applicate is the same with what we otherwise call *ordinate*.

APPLICATION, the act of *applying* one thing to another, by approaching or bringing them nearer together. See APPLY.

Motion is defined by a successive *application* of any thing to different parts of space.

The *application* of a vesicatory to the neck, or other part, produces an irritation of the bladder.

The true and great secret in physic is, how to *apply* a medicine, not how to make it.

APPLICATION is also used for the adjusting, accommodating, or making a thing quadrate to another.

Thus we say, the *application* of a fable, &c.

APPLICATION, in theology, is particularly used for the act whereby our Saviour transfers, or makes over to us, what he had earned or purchased by his holy life, and death.

It is by this *application* of the merits of Christ, that we are to be justified; and entitled to grace, and glory.

The sacraments are the ordinary means, or instruments, whereby this *application* is effected.

APPLICATION is sometimes also used in geometry, for what in arithmetic we call *division*.

APPLICATION also signifies the fitting or applying of one quantity

quantity to another, whole areas, but not figures, are the same.

Thus Euclid shews how, on a right line given, to apply a parallelogram that shall be equal to a right-lined figure given.

APPLY, among mathematicians, sometimes signifies to transfer a line given into a circle, most commonly, or into any other figure; so as its ends shall be in the perimeter of the figure.

APPLY denotes also as much as *divide*, especially among Latin writers; who, as they say, *duc AB in CB*, draw AB into CB, when they would have AB multiplied by CB; or rather when they would have a right-angled parallelogram made of those lines: so they say, *applica AB ad CB*, apply AB to CB, when they would have CB divided by AB; which is thus expressed, $\frac{CB}{AB}$.

APPLY also signifies to fit quantities, whose areas are equal, but figures different.

APPOINTEE, a foot-foldier, in the French army, &c. who for his long service, and bravery, receives pay above private tentines. See **ANSPESSADE**.

APPOINTMENT, a pension or salary given by great lords and princes to persons of worth and parts, in order to retain them in their service.

The term is chiefly used among the French.—The king of France gives large appointments to several of the officers in his service.

Appointments differ from wages, in that the latter are fixed and ordinary, being paid by the ordinary treasurers; whereas *appointments* are annual gratifications granted by brevet for a time uncertain, and are paid out of the privy purse.

APPORTIONMENT, or **APPORCIONMENT**, **APPORTIONNEMENT**, in law, a dividing of a rent into two or more parts, or portions, according as the land whence it issues is divided among two, or more proprietors.

Thus if a man, having a rent-service issuing out of land, purchase a part of the land; the rent shall be *apportioned*, according to the value of the land.—So if a man let lands for years, reserving rent, and a stranger after recover part of the lands, the rent shall be *apportioned*.

But a rent-charge cannot be *apportioned*, nor things that are entire; as if one hold land by service, to pay to his lord yearly at such a feast a horse or a rose; there, if the lord purchase a part of the land, this service is totally extinct; because such things cannot be divided without hurt to the whole.—But if part of the land, out of which a rent-charge issues, descends to the grantee of the rent, this shall be *apportioned*.—A man purchases part of the land where he hath common appendant, the common shall be *apportioned*: of common appurtenant it is otherwise; and if by the act of the party, the common is extinct. Common appendant and appurtenant may be *apportioned* on alienation of part of the land to which it is appendant or appurtenant.—Conditions generally are entire, and cannot be *apportioned* by the act of the party; a contract may not be divided or *apportioned*, so as to subject a man to two actions.

APPISAL of *Sheriffs* is the charging them with money received on their account in the exchequer. 22 & 23 Car. 2.

APPOSER, in law.

APPOSITION, the act of putting or applying one thing to another.

APPOSITION is used in physics, in speaking of bodies which derive their growth from the adjunction or union of neighbouring bodies.

Most bodies of the fossil or mineral kingdom are formed by juxtaposition, or the *apposition* of parts, brought to join and adhere to each other.

APPOSITION, in grammar, denotes the putting two or more substantives together in the same case, and without any copular conjunction between them.

Thus, Flanders, bloody theatre, horrible scene of war; love, enemy of human quiet; peace, parent of riches, source of faction, &c.

APPRAISING*, the act of rating, valuing, or setting a price on goods, by a person who is a competent judge, and is authorized thereto.

* The word is derived from the French *apprécier*, which signifies the same thing.—Hence we also say an *appraiser*, a sworn *appraiser*, an *appraisement*, &c.

APPREHENSION*, in logic, denotes the attention of the mind to an object presented either to our senses, or our imagination.

* The word literally denotes the action of the hand, whereby it takes hold of, and grasps any thing; being formed of the Latin *ad*, to, and *prehendo*, I hold, I catch.

In this sense, *apprehension* differs from *notion*, or *idea*, as the

act of the mind whereby a notion or idea is formed differs from an act of the mind whereby we attend to a notion or idea already formed.

APPREHENSION, in law, signifies the seizing a criminal, in order to bring him to justice.

APPRENDRE, in our ancient law-books, a fee or profit to be taken or received.

APPRENTICE, one who is bound by covenant to serve a tradesman or artificer a certain time; usually seven years; upon condition of the master's instructing him in his art or mystery.

Sir Thomas Smith says, that apprentices are a kind of bond-men, or slaves, differing from others only in this, that they are servants by covenant, and for a time, *de Rep. Anglor. Lib. 3*.

Anciently, benchers in the inns of court were called *apprentices of the law*, in Latin *apprenticii juris nobiliores*; as appears by Mr. Selden's notes on Fortescue: and so the learned Plowden styles himself. See **BENCHER**.

Sir Henry Finch, in his *Nomotechnia*, writes himself *apprentice de ley*: Sir Edward Coke in his *Instit.* says, *apprenticii legis* in pleading are called *homines conficiarii*, & in *lege periti*; and in another place, *apprentices* and other counsellors of law.

APPROACH. See **ACCESS** and **APPROXIMATION**.

The curve of *equable Approach*; *Accessus æqualiter*, first proposed by M. Leibnitz, has caused some sweat among analysts.—The business is to find a curve, wherein a body descending by the sole power of gravity shall approach the horizon equally in equal times.—This curve has been found by Bernoulli, Varignon, Maupertuis, and others, to be the second cubical parabola, so placed as that its point of regression is uppermost. *Vid. Hist. Acad. R. Science. An. 1699. p. 82. Mem. An. 1730. p. 129. Mem. p. 333*.

APPROACHES, in fortification, the several works made by the besiegers for advancing or getting nearer to a fortress, or place besieged.—See *Tab. Archit. fig. 21*.

Such are trenches, mines, saps, lodgments, batteries, galleries, epaulments, &c.

APPROACHES, or *Lines of APPROACH*, are particularly used for trenches dug in the ground, and their earth thrown up on the side next the place besieged; under shelter or defence whereof the besiegers may approach, without loss, to the parapet of the covered way; and plant guns, &c. wherewith to cannonade the place.

The lines of *approach* are to be connected by parallels or lines of communication.

The besieged frequently make *counter-approaches*, to interrupt and defeat the enemies *approaches*. See **COUNTER-APPROACH**.

APPROPRIARE *ad honorem*; in law, signifies to bring a manor within the extent and liberty of such an honour. See **HONOUR**, and **MANOR**.

APPROPRIARE *Communam*, in law, signifies to discommon, i. e. to separate and inclose any parcel of land, which before was open common.

APPROPRIATE, **APPROPRIATED**, in philosophy, is understood of something which is indeed common to several; yet, in some respects, is peculiarly attributed to one.

Thus, creation is common to the Father, Son, and Holy Ghost; and yet is *appropriated* to the Father.

APPROPRIATE, in law, is understood of a church or benefice, the patronage whereof is annexed to some church-dignity, who appoints a vicar to serve the cure; the patron receiving the chief produce of it.

There are computed to be in England 3845 churches *appropriate*, and *impropriate*.

APPROPRIATION, the act of *appropriating*, i. e. of applying a church-benefice, which of its own nature is *juris divini* and no person's patrimony, to the proper and perpetual use of some religious community, to enjoy for ever.

Appropriation, is where the advowson of a parsonage is given or belongs to any bishopric, religious house, college, &c. and to their successors; so that the house or body is both patron and parson, and some one of the members officiates as vicar.

It is called *appropriation*, because the profits of the living are appropriated to the use of the patrons; so that parsons, though they are not ordinarily accounted *domini usufructuarii*, having no right of fee-simple; yet, by reason of the perpetuity of their succession, are here reputed owners of the fee-simple, and are therefore called *propriarii*.

To make an *appropriation*, after licence obtained of the king in chancery, the consent of the diocesan, patron, and incumbent, is necessary, if the church be full; if it be void, the diocesan and the patron, upon the king's licence, may conclude it.

To dissolve an *appropriation*, it is enough to present a clerk to the bishop, and he to institute and induct him: for that once done, the benefice returns to its former nature. This is called *disappropriation*.

APPROVEMENT, **APPROVEMENTUM**, or **APPROVIAMETUM**, is sometimes used in ancient writers for an improvement, or rise of the value and worth of a thing. See **VALUE**.

Thus to *approve*, *approbare*, is to make the best benefit of a thing by increasing the rent, &c. *Cum omnibus proviamentis & aliis pertinentiis suis*, &c.

Hence, in some ancient statutes, bailiffs of lords in their franchises are called their *approvers*.

A bailiff is not to think it below him to approve, *approbare* his master's goods; but of his barley to make malt, of his wool to make cloth, &c.

APPROVEMENT, is more particularly used where a man hath common in the lord's waste, and the lord incloseth part of the waste for himself; leaving sufficient common, with egress and regress, for the commoner.

APPROVER, in our laws, one who, confessing felony in himself, appealeth or impeacheth another or more of his accomplices.

He is also called from the French *approver*, *comprobare*, because he must prove what he hath alledged in his appeal.—This proof was anciently either by battle, or by the country, at the choice of the appellee.

APPROVERS of the king are those who have the letting of the king's demesnes in small manors, &c. See **DEMESNE**.

APPROXIMATION, in arithmetic, a continual approach still nearer and nearer to a root or quantity sought, without a possibility of ever arriving at it exactly.

We have divers methods of *approximation* delivered by Wallis, Raphson, Halley, Howard, &c. all of them being no other than series's infinitely converging, or approaching still nearer to the quantity required, according to the nature of the series.

It is evident, that if a number proposed be not a true square, it is in vain to hope for a just quadratic root thereof, explicable by rational numbers, integers or fractured; whence, in such cases, we must content ourselves with *approximations*, somewhat near the truth, without pretending to accuracy; and so for the cubic root, of what is not a perfect cube; and the like for superior powers.

This the ancients were aware of, and accordingly they had their methods of *approximation*; which, though scarce applied by them beyond the quadratic or perhaps the cubic root, are yet equally practicable, by due adjustments, to the superior powers also: as is shewn in the *Philosoph. Transact.* N^o. 215.

If there be a non-quadratic or non-cubic number; the former being expressed by $aa+b$, and the latter by $aaa+b$, where aa and aaa are the greatest square and cube in the

proposed numbers; then $\sqrt{aa+b} = a + \frac{ab}{2aa + \frac{1}{2}b}$; and $\sqrt[3]{aaa+b} = a + \frac{ab}{3aaa+b} = \frac{1}{3}a + \sqrt[3]{\frac{1}{3}aa + \frac{b}{3a}}$ will be easy and expeditious *approximations* to the square and cube root.

To extract the root of an equation by **APPROXIMATION**.—1^o. For a quadratic equation—suppose the equation $x^2 - 5x - 31 = 0$; let the root be $8+y$, so that y may denote the fraction, whereby the assumed number either exceeds or comes short of the root: Then

$$\begin{aligned} x^2 &= 64 + 16y + y^2 \\ -5x &= -40 - 5y \\ -31 &= -31 \\ \hline -7 + 11y + y^2 &= 0 \end{aligned}$$

Since the powers of fractions are continually decreasing; and we only here want a root nearly true; y^2 is cast away: upon which,

$$\begin{aligned} -7 + 11y &= 0 \\ y &= \frac{7}{11} = \frac{1}{1} \text{ nearly } = 0.6 \end{aligned}$$

Wherefore $x = 8 + 0.6 = 8.6$

Suppose $x = 8.6 + y$. Then

$$\begin{aligned} x^2 &= 73.96 + 15.52y + y^2 \\ -5x &= -43.00 - 5y \\ -31 &= -31 \\ \hline 73.96 - 43.00 - 31 + 15.52y - 5y &= 0 \end{aligned}$$

Which, being reduced to the same denomination, as here follows

$$\begin{aligned} 73.96 - 43.00 - 31.00 + (17.20 - 5.00)y &= 0 \\ -0.04 + 12.20y &= 0 \\ 12.20y &= 0.04 \end{aligned}$$

$$y = 0.04 : 12.20 = 0.0032$$

Therefore $x = 8.6000 + 0.0032 = 8.6032$

Suppose $x = 8.6032 + y$; Then will

$$\begin{aligned} x^2 &= 7401505024 + 17220640000y + y^2 \\ -5x &= -43.01600000 - 500000000y \\ -31 &= -31.00000000 \\ \hline 7401505024 - 43.01600000 - 31.00000000 &= 0 \\ 7401505024 - 74.01600000 - 31.00000000 &= 0 \\ 7401505024 - 74.01600000 - 31.00000000 &= 0 \end{aligned}$$

Therefore $x = 8.603200000 + 0.0000077808 = 8.603277808$.

Suppose, again, the root of a cubic equation $x^3 + 2x^2 - 23x - 70 = 0$ be required by *approximation*; here let the root be $5+y$, since the terms are omitted wherein y^2 and y^3 are found; there is no necessity for expressing them in the transformation of the equation. Wherefore, we find

$$\begin{aligned} x^3 &= 125 + 75y + \dots \\ + 2x^2 &= 50 + 20y + \dots \\ -23x &= 115 - 23y \\ -70 &= -70 \\ \hline -10 + 72y &= 0 \end{aligned}$$

$$y = \frac{10}{72} = 0.1$$

Therefore $x = 5 + 0.1 = 5.1$

Suppose $x = 5.1 + y$: Then will

$$\begin{aligned} x^3 &= 132.651 + 78.030y + \dots \\ + 2x^2 &= 52.020 + 20.400y \\ -23x &= 117.300 - 23.000y \\ -70 &= -70.000 \\ \hline -2.629 + 75.430y &= 0 \\ 75.430y &= 2.629 \end{aligned}$$

$$y = 2.629 : 75.430 = 0.0348$$

Wherefore $x = 5.1 + 0.0348 = 5.1348$.

And after the same manner might one proceed to infinity.

APPUI, in the manage, *q. d.* rest or stay upon the hand; is the reciprocal effort between the horse's mouth and the bridle-hand; or the sense of the action of the bridle on the hand of the horseman.

A just *appui* of the hand is the nice bearing up or stay of the bridle; so that the horse, being aware of the sensibility and tenderness of his mouth, dares not rest too much upon the bit-mouth, nor check or beat upon the hand to withstand it.

A dull, obtuse *appui*, is when a horse has a good mouth, but his tongue is so thick, that the bit cannot work, or bear upon the bars; the tongue not being so sensible as the bars: though the like effect is sometimes owing to the thickness of his lips.—A horse is said to have no *appui*, when he dreads the bit-mouth; is too apprehensive of the hand, and cannot bear the bit.—He is said to have too much *appui* when he rests or throws himself too much, or too hardly upon the bit.—Horses designed for the army ought to have a full *appui* upon the hand.

APPULSE, in astronomy, the approach of any planet to a conjunction with the sun, or a star.

APPURTENANCES*, or **APPERTINENCES**, in common law, signify things belonging to some other as their principal.

* The word is formed of the Latin *ad*, to, and *pertinere*, to belong.

Appurtenances may either be things corporal, as hamlets belonging to a chief manor; or incorporeal, as liberties and services of tenants. See **APPENDANT**.

APRICOT-WATER. See the article **WATER**.

APRIL*, the fourth month of the year, according to the common computation, but the second according to that of the astronomers.

* The word is derived from the Latin *aprilis*, of *aperio*, I open; because the earth in this month, begins to open her bosom for the production of vegetables.

In this month the sun travels through the sign taurus.

APRIORI Demonstration. See **DEMONSTRATION**.

APRON, in gunnery, a piece of lead, which caps or covers the vent or touch-hole of a great gun.

APSI*, or **ANSIS**, in ecclesiastical writers denotes an inner part in the ancient churches, wherein the clergy sat, and where the altar was placed.

* It is supposed to have been thus called because covered with an arch or vault of its own, by the Greeks called *αψις*, and by the Latins *apsis*; Ildoroth with less probability imagines it so called as being the most luminous part; from the Greek word *απσιν*, to give light.

Apsis, in this sense, amounts to the same with what is otherwise called *chœur*, *concha*, *camera*, and *presbyterium*; and stands opposed to the *nave*, or body of the church.

The ancient *apsis* was of a hemispherical figure, and consisted of two parts; the choir and the sanctuary.—The former had seats or stalls placed around it, wherein the ecclesiasticks were disposed. In the middle or farthest part, was the bishop's throne. The sanctuary was at the opposite end, next the *nave*, from which it was separated by a grate. See **SANCTUARY**.

In the middle of this was the altar erected on a pulpitum; and over the altar was the cibory, or cup, serving as a cover or canopy to it. *Vid. Ceramoy in Mem. de Trev. Juil. an. 1710. p. 1268, seq.*

Several ceremonies were only to be performed before, or in the face of the *apfis*, as, imposing hands; hair-shirts, &c. on penitents guilty of public offences. Frequent mention is also made of the *faints in the apfis*; the bodies of holy bishops, and others, being translated with great ceremony to this part of the church. *Syn. 32. Carth. can. 32. Spelm. in voc.*

Apfis is more particularly used for the bishop's-seat, or throne, in ancient churches.

It seems to have been thus called, because situate in the *apfis* of the church, though some imagine it to have been primarily so named, and to have given the denomination of *apfis* to the part of the church where it stood. *Cordem. ubi supra.*

This was more peculiarly called *apfis gradata*, because raised on steps above the ordinary stalls.—It was also denominated *Exedra*, and of latter times *Tribune*.

APFIS is also used for a reliquary, or case, wherein the relics of saints were anciently kept.

It took the name *apfis*, from its being round or arched at the top; or perhaps from the place where it was kept.

The *apfis* was commonly placed on the altar: it was usually of wood, sometimes also of gold and silver, with sculptures, &c. *Vid. Spelm. & du Cang. Gloss. in voc.*

APFIS, in astronomy, is applied to two points in the orbits of planets, wherein they are at the greatest, and the least distance from the sun or earth.

The *apfis* at greatest distance is called the *higher* or *summa apfis*; that at least distance the *lower*, *ima apfis*, or *infima*.

The two *apfides* are also called *auges*.

The higher *apfis* is more peculiarly denominated the *aphelion*, or *apogee*; the lower, the *perihelion*, or *perigee*.

The diameter which joins these two points is called the line of the *apfides*, and this passes through the center of the orbit of the planet, and the center of the earth. In the modern astronomy this line makes the longer axis of the elliptical orbit.—Such is the line AP, (*Tab. astron. fig. 1.*) drawn from the aphelion A to the perihelion P. The eccentricity is reckoned in the line of the *apfides*; being the distance between the center of the orbit of the planet, C, and the center of the sun or earth, S, according as the Copernican or the Ptolemaic system is followed. For the motion of the line of the *apfides*, see *APOGEE*.

The motion of a planet from one *apfis* to another; *s. gr.* of the moon, from apogee to perigee, and back again from perigee to apogee, are considered by mechanical philosophers as oscillations, and accounted for from the laws of the pendulum: consequently they must one day cease, when the equilibrium is restored. *Vid. Horreb. Clav. Astronom. c. 20.*

Others apprehend something immaterial in the motion; and propose, as insoluble questions, How the equilibrium was first destroyed; Why not restored again; and whence the breach is continually renewed? *Vid. Mem. de Trev. Avril 1730. p. 709, seq.*—But these are persons unacquainted with the secrets of the Newtonian philosophy. *Vid. Newt. Prin. l. 1. sic. 9. Herman. Phoron. l. 1. c. 4.** See also *GRAVITATION, PLANET, ORBIT, DISTANCE, and PERIOD*.

AP-THANES, an ancient term for the higher nobility in Scotland. See *THANE*.

APTITUDE, the natural disposition any thing hath to serve for such or such a purpose.—Thus, oil hath an *aptitude* to burn, and water to extinguish fire.

*APTOTE**, *Ἀπτωτος*, in grammar, a noun indeclinable, or which is without any variation of case.

* The word is derived from the Greek privative *α*, and *πτωσις* *casus*.

Such are the words, *fas*, *nefas*, &c.

APUS, in astronomy the bird of paradise; one of the constellations of the southern hemisphere, not visible in our latitude.

*APYREXY**, *Ἀπυρεξία*, in medicine, the intermission of a fever, or ague.

* The word is formed of the privative particle *α*, and *πυρ* *ignis*, fire or heat; or *πυρραι*, *fabricatio*, to be searified.

*AQUA**, in natural history, physics, chemistry, medicine, &c. See *WATER*.

* The word is pure Latin, and supposed to be compounded of *a* and *qua*, *q. d.* from which; alluding to the opinion that water is the basis or matter of all bodies.

AQUA fortis, is a corrosive liquor prepared from nitre, and vitriol; and serving as a menstruum wherewith to dissolve silver, and all other metals except gold.

AQUA fortis is made by distilling purified nitre with calcined vitriol, or rectified oil of vitriol, in a strong heat: the li-

quor, which rises in blood-red fumes, being collected, is the *aqua fortis*.

In preparing compound *aqua fortis*, some mix either sand or clay, or ashes, with the calcined vitriol and nitre, in order to hinder their melting too readily; and thus prevent the too hasty evaporation: when the fusion is thus prevented, the parts of the salts receive more violent impressions from the fire, are better converted into a volatile spirit, which is the *aqua fortis*.

If to the spirit of nitre, &c. thus distilled, sea-salt, or sal-armoniac, be added; it commences *aqua regia*, and will no longer dissolve silver, but will now dissolve gold.

Hence, to try whether or no *aqua fortis* be pure; put a grain of a solution of silver in *aqua fortis*, into a like quantity of the water in question; and if the solution remains without either the water's turning milky, or the silver precipitating, the *aqua fortis* is pure.

Aqua fortis is commonly held to have been invented about the year 1300; though others will have it to have been known in the time of Moses.—It is a liquor of various and extensive use.—It is very serviceable to refiners for parting or separating silver from gold.—To the workers in mosaic, for staining and colouring their woods. See *MARQUETRY*.—To dyers, in their colours, and particularly in scarlet.—To other artists, for the colour of bone and ivory; which is done by steeping the matters therein, after first tinging it with copper or verdigraese, &c. See *DYING*.

Some also convert *aqua fortis* into *aqua regia*, by dissolving in it a fourth of its weight of sal-armoniac, and then stain therewith ivory hafts and bones, of a fine purple colour.—There are, also, book-binders, who throw it on leather, and thereby make fine marble-covers for books.—And there are diamond-cutters, who use it to separate diamonds from metalline powders.—It is, farther, of service in etching copper, or brass plates. See *ETCHING*.—Lastly, Mr. Boyle assures us he has caused canes to be stained like tortoise-shell, by a mixture hereof with oil of vitriol, laid on them at several times, over live coals, to cause it to penetrate the deeper: and, afterwards, giving them a gloss with a little soft wax and a dry cloth. See *SUPPLEMENT, Article Aqua fortis*.

AQUA Marina, *AQUE Marine*, in natural history, a gem, or precious stone, of a sea-green colour; whence its name.

It is of about the same hardness with the amethyst.

Some of the critics contend for its being the sixth stone in the rationale of the Jewish high priest; called in the Hebrew, *tharshis*; and rendered in Latin by *beryllus*, *thalassius*, &c. Jonathan and Onkelos call this, in the Chaldee, *נִרְמָה*, *cherum jamma*: though the Seventy, St. Jerom, Aquila, Pagninus, the translators of Geneva, and Schindler, render it *chrysolithus*.—Others will have this stone a *turquoise*. And Leo de Juda, and Hutterus translate it *hyacinthus*.

Several of the lapidaries take it, however, to be the *beryl*; which coincides with the first opinion: the *beryl* being only another name for the *aqua marina*.—Pliny represents this as related to the *smaragdus*, but of a colour less brisk, and imitating a pure sea-water green. See *SUPPLEMENT, article BERYLL*.

AQUA omnium forum, in pharmacy, signifies the distilled water of cows-dung, when they are at grass.—Some also call cows-urine by this name.—And in English all flower water.

AQUA Regia, or *AQUA regalis*, an acid corrosive spirit or water, serving as a menstruum to dissolve gold.

It is thus called because it dissolves gold, which is vulgarly esteemed the king of metals.—It is sometimes also called *aqua chrysolica* and *stygia*.—The basis or essential ingredient of *aqua regia*, is common or sea-salt; which is the only salt in nature that will operate on gold.

There are divers ways of preparing it; for, in effect, the salt will not fail of its end, in what form soever applied.—The common way is by mixing common salt, or sal-armoniac, or the spirit thereof, with spirit of nitre; or with common *aqua fortis*, which is made of nitre and vitriol.

AQUA secunda. See the article *SECUNDA*.

AQUA vitæ, is commonly understood of what we otherwise call brandy, or the distilled spirit of wine, either simple or prepared with aromatics, differently according to the different intentions.

Some, however, distinguish between them; appropriating the term brandy to what is procured from wine, or the grape; and *aqua vitæ* to that drawn after the same manner from malt, &c.

AQUA & igni interdictio. See *INTERDICTION*.

AQUÆDUCT, *AQUÆDUCTUS*, *q. d. ductus aque*, a conduit of water; is a construction of stone or timber, built on an uneven ground, to preserve the level of water, and convey it by a canal from one place to another.—There are *aquæducts* under ground, and others raised above it, supported by arches.—The Romans were very magnificent in their *aquæducts*; they had some that extended an hundred miles. Frontinus, a man of consular dignity, and

who had the direction of the *aqueducts* under the emperor Nerva, tells us of nine that emptied themselves through 13,594 pipes, of an inch diameter. Vigenere has observed, that, in the space of twenty-four hours, Rome received from these *aqueducts* no less than five hundred thousand hogheads of water.—The *aqueduct*, built by Lewis XIV. near Maintenon, for carrying the river Eure to Versailles, is perhaps the greatest in the world. It is 7000 fathoms long; and its elevation 2560 fathom; containing 242 arcades. V. *Philos. Transf. ap. Lowth. l. p. 594.*

AQUEDUCT, AQUEDUCTUS, in anatomy, denotes a bony kind of canal, or passage, in the os petrosum, supposed to contribute to the purposes of hearing.—It is called *aqueduct* not only on account of its form, but, as some also imagine, from its serving to discharge any foreign matters collected in the inner cavities of the ear.—It is sometimes also called, *aqueductus Fallopi*, from the name of its first discoverer.—Several authors confound it with the *tuba Eustachiana*.

The *aqueductus Fallopi* is sometimes also called *meatus cæcus*; by others *meatus cochlearis*, and *meatus caprolaris*, by others *canalis particularis*, *meatus auditorius internus*, and *foramen auditorium internum*.

AQUARIANS, AQUARI, a kind of heretics in the third century, who instead of wine used nothing but water in the sacrament.

It is said the occasion of the abuse was owing to the persecution which prevailed in those times: for the Christians, being then obliged to celebrate the sacrament in the night, found it necessary to make use of water, lest the smell of the wine should betray them to the heathens. But they afterwards went further, and actually forbid the use of wine in the eucharist, even when it might be used with safety.

Epiphanius tells us, the *Aquarians* were the followers of Tattian; and were so called from the word *aqua*, water, because they abstained wholly from wine, and did not use it even in the eucharist.

AQUARIUS, in astronomy, the eleventh sign in the zodiac, reckoning from Aries; from which also the eleventh part of the ecliptic takes its name. See **SIGN** and **CONSTELLATION**. The sun moves through *Aquarius* in the month of January; it is marked thus, ♒.

The poets feign, that *Aquarius* was Ganymede, whom Jupiter ravished under the shape of an eagle, and carried away into heaven, to serve as cup-bearer in the room of Hebe and Vulcan; whence the name.—Others hold, that the sign was thus called, because, when it appears in the horizon, the weather usually proves rainy.

The stars in the constellation *Aquarius*, in Ptolemy's catalogue, are 45; in Tycho's 40; in the Britannic catalogue 99: the longitudes, latitudes, magnitudes, &c. whereof, according to the two former, are given by Hevelius: according to the last, they are as follow:

Names and situations of the stars.	Longitud.	Latitude.	Magn.
Preced. in the handkerchief against the hand.	7 24 06	8 06 41N.	5

AQUATIC, something which lives, breeds, or grows, in or about the water.

Thus we have *aquatic* plants, and *aquatic* animals. Trees which grow peculiarly on the banks of rivers, or in marshes, &c. are also called *aquatics*.

The ancient Romans had also their *aquatic* or *aquatic* gods, *dii aquatiles*; called by Catullus, *dii litorales*: concerning whom we have an inscription in Reinesius, NEPTVNO ET DIS AQUATILIBVS. Cl. l. n. 9. *Strabo. Syn. Antig. Rom. c. l. p. 165.*

To this class belong'd the Tritons, the ministers of Neptune.

AQUATIC ROAD. See the article **ROAD**.

AQUEDUCT. See **AQUEDUCT**.

AQUEOUS, AQUOSUS, something that partakes of the nature of water, or abounds therein. See **WATER**.

—Thus

AQU

Thus milk is said to consist of an *aquous* or ferous, and a butyrous part.
The chemists separate the *aquous* part or phlegm from all bodies by distillation.

AQUEOUS Bath. See the article BATH.

AQUEOUS Ducts. See the article AQUEOUS.

AQUEOUS Humour, is the first or outermost of the three humours of the eye.

It lies immediately above the tunica aranea, and ciliary ligament, and under the cornea, which it causes to protuberate a little; and is supposed to be furnished by certain ducts provided for the purpose.—It is found so spirituous, that it will not freeze in the severest frost.

Anatomists are divided about the origin and conveyance of this humour.—It is certain, the source must be pretty plentiful, inasmuch as, if by any accident the coats it is contained in be wounded, so that the humour runs out, and the cornea falls or collapses, the wound readily heals, by only closing the eye, and the humour recruits: of which we have numerous instances among physicians.

Dr. Nuck thinks he has discovered the ducts whereby this humour is furnished.

Others denying the reality of those ducts, suppose it immediately derived from the arteries. Dr. Drake admits the ducts, and takes them to be only branches of the excretory ducts of the glandula innominata, and lachrymalis; which, piercing the tunics of the eye, deliver their liquor by ways hitherto unknown.

AQUILA, in natural history, &c. See EAGLE.

AQUILA, in astronomy, a constellation of the northern hemisphere; usually joined with Antinous.

The stars in the constellation *Aquila* and Antinous, in Ptolemy's Catalogue, are 15; in Tycho's, 17; in the Britannic catalogue, 75: the longitudes, latitudes, magnitudes, &c. whereof, according to the two first, are given by Hevelius; according to the last, they are as follow:

Names and situations of the Stars.		Sign.	Longitud.	Latitude North.	Magn.
			0 1 11	0 1 11	
Preced.	} of three inform. towards Sagittary.	4	49 57	14 59 07	4

AQUILINE, AQUILINUS, something belonging to an eagle. Hence, *aquiline* nose denotes a hooked nose, or such as is like the beak of an eagle; called also a hawk's nose.

AQUILO, is used by Vitruvius for the north east wind; or that which blows at 45° from the north towards the east point of the horizon. See WIND, NORTH, and POINT.

The poets gave the name *aquilo* to all stormy winds dreaded by the mariners.

AQUEOUS Ducts, Ductus Aqueosi Nuckii, are certain ducts in the sclerotic, discovered by Dr. Nuck, whereby the aqueous humour of the eye is supposed to be conveyed into the inside of the membranes which inclose that liquor. But the discovery is not universally allowed. See AQUEOUS Humour.

ARA, the altar, in astronomy, a southern constellation; consisting of eight stars. See ALTAR.

ARAB, ARABIAN. See ARABIC.

The ARAB, or ARABIAN horse, is said to be nursed with camel's milk: there are many strange reports of this beast. The duke of Newcastle assures us, that the ordinary price of one is 1000, 2000, or 3000 pounds; and that the Arabs are as diligent in keeping the genealogies of their horses, as princes of their families. They strike medals on every occasion to keep up the pedigree. The fortune the Arabians give their sons, when arrived at manhood, is, two suits of arms, with two scimiters, and a horse; who always lies in the next room to them.—Yet such of the breed as have been brought into England never proved very extraordinary.

ARABIAN Year. See ARABIAN YEAR.

ARABESQUE, or ARABESK, something done after the manner of the Arabians.

Arabesque, Grottesque, and Moresque, are terms applied to such paintings, ornaments of freezes, &c. wherein there are no human or animal figures, but which consist wholly of imaginary foliage, plants, stalks, &c. See GROTESQUE.

The words take their rise from hence, that the Moors, Arabs, and other Mahometans, use these kinds of ornaments; their religion forbidding them to make any images or figures of men, or other animals.

ARABIC, ARABICUS, something that relates to Arabia, or the Arabs. See ARAB.

ARABIC, or ARABIC Tongue, is a branch or dialect of the Hebrew.

Father Angelo de St. Joseph speaks much of the beauty and copiousness of the *Arabic*. He assures us it has no less than a thousand names for a sword; five hundred for a lion; two hundred for a serpent; and eighty for honey.

ARABIC Figures, or Characters, are the numeral characters commonly made use of in arithmetical computations.

The *Arabic* characters stand contradistinguished to the Roman.

The learned are generally of opinion, that the *Arabic* figures were first taught us by the Saracens, who borrowed them from the Indians.—Scaliger was so satisfied of their novelty, that he immediately pronounced a silver medallion he was consulted about, modern; upon his being told of the numeral figures 234, 235, being on it. The common opinion is, that Planudes, who lived towards the close of the thirteenth century, was the first Christian who made use of them. Father Mabillon even assures us, in his work de *Re Diplomatica*, that he has not found them any where earlier than the fourteenth century.

Yet Dr. Wallis insists on their being of a much older standing; and concludes they must have been used in England, at least as long ago as the time of Hermannus Contractus, who lived about the year 1050; if not in ordinary affairs, yet at least in mathematical ones, and particularly in the astronomical tables. *V. Wall. Algebr. c. 4.*

The same author gives us an instance of their antiquity in England, from a mantle-tree of a chimney, in the parsonage house of Helmdon in Northamptonshire, wherein is the following inscription in Basso Relievo, M^o 133, being the date of the year 1133. Philof. Transact. N^o 154. Mr. Luffkin furnishes a yet earlier instance of their use, in the window of a house, part of which is a Roman wall, near the market-place in Colchester; where between two carved Lions stands an escutcheon, containing the figures 1090. Philof. Transact. N^o 255. Mr. Huet is even of opinion, that these characters were not borrowed from the Arabs, but from the Greeks; and that they were originally no other than the Greek letters, which we all know that people made use of to express their numbers by. See NUMBER.

Gum ARABIC is the name of a gum which distills from a species of acacia, growing in Egypt and Arabia, called by Botanists *acacia vera*.

It is very common among us, but little is to be met with which is genuine; it is frequently adulterated with our common cherry and plumb-tree gums.—That is accounted best which is in smallest pieces, and almost of a white colour.

It dissolves easily in any aqueous liquor, and is good in all kinds of fluxes; particularly in catarrhs; as it thickens and softens the too acrimonious humours.

ARABIC, a kind of heretics, who sprung up in Arabia, about the year 207; whose distinguishing tenet was, that the soul died with the body, and also rose again with it. Eusebius, *lib. vi. c. 38.* relates, that a council was called to stop the progress of this rising sect; and that Origin assisted at it; and convinced them so thoroughly of their error, that they abjured it.

ARABICUS *Coffus*. See the article COSTUS.

ARABISM, ARABISMUS, an idiom or manner of speaking peculiar to the Arabs, or the Arabic language.

R. Martin maintains, that the γ sometimes expresses an oath, in the Hebrew as well as the Arabic: Abenezra, a perfect master of the Arabic, and who makes great use thereof to explain the Hebrew, does not reject the sentiment, nor yet much approve it: he contents himself barely to rehearse it, which, for so zealous a partisan of *Arabisms*, is enough to shew that he had no great opinion of it.—Father Souciot.

ARABLE Land, anciently called ARALIA, is such as is fit for tillage, or plowing; or which is actually plowed up from time to time.

It is thus called from the Latin *arare*, of *aratrum*, a plough. See PLOUGHING.

ARABUM *Lepra*. } See the article { LEPRA.

ARABUM *Sandaracha*. } See the article { SANDARACHA.

ARAC, or ARACH, a spirituous liquor, imported from the East Indies; chiefly used by way of dram, and in punch.

The nature and composition of this celebrated liquor has been much controverted.—The name *arac*, Mr. Lockyer assures us, is an Indian word for strong waters of all kinds; for that they call our spirits and brandy, *English arac*.—But, what we understand by the name *arac*, is really no other than a spirit procured by distillation, from a vegetable juice called *toddy*, which flows by incision out of the cocoa-nut tree, and some other trees like the birch-juice procured among us.

The *toddy*, Mr. Lockyer adds, is a pleasant drink of itself when new, but purges those not used to it; and, when stale, is heady, and finally makes good vinegar. The English at Madras use it as leaven to raise their bread with.

Goa and Batavia are the chief places for *arac*.—At Goa there are divers kinds; single, double, and treble distilled. The double distilled, which is that commonly sent abroad, is but a weak spirit in comparison with Batavia *arac*; yet on account of its peculiar and agreeable flavour, is preferred to all the other *aracs* of India. This is attributed to the earthen vessels, which alone they use at Goa to draw the spirit; whereas at Batavia they use copper stills.

The Parier *arac*, made at Madras, and the Columbo, and Quilone *arac*, at other places, being fiery hot spirits, are little valued by the Europeans, and therefore rarely imported; though highly prized among the natives. See SUPPLEMENT, article RACK.

ARACHNOIDES *, in anatomy, a fine, thin, transparent membrane, which lying between the dura, and pia mater, is supposed to invest the whole substance of the brain, medulla oblongata, and spinal marrow.

* The word is borrowed from the Greek *αραχνη*, a spider, or spider's web; and *ιδεα*, form: in regard of the fineness of the part, which is supposed to resemble that of a spider's web.

Many anatomists deny the existence of such third meninx, or

membrane; and contend that it ought rather to be looked on as the external lamina of the pia mater, which sends its internal lamella between the folds of the cortical part of the brain.

ARACHNOIDES, or ARANEA *Tunica*, is likewise used for a fine, slender tunic, wherewith the crystalline humour is incased.

This, others call *crystalloides*, and *tunica crystallina*, or *capsula crystallina*.—Many have even doubted of its existence, which is the more extraordinary in that Galen speaks of it, and compares it to a pellicle of an onion; Velsalius resembles it to fine transparent horn.—It is easily found in quadrupeds, especially the sheep, ox, and horse; and tho' it be a little more difficult to discover in man, yet after a person has once been shewn it, he will readily find it.

What is surprizing, Briggs says not a word of it; and so able an anatomist as Ruysch, was long in suspense about it: it was only by means of his injections that he discovered it in man; though so easy to discern in a sheep.

The *arachnoides* adheres by its posterior part to the vitreous tunic.—In man it is about twice as thick as a spider's web, at least the fore-part of it; in an ox it is as thick again as in man; and in an horse it is thicker than in an ox.

It has three uses: First, to retain the crystalline in the collet of the vitreous humour, and prevent its changing situation: Secondly, to separate the crystalline from the aqueous humour, and prevent its being continually moistened therewith: Thirdly, the lymphatics furnish a liquor which they discharge into its cavity, wherewith the crystalline is continually refreshed and kept in right order; inasmuch that when this liquor is wanting, the crystalline soon dries, grows hard, and opaque, and may even be reduced to powder. *V. Petit, in Mem. Acad. R. Scienc. an. 1730. p. 622. segg.*

ARÆOMETER *, ARÆOMETRUM, an instrument wherewith to measure the density or gravity of fluids.

* The word is formed of the Greek *αραιος*, *rarus*, *tenuis*, thin; and *μετρον*, measure.

The *aræometer*, or water-poise, is usually made of glass; consisting of a round hollow ball, which terminates in a long slender neck, hermetically sealed a-top: there being first as much running mercury put into it, as will serve to balance or keep it swimming in an erect position.

The stem is divided into degrees; (as represented *Tab. Pneumaticæ*, fig. 18.) and by the depth of its descent into any liquor, the lightness of that liquor is concluded; for that fluid in which it sinks least, must be heaviest; and that in which it sinks lowest, lightest.

M. Homborg has invented a new *aræometer*, described in *Philof. Transact.* N^o. 262. thus: *A* (fig. 19.) is a glass-bottle or matrafs, with fo slender a neck, that a drop of water takes up in it about five or six lines, or $\frac{1}{2}$ of an inch. Near that neck is a small capillary tube *D*, about six inches long, and parallel to the neck.—To fill the vessel, the liquor is poured in at the mouth *B*, (which is widened to receive a tunnel) till it run out at *D*; that is, till it rise in the neck to the mark *C*, by which means you have always the same bulk or quantity of liquor; and consequently, by means of the balance, can easily tell, when different liquors fill it, which weighs most, or is most intensely heavy.

Some regard, however, is to be had in these trials to the season of the year, and degree of heat and cold in the weather: by reason some liquors rarely with heat, and condense with cold, more than others; and accordingly take up more or less room.

By means of this instrument, the ingenious author has made a table, to shew the different weights of the same bulk of the most considerable chemical liquors, both in summer and winter; as follows:

The *aræometer* full of | weighed in summer. | in winter.

	oz.	dr.	gr.	oz.	dr.	gr.
Quick-silver	11	00	06	11	00	32
Oil of tartar	01	03	08	01	03	31
Spirit of urine	01	00	32	01	00	43
Oil of vitriol	01	03	58	01	04	03
Spirit of nitre	01	01	40	01	01	70
— salt	01	00	39	01	00	47
Aqua fortis	01	01	38	01	01	55
Vinegar	00	07	55	00	07	60
Spirit of wine	00	06	47	00	06	61
River water	00	07	53	00	07	57
Distilled water	00	07	50	00	07	54

The instrument itself weighed, when empty, one dram twenty eight grains.

ARÆOPAGUS } See the articles { AREOPAGUS.

ARÆOPAGITIC } See the articles { AREOPAGITIC.

ARÆOSTYLE, ARÆOSTYLOS, in the ancient architecture, a sort of intercolumnation, wherein the columns were placed at the distance of eight, or, as some say, ten modules from one another.—See *Tab. Archit.* fig. 48. See also the article INTERCOLUMNATION.

In the *aræostyle*, the columns were the widest and openest they

22

Artificial ARBOURS, and cabinets, are made of lattice-work, borne up by standards, cross-rails, circles and arches of iron. For these *arbours*, they make use of small fillets of oak, which being planted and made strait, are wrought in chequers, and fastened with wire.

ARC*, or **ARK**. See the article **ARK**.

* The words are formed from the Latin *arcus*, a bow.

ARCANUM literally signifies a *secret*; and is therefore very pertinently applied by quacks and impostors in medicine, who conceal their ignorance and fraud under a pretence of secrecy.—Hence legions of *arcana*.

There are also standing official compositions, under the denomination of *arcana*.—Such are the

ARCANUM Corallinum, a preparation of red precipitate; made by distilling it with the spirit of nitre; and repeating the distillation again and again, till a fine red powder be procured. This powder boiled in water, and the water poured off, and tartarised spirit of wine put to the powder; two or three cohobations are made: which leave a powder, much like the prince's powder; said to be of good use in the gout, dropsy, scurvy, &c. It operates chiefly by stool.

ARCANUM duplicatum is prepared of the caput mortuum of aqua fortis, by dissolving it in hot water, filtering, and evaporating it to a cuticle; and then leaving it to shoot.

The *arcanum duplicatum*, or *panacea duplicata* is extolled as a diuretic, and sudorific.—The recipe was purchased at the expense of 500 dollars, by that great virtuoso the duke of Holstein. Schroder, that prince's physician, writes wonders of its great uses in hypochondriacal cases, and in continued and intermitting fevers, stone, scurvy, &c.

ARCANUM Joviale is made of an amalgama of mercury and tin, digested in spirit of nitre; the spirit being drawn off, the remaining matter is wetted with spirit of wine, and the spirit burnt away; and this for several times till the pungent taste is wholly gone: what remains is used much with the same intentions as the antisepticum Poterii, and is recommended by some as a sudorific.

ARC-BOUTANT*, in building, a kind of flat arch, or part of an arch, abutting against the feet of an arch, or reins of a vault, to support, and prevent their giving way.

* The name is French; formed of *arc* and *bouter*, to abut.

Arc-boutants are only arched buttresses. See **BUTTRESS**.

ARC, **ARK**, **ARCUS**, a part of any curve line; *e. gr.* of a circle, an ellipsis, or the like.

ARCH of a circle is a part of the circumference thereof, less than a half, or semicircle.—Such is AEB (*Tab. Geometry*, fig. 6.)

The base or line AB, that joins the two extremes of the arch, is called the *chord*; and the perpendicular DE, raised in the middle of that line, the *sine* of the arch. See **CHORD** and **SINE**.

All angles are measured by *arches*.—To know their quantity, an *arch* is described, having its centre in the point of the angle. See **ANGLE**.

Every circle is supposed to be divided into 360 degrees; and an *arch* is estimated according to the number of those degrees it takes up. Thus an *arch* is said to be of 30, of 80, of 100 degrees. See **DEGREE**.

Concentric ARCHES. See the article **CONCENTRIC**.

Equal ARCHES are such *arches* of the same or equal circles, as contain the same number of degrees. See **EQUAL**.—Hence

In the same or equal circles, equal chords subtend equal *arches*.—And hence, again, *arches* intercepted between parallel chords are equal.

A radius, CE, fig. 6. which bisects the chord in D, does also bisect the *arch* in E; and is perpendicular to the chord; and on the contrary. And hence the problem, to bisect an *arch* is solved, by drawing a line CE perpendicular to the chord in D.

Similar ARCHES are those which contain the same number of degrees of unequal circles. See **SIMILAR**, and **LIKE**.—Such are the *arches* AB and DE, fig. 87.

Two radii being drawn from the centre of two concentric circles, the two *arches* intercepted between them bear the same ratio to their respective peripheries; and also the two sectors to the areas of their respective circles. See **ANGLE**.

The distance of the centre of gravity of an *arch* of a circle, from the centre of the circle, is a third proportional to a third part of the periphery and the radius. See **CENTRE** of gravity.

For the sines, tangents, &c. of *arches*; see **SINE**, **TANGENT**, &c.

ARCH in astronomy.—**Diurnal ARCH** of the sun is part of a circle parallel to the equator, described by the sun in his course betwixt rising and setting. See **DIURNAL**, **DAY**, &c. His *nocturnal arch* is of the same kind; excepting that it is described betwixt his setting and rising. See **NIGHT**, **RISE**, &c. See also **NOCTURNAL**.

The latitude and elevation of the pole are measured by an *arch* of the meridian; and the longitude, by an *arch* of a parallel circle. See **ELEVATION**, **LATITUDE**, **LONGITUDE**, &c.

ARCH of progression, or direction, is an *arch* of the ecliptic which a planet seems to pass over, when its motion is according to the order of the signs. See **DIRECTION**.

ARCH of retrogradation is an *arch* of the ecliptic, described while a planet is retrograde, and moves contrary to the order of the sign. See **RETROGRADATION**.

ARCH of station. See **STATION** and **STATIONARY**.

ARCH between the centres is an *arch*, as AI, (*Tab. Astronomy*, fig. 35.) passing from the centre of the moon's shadow, A, perpendicular to her orbit GH. See **ECLIPSE**.

If the aggregate of the *arch* between the centres AI, and the apparent semi-diameter of the moon, be equal to the semi-diameter of the shadow; the eclipse will be total without any duration: if less, total with some duration; and if greater, yet less than the sum of the semi-diameters of the moon and the shadow, partial.

ARCH of vision is the sun's depth below the horizon, at which a star, before hid in his rays, begins to appear again. See **POETICAL** **RISE**.

ARCH, in architecture, is a concave structure, raised with a mould bent in form of the *arch* of a curve, and serving as the inward support of any superstructure.—See *Tab. Archit.* fig. 36, and 37.

An *arch*, says Sir Henry Wotton, is nothing but a narrow or contracted vault; and a vault, is a dilated *arch*. See **VAULT**. *Arches* are used in large intercolumnations of spacious buildings; in porticos, both within and without temples; in public halls, as ceilings, the courts of palaces, cloisters, theatres, and amphitheatres.

They are also used as buttresses and counter-forts, to support large walls laid deep in the earth, for foundations of bridges and aqueducts, for triumphal arches, gates, windows, &c.

Arches are sustained by piers, imposts, &c.

Arches are either circular, elliptical, or flat.

Circular ARCHES are of three kinds, *viz.*

Semicircular ARCHES, those which make an exact semicircle, and have their centre in the middle of the chord of the *arch*; called also by the French builders, *perfect arches*, and *arches en plein centre*.

Scheme ARCHES, those which are less than a semicircle, and consequently are flatter *arches*; containing some, 90 degrees, others 70, and others only 60; called also *imperfect arches*.

ARCHES of the third and fourth point, as some of our workmen call them, though the Italians call them *di terzo* and *quarto acuto*, because they always concur in an acute angle at top.—These consist of two *arches* of a circle meeting in an angle at the top, and are drawn from the division of the chord into three or four parts, at pleasure.—Of this kind are many of the *arches* in old Gothic buildings; but on account, both of their weakness and unsightliness, they ought, according to Sir Henry Wotton, to be for ever excluded out of all buildings.

Elliptical ARCHES consist of a semi-ellipsis; and were formerly much used instead of mantle-trees in chimneys.—These have commonly a keystone and chaprels or imposts.

Straight ARCHES are those, whose upper and under edges are flat; as in the others they are curved; and those two edges also parallel, and the ends and joints all pointing towards a centre.—These are principally used over windows, doors, &c.

The doctrine and use of *arches* is well delivered by Sir Henry Wotton, in the following Theorems.—1st, All matter, unless impeded, tends to the centre of the earth in a perpendicular line.

2^{dy}, All solid materials, as bricks, stones, &c. in their ordinary rectangular form, if laid in numbers, one by the side of another, in a level row, and their extreme ones sustained between two supporters; those in the middle will necessarily sink, even by their own gravity, much more if pressed down by any superincumbent weight.—To make them stand therefore, either their figure or their position must be altered.

3^{dly}, Stones, or other materials being figured cuneatim, *i. e.* wedge-wise, broader above than below, and laid in a level row, with their two extremes supported as in the preceding theorem, and pointing all to the same centre; none of them can sink, till the supporters or buttments give way, because they want room in that situation to descend perpendicularly. But this is but a weak structure; in regard the supporters are subject to too much impulsion, especially where the line is long; for which reason the form of flat *arches* is seldom used, excepting over doors and windows, where the line is short.—In order to fortify the work, therefore, we must not only change the figure of the materials, but also their position.

4^{thly}, If the materials be shaped wedge-wise, and be disposed in form of a circular *arch*, and pointing to some centre; in this case, neither the pieces of the said *arch* can sink downwards, for want of room to descend perpendicularly; nor can the supporters or buttments suffer much violence as in the precedent platform: for the convexity will always make the incumbent weight rather rest upon the supporters, than heave them outwards: whence this corollary may be fairly

deduced, that the securest of all the *arches* above mentioned is the femicircular; and of all vaults, the hemispherical.

Sibly, As femicircular vaults, raised on the whole diameter, are the strongest; so those are the most beautiful, which keeping to the same height, are yet diffended one fourteenth part longer than the said diameter: which addition of width will contribute greatly to their beauty, without diminishing any thing considerable of their strength.

It is, however, to be observed, that, according to geometrical strictness, to have the strongest *arches*, they must not be portions of circles, but of another curve, called the *catenaria*, whose nature is such, that a number of spheres disposed in this form will sustain each other, and form an *arch*.

Dr. Gregory even shews, that *arches*, constructed in other curves, only stand or sustain themselves by virtue of the *catenaria* contained in their thickness; so that were they made infinitely slender or thin, they must tumble of course; whereas the *catenaria*, though infinitely slender, must stand, in regard no one point thereof tends downward more than any other. Philosph. Transact. N^o 231.—See further of the theory of *arches* under the article VAULT.

ARCH is particularly used for the space between the two peers of a bridge.

The chief or *master-arch* is that in the middle; which is widest, and usually highest, and the water under it deepest: being intended for the passage of boats or other vessels.—We read of bridges in the east, which consist of 300 *arches*.

ARCH-Stone. See the articles, KEY-Stone, and VOUSOIR. Tympan of ARCH. See the article TYMPAN.

Triumphal ARCH is a gate or passage into a city, built of stone or marble, and magnificently adorned with architecture, sculpture, inscriptions, &c. serving not only to adorn a triumph, at the return from a victorious expedition, but also to preserve the memory of the conqueror to posterity.

The most celebrated triumphal *arches*, now remaining of antiquity, are that of Titus, of Septimius Severus, and of Constantine, at Rome, of which we have figures given us by Des Godetz.—One of the gates of Orange is a triumphal *arch* of C. Marius.—The gates, Peyro at Montpellier, and of St. Denis, St. Martin, and St. Antoine at Paris, do also deserve to have been triumphal *arches*.

Mural ARCH. See the article MURAL.

ARCH, in the scripture sense. See the article ARK.

ARCH, or ARCHT, is also a term without any meaning of itself, but which becomes very significant in composition with other words; as it heightens and exaggerates them; and has the force of a superlative, to shew the greatest degree, or eminence of any thing.

* The word is formed of the Greek *αρχη*, beginning; whence *αρχος*, princeps, *summus*, prince, or chief.

The we say *arch-fool*, *arch-rogue*, &c. to express folly, and knavery in the utmost degree.—So also *arch-treasurer*, *arch-angel*, *arch-bishop*, *arch-heretic*, &c. to denote such as have a pre-eminence over others.

In English, we usually cut off the final *i*, from *archi*, though with very ill effect; as the words wherewith it is joined, sound much harsher on that score, than they would do were it preserved entire, as it is in most other languages.

ARCHÆUS, or ARCHEUS. See the article ARCHEUS.

ARCH-ANGEL*, an intellectual substance or angel, placed in the eighth rank among the blessed spirits which compose the celestial hierarchy.

* The word is compounded of the Greek *αρχος*, prince, and *αγγελος*, angel.

ARCHBISHOP, ARCHIEPISCOPUS, a metropolitan prelate, having several suffragan bishops under him.

Archbishops were not known in the east, till about the year 320; and though there were some soon after this who had the title, yet that was only a personal honour by which the bishops of considerable cities were distinguished.—It was not till of late that *archbishops* became metropolitans, and had suffragans under them.

Athanasius appears to be the first who used the title *archbishop*, which he gave occasionally to his predecessor; Gregory Nazianzen, in like manner, gave it to Athanasius: not that either of them were entitled to any jurisdiction, or even any precedence, in virtue thereof.

Among the Latins, Isidore Hispalensis is the first that speaks of *archbishops*. He distinguishes four orders or degrees in the ecclesiastical hierarchy, viz. patriarchs, *archbishops*, metropolitans, and bishops.

England is divided into two archbishoprics, or provinces.

ARCHBISHOPRIC, ARCHIEPISCOPATUS, the dignity of archbishop; or the province under his jurisdiction.

There are now two *archbishoprics* in England, viz. of Canterbury and York; the prelates whereof are called *primates*, and *metropolitans*; with this only difference, that the former is

called primate of all England, and the latter simply, primate of England.

The archbishop of Canterbury had anciently jurisdiction over Ireland as well as England, and was styled a patriarch, and sometimes *alterius orbis papa*, and *orbis Britannici pontifex*. Matters were done and recorded in his name thus, *anno pontificatus nostri primo*, &c.

He was also *Legatus natus*. See LEGATE.

He even enjoyed some special marks of royalty; as, to be patron of a bishopric, which he was of Rochester; and to make knights, coin monies, &c.—He is still the first peer of England, and the next to the royal family; having precedence of all dukes, and all great officers of the crown.

He has, by common law, the power of probate of wills and testaments, and granting letters of administration.

He has also a power to grant licences and dispensations in all cases formerly sued for in the court of Rome, and not repugnant to the law of God.

He also holds several courts of judicature; as court of arches, court of audience, prerogative court, and court of peculiars.

The archbishop of York has the like rights in his province, as the archbishop of Canterbury: he has precedence of all dukes not of the royal blood; and of all officers of state, except the lord high chancellor. He has also the rights of a count Palatine over Hexamsire.

ARCH-BUTLER, ARCHIPINCERNA, the great butler or skinker of the empire.

The king of Bohemia is *arch-butler*: and his business as such is to present the first cup at an imperial entertainment; but he is not obliged to officiate with his crown on. He has for vicar or deputy the hereditary prince of Limbourg.

ARCH-CHAMBERLAIN, ARCH-CAMERARIUS, an officer of the empire; much the same with what in England we call *great chamberlain*.

The elector of Brandenburg is *arch-chamberlain* of the empire, being so appointed by the golden bull; and, in that quality, he bears the scepter before the emperor, walking on the left hand of the elector of Saxony. At some solemnities he also serves on horseback like other electors, carrying a bason with a towel in his hands: which alighting he sets it for the emperor to wash.—He has his vicar or sub *arch-chamberlain*, who is prince of Hohenzollern, of the house of Brandenburg.

ARCH-CHANCELLOR, ARCH-CANCELLARIUS, a great chancellor, who anciently presided over the notaries, that is, the secretaries of a court.

This office chiefly obtained in France, under the two first races of their kings; and afterwards under the empire: as they had three several territories, Germany, Italy, and Arles; they had three *arch-chancellors*: and hence the three *arch-chancellors* still subsisting in Germany; the archbishop of Mentz being *arch-chancellor* of Germany, the archbishop of Cologne of Italy, and the archbishop of Treves of Arles.

Bern. de Mallincrot, in an express treatise *de Archicancellariis Imperii Romani*, shews, that these three archbishops were *arch-chancellors* before they were electors.—We also read of *arch-chancellors* of Burgundy, &c.

ARCH-CHANTOR, ARCHICANTOR, the chief or president of the chantors of a church.

ARCHDEACON, ARCHIDIACONUS, a church officer vested with a jurisdiction over the laity and clergy, next after the bishop, either through the whole diocese, or only a part of it.

The *archdeacon*, sometimes also called *arch-levite*, was originally the first and eldest of the deacons who attended on the bishop: whence his name.

An *archdeacon* was not known before the council of Nice: his function is since become a dignity; and even set above that of priest: though anciently it was quite otherwise. The *archdeacon* was the bishop's chief minister for all external concerns, and particularly the administration of the temporalities. He took care that order and decency were observed in divine service; looked to the ornaments and utensils of the church; had the direction of the poor, and the inspection of the manners and behaviour of the people: for which reason he was called the *bishop's heart*, and *eye*; *oculus episcopi*, & *cor episcopi*.

These advantages soon got him the upper hand over priests, who had only spiritual functions. But he had no jurisdiction over them till the sixth century; though by that time he was become superior to the archimandrite, or rural dean.

In the tenth century, *archdeacons* were considered as having jurisdiction in their own right, or attached to their office; with a power of delegating it to others. But from that time measures were taken to lessen their power, by increasing their number.—He whose district lay in the capital city took the quality of *great archdeacon*.

We have sixty *archdeacons* in England: their office is to visit every two years in three, to enquire into reparations and moveables belonging to the church, reform abuses in ecclesiastical

saical matters, and bring the more weighty affairs before the bishop; besides which, they have also a power to suspend excommunicate, and in many places to prove wills, and in some to institute to benefices.

It is one part of the *archdeacon's* office to induct all clerks into their benefices within his jurisdiction; and, by the act of uniformity, he is now obliged to be in priests' orders.

Many *archdeacons* in old foundations, have, by prescription, their courts and officials as bishops have.

ARCH-DRUID, ARCHDRUIDA, the chief or pontiff of the ancient *Druids* in a nation. See **DRUID**.

ARCHDUKE, ARCHIDUX, a duke vested with some quality, pre-eminence, and authority above other dukes.

The *archduke* of Austria is a very ancient title. There have also formerly been *archdukes* of Lorraine, and Brabant.

Austria was erected into a marquissate by Otho, or Henry I. and into a duchy by Frederic I. in 1156: but we do not well know when, nor why the title *archduchy* was given it.—It is commonly held, that duke Frederic IV. first assumed the quality: others say, it was first given by the emperor Maximilian I. in 1459, and ample privileges annexed to it.

The principal privileges of this state are, that the *archduke* shall distribute justice in his own dominions, without appeal; that he shall be judged to have received the investiture of his states, after having demanded it three times; and that he cannot be deprived of his countries, even by the emperor and the states of the empire: that no affair of the empire can be concluded without his participation; and that he have a power of creating counts, barons, and gentlemen, throughout the whole empire: which are privileges to which the other dukes of the empire are entire strangers.

ARCHE, *αρχη*, is a Greek word, importing the *beginning*.

ARCHE, among physicians, is the beginning or first period of a disease.

ARCHED Fountain. See the article **FOUNTAIN**.

ARCHED Legs is an imperfection in a horse, when being in his natural position he has his legs bent forwards; so as his whole leg makes a kind of arch or bow.

This usually arises from excessive labour, whereby the back-fins are made to shrink up, so that the legs remain *arched*, and naturally tremble after a little riding. Though the disorder is natural to some horses.

ARCHERS*, a kind of militia or soldiery, armed with bows and arrows.

* The word is formed of the Latin *arcus*, a bow; whence *arcarius*, and even *arguis*, and *arquite*, as they are also denominated in the corrupt state of that tongue.

Archers were much in use in former times; but they are now laid aside, excepting in Turkey, and some of the eastern countries; where there are companies of *archers* still on foot in their armies: and with which they did terrible execution at the battle of Lepanto.

The name *archer*, however, is still retained even where the thing is lost: thus in France, the officers who attend the lieutenants of police, and provosts, to make captures, seizures, arrests, &c. are called *archers*; though their arms be only halberds or carabines.—In this sense they say, the *archers* of the *grand prévôt de l'hôtel*; of the *prevost des marchands*; the city *archers*; the *archers du guet*, or of the watch, &c.

—Small parties of *archers*, called also *gens de mareschaussée*, are continually patrolling on the great roads, to secure them against robbers.—The Carriages of Lyons, &c. are always escorted by a party of *archers*.

To the diligence of these *archers* or marshals men, it is owing, that persons now travel in all parts of France in the utmost security; there being fewer robberies on the highway in that whole kingdom in a year, than about London in a week.

They have also their *archers des pauvres*, *archers* of the poor; whose office it is to seize such beggars as they find in the streets, and carry them to the hospitals.

ARCHERY, the art or exercise of shooting with bow and arrows.

ARCHERY was greatly encouraged among our ancestors, and many statutes were made for the regulation thereof: whence it was that the English *archers* became the best in Europe. Most of our victories in France were the purchase of the long bow.—In the stat. 33 H. 8. complaint is made of divers new and crafty games invented, as *loggetting*, *shovegraat*, &c. by reason whereof *archery* was sorely decayed, and divers bowmen and fletchers, for lack of work, were forced to go and live in Scotland.—By this act, all men under 60 years of age are commanded to exercise shooting in long-bows; and to have a bow and arrows always ready.—Children from 7 years old to 17, are also enjoined to be bred up in shooting; and to have always a bow and two shafts in readiness.—Even servants are not excused; but those who want money to buy a bow are to be supplied by their masters, and the price to be deducted out of their wages.—Aliens are also forbid by it to shoot with a long bow, without especial licence from the king.

By the same law it is forbid to shoot at a standing mark; unless it be for a rover, where the archer is to change his mark at every shot.—Any person above 24 years old is also forbid to shoot with any prick-shaft, or flight, at a mark of eleven score yards or under. 33 H. 8. c. 9.—The former was a provision for making good marksmen at fight; the latter for giving strength and linens.

ARCHERY in our ancient customs, a service of keeping a bow for the use of the lord, to defend his castle.

ARCHES, or *Court of ARCHES*, is one of the archbishop's courts; to which appeals lie in ecclesiastical matters, from all parts of the province of Canterbury.

This court is thus called, from the *arched* church and tower of St. Mary le Bow, where it was wont to be held. The officers belonging to it are the judge, attorney, registers, advocates, proctors, &c.

The judge of the court of *arches* is called the *dean of the arches*, or the *official of the arches* court, &c. with which official is commonly joined a peculiar jurisdiction over thirteen parishes in London, termed a *denary*, exempt from the authority of the bishop of London, and belonging to the archbishop of Canterbury; of which the parish of Bow is one, and the principal.

Others suppose the denomination and functions of dean of the *arches* to have *arise* hence, that the archbishop's official, or dean, being often employed abroad in foreign embassies, the dean of the *arches* was his substitute in this court.

This judge on any appeal made, forthwith, and without any farther examination of the cause, sends out his citation to the appellee, and his inhibition to the judge from whom the appeal was made.

The advocates, who are allowed to plead in the *arches* court, are to be doctors of the civil law, in one of our universities.

ARCHETYPE*, **ARCHETYPUS**, the first pattern, or model, by which any work is formed, or which is copied after, to make another like it.

* The word is compounded of *αρχη*, beginning; and *τυπος*, type. See **TYPE**.

In this sense the word coincides with *original*, or *prototype*; and stands opposed to *copy*.

Among minters, &c. *archetype* is peculiarly used for the standard or original weight, by which the other weights are to be adjusted and examined.

Philosophers, particularly the Platonists, talk of an *archetypal* world; meaning, the world, such as it existed in the divine mind, or in the idea of God, before the visible creation.

ARCHEUNUCH, ARCHIEUNUCHUS, the chief of the eunuchs.

The *archeunuch* was one of the principal officers in Constantinople, under the Greek Emperors.

ARCHEUS*, an obscure term, used chiefly among the ancient chymists, to express I know not what principle of life and motion, the cause of all the effects which we observe in nature.

* The word is derived from *αρχη*, principle.

As the chymists differ in their ideas of a vital cause; the term *archeus* becomes applied to very different things: though most of them conceive it of the nature of fire.

Some use *archeus*, to denote the fire lodged in the centre of the earth; to which they ascribe the generation of metals and minerals, and which they believe to be the principle of life in vegetables.

Others, by the word *archeus*, mean a certain universal spirit, diffused throughout the whole creation, the active cause of all the phenomena in nature.

Others, instead of *archeus*, chuse to call this the *anima mundi*; and others, the *vulcan* or heat of the earth.

They add, that all bodies have their share of this *archeus*; and that, when this is corrupted, it produces diseases, which they call *archeal diseases*.

They likewise attribute ideas to it; which for this reason they call *archeal ideas*.

Helmont is a great asserter of the dogma of an *archeus*.—

“No poison says he, can act on a dead carcass: if, therefore, it have any effect, it is by means of the *archeus*.”

“He adds, that if any heterogeneous body happen to be present to the *archeus*, it rises into a fervour, endeavours to expel the hostile matter; and, in order to

“that, exerts all the force of the body.—To cure any disease, therefore, is to pacify, and compose this *archeus*.”

“*archeus*. This *archeus*, he holds, is irritated at the least appearance of any thing heterogeneous; and as its office

“is to watch over the health and safety of the whole body, it is excited at the very shadow of the enemy,

“and at once calls its forces to the charge, raises fevers, &c. All, therefore, required to an universal medicine

“is, something that may readily pacify, and lay this unnatural fever upon all occasions.” This doctrine of

Helmont,

Helmont, Boerhaave observes, would not be so absurd, did he not ascribe understanding to this *archeus*: setting this aside, the principle which renders poisons deadly, and remedies beneficial, is the circulation of the blood.

ARCHIACOLYTHUS, an ancient dignity, in cathedral churches: the ministers whereof were divided into four orders, or degrees, viz. priests, deacons, subdeacons, and *acolythi*; each of which had their chiefs. The chief of the *acolythi* was called *archiacolythus*. See **ACOLYTHUS**, &c.

ARCHIATER*, **ARCHIATRUS**, *Ἀρχιᾶτρος*, properly denotes the chief physician of a prince who retains several.

* The word is formed of the Greek *αρχον*, *principium*, chief, and *ιατρος*, *medicus*, a physician.

ARCHIDAPIFER, or chief sewer, is a great officer of the empire.

The elector of Bavaria is *archidapifer*.—The palatine of the Rhine at one time pretended this office was annexed to his Palatinate; but he has since desisted.

ARCHIGALLUS, in antiquity, the high priest of Cybele, or the chief of the eunuch-priests of that goddess, called Galli.

ARCHILOCHIAN, a term in poetry, applied to a sort of verses, whereof *Archilochus* was the inventor.

These consist of seven feet; the four first whereof are ordinarily dactyls, though sometimes spondee; the three last trochees: for instance;

Solvitur aris hyems grata vice veris & Favoni. Hor.

It is usual to mix iambic verses of six feet, abating a syllable, with *archilochian* verses; this Horace himself has done in the ode now cited.

These verses are called *dactylic*, on account of the dactyls at the beginning.

ARCHI-LUTE. See the article **ARCHELUTO**.

ARCHIMANDRITE, *Ἀρχιμανδριτης*, the superior of a monastery; amounting to what we now call *abbot*.

Covarruvias observes, that the word literally denotes the chief or leader of a flock; in which sense it may be applied to any ecclesiastical superior: and accordingly, we find the name sometimes attributed to archbishops. But among the Greeks, where it is chiefly used, it is always restrained to the chief of an abbey.

M. Simon maintains the word originally to be derived from the Syriac; at least the part *mandrite*, which, by a circution, he makes to signify a solitary, or monk.

ARCHIMEDES'S Screw. See the article **SCREW**.

ARCHIMIME, **ARCHIMIMUS**, is the same thing, in effect, with *arch-buffoon*, or mimic.

The *archimimes*, among the Romans, were persons who imitated the manners, gestures, and speech both of people living and those who were dead.

At first they were only employed on the theatre; but were afterwards admitted to their feasts, and at last to their funerals; where they walked after the corpse, counterfeiting the gestures and behaviour of the person who was carrying to the funeral pile; as if he were still alive.

ARCHIPELAGO*, in geography; a sea interrupted by a great number of islands.

* The word is formed by corruption of *Ἀρχιπελάγος*, *q. d.* *Ægean* sea, which, again, is formed of *Ἀρχαῖος Πέλαγος*, a name originally given it by the Greeks; but for what reason is not agreed on.

The most celebrated *Archipelago*, and that to which the name is in some measure appropriated, is that between Greece, Macedonia, and Asia; wherein are the islands of the *Ægean* sea: which is called the *white sea*, in contradistinction to the *Euxine*, which they call the *black sea*.

The modern geographers mention other *Archipelago's*; as, that of Lazarus, near the coast of Malabar and Malacca; the *Archipelago* of Mexico; and that of the Caribbees, wherein are above 12000 islands; that of the Philippines, called, by some, the *great Archipelago*, containing 11000 islands; and also those of the Molucco's, of Celebes, &c.

ARCHIPHERACITÆ, *Ἀρχιφεραιται*, ministers in the Jewish synagogues appointed to read and interpret the *Pera-kim*, or titles and heads of the law, and the prophets.

The *archipheracita* was not the same with the *archisynagogus*, as Grotius and others have mistakenly imagined; but rather the chief or principal of those appointed to read, explain, and profess the law, in their schools.—And hence the name; which is formed of the Greek *αρχος*, chief; and the Hebrew or Chaldee, *פֶּרַק*, *pherak*, division, or chapter.

ARCHISTRATEGUS, *Ἀρχιστρατηγος*, the generalissimo, or captain-general of an army. See **STRATEGUS**.

ARCHITECT*, **ARCHITECTUS**, a person skilled in architecture, or the art of building: who makes plans and designs of edifices, conducts the work, and directs the masons and other artificers employed therein.

* The word is derived from the Greek *αρχος*, *princeps*, and *τεκτων*, *faber*, workman, *q. d.* the principal workman.

The most celebrated *architects* are, Vitruvius, Palladio, Scamozzi, Serlio, Vignola, Barbaro, Cataneo, Alberti, Viola, Inigo Jones, Bullant, and De Lorme.

Vitruvius enumerates twelve qualities requisite to an *architect*; that he be docil and ingenious; literate; skilled in designing; in geometry; optics; arithmetic; history; philosophy; music; medicine; law, and astronomy*. See **BUILDING**, &c.

* Sure, Martial had never read Vitruvius, when he threw the cryer and the architect into the same class:

Duri si puer ingeni videtur,

Preconem faciat, vel Architectum.

ARCHITECTONIC, that which builds a thing up regularly, according to the nature, and intentions thereof.

Thus, that plastic power, spirit, or whatever else it be which hatches the ova of females into living creatures of the same species, is by some called the *architectonic* spirit.

ARCHITECTONIC Machine. See the article **MACHINE**.

ARCHITECTURE, **ARCHITECTURA**, the art of building, i. e. of erecting edifices, proper either for habitation, or defence.

Architecture is usually divided; with respect to its objects, into three branches, *civil*, *military*, and *naval*.

Civil **ARCHITECTURE**, called also absolutely and by way of eminence *architecture*, is the art of contriving and executing commodious buildings for the uses of civil life; as houses, temples, theatres, halls, bridges, colleges, portico's, &c.

Architecture is scarce inferior to any of the arts in point of antiquity.—Nature and necessity taught the first inhabitants of the earth to build themselves huts, tents, and cottages; from which, in course of time, they gradually advanced to more regular and stately habitations, with variety of ornaments, proportions, &c. See Vitruvius's account of the origin of *architecture* under the article **ORDER**.

The ancient writers represent the Tyrians as the first among whom *architecture* was carried to any tolerable pitch; and hence it was that Solomon had recourse thither for workmen to build his temple. Villalpandus, indeed, contends that only under-workmen were sent for from Tyre, artificers in gold, silver, brass, &c. and that the rules of *architecture* were delivered by God himself to Solomon. Hence, he adds, the Tyrians properly speaking learned their *architecture* from Solomon; which they afterwards communicated to the Egyptians; these to the Grecians, and these again to the Romans.—In effect, the author last cited undertakes to prove, that all the beauty and advantages of the Greek and Roman buildings were borrowed from the Jewish temple. *Tem. li. Part. ii. Lib. Isagog. iii. C. ix. x.*

To confirm this, Sturmius produces several passages in Vitruvius, where the rules given by that architect, *Lib. vi. C. 11.* and *Lib. v. C. 1.* quadrate exactly with what Josephus relates of the temple of Jerusalem, *Antiq. Jud. lib. vi. & viii. &c.*

To what a pitch of magnificence the Tyrians and Egyptians carried *architecture*, before it came to the Greeks, may be learned from Isaiah xxiii. 8. and from Vitruvius's account of the Egyptian Oeci; their pyramids, obelisks, &c.

Yet, in the common account, *architecture* should be almost wholly of Grecian original: three of the regular orders or manners of building are denominated from them, viz. *Corinthian*, *Ionian*, and *Doric*: and there is scarce a part, a single member, or moulding, but comes to us with a Greek name.

Be this as it will, it is certain the Romans, from whom we derive it, borrowed what they had entirely from the Greeks; nor do they seem, till then, to have had any other notion of the grandeur and beauty of buildings, beside what arises from their magnitude, strength, &c.—Thus far they were unacquainted with any order beside the *Tuscan*.

Under Augustus, *architecture* arrived at its glory: Tiberius neglected it, as well as the other polite arts. Nero, amongst a heap of horrible vices, still retained an uncommon passion for building, but luxury and dissoluteness had a greater share in it, than true magnificence.—Apollodorus excelled in *architecture*, under the emperor Trajan, by which he merited the favour of that prince; and it was he who raised the famous Trajan column, subsisting to this day.

After this, *architecture* began to dwindle again; and though the care and magnificence of Alexander Severus supported it for some time, yet it fell with the western empire, and sunk into a corruption, from whence it was not recovered for the space of twelve centuries.

The ravages of the Visigoths, in the fifth century, destroyed all the most beautiful monuments of antiquity; and *architecture* thenceforward became so coarse and artless, that their professed architects understood nothing at all of just designing, wherein its whole beauty consists: and hence a new manner of building took its rise, which is called the *Gothic*.

Charlemagne did his utmost to restore *architecture*; and the French applied themselves to it with success, under the en-

couragement of H. Capet: his son Robert succeeded him in this design; till by degrees the modern *architecture* was run into as great an excess of delicacy, as the Gothic had before done into massiveness. To these may be added, the Arabick, and Morisk or Moorish *architecture*, which were much of a piece with the Gothic, only brought in from the south by the Moors and Saracens, as the former was from the north by the Goths and Vandals.

The architects of the 13th, 14th, and 15th century, who had some knowledge of sculpture, seemed to make perfection consist altogether in the delicacy and multitude of ornaments, which they bestowed on their buildings, with a world of care and sollicitude; though frequently without any conduct or taste.

In the two last centuries, the architects of Italy and France were wholly bent upon retrieving the primitive simplicity and beauty of ancient *architecture*; in which they did not fail of success: inasmuch, that our churches, palaces, &c. are now wholly built after the antique.—

Civil Architecture may be distinguished, with regard to the several periods or states thereof, into the *antique*, *ancient*, *gothic*, *modern*, &c.

Another division of *civil architecture* arises from the different proportions which the different kinds of buildings rendered necessary, that we might have some proper for every purpose, according to the bulk, strength, delicacy, richness, or simplicity required.—

Hence arose five orders or manners of building, all invented by the ancients at different times, and on different occasions, viz. *Tuscan*, *Doric*, *Ionic*, *Corinthian*, and *Composite*; the history, characters, &c. of each whereof see under their respective articles, *TUSCAN*, *DORIC*, *IONIC*, *CORINTHIAN*, and *COMPOSITE*.

What forms an order is, the column with its base and capital; surmounted by an entablature, consisting of architrave, frieze, and cornice; and sustained by a pedestal.

For a general view of the elements of *architecture*, with the rules which obtain with respect to the matter, form, proportion, situation, foundation, distribution, covering, apertures, &c. See the article *BUILDING*.

For particulars, see *FOUNDATION*, *WALL*, *ROOF*, *WINDOW*, *DOOR*, *CEILING*, &c.

There are several arts subservient to *architecture*, as carpentry, masonry, paving, joinery, smithery, glazery, plumbery, plastering, gilding, painting, &c. See *CARPENTRY*, *MASONRY*, *PAVING*, *JOINERY*, *PAINTING*, *PLUMBRY*, *SCULPTURE*, *GILDING*, &c. See also *TIMBER*, *STONE*, *BRICK*, *TILE*, *MORTAR*, *LEAD*, *GLASS*, &c.

We have no Greek authors at this time extant on *architecture*.—The first who wrote of it was Agatharchus the Athenian, who was seconded by Democritus and Theophrastus.—Among the Latins, Fufsius, Terentius Varro, Publius Septimius Rufus, and Epaphroditus, all wrote *de re architectonica*.

But, of all the ancients, Vitruvius is the only entire author whose works we have; though Vegetius relates, that there were 700 architects at Rome in his time.—He lived under Augustus, and composed a complete system of *architecture*, in ten books, which he dedicated to that prince. There are two things censured by the moderns in this excellent work, viz. want of method, and obscurity. The mixture of Latin and Greek also, in Vitruvius, is such, that Leon Baptist Alberti, has observed, he wrote Latin to the Greeks, and Greek to the Latins: he adds, that the work contains abundance of things superfluous and foreign to the purpose.—For this reason, M. Perrault has extracted all the rules out of Vitruvius's prolix work, and has methodized and published them in a little abridgment.—Several authors have also endeavoured to explain the text of Vitruvius, particularly Philander, Barbaro, and Salmassius, in notes added to their several Latin editions; Rivius and Perrault, in the notes to their German and French Versions; and Baldus, in his *Lexicon Vitruvianum* enlarged by de Laet.—The same M. Perrault has also composed an excellent treatise of the *five orders*, which may be esteemed a supplement to Vitruvius, who left the doctrine of the orders defective.

The authors upon *architecture*, since Vitruvius, are—Leon Battista Alberti, who, in 1512, published ten books of the art of building, in Latin, designed to outvie Vitruvius; in which, however, he has not succeeded: His work has abundance of good things, but it is deficient in the doctrine of the orders.—Seb. Serlio, who wrote seven books of *architecture*, five of which concerning the five orders, were made public in 1602; throughout all which, he religiously keeps to Vitruvius's rules: the seventh was since published in 1575; but the sixth, concerning private buildings, has not yet appeared.—And. Palladio, who wrote four books of *architecture*, containing the fundamental rules of the art, with various instances of all the kinds of works; published in Italian in 1575: the two first books are rendered into High-Dutch, and enlarged with annotations by Boeckler.—Phil. de Lorme, who published nine books of *architecture*, in French in 1567.

—J. Barozzi de Vignola, who, in 1631, made public his rules of the five orders, in Italian; this work has been since translated, with large additions, by Daviler, under the title of *Cours d'architecture*, &c. and since also into High-Dutch, with notes.—

To these are to be added Vincent Scamozzi, in his *Idea of Universal Architecture*, published in 1615, in Italian; Car. Phil. Dieuflart, in his *Theatre of Civil Architecture*, published in High-Dutch in 1697; wherein he not only delivers the rules of *architecture*, but explains and compares the five orders as laid down by Palladio, Vignola, Scamozzi, and others: which same design was also executed in French by R. Freart de Cambray, in a *Parallel of the ancient architecture with the modern*, published in French in 1650, and since translated into English, with additions, by Mr. Evelyn. Fr. Blondel director of the royal academy of painting, &c. in 1698, gave a *Course of architecture*, in French; being a collection from all the celebrated writers upon the subject of the orders, &c.—Nic. Goldman, in a treatise of *Stylometris*, published in Latin and High-Dutch, in the year 1661, has done good service, by reducing the rules and orders of *architecture* to a further degree of perfection, and shewing how they may be easily delineated by means of certain instruments invented by him.

Lastly, the Elements of *architecture* are very ingeniously laid down by Sir H. Wotton.—The same are also reduced by Sturmius, and Wolfius, to certain rules and demonstrations; and thus is *architecture* brought into the form of a mathematical art; by the first, in his *Mathesis Juvenil*, and by the second, in his *Elementa Mathematica*, tom. II. an. 1715.

MILITARY ARCHITECTURE is the art of strengthening and fortifying places, to screen them from the insults of enemies, and the violence of arms.

This we more usually call *Fortification*.

The business of *military architecture* is, to erect forts, castles, and other fortresses, with ramparts, bastions, &c.

NAVAL ARCHITECTURE, or *Ship-building*, is that which teaches the construction of ships, galleys, and other floating vessels for the water; with ports, moles, docks, &c. on the shore.*

* How it stood in the days of Homer, may be seen in his *Odyssey*. 5. 244.

ARCHITECTURE in perspective, is a sort of building, wherein the members are of different measures and modules, and diminish in proportion to their distance; to make the work appear longer and larger to the view than really it is.

Such is the celebrated pontifical stair-case of the Vatican, built under pope Alexander VII. by the cavalier Bernino.

COUNTERFEIT ARCHITECTURE is that which has its projections painted either in black or white, or coloured after the manner of marble; as is seen practised in the frontispieces and palaces in Italy, and in the pavilions of Marly.

This painting is done in fresco, upon plastered walls; and in oil, on walls of stone.

Under the name of *counterfeit architecture*, which we otherwise call *scene-work*, is likewise comprehended, that painted on slight boards or planks of wood, wherein the columns, pilasters, and other parts of building, seem to stand out, with a relief; the whole being coloured in imitation of various marbles, metal, &c. and serving in the decorations of theatres, triumphal arches, public entries, funeral pomp, &c.

ARCHITRAVE*, in building, that part of a column, or order of column, which lies immediately upon the capital.—See *Tab. Archit. fig. 24, 26, 28, 30, and 32, and fig. 49. lit. a.*

* The Greeks call it *Epistyle*. See *EPISTYLE*.

The *architrave* is the lowest member of the entablature.

The *architrave* is supposed to represent the principal beam in timber buildings; whence the name, which is formed of the Greek *αρχι*, chief; and the Latin *trabis*, beam.

The *architrave* is different in the different orders.—In the Tuscan it only consists of a plain face, crowned with a fillet; and is half a module in height. In the Doric and Composite, it has two faces, or fasciæ; and three in the Ionic and Composite; in which last order it is $\frac{1}{2}$ of a module high, though but half a module in the rest.

Architects, however, take a deal of latitude in this part; some using more members than others; and many of them having two or three forms of *architraves*. What we give, is after Vignola. *Architrave* is sometimes also called the *raison-piece*, or *master-beam* in timber-buildings, as portico's, cloisters, &c. In chimneys it is called the *mantle-piece*, and over the jaumbs of doors, or lintels of windows, the *Hyperthyron*.

ARCHITRAVE CORNICHE. See the article *CORNICHE*.

ARCHITRAVE DOORS, as those which have an *architrave* on the jaumbs and over the door, upon the cap-piece, if straight; or on the arch, if the top be curved.

in the air, the Resurrection, the Resurrection

1998, 1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2486, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2494, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507, 2508, 2509, 2510, 2511, 2512, 2513, 2514, 2515, 2516, 2517, 2518, 2519, 2520, 2521, 2522, 2523, 2524, 2525, 2526, 2527, 2528, 2529, 2530, 2531, 2532, 2533, 2534, 2535, 2536, 2537, 2538, 2539, 2540, 2541, 2542, 2543, 2544, 2545, 2546, 2547, 2548, 2549, 2550, 2551, 2552, 2553, 2554, 2555, 2556, 2557, 2558, 2559, 2560, 2561, 2562, 2563, 2564, 2565, 2566, 2567, 2568, 2569, 2570, 2571, 2572, 2573, 2574, 2575, 2576, 2577, 2578, 2579, 2580, 2581, 2582, 2583, 2584, 2585, 2586, 2587, 2588, 2589, 2590, 2591, 2592, 2593, 2594, 2595, 2596, 2597, 2598, 2599, 2600, 2601, 2602, 2603, 2604, 2605, 2606, 2607, 2608, 2609, 2610, 2611, 2612, 2613, 2614, 2615, 2616, 2617, 2618, 2619, 2620, 2621, 2622, 2623, 2624, 2625, 2626, 2627, 2628, 2629, 2630, 2631, 2632, 2633, 2634, 2635, 2636, 2637, 2638, 2639, 2640, 2641, 2642, 2643, 2644, 2645, 2646, 2647, 2648, 2649, 2650, 2651, 2652, 2653, 2654, 2655, 2656, 2657, 2658, 2659, 2660, 2661, 2662, 2663, 2664, 2665, 2666, 2667, 2668, 2669, 2670, 2671, 2672, 2673, 2674, 2675, 2676, 2677, 2678, 2679, 26

[illegible]

ARCHITRAVE-Windows, of timber, are commonly an ogee raised out of the solid timber, with a lift over it: though sometimes the mouldings are struck and laid on; and sometimes they are cut in brick.

The upper fascia is called the *header*, or *heading architrave*; and the lower the *jack*.

ARCHITYPE. See the article **ARCHETYPE**.

ARCHIVAULT*, in architecture, the inner contour of an arch; or a band or frame adorned with mouldings, running over the faces of the arch-stones, and bearing upon the impostis.—See *Tab. Archit. fig. 36, lit. bb. and fig. 40*.

* The word is French, *Archivolte*, where it signifies the same thing; formed of the Latin, *arcu volutus*.

It is different in the different orders.—In the Tuscan, it has only a single face; it has two faces crowned, in the Doric and Ionic; and the same mouldings with the architrave in the Corinthian and Composite.

ARCHIVE*, or **ARCHIVES**, a chamber or apartment wherein the records, charters, and other papers and evidences of a state, house, or community, are preserved; to be consulted occasionally.

* The word comes from the Latin *arca*, a chest or coffer; or the Greek *αρχαιον*, which Suidas uses in the same sense. In some Latin writers we meet with *archarium*.

We say the *archives* of a college, of a monastery, &c. The *archives* of ancient Rome were in the temple of Saturn; the *archives* of the court of chancery are in the rolls-office.—In the code we meet with *archivum publicum, vel armarium publicum, ubi acta & libri exponantur. Cod. de fed. instrum. auth. ad huc xxx. q. i. Trev.*

ARCH-LEVITE, **ARCHILEVITA**. See **ARCHDEACON**.

ARCH-MARSHAL, **ARCHIMARISCALLUS**, the grand marshal of the empire.

The elector of Saxony is *archmarshal* of the empire; and in that quality he goes immediately before the emperor, bearing a naked sword.

ARCH-MINISTER, **ARCHIMINISTER**, the prime minister of a prince or state.

Charles the Bald having declared Bofon his viceroy in Italy, under the title of duke, made him also his first minister under that of *archminister*: the word is derived from the Greek *αρχι*, and the Latin *minister*.—Chorier.

ARCHON*, in antiquity, the chief magistrate of the city and commonwealth of Athens.

* The word is Greek, *αρχων*; where it literally signifies a commander, or one that governs.

After the Athenians had abolished monarchy, they created *archons*, who were obliged to render an account of their administration to the people.

Some of these were annual, and others perpetual: Medon, the son of Codrus, was the first of those; and Creon of these.—The occasion of their institution was this: Codrus, king of Athens, having devoted himself, for the good of his people, in the war with the Heraclidae; his sons, Medon and Nileus, disputed the crown betwixt them: the Athenians took this occasion of dissolving their monarchy, and, in lieu of kings, created perpetual governors, under the name of *archons*.—Medon, son of Codrus, was he who first had this charge, and his descendants (from him called *Medonidae*) enjoyed it for 287 years. But a perpetual magistracy seemed to this free people too lively an image of royalty, the very shadow whereof they were resolved to abolish. Accordingly, the administration of an *archon*, which had before been perpetual, (*viz.* in the first year of the seventh Olympiad) they now reduced to ten years; and about 70 years after, to one year; with a view of recovering, as oft as possible, the authority into their own hands, which they never transferred to the magistrates, but with regret.—There were in all thirteen perpetual *archons*, and seven decennial ones; the first whereof was established in the 24th Olympiad.

Under the Roman emperors, several other Greek cities had two *archons*, for chief magistrates; which were the same with the *duumviri* in the colonies, and municipia.

ARCHON is also applied by some authors to divers officers both civil, and religious, under the eastern or Greek empire.

Thus, bishops are sometimes called *archontes*; and the same may be said of the lords of the emperor's court. We also read of the *archon of the antimenia*, *archon of archons*, *grand archon*, *archon of churches*, *archon of the gospel*, *archon of the walls*, &c.

ARCHONTICI, in church-history, a sect of heretics, who arose towards the close of the second century; thus called from the Greek *αρχοντες*, q. d. *principalities*, or *hierarchies of angels*; by reason they held the world to have been created not by the supreme God, but by certain subordinate powers called *archontes*, or angels. The *Archontici* were a branch of Valentiniens. See **VALENTINIAN**.

ARCH-PRIEST, **ARCHIPRESBYTER**, a priest, or pres-

byter established in some dioceses, with a pre-eminence over the rest.

Anciently, the *arch-priest* was the first person after the bishop: he was seated in the church next after the bishop; and even acted as his vicar, in his absence, as to all spiritual concerns.

In the sixth century, there were found several *arch-priests* in the same diocese; from which time some will have them to have been called *deans*.

In the ninth century, they distinguished two kinds of cures or parishes; the smaller, governed by simple priests; and the baptismal churches, by *arch-priests*, who, beside the immediate concern of the cure, had the inspection of the other inferior priests, and gave an account of them to the bishop, who governed the chief or cathedral church in person.

There are *arch-presbyters* still subsisting in the Greek church; vested with most of the functions and privileges of *episcopii*, or rural deans.

ARCH-PRINTER, **ARCHITPOGRAPHUS**. See **PRINTER**.

ARCH-PRIOR was a name sometimes given to the master of the order of templars.

ARCH-TREASURER, *Architthesaurarius*, the great treasurer of the German empire.

This office was created with the 8th electorate, in favour of the elector Palatine, who had lost his former electorate, which was given to the duke of Bavaria, by the emperor Ferdinand II. who took it away from Frederic V. Elector Palatine after the battle of Prague, where he was defeated in maintaining his election to the crown of Bohemia. See **ELECTOR**.

The dignity of *arch-treasurer* is contested between the elector of Brunswick, now king of Great-Britain, who claims it in virtue of his descent from the elector Frederic; and the present elector Palatine.

ARCILEUTO, **ARCHILUTE**, a long, and large lute, having its bass-strings lengthened after the manner of the theorbo, and each row doubled either with a little octave or an unison.—It is used by the Italians for playing a thorough-bass. *Broff. p. 10*.

ARCTIC, *Arcticus*, in astronomy, an epithet given to the north-pole, or the pole raised above our horizon. See **NORTH**, and **POLE**.

It is called the *arctic pole*, on occasion of the constellation of the little bear, in Greek called *αρκτος*, the last star in the tail whereof nearly points out the north pole. See **URSA MINOR**.

ARCTIC Circle is a lesser circle of the sphere, parallel to the equator, and 23° 30' distant from the north pole: from whence its name.

This, and its opposite, the *antarctic*, are called the two *polar circles*; and may be conceived to be described by the motion of the poles of the ecliptic, round the poles of the equator, or of the world.

ARCTOPHYLAX, in astronomy, a constellation, otherwise called *Boötes*.

ARCTURUS, in astronomy, a fixed star, of the first magnitude, in the constellation *Arctophylax*, or *Boötes*.

* The word is formed of *αρκτος*, bear; and *υπα*, tail, q. d. bear's tail; as being very near it.

Arcturus rises on the first day of September, and sets on the thirteenth day of May; and has been supposed rarely to appear without bringing some storm.

ARCTUS, *Arctus*, in astronomy, a name given by the Greeks to two constellations of the northern hemisphere; by the Latins called *Ursa major*, and *minor*, and by us the *greater*, and *lesser bear*. See **URSA major** and **minor**.

ARCUATION is used by some writers in surgery, for an incurvation of the bones; such as we see in the case of rickets, &c.

ARCUATION, in gardening, denotes a method of raising trees by layers.

This, Switzer observes, is now the general method of raising such trees as can't be raised from seed, as the platanus, elm, abele, lime, alder, willow, &c.

The first thing here done is, to procure large and strong mother-plants called *stools*. These, being planted in a trench, will throw out twenty, thirty, forty, or fifty plants a-piece; which may be begun to be laid about the Michaelmas following; at which time, if the stools have been carefully managed, they will have shot five, six, or more main branches out of the root, and on every one of these, as many side or collateral branches.

These main branches are to be bent down to the ground, and when thus laid quite round the stool, and pegged fast down, the small ones may be served in the same manner. Thus the main branches are to be covered over, all except the top; and the small, or sides branches, to be cover'd over two or three inches thick upon the joints. This done, they may be treaded, to make them take root the better.

About the middle of September they may be opened; when it is probable they will have taken root: otherwise they may lie till next spring; and then taking them up, they are to be planted in the nursery.

ARCUTIO, a machine made of a board covered with pieces of hoops, used in Italy to prevent children from being overlaid and smothered by nurses, or others.

Every nurse in Florence is obliged to lay her child in an *arcutio*, under pain of excommunication.—See a figure and description of the *arcutio*, given by Mr. St. John, in *Phil. Transf.* No 422. p. 256.

ARDENT*, **ARDENS**, something hot, and, as it were, burning.

* The word is formed of the Latin *ardere*, to burn.

ARDENT Fever is a violent burning fever, otherwise called *caufus*. See **FEVER**.

ARDENT Spirits are those distilled from fermented vegetables; thus called, because they will take fire, and burn.

Such are, brandy, spirit of wine, rum, arrack, &c.

ARDERS, fallowings, or plowings of grounds. See **PLOUGHING**, **FALLOW**, &c.

ARDOR Ventriculi, a heat in the stomach, usually expressed by the term *heart-burn*, or *cardialgy*.

A RE, or **A-LA-MIRE**, one of the eight notes in the scale of music. See **NOTE**.

AREA*, in general, denotes any plain surface, whereon we walk, &c.

* The word is Latin, importing more properly a thrashing-floor; and is derived from *arere*, to be dry.

AREA in geometry, denotes the superficial content of any figure.

Thus, if a figure, *e. gr.* a field, be in form of a square, and its side be 40 foot long, its *area* is said to be 1600 square feet, or it contains 1600 little squares, each a foot every way.

Hence, to find the *area* of a triangle, square, parallelogram, rectangle, trapezium, rhombus, polygon, circle, or other figure, is to find the magnitude or capacity thereof in square measure.—To do which, see the article **TANGLE**, &c.

To find the *area* of fields, and other inclosures; they first survey or take the angles thereof, then plot them on paper, and thus cast up their contents in acres, roods, &c. after the usual manner of other plain figures.

The law by which the planets move round the sun, is this, that a line or radius, drawn from the centre of the sun to the centre of the planet, always sweeps or describes elliptic *areas* proportional to the times. Thus, the sun being supposed in S; and a planet in A, (*Tab. Astronomy*, fig. 61. N^o 2.) and letting it proceed in any given time, to B, in such progress, its radius AS will have described the *area* ASB. Suppose again, the planet to be arrived to P; then the elliptic space PSD being drawn equal to the other ASB, the planet will move through the arch PD, in the same time as through the arch AB.

Sir I. Newton demonstrates, that whatever bodies do observe such law in their motions about any other body, do gravitate towards such body.

AREA is also used in medicine, for a disease which makes the hair fall.

The *area* is a general kind of depilation, and is distinguished into two species, *alopecia* and *ophiasis*. See **ALOPECIA**, &c.

ARENA* among the Romans, sometimes signified the same with an *amphitheatre*, *viz.* a place where the gladiators had their combats.

* The word is originally Latin, and signifies *sand*, in regard the place was always strewed with sand, to conceal from the view of the people, the blood spilt in the combat.

Properly speaking, *arena* was only the pit, or space in the middle of those places, where the athletes and gladiators performed.

The *arena* was the same thing with regard to the gladiators, that the campus, or field, was to soldiers and armies, *viz.* the place where they fought.—He who fought in the *arena*, was called *arenarius*. See **GLADIATOR**.—Nero is said to have strewed the *arena* with gold dust.

ARENATION is used by some physicians for a kind of dry bath, in which the patient only sits with his feet on hot sand.

AREOLA, or **AREOLA Mamillaris**, in anatomy, the coloured circle which surrounds the nipple. See **BREAST**.

AREOPAGUS, or **ARÆOPAGUS**, *Ἀρειοπάγος*, in antiquity, a sovereign tribunal at Athens; famous for the justice and impartiality of its decrees, to which the Gods themselves are said to have submitted their quarrels.

Authors are divided, as to the reason and origin of the name: some imagine *areopagus* the proper name of the court of justice, which was situate on a hill, in Athens; and that in this court the senate of that illustrious city assembled.—Others say, that *areopagus* was the name of

the whole suburbs of Athens, wherein stood the hill on which the court was built: and the name *areopagus* seems to countenance this last opinion; for it signifies literally, the hill or rock of Mars, from *ἄρειος*, hill, and *ἄγος*, belonging to Mars. In effect, the denomination might either arise hence, that the *areopagus* was built in a place where had been a temple of Mars; or, because the first cause pleaded there was that of this God, who was accused of killing Halirrotius, the son of Neptune, and tried here before twelve Gods, and acquitted by a majority of voices; or finally, because the Amazons, whom the poets feign to have been the daughters of Mars, when they besieged Athens, pitched their tents, and offered sacrifices to the God of war, in this place.

This tribunal was in great reputation among the Greeks; and the Romans themselves had so high an opinion of it, that they trusted many of their difficult causes to its decision. Authors are not agreed about the number of the judges who composed this august court.—Some reckon thirty-one, others fifty-one, and others five hundred: in effect, their number seems not to have been fixed, but to have been more or less in different years.—By an inscription quoted by Volaterranus, it appears they were then three hundred.

At first this tribunal only consisted of nine persons, who had all discharged the office of archons, had acquitted themselves with honour in that trust, and had likewise given an account of their administration before the Logistæ, and undergone a very rigorous examination. Their salary was equal, and paid out of the treasury of the republic: they had three Oboli for each cause.

The *areopagites* were judges for life.—They never sat in judgment but in the open air, and that in the night-time, to the intent that their minds might be more present and attentive, and that no object, either of pity or aversion, might make any impression upon them.—All pleadings before them were to be in the simplest and most naked terms; without exordium, epilogue, passions, &c.

At first they only took cognizance of criminal causes, but in course of time their jurisdiction became of greater extent.—Mr. Spon, who examined the antiquities of that illustrious city, found some remains of the *areopagus* still existing in the middle of the temple of Theseus, which was heretofore in the middle of the city, but is now without the walls.—The foundation of the *areopagus* is a semicircle, with an eplanade of 140 paces round it, which properly made the hall of the *areopagus*. There is a tribunal cut in the middle of a rock, with seats on each side of it, where the *areopagites* sat, exposed to the open air.

This court is said by some to have been instituted by Solon; but others carry it much higher, and assert it to have been established by Cecrops, about the time that Aaron died, *viz.* in the year of the world 2553, maintaining withal, that Solon only made some new regulations in it, increased its power and privileges, and made it superior to the Ephetes, another celebrated court instituted by Draco.—In effect, Demosthenes himself, in his oration against Ctesiphon, owns himself at a loss on the point: *The institutors of this tribunal*, says he, *whatever they were, whether gods or heroes*.

AREOMETER, } See { **ARÆOMETER**.

AREOSTYLE, } See { **ARÆOSTYLE**.

AREOTICS, } See { **ARÆOTICS**.

ARETOLOGY, **ARÆTOLOGIA**, that part of moral philosophy which treats of virtue; its nature, and the means of arriving at it.

ARGAL, or **ARGEL**, the hard lees sticking to the sides of wine-vessels; more frequently called *tartar*.

ARGEA, or **ARGEI**, in antiquity, human figures made of rushes, thrown annually by the vestals into the river Tiber, on the day of the ides of May.

This ceremony we learn from Festus and Varro; the latter of whom, however, says they were cast by the priests; unless by *sacerdotibus*, we suppose he meant priestesses. He adds, that the number of figures was thirty.

Plutarch, in his Roman questions, enquires, why they were called *Argæ*? there are two reasons assigned; the first, that the barbarous nation, who first inhabited these parts, cast all the Greeks they could meet with into the Tiber; for *Argians* was a common name for all Grecians; but that Hercules persuaded them to quit so inhuman a practice, and to purge themselves of the crime, by instituting this solemnity.—The second, that Erander, an Arcadian, and a sworn enemy of the Argians, to perpetuate that enmity to his posterity, ordered the figures of Argians to be thus cast into the river.

ARGENT, in heraldry, signifies the colour white, used in the coats of gentlemen, knights and baronets.

Barons and all nobles have the white colour called *pearl*; and sovereign princes have theirs called *luna*.—Without either *argent* or *or*, the heralds say, there can be no good armory.

Argent is expressed in engraving, by the parts being left plain, without any strokes from the graver. The word is French,

French, derived from the Latin *argentum*, silver; this colour being supposed the representation of that metal: whence the Spaniards call this field *campo de plata*, a silver field. In the doubling of mantles, where the white is supposed to represent a fur, and not a metal, it may be blazoned white.

ARGENTUM Album, mentioned in domestic, signifies, according to Spelman, bullion, or silver uncoined. In those ancient days, such metal passed as money from one to another in payment.—*Sumitur pro ipso hoc metallo pensili non signato.*

ARGENTUM Dei, God's penny, anciently signified *earnest money*, or money given to bind a bargain; in some places called *erles*, or *arles*, and by the civilians, and canonists *arrhae*. *Et cepit de predicto Henrico tres denarios de argento Dei præ manibus.*

ARGILLA, or **ARGIL**, Clay; a general name for all earthen used in pottery, brick and tile making, and for the like purposes.

ARGO, in antiquity, a ship or vessel celebrated among the poets; being that wherein the Argonauts made their expedition.

The critics are divided about the origin of the name: some will have it thus called from the person who built it, *Argus*; others, by antiphrasis, from the Greek word *argos*, slow, as being a light sailer; others from the city *Argos*, where they suppose it built: others, from the *Argives*, who went on board it, according to the distich quoted from an ancient Latin poet by Cicero, in his first *Tuiculan*;

*Argo, quia Argivi in ea, delicti viri,
Vesti, petebant pellem inauratam arietis.*

Ovid calls *Argo* a sacred ship, *sacram confendis in argum*; by reason, say some, that Minerva contrived the plan, and even assisted in the building thereof; or rather, on account of a piece of timber in its prow, which, they say, spoke, and rendered oracles.—Several authors make mention of this piece of timber, which is said to have been hewn in the sacred forest of Dodona.

Jafon having happily accomplished his enterprize, consecrated the ship *Argo* to Neptune; or, as others say, to Minerva, in the Isthmus of Corinth; where, they add, it did not remain long before it was translated into heaven, and made a constellation.

The generality of authors represent the ship *Argo* as of a long make, resembling the modern galleys; and furnished with thirty benches of rowers.—The scholiast of Apollonius observes, that it was the first long vessel ever made: and Pliny relates the same, after Philostephanus, who had affirmed, that Jafon was the first that trusted out to sea in a long vessel: *Longa nave Jafonem primum navigasse, Philostephanus auctor est. Hist. Nat. l. 7. c. 56.*—It could not however be of any great bulk, since the Argonauts were able to carry it on their backs from the Danube to the Adriatic sea.

ARGO Navis, or the *ship*, in astronomy, is a constellation of fixed stars, in the southern hemisphere, whose stars, in Ptolemy's catalogue, are 8; in Tycho's 11; in the Britannic catalogue 25; the longitudes, latitudes, magnitudes, &c. whereof are as follow:

Names and situations of the stars.	Longit.	Latitude.	Magn.
Preced. under the shield in the stern	29 10 21	47 26 26	3
Between the sail and lancea	24 57 46	30 30 11	3 4

ARGOL, the same with *Tartar*. See **TARTAR**.
VOL. I.

ARGONAUTS, in antiquity, a company of fifty-two; or according to others, fifty-four heroes, who embark'd along with Jafon, in the ship *Argo*, for Colchis; with a design to obtain the golden fleece. Hercules, Theseus, Castor, Orpheus, &c. were of the number of the *Argonauts*.

ARGONAUTS of St. Nicholas was the name of a military order, instituted by Charles III. king of Naples, towards the end of the fourteenth century.

They wore a collar of shells, enclosed in a silver crescent, whence hung a ship with this device, *Non credo tempori*, I do not trust time. Hence these *Argonaut* knights came to be called *knights of the shell*. They received the order of St. Basil, archbishop of Naples, and held their assemblies in the church of St. Nicholas, their patron.

ARGUMENT, **ARGUMENTUM**, in rhetoric, as defined by Cicero, is some probable matter alleged to gain belief.

Logicians, somewhat more scientifically, define *argument*, a medium, from whose connection with two extremes, the connection of the two extremes themselves is inferred.

Arguments are divided, with regard to their source, into those fetched from *reason*, and those from *authority*.

Logicians also divide their *arguments*, with regard to their form, into *sylogisms*, *enthymemes*, *inductions*, &c.

An *Argument in form* is a syllogism framed according to the strict rules of logic.—According to Aristotle, the enthymeme is the *argument of rhetoric*, as the syllogism is that of logic.—Rhetoric is defined by some, the art of finding *arguments* adapted to persuade, or gain belief.

Rhetoricians divide *arguments*, with respect to the places they are drawn from, into *intrinsic* or *artificial*; and *extrinsic* or *inartificial*, or *remote*.

Artificial, or *intrinsic ARGUMENTS*, by the Greeks called *enxeia*, by Cicero *instita*, are the proper invention of him who speaks; or they are those which are taken from the subject treated of; of which there are several kinds, *viz.* genus and species, form, cause, and effect, &c. See each in its place, **GENUS**, &c.

To these some add two other places of *argument*, *viz.* the manners, and the passions.

Inartificial, or *extrinsic ARGUMENTS*, *enxeia*, by Cicero called *assumpta*, are those which are borrowed from abroad, and are only applied by the orator to the point in hand; such are laws, common report, books, oaths, torture, and witnesses.

A late author divides the places, or general heads of *arguments*, with regard to their end, into 1st, those intended to persuade or dissuade, which are chiefly drawn from the considerations of profit, honour, and equity: 2^d, those intended to praise, or dispraise:—And 3^d, those intended to accuse and defend.

Dialectical ARGUMENT. See the article **DIALECTICAL**.

ARGUMENT is also used for a syllabus, or abridgment of the subject of a book, history, comedy, or the like.

We have almost lost the original use of prologues, which was to give the *argument* of the play.

ARGUMENT, in astronomy, is an arch whereby we seek another unknown arch proportional to the first.

Hence **ARGUMENT of Inclination** is an arch of a planet's orbit, intercepted between the ascending node, and the place of the planet from the sun, numbered according to the succession of the signs. See **INCLINATION**.

Menstrual ARGUMENT of Latitude is the distance of the moon's true place, from the sun's true place. See **PLACE**.

By this we find the quantity of the real obscuration in eclipses, or how many digits are darkened in any place. See **ECLIPSE**.

ARGUMENT of the moon's menstrual longitude, or **Menstrual ARGUMENT of the longitude**, is an arch of her eccentric, L. P. (*Tab. Astron. fig. 32.*) intercepted between her true place once equated L; and a right line P Q, drawn through the centre of the eccentric B, parallel to the menstrual line of the apsidæ.

The annual *argument of longitude* is represented by the angle D A H.

ARGUMENTATION, the act of inventing or framing *arguments*, of making inductions, and drawing conclusions. See **ARGUMENT**, **INDUCTION**, **CONCLUSION**, &c. See also **DISCOURSE**, **RATIOCINATION**, &c.

Argumentation, according to Cicero, is the delivering or unfolding of an argument.—The matter of *argumentations* is propositions; the form, their due disposition, with regard to one another, so as a conclusion may be drawn from them. See **PROPOSITION**, **SYLLOGISM**, **ENTHYMEME**, and **SORTES**.

ARGYRASPIDES, or **ARGYROSPIDES**, in antiquity, persons armed with silver bucklers, or bucklers silvered. See **BUCKLER**.

The *Argyraspides*, according to Quintus Curtius, *Hist. iv. 13. 27.* made the second corps of Alexander's army; the first was the phalanx.

According to Justin's account, *Lib. xii. c. 7.* Alexander having penetrated into India, and extended his empire as far as the ocean; for a monument of his glory, ordered the armour of his soldiers, and the hounding of his horses, to be adorned with silver.—And hence commanded them to be called *Argyrafides*, from the Greek *αργυρος*, silver, and *αἰνός*, buckler.

By this author it should seem that Alexander's whole army were called *Argyrafides*.—After that prince's death, the *Argyrafides* despised all other chiefs of the army, disdaining to obey any other, having borne arms under Alexander.

ARGYROPOEIA*, in alchymy, the art of making silver, out of other more imperfect metals.

* The word is formed of *αργυρος*, silver, and *ποιεω*, I make.

The scope and design of *argyropeia*, and *chrysopeia*, is to make gold and silver. See **TRANSUTATION**, and **PHILOSOPHERS Stone**.

ARIANS, a sect of ancient heretics, retainers to Arius, a presbyter of the church of Alexandria about the year 320.—who owned Christ to be God, yet maintained him inferior to the father even as to his deity, and his essence to be different from that of the father, and that he was neither co-eternal nor co-equal with him.—Also that the Holy Ghost was not God, but a creature of the son.

The *Arians* were first condemned and anathematized by a council at Alexandria, under Alexander bishop of that city; and afterwards by 380 fathers in the general council of Nice.—After this council they divided into several parties, and factions. Some held that the son was made *ex nihilo*, *ἐκ μη οὐκ*, or of nothing; and added, that he was in all respects unlike the father, *κατα πάντα ἀνίσταται τῷ πατρί*. This was the doctrine of Acacius bishop of Cæsarea, whose followers were hence denominated *Acaciani* and *Anomæi*. The same was afterwards espoused by Ursacius bishop of Tyre, and Eudoxius bishop of Antioch, afterwards of Constantinople; whence the denominations of *Ursaciani* and *Eudoxiani*. To these also adhered Aetius, and his disciple Eunomius, bishop of Cyzicus; whence the *Aetiani* and *Eunomiani*.—Others held, that the son was like the father, and begot of his substance, though not co-eternal with him: they rejected the terms consubstantiality or homousia, and substituted that of likeness or similitude in their stead; anathematizing all those who held the son unlike the father, or a creature like other creatures, and made of nothing. Such was the faith of the council of Arimini, and the second council of Nice.—Lastly, others believed orthodoxly of the father and son, but denied the deity of the Holy Ghost, and his consubstantiality with father and son. These were denominated *Semiariani*.

ARIANISM, an ancient heresy in the church, broached by Arius, in the beginning of the fourth century; who denied that the son was God consubstantial, and co-equal with the father; and asserted him to be a creature made out of nothing, and in time.

The *Arians* owned, that the son was the word, but denied that word to have been eternal; asserting, that it had only been created before all other beings.—They held, that Christ had nothing of man in him, but the flesh, with which the word was joined, which supplied the rest.

This heresy was condemned in the first council of Nice, in 325*; but, notwithstanding that, it was not extinguished: on the contrary, it became the reigning religion, especially in the east, where it obtained much more than in the west**.

* It is even said, that there was an order of Constantine's, that whosoever should meet with any book composed by Arius, and not burn it, should be immediately punished with death. *V. Secret. Hist. Eccles. l. 9.*

** By the influence of the emperor Constantius, and the insinuations of the two Arian bishops Valens and Ursinus, who persecuted the western bishops, that peace might be restored by only setting aside those ambiguous Nicene terms, *κατα, ὁμοουσιος, and ὁμογενος*, which were not to be found in scripture, and which afforded great perplexity and scandal to weak minds; they were brought to subscribe an Arian formula of faith, in the council of Arimini, which was soon after confirmed in the second council of Nice, and established in the east. At the same time the confession of faith of the first council of Nice was condemned by the second. And thus was the world rendered Arian, as it were by stratagem.—But the pacification held not long: Many, who had subscribed the Arian confession, recanted, returned to the faith of the first Nicene council, and anathematized the second; by which means the war was renewed, and the word *Homousia* was recalled and settled in its former honour, as denoting of *one and the same substance*. The like was endeavoured to be done by the word *ὁμογενος*; but this occasioned a new dispute between the Greeks and Latins.

At the time of St. Gregory Nazianzen, the *Arians* were masters of the capital city of the empire, and frequently up-

braided the orthodox with the smallness of their numbers. Accordingly that father begins his twenty-fifth oration thus: "Where are those who reproach us with our poverty, and define the church by the multitude of people; despising the little flock," &c.

Arianism was carried in the sixth century into Africa under the Vandals; and into Asia under the Goths: Italy, the Gauls, and Spain, were also deeply infected with it. But, having reigned thirty years with great splendor, it sunk almost all at once.

Erasmus seems to have aimed, in some measure, to restore *Arianism*, at the beginning of the sixteenth century, in his commentaries on the New Testament: accordingly, he was reproached by his adversaries, with Arian interpretations and glosses, *Arian tenets*, &c. To which he made little answer, save that there was no heresy more thoroughly extinct than that of the *Arians*: *Nulla heresis magis extincta quam Arianorum*. But the face of things was soon changed: Servetus, a Spaniard by nation, published in 1531, a little treatise against the mystery of the Trinity; which once more set the heresy of the *Arians* on foot in the west.—Indeed he rather shewed himself a Photinian, than an Arian; only that he made use of the same passages of scripture, and the same arguments against the divinity of our Saviour, with the proper *Arians*.

It is true, Servetus had not, properly speaking, any disciples; but he gave occasion, after his death, to the forming of a new system of *Arianism* in Geneva, much subtler, and more artful than his, and which did not a little perplex Calvin.—From Geneva, the new *Arians* removed to Poland, where they gained considerable ground; but at length they degenerated, in great measure, into Socinians. See **SOCINIAN**.

The learned Grotius himself seems to have bordered a little on *Arianism*, in his notes on the New Testament; where he mounts the father too high above the son; as if the father alone was supreme God, and the son inferior to him even in respect of his divinity. Though it is rather the doctrine of the Semi-Arians, than of the *Arians*, that he seems to give into.

ARIES, or the *Ram*, in astronomy, the first of the twelve signs of the zodiac; from which also a twelfth part of the ecliptic takes its denomination.

The stars in the constellation *Aries*, in Ptolemy's catalogue, are 18; in Tycho's 21; in the Britannic catalogue 65; the longitudes, latitudes, magnitudes, &c. whereof, are as follow:

Names and situations of the stars.	Longitud.	Latitude.	Magn.

ARIES, also denotes a *battering ram*; or a military engine with an iron head, much in use among the ancients, to batter and beat down the walls of places besieged.

Of this there were three kinds; the first rude and plain, the others artificial and compound.—

The first seems to have been no more than a great beam, which the soldiers bore in their arms, and with one end of it, by main force, assailed the walls. This required a great force to work it, yet produced but a small effect.

The second or compound ram is described by Josephus, (*de excid. Hierosol.* 3.) thus: "The ram is a vast long beam, like the mast of a ship, strengthened at one end with a head of iron, something resembling that of a ram, whence it took its name. This is hung by the middle, with ropes to another beam, which lies across a couple of posts; and hanging thus equally balanced, is, by a great number of men, violently thrust forward, and recoiled backwards, and so shakes the wall with its iron head. Nor is there any tower or wall so thick or strong, as to resist the repeated assaults of this forcible machine."

The third only differed from the former in that it was covered with a *χλυν* or skreen to guard the soldiers, whence it is also called *testudo arietaria*.

M. Felibien describes a fourth sort of *battering ram*, which run on wheels; and was the most perfect and effectual of them all. Vitruvius affirms, that the *battering ram* was first invented by the Carthaginians, while they laid siege to Cadiz: theirs was the simple kind first mentioned: Pephalmenos, a Tyrian, afterwards contrived to suspend it with ropes; and finally Polydus, the Theffalian, to mount it on wheels, at the siege of Byzantium, under Philip of Macedon. Yet Pliny assures us, the ram was invented at the siege of Troy; and that it was this that gave occasion to the fable of a wooden horse.

The engine opposed to the *ram* was called *lupus*, the wolf.—Plutarch tells us, that Mark Anthony, in the Parthian war, used a ram of 80 foot long; and Vitruvius assures us, they were sometimes made 106, and sometimes 120 foot long; to this great length, perhaps, the force of the engine was in great measure owing.

The *ram* was managed at once by a whole century of soldiers; so that it played continually, and without intermission; being usually covered with a vinea, to protect it from the attempts of the enemy.

ARIETATION. See the article EARTHQUAKE.

ARIETUM Levatio, an ancient kind of sportive exercise, probably the same with what of later times is called *running at the quintain*. See QUINTAIN.

ARISE.—Licence to ARISE. See LICENCE.

ARISH, a Persian long measure, containing 3197 English feet. *Arith. tab.* 32.

ARISTA, in botany, a long needle-like beard, that grows out from the husk of corn, or grass; called also the *awn*.

ARISTARCHUS, in its original Greek, ἀριστο-αρχος, signifies *good prince*; but in its ordinary use among the learned, denotes a very severe critic; there having been a learned grammarian of that name, who criticized on the verses of the very best poets, as Homer, &c.

Hence we derive the titles of several books; as *Aristarchus sacer*, the name of Heinsius's notes on the new testament; *Aristarchus anti-bentleianus*, &c.

ARISTOCRACY*, **ARISTOCRATIA**, a form of govern-

ment, where the supreme power is lodged in the hands of the optimates, i. e. of a council, or senate composed of the principal persons of a state, either in respect of nobility, capacity, or probity.

* The word is derived from ἀριστο-, *optimus*; and ἀρχος, *impero*, I command, govern.

The ancient writers of politics prefer the *aristocratical* form of government to all others.—The republic of Venice is an *aristocracy*.

Aristocracy, seems to coincide with *oligarchy*; which, however, is more ordinarily used to signify a corruption of an aristocratical state, where the administration is in the hands of too few; or where some one or two usurp the whole power.

ARISTOLOCHIA, popularly called *Biribwort*; a medicinal plant, used as an ingredient in Venice treacle, and many other compositions.

Cicero derives its name from its inventor Aristolochus: others from its virtues.—These last suppose it formed from ἀριστο-, *optimus*, and λοchia, or purgations, in regard it is found of excellent use in bringing down the lochia, or discharges of women newly delivered.

There are four kinds of *aristolochia*, viz. the *round*, *long*, *rampant* or *creeping*, called also *clematitis*, and the *slender*; but only the roots of the two former are used among us.

The *round*, or *aristolochia retunda*, is of a sub-acrid aromatic taste, and is found very commonly in Languedoc, Spain, and Italy: its root is of particular use in facilitating delivery, provoking the menses, and bringing down the afterbirth; and is externally applied in vulnerary tinctures, and in waters for gangrenes: it is also supposed to have some alexipharmic quality; and is reckoned detergent externally, and suppurative.

The *long-rooted*, *aristolochia longa*, likewise grows in Languedoc; its root is used in electuaries, and in tinctures for the asthma, and to excite the menses; and its decoction, in lotions, to facilitate the delivery of the afterbirth, &c.

Besides these, there are several other kinds of *aristolochia*, in America; one particularly in Virginia, whose roots are used against the bites of venomous beasts, in malignant fevers, and the small-pox.—Its alexipharmic virtue has occasioned it to be called *Viperinum Virginiae* and *Serpentaria Virginiana*. See SERPENTARIA.

ARISTOTELIAN, something that relates to the philosopher Aristotle.—Thus we say an *aristotelian* dogma, the *aristotelian* school, &c.

The philosopher from whom the denomination arises was the son of Nicomachus, physician of Amyntas king of Macedonia, born in the year of the world 3566; before Christ, 348; at Stagira, a town of Macedonia; or, as others say, of Thrace; whence he is also called the *Stagirite*.

At seventeen years of age he entered himself a disciple of Plato, and attended in the academy till the death of that philosopher.

Repairing afterwards to the court of king Philip; at his return he found, that Xenocrates, during his absence, had put himself at the head of the academic sect; upon which he chose the Lyceum for the future scene of his disputation.

It being his practice to philosophize walking, he got the appellation *peripateticus*; whence his followers were also called *Peripatetics*.—Tho' others will have him to have been thus named from his constantly attending on Alexander at his recovery from an illness, and discoursing with him as he walked about.

Aristotle was a person of admirable genius, and of great and various learning: Averroes makes no scruple to call him 'the genius of nature, the limit of human understanding;' and declares him sent by providence to teach us all that may be known.—He is accused of too immoderate a desire of fame, which led him to destroy the writings of all the philosophers before him, that he might stand singly and without competitors. And hence, in the schools, Aristotle is called *The Philosopher*. Laertes, in his life of Aristotle, enumerates his books, to the number of 4000; of which scarce above 20 have survived to our age: they may be reduced to five heads; the first, relating to poetry and rhetoric; the second, to logics; the third, to ethics and politics; the fourth to physics; and the fifth to metaphysics. In all which, as there are many things excellent and invaluable, particularly what relates to poetry, rhetoric, and the passions; so there are others, in the other parts, which the improvements of later ages have taught us to explode and despise.

ARISTOTELIAN Philosophy, the philosophy taught by Aristotle, and maintained by his followers.

The *Aristotelian* is otherwise called the *peripatetic philosophy*; the rise and fate whereof, see under the article PERIPATETICS.

ARISTOTELIANS, a sect of philosophers otherwise called *Peripatetics*. See ARISTOTELIAN, and PERIPATETIC.

The *Aristotelians* and their dogma's prevail to this day, in the schools and universities; in spite of all the efforts of the Cartesian, Newtonian, and other corpuscularians.

The principles of Aristotle's philosophy, the learned agree, are chiefly laid down in the four books *de Cæle*; the eight books of *Physical Acoustics*, *Physics*, *Metaphysics*, belonging rather to logics, or metaphysics, than to physics.—To give an idea, then, of *Aristotelianism*, the reigning system of many ages; and shew Aristotle's method of philosophizing; we cannot do better than produce a specimen of that work.

Those four books he entitles, *de Cæle*, *æpi Ouranis*, because the heavens are the chief of the simple bodies he treats of. He begins with proving, that the world is perfect; which he does thus.—All bodies, says he, have three dimensions; they cannot have more, for the number three, according to Pythagoras, comprehends all: now the world is the assemblage of all bodies, therefore the world is perfect.

In the second chapter, he lays down certain peripatetic axioms; as—that all natural bodies have of themselves a power of moving; that all local motion is either rectilinear, circular, or composed of the two; that all simple motions are reducible to three, the motion of the centre, the motion towards the centre, and the motion about the centre: that all bodies are either simple or compounded; simple are those which have some power within themselves, whereby they move, as fire, earth, &c. compound are such as receive their motion from those others whereof they are compounded.

From these principles he draws several consequences.—A circular motion, says he, is a simple motion: but the heavens move in a circle; therefore the motion of the heavens is simple: but a simple motion can only belong to a simple body; i. e. to a body which moves by its own power. Therefore the heavens are a simple body, distinct from the four elements, which move in right lines. This proposition he likewise proves by another argument, thus.—There are two kinds of motions, the one natural, the other violent; the circular motion of the heavens, therefore, is either the one or the other: if it be natural, the heaven is a simple body distinct from the four elements, since the elements do not move circularly in their natural motion: if the circular motion be contrary to the nature of heaven, either that heaven must be some of the elements, as fire, or something else: but heaven cannot be any of the elements; e. gr. it cannot be fire; for, if it were, the motion of fire being from below upwards, the heavens would have two contrary motions, the one circular, the other from below, upwards, which is impossible. Again; if the heaven be any other thing which does not move circularly of its own nature, it will have some other natural motion, which likewise is impossible; for if it move naturally from below upwards, it will be either fire or air; if from above downwards, it will be water or earth; *ergo*, &c.—A third argument is this.—The first and most perfect of all simple motions must be that of a simple body; especially that of the first and most perfect of all simple bodies: but the circular motion is the first and most perfect of all simple motions, because every circular line is perfect, and no right line is so: for if it be finite, something may be added to it; if infinite, it is not perfect, because it wants an end, and things are only perfect when they are ended. Therefore, the circular motion is the first and most perfect of all motions; and therefore a body which moves circularly is simple, and the first and most divine of simple bodies. His fourth argument is—That all motion is either natural or not; and every motion which is not natural to some bodies, is natural to others: now the circular motion is not natural to the four elements; there must, therefore, be some simple body to which it is natural: therefore the heaven, which moves circularly, is a simple body, distinct from the four elements.—Lastly, the circular motion is either natural or violent to any body; if it be natural, it is evident this body is one of the most simple and perfect; if it be not, it is strange this motion should last for ever.—From all these arguments, therefore, it follows, that there is some body distinct from the circumambient ones, and which is of a nature as much more perfect than they, as it is more remote. Such is the substance of his second chapter.

In the third chapter, he asserts, that the heavens are incorruptible, and immutable; and the reasons he gives for it, are—That they are the abode of the gods, that no person has ever observed any alterations in them, &c.

In the fourth chapter, he attempts to prove, that the circular motion has no contrary: in the fifth, that bodies are not infinite: in the sixth, that the elements are not infinite: in the eighth, he shews that there are not several worlds of the same kind, by this very good argument; that as earth is heavy by nature, if there were any other earth beside ours, it would fall upon our heads, our earth being the centre, to which all heavy bodies tend. In the ninth, he proves it impossible that there should be several worlds, because if there were any body above the heavens, it must be either simple or compound, in a natural or a violent state; none of which is possible, for reasons which he draws from the three kinds of motions above mentioned. In the tenth, he maintains, that the world is eternal, because it is impossible it should have had any beginning, and because it endures for ever. He employs the eleventh in explaining the notion of incorruptibility; and in the twelfth endeavours to shew, that the world

is incorruptible, because it could not have any beginning, and because it endures for ever: all things, says he, subsist either during a finite, or an infinite space: but what is only infinite one way, is neither finite nor infinite; therefore nothing can subsist in this manner.

The reader, we are of opinion, will find this taste of peripateticism sufficient; otherwise it had been easy to have given him his fill. If he requires more, let him have recourse to the articles PRINCIPLE, ELEMENT, FORM, QUALITY, ACCIDENT, SYMPATHY, FUGA VACUI, ANTIPERISTASIS, &c.

It were needless to point out the particular defects in the specimen here laid down; it is easy to observe, that the principles are most of them false and impertinent, and the reasonings absurd and inconclusive; but that the greatest part has no distinct meaning at all.

Such is the philosophy, and such the method of philosophizing, of him who was called the genius of nature, the prince of philosophers, Aristotle.—Yet such was his authority, for many ages in the schools, that when a disputant quoted a passage from him, his opponent durst not say *transit*, but must either deny the passage, or reconcile it to his own cause. *Vid. Bayl. Dict. T. I. p. 469.*

ARISTOTELICA *Rota*. See the article *ROTA*.

ARITHMETIC, ARITHMETICA, the art of numbering; or, that part of mathematics which considers the powers and properties of numbers, and teaches how to compute or calculate truly, and with expedition and ease.

Some authors chuse to define *arithmetic*, the science of discrete quantity.

Arithmetic consists chiefly in the four great rules or operations of addition, subtraction, multiplication, and division.

It is true, for the facilitating and expediting of computations, mercantile, astronomical, &c. divers other useful rules have been contrived; as, the rules of proportion, of alligation, of false position, extraction of square and cube roots, progression, fellowship, interest, barter, rebate, reduction, tare and tret, &c.—But these are only applications of the first four rules. See these rules under their several heads, ADDITION, &c.

We have very little intelligence about the origin and invention of *arithmetic*; history neither fixes the author, nor the time.—In all probability, however, it must have taken its rise from the introduction of commerce; and consequently it should be of Tyrian invention.

From Asia it passed into Egypt, (Josephus says by means of Abraham.) Here it was greatly cultivated and improved; inasmuch, that a large part of the Egyptian philosophy and theology seems to have turned altogether upon numbers. Hence those wonders related by them about unity, trinity; the numbers seven, ten, four, &c.

In effect, Kircher, in his *Oedip. Egypt. Tom. II. p. 2*, shews, that the Egyptians explained every thing by numbers; Pythagoras himself affirming, that the nature of numbers goes through the whole universe; and that the knowledge of numbers is the knowledge of the deity.

From Egypt *arithmetic* was transmitted to the Greeks, who handed it forward, with great improvements, which it had received by the computations of their astronomers, to the Romans; from whom it came to us.

The ancient *arithmetic*, however, fell far short of that of the moderns: most of what they did was to consider the various divisions of numbers; as appears from the treatises of Nicomachus, wrote in the third century of Rome, and that of Boethius, still extant. A compendium of the ancient *arithmetic*, wrote in Greek, by Pselus, in the ninth century from our Saviour, was given us in Latin by Xylander, in 1556.—A more ample work of the same kind was wrote by Jordanus, in the year 1200; published with a comment by Faber Stapulensis in 1480.

Arithmetic, under its present state, is variously divided, into different kinds; *theoretical, practical, instrumental, logarithmical, numerical, specious, decimal, dynamical, tetraçyal, duodecimal, sexagesimal*, &c.

Theoretical ARITHMETIC is the science of the properties, relations, &c. of numbers, considered abstractedly; with the reasons and demonstrations of the several rules.

Euclid furnishes a *theoretical arithmetic*, in the seventh, eighth, and ninth books of his elements.—Barlaam Monachus has also given a theory for demonstrating the common operations, both in integers and broken numbers, in his *Logistica*, published in Latin by J. Chambers, an Englishman, in 1600.—To which may be added Lucas de Burgo, who, in an Italian treatise published in 1523, gives the several divisions of numbers from Nicomachus, and their properties from Euclid; with the algorithm, both in integers, fractions, extractions of roots, &c.

Practical ARITHMETIC is the art of numbering or computing; that is, from certain numbers given, for finding certain others whose relation to the former is known.

As, if a number be required equal to two given numbers 6 and 8.

The first entire body of *practical arithmetic*, was given by Nich. Tartaglia a Venetian, in 1556, consisting of two books; the former, the application of *arithmetic* to civil uses; the latter, the grounds of algebra. Something had been done before by Stifelius, in 1544; where we have several particulars concerning the application of irrationals, coffices, &c. no where else to be met withal.

We omit other mere practical authors which have come since, the number whereof is almost infinite; as Gemma Frisius, Metius, Clavius, Ramus, Buckley, Diggs, Record, Wingate, Cocker, Leybourn, &c.

The theory of *arithmetic* is joined with the practice, and even improved in several parts, by Maurolycus in his *Opuscula Mathematica*, 1575; Henefichius in his *Arithmetica Perfecta*, 1609, where the demonstrations are all reduced into the form of syllogisms; and Taquet in his *Theoria & Praxis Arithmetica*, 1704.

HARMONICAL ARITHMETIC. See HARMONICAL.

Instrumental ARITHMETIC is that, where the common rules are performed by means of instruments contrived for ease and dispatch; such are several sorts of scales, and sliding-rules; such, more particularly, are Napier's bones, described under their proper article: Sir Sam. Mordland's instrument, the description whereof was published by himself, in 1666; that of M. Leibnitz, described in the *Miscell. Berlin.* and that of Polenus published in the Venetian Miscellany, 1709.—To these may be added,

Logarithmetical ARITHMETIC, perform'd by tables of logarithms.

The best piece on this subject is Hen. Briggs's *Arithmetica Logarithmica*, 1624.

To this head may also be added, the universal *arithmetical tables of Prosthaphereze*, published in 1610, by Herwart ab Hohenburg; whereby multiplication is easily and accurately performed by addition, and division by subtraction.

The Chinese have little regard to any rules in their calculations; instead of which, they use an instrument made of a little plate, a foot and half long, across which are fitted ten or twelve iron wires, on which are strung little round balls. By drawing these together, and dispersing them again one after another, they count, somewhat after the manner in which we do by counters; but with so much ease and readiness, that they will keep pace with a man reading a book of account, let him make what expedition he can; and at the end the operation is found done; and they have their way of proving it. *Le Comte.*

Logistical ARITHMETIC. See the article LOGISTICAL.

Numerous ARITHMETIC is that which gives the calculus of numbers or indeterminate quantities; and is performed by the common numeral, or arabic characters.

Specious ARITHMETIC is that which gives the calculus of quantities; using letters of the alphabet instead of figures, to denote the quantities.

Specious arithmetic coincides with what we usually call *algebra*, or *literal arithmetic*.

Dr. Wallis has joined the numeral with the literal calculus; and by means hereof, demonstrated the rules of fractions, proportions, extractions of roots, &c. A compendium of which is given by Dr. Wells, under the title of *Elementa Arithmetica*, An. 1698.

Decimal ARITHMETIC is that performed by a series of ten characters, so that the progression is from 10 to 10.

Such is the common *arithmetic* among us, which makes use of the ten *arabic* figures, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9; after which we begin 10, 11, 12, &c.

This method of computation is not very ancient, being utterly unknown to the Greeks and Romans.—It was introduced into Europe by Gerbert, who was afterwards pope, under the name of Sylvester II. who borrowed it from the Moors of Spain.—No doubt it took its origin from the ten fingers of the hands, which were made use of in computations before *arithmetic* was brought into an art.

The eastern missionaries assure us, that to this day the Indians are very expert at computing on their fingers, without any use of pen and ink. *Let. Edif. & Cur.*—Add, that the natives of Peru, who do all by the different arrangement of grains of maize, out-do any European, both for sureness and dispatch, with all his rules.

Decimal Arithmetic is also used for the doctrine of decimal fractions.

Binary, or Dyadic ARITHMETIC, is that, wherein only two figures, unity, or 1, and 0, are used. See BINARY ARITHMETIC.

M. Dancicourt, in the *Miscell. Berl.* gives us a specimen of the use hereof in arithmetical progressions; where he shews, that the laws of progression may be easier discovered hereby, than in any other method where more characters are used.

Tetradic ARITHMETIC is that, wherein only the figures 1, 2, 3, and 0, are used.

We have a treatise of this *arithmetic*, by Erhard Weigel; but both binary and this are little better than curiosities, espe-

VOL. I.

cially with regard to practice; inasmuch, as the numbers may be much more compendiously expressed by decadal *arithmetic*, than by either of them.

Vulgar ARITHMETIC is that converfant about integers and vulgar fractions.

Sexagesimal, or Sexagenary ARITHMETIC is that which proceeds by sixties; or the doctrine of sexagesimal fractions.

Sam. Reyher has invented a kind of sexagenal rods, in imitation of Neper's bones, by means whereof the sexagenary *arithmetic* is easily performed.

Political ARITHMETIC is the application of *arithmetic* to political subjects; as, the strength and revenues of princes, number of inhabitants, births, burials, &c. See **POLITICAL ARITHMETIC**.—Hither also may be referred the doctrine of CHANCES, GAMING, &c.

ARITHMETIC of Infinites is the method of summing up a series of numbers consisting of infinite terms; or of finding the ratios thereof.

This method was first invented by Dr. Wallis; as appears from his *Opera mathematica*, where he shews its use in geometry, in finding the areas of superficies, and the contents of solids, and their proportions.—But the method of fluxions, which is an universal *arithmetic* of infinites, performs all this much easier; and multitudes of other things which the former will not reach.

ARITHMETIC of Rationals and Irrationals. See RATIONAL, &c.

ARITHMETICAL Complement of a logarithm, is what the logarithm wants of 10.0000000.

Thus the arithmetical complement of 7.1079054 is 2.8920946; where each figure but the last is subtracted from 9; and that from 10.

ARITHMETICAL Medium or Mean,
ARITHMETICAL Progression,
ARITHMETICAL Proportion,
ARITHMETICAL Ratio,
ARITHMOMANCY*, *Arithmomania*, a kind of divination, or method of foretelling future events, by means of numbers.

* The word is compounded of *arithmos*, number, and *mania* divination.

The gematria, which makes the first species of the Jewish cabala, is a sort of *arithmomania*. See GEMATRIA.

ARK, or **ARC**, *arcus*, in geometry, arcuosity, &c. See **ARC**.

ARK, ARCA, in the scripture language, denotes a kind of floating vessel built by Noah, for the preservation of the several species of animals from the deluge.

The ark has afforded several points of curious enquiry among the critics and naturalists, relating to its form, capacity, materials, time of building, place of resting after the flood, &c.

Noah is computed to have been an hundred years in building the ark, viz. from the year of the world 1557, to the flood, which happened in the year 1656: at least, this is the common opinion of the learned. Origin, *lib. iv. contra Coll. St. Austin, de Civit. Dei, lib. xv. c. 27.* and *contra Faust. lib. xii. c. 18.* and in his *Quest. on Gen. v. and xxiii.* Rupert. *lib. iv. in Gen. xx.* assert as much; and are followed by Sallian, Torniel, Spondeus, Pelletier, &c.

Yet Berosus affirms, that Noah only began to build the ark seventy-eight years before the flood: Salomon Jarchi, on the other hand, will have it to have been an hundred and twenty years in building, and Tanchuma only fifty-two. See the Texts, Gen. vi, &c.

Fa. Fourrier, in his *Hydrography*, gives into the opinion of the fathers; noting, that the hands employed in it were only Noah and his three sons. To this purpose he alleges the instance of Archias of Corinth, who, with the help of three hundred workmen, built Hiero's great ship in one year. Add, that Noah's eldest son was not born till about the time when the ark was begun, and the younger after; so that it was a long time ere they could do their father any service.—However, for so large a building, a prodigious number of trees must have been required, which would employ a great number of workmen to fell and hew; were it possible for three men to have lain them?

The wood whereof the ark was built, is called in scripture *קָדָשׁ, etse gopher*, gopher wood: and in the XXX. *קָדָשׁ, etse gopher*, square timbers. Onkelos and Jonathan render gopher by *קָדָשׁ, kedros*, cedar: St. Jerom, in the vulgate, by *ligna lævigata*, planed wood; and elsewhere, *ligna bituminata, q. d.* pitched woods. Kimkhi translates it, *wood most proper to float*; Vatable, *light wood*, which swims in the water without corrupting: Junius, Tremellius, and Buxtorf, a kind of cedar, by the Greeks called *αἰθναῖον*; Avenarius and Munster, *pine*; Fuller and Bochart, *cyress*; others, *fir*; Castalio, *turpentine*, &c.—Pelletier preters the opinion of those who hold the ark made of cedar: his reasons are, the incorruptibility of that wood; the great plenty thereof in Asia, whence Herodotus and Theophrastus relate, that the kings of Egypt and Syria built whole fleets thereof,

I M m

in

in lieu of deal; and the common tradition throughout the east imports, that the *ark* is preserved entire to this day on mount Ararat.

The dimensions of the *ark*, as delivered by Moses, are three hundred cubits in length, fifty in breadth, and thirty in height; which, compared with the great number of things it was to contain, seems to many to have been too scanty. And hence an argument has been drawn against the authority of the relation. Celsius long ago laughed at it, calling it *αἰσθητὸν ἀδόκοντον*, the absurd *ark*. To solve this difficulty, many, both of the ancient fathers and later critics, have been put to very miserable shifts. Origen, St. Augustin, and others, maintain, that by the cubits here spoke of, we are to understand the Egyptian geometrical cubit, equal, according to them, to six vulgar cubits, or nine foot. But the truth is, it does not appear there ever was any such measure as a geometrical cubit either among Egyptians or Jews.—Others account for it, by asserting the stature of mankind, in the first ages to have been much greater than in our days; and consequently the cubit, which is taken from a part of the human body, proportionably larger. But this does not avail, since the same reason will infer an equal augmentation of the size of other animals.—Others suppose the sacred cubit here spoke of, which was a hand's breadth longer than the civil one; but this only affords a small supply; beside, that the sacred cubit does not appear to have been ever used, except in sacred edifices, as the temple and tabernacle.

This difficulty is much better solved by Buteo and Kircher, wherein, supposing the common cubit of a foot and a half, they prove geometrically, that the *ark* was abundantly sufficient for all the animals supposed to be lodged therein.—Snellius computes the *ark* to have been above half an acre in area: Cuneus, Buteo, and others, have also calculated the capacity of the *ark*.—Dr. Arbuthnot computes it to have been 81062 tons.—Father Lamy shews that it was an hundred and ten foot longer than the church of St. Mary at Paris, and sixty-four foot narrower; to which his English translator adds, that it must have been longer than St. Paul's church in London, from west to east, broader than that church is high in the inside, and about fifty-four foot in height, of our measure.

The things contained in it were, besides eight persons of Noah's family, one pair of every species of unclean animals, and seven pair of every species of clean animals, with provisions for them all, during the whole year.—The former appears at first view almost infinite, but if we come to a calculus, the number of species of animals will be found much smaller than is generally imagined, not amounting to an hundred species of quadrupeds, nor two hundred of birds; out of which, in this case, are to be excepted such animals as can live in the water.—Zoologists usually reckon but an hundred and seventy species in all; and bishop Wilkins shews, that only seventy-two of the quadruped kind needed a place in the *ark*.

By the description Moses gives of the *ark*, it appears to have been divided into three stories, each ten cubits, or fifteen foot high: and it is agreed on, as most probable, that the lowest story was destined for the beasts, the middle for the food, and the upper for the birds, with Noah and his family; each story being subdivided into different apartments, stalls, &c.—Though Josephus, Philo, and other commentators, add a kind of fourth story, under all the rest; being, as it were, the hold of the vessel, to contain the ballast, and receive the filth and feces of so many animals.

Drexelius makes three hundred apartments; father Fournier three hundred thirty-three; the anonymous author of the questions on Genesis, four hundred; Buteo, Temporalis, Arias Montanus, Hofius, Wilkins, Lamy, and others, suppose as many partitions as there were different sorts of animals.—Pelletier only makes seventy-two, viz. thirty-six for the birds, and as many for the beasts: his reason is, that if we suppose a greater number, as three hundred thirty-three, or four hundred, each of the eight persons in the *ark* must have had thirty-seven, forty-one, or fifty stalls to attend and cleanse daily, which he thinks impossible. But there is not much in this; to diminish the number of stalls, without a diminution of the animals, is vain; it being, perhaps, more difficult to take care of three hundred animals in seventy-two stalls, than in three hundred.

Buteo computes, that all the animals contained in the *ark*, could not be equal to five hundred horses; he even reduces the whole to the dimensions of fifty-six pair of Oxen. Father Lamy enlarges it to sixty-four pair, or an hundred and twenty-eight oxen; so that supposing one ox equal to two horses, if the *ark* had room for two hundred fifty-six horses, there must have been room for all the animals. But the same author demonstrates, that one floor of it would suffice for five hundred horses, allowing nine square feet to an horse.

As to the food in the second story, it is observed by Bateo from Columella, that thirty or forty pounds of hay ordinarily suffices an ox for a day; and that a solid cubit of hay, as usually pressed down in our hay-racks, weighs about forty pound; so that a square cubit of hay is more than enough

for one ox one day.—Now it appears that the second story contained 150000 solid cubits; which, divided between two hundred and six oxen, will afford each more hay by two thirds, than he can eat in a year. Bishop Wilkins computes all the carnivorous animals equivalent, as to the bulk of their bodies and their food, to twenty-seven wolves; and all the rest to two hundred and eighty beeves. For the former he allows 1825 sheep, and for the latter 109500 cubits of hay: all which will be easily contained in the two first stories, and a deal of room to spare.—As to the third story, no body doubts of its being sufficient for the fowls, with Noah, his sons and daughters.

Upon the whole, the learned bishop remarks, that of the two, it appears much more difficult to assign a number and bulk of necessary things to answer the capacity of the *ark*, than to find sufficient room for the several species of animals already known to have been there.—This he attributes to the imperfection of our lists of animals, especially those of the unknown parts of the earth; adding, that the most expert mathematician at this day could not assign the proportions of a vessel better accommodated to the purpose, than is here done; and hence finally concludes, that 'the capacity of the *ark*, which had been made an objection against scripture, ought to be esteemed a confirmation of its divine authority; since, in those ruder ages, men, being less versed in arts and philosophy, were more obnoxious to vulgar prejudices than now; so that had it been an human invention, it would have been contrived according to those wild apprehensions which arise from a confused and general view of things; as much too big, as it has been repmented too little.'

ARK of the Covenant, in scripture, denotes a kind of chest, wherein, by God's command, Exod. xxv. 16. were kept the two tables of stone, whereon God had engraven the ten commandments given to Moses on the mount, and held in high veneration among the Hebrews.

The *ark* was repositied in the holiest place of the tabernacle.—It was taken by the Philistines, and detained twenty, some say forty, years, at Kirjath Jearim; but the people being afflicted with emroids on account of it, afterwards returned it with divers presents.—It was afterwards placed in the temple.

Josephus describes it as five palms long, three broad, and as many high; the wood, both within side and without, was lined with plates of gold, and fitted with golden hinges.—The lid or covering of the *ark* was called the *propitiatory*, over which were two figures placed called *Cherubim*, a kind of spirits with wings of a peculiar form never seen but by Moses before the throne of God. It may be added, that some critics take the word *cherub*, כְּרוּב, to be only a transposition of the Hebrew letters of the word *rehab*, רִיבּוּב, *chariot*; and that by the *Cherubim* being placed over the *ark*, we are only to understand, that the *ark* was a sort of chariot, on which God fate.

The Jews, to this day, have a kind of *ark* in their synagogues, wherein their sacred books are repositied, in imitation of the ancient *ark* of the covenant.—This they call *aron*. Leo of Modena gives a description thereof in his account of the *Customs and Ceremonies of those of his Nation*: 'The Jews, says he, in the eastern side of all their synagogues, have an *ark*, or armory, called *aron*; in memory of the *ark* of the covenant. In this are preserved the five books of Moses, wrote on vellum, with ink made on purpose,' &c.

Tertullian calls this *ark*, *Armarium Judaicum*; whence the Phrase, to be in the armory of the synagogues, q. d. in the number of canonical writings.

A R M, *brachium*, a part of the human body, terminating at one end in the shoulder, and at the other in the hand.

Among physicians and anatomists, **ARM** only includes that part between the shoulder and the elbow; the rest, from the elbow to the wrist, being taken into the greater hand; by others called the *fore-arm*. See **HAND**.

The *arm*, in this latter acceptation, has only one large bone, called the *humerus*, or shoulder-bone. See **HUMERUS**.

It has five sorts of motions, which are effected by five pair of muscles; upwards, by the deltoides, supraspinatus, and coracobrachialis; downwards, by the teres, rotundus major, and latissimus dorsi; forwards, by the pectoralis; backward, by the infraspinatus; and circularly, by the transversalis, subscapularis, and infraspinatus. See each muscle described under its proper article.

The other part consists of two bones, called *foels*; viz. the radius and cubitus, or ulna.

The muscles whereby this part is moved, are the biceps, brachies internus, gemellus, brachies externus, anconeus, pronator radii teres, and quadratus; supinator longus, and brevis.—See each in its place.—The usual venæctions are in the *arm*.

ARM, in the manage, is applied to a horse, when he endeavours to defend himself against the bit; to prevent obeying, or being checked thereby.

A horse is said to *arm* himself, when he presses down his head,

head, and bends his neck, so as to rest the branches of the bridle upon his brislet; in order to withstand the effort of the bit, and guard his bars and his mouth.

A horse is said to *arm himself with the lips*, when he covers the bars with his lips, and deadens the pressure of the bit.—This frequently happens in thick-lipped horses.—The remedy is by using a bit-mouth, forged with a canon or scatch-mouth, broader near the bankers than at the place of its pressure, or rest upon the bars.

For *arming against the bit*, the remedy is to have a wooden ball covered with velvet, or other matter, put on his chaul; which will so press him between the jaw-bones, as to prevent his bringing his head so near his breast.

ARM, is also used in geography for a branch of a sea, or river.

Italy and Sicily are only parted by an *arm of the sea*.—St. George's *arm*, in the Mediterranean, is the Thracian Bosphorus.

Among gardeners, *arm* is sometimes used in respect of cucumbers and melons, in the same sense as branch, of other plants.

ARM is also used figuratively for *power*.—The secular *arm* is the lay or temporal authority of a secular judge; to which recourse is had for the execution of the sentences passed by ecclesiastical judges.

The church sheds no blood: even the judges of inquisition, after they have found the person guilty, surrender him to the secular *arm*.

The council of Antioch, held in 341, decrees, that recourse be had to the secular *arm* to repress those who refuse obedience to the church: for secular *arm*, they here use exterior power.

ARM, in the military art, heraldry, &c. See ARMS, and ARMOUR.

ARM, in the sea-language.—A ship is said to be *armed*, when fitted out and provided in all respects for war.

Also, a cross-bar-shot is said to be *armed*, when some rope-yarn, or the like, is rolled round about one end of the iron bar which runs through the shot, both that the shot may be the better rammed down into the gun, and left the sharp end of the bar should catch into any honey-combs within the cylinder of the piece.

Yard-ARM. See the article YARD.

ARM, in respect of the magnet.—A loadstone is said to be *armed*, when it is capped, cased, or set in iron or steel; in order to make it take up the greater weight; and also to distinguish readily its poles.

* It is surprising, that a little iron fastened to the poles of a magnet should so vastly improve its force, as to render it 150 times stronger than when naked. Mr. Butterfield told Dr. Lister, that some loadstones would gain much more, and others vastly less by *arming* than one would expect.—A strong loadstone ought to have thick irons, and a weak one but thin ones: so that a stone may be easily overhauled.

L'ist. Journ. to Paris.
The usual armour of a loadstone, in form of a right-angled parallelepipedon, consists of two thin pieces of steel or iron, of a square figure, and a thickness proportionable to the goodness of the stone: if a weak stone have a strong armour, it will produce no effect; and if the armour of a strong loadstone be too thin, its effect will not be so considerable as when thicker.—The proper thickness is found by filing it thinner and thinner, till its effect is found at the greatest possible strength.

The armour of a spherical loadstone consists of two steel shells fastened to one another by a joint, and covering a good part of the convexity of the stone. This also is to be filed away, till the effect is found the greatest.

Kircher, in his book *de Magnete*, tells us, that the best way, to *arm* a loadstone is, to drill a hole through the stone from pole to pole, and in that, to place a steel rod of a moderate length; which rod, adds he, will take up more weight at the end, than the stone itself *armed* the common way can do.

ARMA dare, to give arms, in some ancient charters, signifies to dub, or make a knight.

ARMA depone, to lay down arms, was a punishment anciently enjoined when a man had committed an offence. *Leg. Hen. I.*

ARMA mutare, q. d. to change arms, was a ceremony used to confirm a league or friendship.

ARMA moluta were sharp weapons: Fleta calls them *Arma emolita*.

ARMA revertsata, inverted arms; was a punishment when a man was convicted of treason or felony.

ARMAMENT, a large body of forces, raised and provided with the furniture of war, either for land or sea service.

ARMAN, among farriers, a confection of great efficacy to prevent a total loss of appetite in horses.

ARMARIUM unguentum, among hermetical philosophers, a sympathetic ointment, or weapon *salve*, whereby wounds

are said to have been cured at a distance, by only dressing the weapon. See SYMPATHETIC.

ARMED, in the sea-language, &c. See ARM.

ARMED, in heraldry, is used in respect of beasts and birds of prey, when their teeth, horns, feet, beak, talons, or tusks, are of a different colour from the rest.—He bears a cock, or a falcon, *armed*, or, &c.

ARMENIAN*, *Bole*, *Boles* ARMENA, a fatty medicinal kind of earth, of three kinds; white, yellow, and red; the last is the most esteemed, it is of considerable use as an absorbent, astringent, and vulnerary.

* It takes the denomination; *Armenian*, ἀπὸ τῆς Ἀρμενίας βοῆος, because brought chiefly out of Armenia, and the neighbouring countries.

The *Armenian bole* is frequently found in the shop-medicines prescribed internally against diarrhoeas, dysenteries, hæmorrhages, catarrhs, and all defluxions: externally it is used in strengthening plasters, for luxations of the joints, &c. See SUPPLEMENT, article ARMENIAN BOLE.

ARMENIANS, in respect of religion, a sect, or division among the eastern Christians; thus called from *Armenia*, the country anciently inhabited by them.

The *Armenians*, since the conquest of their country by Schah Abas king of Persia, have had no fixed place of habitation, but are dispersed in divers parts of Persia, Turkey and Tartary, and even some parts of Europe, particularly Poland.—Their chief employment is merchandise, in which they excel.—The cardinal de Richlieu, we are told, had a design to make an establishment of them in France, for promoting the commerce of that country.

With regard to religion, there are two kinds of *Armenians*; the one catholics, and subject to the pope, having a patriarch in Persia, and another in Poland.—The other make a peculiar sect, having two patriarchs in Natcha. They have their printing-house at Maricilles.

The *Armenians* are generally accused of being of the sect of Monophysites, and only allowing of one nature in Jesus Christ. As to the Eucharist, they agree with the Greeks; except in this, that they mix no water with their wine, and use unleavened bread after the manner of the Latins.

They abstain very rigorously from eating of blood; and meats strangled, and are much addicted to fasting; inasmuch that, to hear them talk, one would conclude that almost their whole religion consisted in fasting.

The monastic order is in great repute among them; since one of their patriarchs introduced that of St. Basil; but part of them, which have united with the church of Rome, have changed their ancient rule, for that of the Dominicans.

ARMENIAN Stone, *Lapis ARMENUS*, λίθος Ἀρμενίος, a mineral stone, or earth, of a blue colour, sometimes spotted with green, black and yellow; anciently brought only from *Armenia*, but now found in Germany and Tyrol.

The *Armenian stone* in its harder state bears a near resemblance to *lapis lazuli*, from which it seems only to differ in degree of maturity: they are distinguished by this, that the *lapis Armenus* is softer, and instead of sparks of gold, is often speckled with green.

Boerhaave ranks it among semi-metals; and supposes it composed of a metal and earth. Woodward says, it owes its colour to an admixture of copper.

Its chief use is in Mosaic work, though it has some place also in physic. Both this and the *lapis lazuli* are ores of copper.

ARMIGER, *Armour-bearer*, in modern writers, denotes a title of dignity, rendered in English, by *Esquire*.

ARMILLA *Membrana* is a name given by some anatomists, to the annular ligament.

ARMILLARY*, *ARMILLARIS*, in astronomy; an epithet given to an artificial sphere, composed of a number of metalline circles, representative of the several circles of the mundane sphere, put together in their natural order.

* The word is formed of the Latin *armilla*, a bracelet.

Armillary spheres ease and assist the imagination to conceive the constitutions of the heavens, and the motions of the heavenly bodies.

Such is that represented, (*Tab. Astron. fig. 21.*)—Where P and Q represent the poles of the world, A D, the equator, E L the ecliptic and zodiac, P A G D the meridian, or the solstitial colure, T the earth, F G, the tropic of cancer, H T the tropic of capricorn, M N the arctic circle, O V the antarctic, N and O the poles of the ecliptic, and R S the horizon.

ARMILUSTRIUM, in antiquity, a feast held among the Romans; wherein they sacrificed, armed at all points, and with the sound of trumpets.

Some define *armilustrum* to have been a feast, wherein a general review was made of all the forces in the campus martius.—But this does not come up to the point; for Varro does not derive the word from the Latin *arma* and *lustrare*, to make a review: but from the custom of holding this feast in the place where the reviews were used to be made, or rather from their going round the place armed with bucklers. And he prefers this last opinion, being persuaded that it was from this ceremony, that the place where the sacrifice was offered to the gods, was called *armilustrum*, or *armilustrum*.

a luendo, or a lufro, i. e. quæ circumbant ludentes, ancilibus armati.

The sacrifice was intended as an *indagatio*, or expiation of arms, and for the prosperity of the arms of the people of Rome; and was celebrated on the fourteenth of the calends of November.

ARMINGS, in a ship, are the same with *wafl-clothes*, being red clothes, hung about the outfiles of the ship's upper-works, fore and aft; and before the cubridge heads.

There are some also hung round the tops, and called *top-armings*.

ARMINIANISM, the doctrine of Arminius, a celebrated professor in the university of Leyden; and of the Arminians, a sect which follow him.

The principal article wherein the Arminians differ from the other reformed confits in this, that, thinking the doctrines of Calvin, with regard to free-will, predestination, perseverance and grace, too severe, they have returned to those of the Romish church, and maintain, that there is an universal grace given to all men; that man is always free, and at liberty to reject or embrace grace, &c.

Gomar, Arminius's colleague, stood strenuously up for a particular or special grace, given only to those who are predestinated or elect; and for a positive decree both of election in some, and of reprobation in others. See **PREDESTINATION**, **ELECTION**, **REPROBATION**, &c.

At length, the matter came to a hearing, before the synod of Dort, in 1618 and 1619, where *Arminianism* was condemned in form.—These disputes began in the year 1609. From the schools they passed into the government, and the republic of Holland was once in a fair way to be overturned by them.

ARMINIANS, a religious sect or party, which arose in Holland, by a separation from the Calvinists. See **ARMINIANISM**.

The *Arminians* are sometimes also called *Remonstrants*, by reason of a remonstrance which they preferred to the States General in 1611, wherein the chief articles of their faith were laid down.

The later *Arminians* carried things much farther than Arminius himself, and even came very near to Socinianism.—Especially under Simon Episcopius.—When the Calvinists upbraided them with renewing an ancient heresy already condemned in the Pelagians, and Semi-Pelagians; they replied, that the mere authority of men could not be allowed a legitimate proof any where but in the church of Rome; that it was not enough to shew any opinion had been condemned, without shewing it had been condemned justly: *Nec satis est damnatam olim sententiam esse, nisi damnandam eam, aut jure aut rite damnatam esse, constet*.

On this principle, which the Calvinists cannot well gain-say, the *Arminians* retrench abundance of those called fundamental articles of religion. Not finding them all clearly expressed in Scripture, they despise all the catechisms and formula's of faith, which the former would restrain them to; and accordingly were condemned at the famous synod of Dort, held in 1618, whereto divines from most of the reformed churches were present.

Many among them have quitted the doctrine of their master relating to the points of eternal election and predestination.—Arminius taught, that God elected the faithful out of a foreknowledge of their faith; but Episcopius, and others, think he elects no person from all eternity, and only elects the faithful, at the time when they actually believe. They speak very ambiguously of the prescience of God, which was the principal strong-hold of Arminius. They look on the doctrine of the trinity as a point not necessary to salvation; and many of them hold there is no precept in Scripture, by which we are enjoined to adore the Holy Ghost; and that Jesus Christ is not equal to God the Father. In which they approach very near to Arianism. And they generally avoid the word *satisfaction of Christ*, which some charge with Socinianism. Though Episcopius declares, that Jesus Christ has made satisfaction to God, so far as to render him propitious to mankind.

They pres with a great deal of earnestness, a general toleration of all those who profess the Christian religion; maintaining that all Christians are agreed in the essential points; and that as it has never been decided by any infallible authority, which of the many ways is the true one, and the most agreeable to the word of God, they ought all to combine on the same footing, to compose one church, without obliging any to quit their own sentiments, or embrace those of others. Their principal writers are Arminius, Episcopius, and Grotius; to which may be added Curcellæus, who has collected a system of theology out of the large diffusive writings of Episcopius, with the addition of many things of his own.—Though Curcellæus, it must be owned, is ranked by the Socinians among the number of their writers.

ARMIS—*Vt* & **ARMIS**. See the article **VI**.

ARMISTICE, **ARMISTITIUM**, a short truce, or a cessation of arms for a small time.

ARMONIA C, or rather **AMMONIA C**, salt, in natural history, a sort of volatile salt; whereof there are two kinds, ancient and modern.

The antient *sal-armoniæ*, called also *sal cyreniacum*, described by Pliny and Dioscorides, was a native salt, generated in the earth, or rather in the sands, in those large inns or caravanferas, where the crouds of pilgrims coming from all parts to the temple of Jupiter Ammon, used to lodge.—The method of conveyance in those parts being on camels; and those creatures when in Cyrene, a province of Egypt, wherein that celebrated temple stood, urining in the stables, or say some in the parched sands: of this urine, which is remarkably strong, sublimed by the heat of the sun, they say there arose a kind of salt, denominated sometimes from the temple *Ammoniac*, and sometimes from the region *Cyreniac*.

This salt being no longer found in those places, some authors suspect there was never any such thing; and that the ancient as well as modern *sal-armoniæ* was factitious.—What pleads for the contrary, is, that the salt frequently belched out in large quantities from mount *Ætna*, appears much of the same nature, and answers to most of the characters of the ancient *sal-armoniæ*. The reason no more is produced in Egypt may be, the cessation of these pilgrimages to that ancient idol.

The characters of *sal-armoniæ* are, that it cools water, turns aqua fortis into aqua regia, and consequently dissolves gold; that it sublimes by a strong fire, and affords a pungent urinous favour.

The modern *sal-armoniæ*, called also *aqua celestis*, is by some held to be native, and to trickle out of the ground about mount *Vesuvius*, *Ætna*, &c. in form of a liquor, which, when filtered and inspissated, becomes *sal-armoniæ*.—But it is certain, the common modern *sal-armoniæ* is compound and factitious; consisting of a mineral, a vegetable, and an animal salt combined together.

Indeed, though there scarce be any drug more common than *sal-armoniæ*, in the modern pharmacy, the public has long been entirely at a loss, both as to the place whence it comes, and how it was made; all they knew for certain, was, that it came from the Levant, and was a volatile urinous salt, penetrated by an acid.—Fether Sicard, the French apothecary, removed the veil, in the *Millionnaire*; *Paraphrase* *de* *Van* *der* *Linde*, 1717.—This salt, says that father, in a letter to the count de Thoulouze, is made in Egypt, in a sort of ovens contrived for that purpose, the tops whereof are perforated with several long-necked glass bottles, filled with foot, a little sea-salt, and the urine of a mule; and well stopp'd.

When done, they cover them up with a body of clay and brick, all but the necks, which lie open to the air; and put the fire in the oven, which they keep up for three days and nights.—The phlegm of the materials contained in the bottles, being thus exhaled by the heat of the fire; and the acid and alkaline salts abounding therein being thus brought together near the necks of the bottles, they coalesce, harden, and form a whitish mass, which is the *sal-armoniæ*.—It must be added, that all foot is not fit for the purpose, but that only exhaling from fuel made of dung; whereof, that of camels is esteemed the strongest and best.

* Pere Sicard seems in this point to have been wrong informed: Mr. Lisle assures us, that the mouths of the glasses are luted with a piece of wet cotton. He adds, that in this state they are placed over the oven or furnace, in a thick bed of ashes, nothing but the neck appearing; and kept there two days and a night, with a continual strong fire. The steam swells up the cotton, and it forms a palate at the vent-hole, hindering thereby the salts from evaporating; which, being confined, stick to the top of the bottle, and are, upon breaking it, taken out in those large cakes, which they send to England. *Shaw's Travels*, Append. 55.

** The boys and girls run about the streets of Cairo, with baskets in their hands, picking up the dung, which they carry and sell to the keepers of the bagnios; or, if they keep it for their own burning, they afterwards sell the foot at the place where the *sal-armoniæ* is made. Also all the villages round about Cairo, where they burn little else than dung, bring in their quota; but the best is gathered from the bagnios, where it cruels upon the walls, about half a finger's breadth. *Lisle ap. Shaw*, loc. cit.

Our chymists have divers ways of preparing a *sal-armoniæ*, in imitation of this.—The common way is by putting one part of common salt, to five of urine; to which some add half that quantity of foot: the whole being put in a vessel, they raise from it by sublimation a white friable farinaceous substance, which they call *sal-armoniæ*.—M. Lemery suspected, that what is imported to us from abroad, must be made after a different manner; he even concluded that it was made as our common salt is, by lotion and evaporation: in which suspicion however it appears, from the foregoing account, he is far from the truth.—We sometimes further purify the salt by dissolution in hot water; which being filtered, and evaporated to a cuticle, shoots into a fine white salt, used in medicine both as a sudorific and a diuretic; it proves also a good aperient in all obstructions.—Its dose is from 20 grains to half an ounce.

There are various preparations of this salt in the modern pharmacy; as, *Sublimate of sal-armoniæ* is of like virtue as the purified. *Volatile sal-armoniæ* is made by subliming the *sal-armoniæ* with salt of tartar; used against malignant fevers as a sudorific; as also in pocket smelling-bottles.

Flowers

Flowers of sal-armoniac made of *sal-armoniac*, with sea-salt, decrepitated.—The virtues are much the same as of the sublimed *sal-armoniac*.

Sometimes, instead of the sea-salt, iron or steel are used; which makes what they call *martial flowers of sal-armoniac*, of a very penetrating and deobstruent nature, and recommended in all kinds of obstructions, cachexies, jaundice, dropsies, &c.

Spirit of sal-armoniac.—Of this we have various kinds, which derive different denominations and properties from the different additional ingredients the salt is distilled withal: as—*spirit of sal-armoniac with tartar*, with *quick-lime*; with *amber*; with *steel or iron*: *sweet spirit of sal-armoniac*; acid *spirit of sal-armoniac*; diuretic *spirit of sal-armoniac*, &c.

ARMOR, or ARMOUR, a defensive habit, wherewith to cover and secure the body from the attacks of an enemy*.

* In ancient statutes this is frequently called *barneis*. See HARNESS.

Parts of *armour* are, the buckler, cuirassé, helmet, coat of mail, gantlet, &c.

A complete *armor* anciently consisted of a casque or helm, a gorget, cuirassé, gantlets, tasses, braccialets, cuisses, and covers for the legs, to which the spurs were fastened.—This they called *armor cap-a-pie*; and was the wear of the cavaliers, and men at arms.

The infantry had only part of it, *viz.* a pot or head-piece, a cuirassé, and tasses; but all light.—Lastly, the horics themselves had their *armor*, wherewith to cover the head and neck.

Of all this furniture of war, scarce any thing is now retained, except the cuirassé: the gorget or neck-piece, worn by officers, being at present only a badge of honour, and of no defence.

The gallantry of going to the battle naked, without any defensive *armor*, prevailed so far, that the French, during the reign of Louis XIV. were obliged to be continually issuing ordinances to restrain it; in consequence of which, the general officers, and those of the cavalry, were obliged to resume the cuirassé, which yet has been but ill observed.

Coat-Armor is the escutcheon of any person, or family, with its several charges, and other furniture, as mantling, crest, supporters, motto, &c.

Thus we say, a gentleman of *coat-armor*; meaning one who bears arms.

ARMORY, or ARMOURY, a store-house of arms, or a place wherein military habiliments are kept, to be ready for use.

There are *armories* in the tower, and in all arsenals, citadels, castles, &c.

ARMORY is also used for a branch of heraldry; being the knowledge of coat-armors, as to their blazons, and various intentions. See HERALDRY.

Master of the ARMORY. See the article MASTER.

Motto of an ARMORY. See the article MOTTO.

ARM-Pit. See the article AXILLA.

ARMS*, ARMA, in a general sense, includes all kinds of weapons, whether for defence, or offence.

* The word is formed from the French *arme*, which Nicod derives from a Latin phrase, *Quod operiant arms*, by reason they cover the shoulders or sides: but it ought rather to be brought from *arma*, which Varro derives *ab arando*, *eo quod arceant hostes*.

ARMS of offence are, the sword, pistol, musquet, bayonet, pike, &c.

ARMS of defence. See under the article ARMOR.

Fire-Arms. See the article FIRE-ARMS.

What contributed most to render the Romans masters of the world, was, that having successively war'd against all nations, they constantly renounced their own methods, *arms*, &c. whenever they met with better.—Thus Romulus during his war with the Sabines, a bold and warlike nation, adopted their broad buckler, in lieu of the small Argian buckler, which he had used till that time. *Montesquieu. Consid. sur les Loix, de la Grand. des Rom. c. 1. p. 2. seq.*

The principal arms of the ancient Britons were, hatchets, scythes, lances, swords, and bucklers: the Saxons, &c. brought in the halbard, bow, arrows, arbalets, &c.

The arms of the Highlanders are, the broad sword, target, poniard, and whinyar or durk, &c. 1 Geo. I. Stat. 2. c. 54. It is supposed, that the first artificial arms were of wood, and were only employed against beasts.—That Nimrod, the first tyrant, turned them against men; and that his son Belus was the first that waged war; whence, according to some, came the appellation *bellum*.—Diodorus Siculus takes Belus to be the same with Mars, who first trained soldiers up to battle.

Arms of stone, and even of brass, appear to have been used before they came to iron and steel.—Josephus assures us, that the patriarch Joseph first taught the use of iron arms in Egypt, arming the troops of pharaoh with a calque and buckler.

VOL. I.

By the ancient laws of England, every man was obliged to bear arms, except the judges and clergy. Under Henry VIII. it was expressly enjoined on all persons to be regularly instructed, even from their tender years, in the use of the arms then in fashion, *viz.* the long bow and arrows, 33 H. 8.

ARMS, ARMA, in the eye of the law, are extended to any thing which a man takes in his hand in his wrath, to call at, or strike another.—So Crompton—*Armorum appellatio non ubique scuta & gladii & galeas significat, sed & fustes & lapides*. See VI & ARMS.

ARMS of courtely, or parade, were those used in the ancient jousts, and tournaments.

These usually were lances not shod; swords without edge or point; and frequently wooden swords, and even canes.

Bas of ARMS was a kind of combat in use among the ancient cavaliers.

Place of ARMS, in fortification, &c. See PLACE of Arms.

ARMS also denote the natural weapons, or parts of defence of beasts; as claws, teeth, tusks of elephants, beaks of birds, &c.

Some animals are sufficiently guarded against all common dangers by their natural clothing, their armature of shells, as the tortoise, &c.—Others, destitute of this guard, are armed with horns; and others with sharp quills, or prickles, as the porcupine and the hedgehog; others with stings &c.

ARMS are also used figuratively for the profession of a soldier.

—Thus we say, he was bred to arms. See SOLDIER.

Fraternity of ARMS. See the article FRATERNITY.

Law of ARMS. See the article LAW.

Suspension of ARMS. See the article SUSPENSION.

ARMS, or ARMORIES, are also used in heraldry, for marks of dignity and honour, regularly composed of certain figures and colours, given or authorized by sovereigns, and bore in banners, shields, coats, &c. for the distinction of persons, families and states, and passing by descent to posterity.

They are called *arms*, in regard they are bore principally on the buckler, cuirassé, banners, and other apparatus of war.—They are also called *coats of arms*, *coat-armour*, &c. because anciently embroidered on fur-coats, &c. See COAT of arms, &c.

Some will have the name to have been first occasioned by the ancient knights, who in their jousts and tournaments bore certain marks (which were frequently their mistress's favours) in their armour, *i. e.* their helms or shield; to distinguish them from each other.

Three flowers *de lys*, in a field azure, are the arms of France.

—The arms of England are three lions.—In the arms of Great-Britain are quartered the arms of France, England, Scotland, and Ireland.

There has been a great dispute among the learned about the origin of arms.—Favyn will have them to have been from the beginning of the world; Segoin from the time of Noah; others from that of Osiris, which is supported by some passages in Diodorus Siculus; others from the times of the Hebrews, in regard arms were given to Moses, Joshua, the twelve tribes, David, &c.

Others will have them to have taken their rise in the heroic age, and under the empires of the Assyrians, Medes, and Persians; building upon the accounts of Philostratus, Xenophon, and Quintus Curtius.

Some pretend that the use of arms, and the rules of blazon, were regulated by Alexander.—Others will have them to have had their original under the empire of Augustus; others, during the inundations of the Goths; and others, under the empire of Charlemaign.

Chorier observes, that, among the ancient Gauls, each man bore a mark on his buckler, by the sight whereof he might be known to his fellows; and hence he refers the original of the arms of noble families.—Camden has observed something like this of the ancient Picts, and Britons, who, going naked to the wars, painted their bodies with blazons, and figures of divers colours, which he supposes to have been different in different families, as they fought divided by kindreds. Yet Spelman says, that the Saxons, Danes, and Normans, first brought arms from the north into England; and thence into France.

Upon the whole it is certain, that from time immemorial, there have been symbolical marks in use among men, to distinguish them in armies, and to serve as ornaments for shields and ensigns; but these marks were used arbitrarily as devices, emblems, hieroglyphics, &c. and were not regular *armories*, like ours, which are hereditary marks of the nobility of a house, regulated according to the rules of heraldry, and authorized by princes.

Before Marius, even the eagle was not the constant ensign of the Roman army; but they bore in their standards a wolf, leopard, or eagle indifferently, according to the fancy of the generals.

The same diversity has been observed with regard to the French and English; on which account, authors are divided when they speak of the ancient arms of those countries.—In effect,

it appears from all the best authors, that the armories of houses, as well as the double names of families, were not known before the year 1000. And several have even endeavoured to prove, that the use of *arms* did not begin till the time of the first croisades of the christians in the east.

The truth is, it appears to have been the ancient tournaments that occasioned the fixing of armories.

Henry the Fowler, who regulated the tournaments in Germany, was the first who introduced these marks of honour, which appear to be of an older standing in Germany, than any other part of Europe.—It was then that coats of *arms* were first instituted; which were a kind of livery composed of several bars, fillets, and colours; whence came the fess, bend, pale, chevron, and lozenge; which were some of the first elements of armories. See *CROSS, FESS, BEND, &c.*—Those who had never been concerned in any tournament had no *arms*, though they were gentlemen.

Such of the nobility and gentry as crossed the sea, in the expeditions to the Holy Land, also assumed these tokens of honour to distinguish themselves.

Before these times, we find nothing upon ancient tombs but crosses, with Gothic inscriptions and representations of the persons deceased. The tomb of pope Clement IV. who died in 1268, is the first whereon we find any *arms*; nor do they appear on any coins struck before the year 1336. We meet with figures, it is true, much more ancient, both in standards and on medals; but neither cities nor princes ever had *arms* in form; nor does any author make mention of blazoning before that time.

Originally, none but the nobility had a right of bearing *arms*; but king Charles V. having ennobled the Parisians, by his charter in 1371, he permitted them to bear *arms*: from whose example, the more eminent citizens of other places did the like.

Camden refers the original of hereditary *arms* in England to the time of the first Norman kings. He says, their use was not established till the reign of king Henry III. and instances in several of the most considerable families in England, wherein, till that time, the son always bore different *arms* from the father.—About the same time it became the custom here in England, for private gentlemen to bear *arms*; borrowing them from the lords of whom they held in fee, or to whom they were the most devoted.

ARMS, at present, follow the nature of titles, which being made hereditary, these are also become so; being the several marks for distinguishing of families and kindreds, as names are of persons and individuals.

Arms make the object of the art of heraldry. See *HERALDRY*.

ARMS are variously distinguished by the heralds.—

Canting ARMS are those, wherein the figures bear an allusion to the name of the family.—Such are those of the family of la Tour in Auvergne, who bear a tower; that of the family of Prado in Spain, whose field is a meadow.

Most authors hold these the most noble and regular, as is shewn by an infinity of instances produced by Father Varenne and Menestrier.—They are much debased, when they come to partake of the Rebus.

Charged ARMS are such as retain their ancient integrity and value, with the addition of some new honourable charge or bearing, in consideration of some noble action.

Assumptive ARMS. See the article *ASSUMPTIVE*.

Full or entire ARMS are such as retain their primitive purity, integrity, or value; without any alterations, diminutions, abatements, or the like.

It is a rule, that the simpler and less diversified the *arms*, the more noble and ancient they are.—For this reason, Garcias Ximenes, first king of Navarre, and his successors for several ages, bore only gules, without any figure at all.

The *arms* of princes of the blood, of all younger sons and junior families, are not pure, and full; but distinguished and diminished by proper differences, &c. See *DIFFERENCE, &c.*

ARMS are also said to be *parted, coupé, quartered, &c.* See *PART, &c.*

Arms are said to be *false and irregular*, when there is something in them contrary to the established rules of heraldry.—As, when metal is put on metal, or colour on colour, &c.

The laws, and other affairs of *arms*, with the cognizance of offences committed therein, belong, among us, to the earl-marshal, and college of *arms*. See *COLLEGE of Arms*.

Arms of Patronage. See the article *PATRONAGE*.

ARMS in falconry denote the legs of an hawk, from the thigh to the foot. See *HAWKING*.

King at Arms,
Herald at Arms,
Poursuivant at Arms,
College of Arms,

ARMY, a large body of soldiers, consisting of horse and foot, under the command of a general, with several ranks of subordinate officers under him.

This is to be understood of a land army.—A naval or sea army,

is a number of ships of war, equipped and manned with sailors and marines, under the command of an admiral, with other inferior officers under him.

We say, an *army* ranged in order of battle.—The march of an *army*.—The retreat of an *army*.—The review of an *army*, &c.

Befiegers are obliged to have an *army* of observation, to prevent relief being brought into the place, or the siege being raised. *Vid. Savin. Nouv. Ecl. Milit. p. 335, seq.*

An *army* consists of squadrons and battalions, and is usually divided into three corps; which are ranged in three lines. The first line is called the vanguard; the second, the main body; and the third, the rear-guard, or body of reserve.—The middle of each line is possessed by foot; the cavalry forms the wings on the right and left of each line; and sometimes they also place squadrons of horse in the intervals between the battalions.

When the *army* is ranged in order of battle, there are five feet distance between every two horses, and three between the foot. But in the shock the file contracts, and its front lessens almost to one half.

In each line the battalions are distant from each other about 180 feet, a distance about equal to the extent of their front; and the same holds of the squadrons, which are about 300 feet distant, the extent of their own front. These intervals are left for the squadrons and battalions of the second line, to range themselves against the intervals of the first line; and those of the third line, against the intervals of the second; that both the one and the other may march more readily through these spaces to the enemy.

There are usually 300 feet left between the first line and the second, and 600 between the second line and the third; that there may be room to rally when the squadrons and battalions are broke. *Savin. Nouv. Ecl. Milit. p. 266.*

Long experience has shewn, that in Europe a prince with a million of subjects cannot keep an *army* of above ten thousand men, without ruining himself. It was otherwise in the ancient republics: the proportion of soldiers to the rest of the people, which is now as about one to an hundred, might then be as about one to eight. The reason seems owing to that equal partition of lands, which the ancient founders of commonwealths made among their subjects; so that every man had a considerable property to defend, and had means to defend it with. Whereas, among us, the lands and riches of a nation being shared among a few, the rest have no way of subsisting, but by trades, arts, and the like; and have neither any free property to defend, nor means to enable them to go to war in defence of it, without starving their families. A large part of our people are either artificers or servants, and so only minister to the luxury and effeminacy of the great. While the equality of lands subsisted, Rome, though only a little state, being refused the succours which the Latins were obliged to furnish after the taking of the city in the consulate of Camillus, presently raised ten legions within their own walls: which was more, Livy assures us, than they were able to do in his time, though masters of the greatest part of the world. A full proof, adds the historian, that we are not grown fronger; and that what swells our city is only luxury, and the means and effects of it. *Vid. Liv. Dec. 1. l. 7. Confid. sur les Causes de la grand. des Rom. c. 3. p. 24.*

Our *armies* anciently were a sort of militia, composed chiefly of the vassals and tenants of the lords.

When each company had served the number of days or months enjoined by their tenure, or the customs of the fief they held; they returned home. See *TENURE, FES, &c.*

The *armies* of the empire consist of divers bodies of troops, furnished by the several circles. See *EMPIRE* and *CIRCLE*.

The gross of the French *armies*, under the Merovingian race, consisted of infantry. Under Pepin and Charlemagne, the *armies* consisted almost equally of cavalry and foot; but since the declension of the Carolingian line, the fees being become hereditary, the national *armies*, says le Gendre, are chiefly cavalry.

The *armies* of the grand signior consist chiefly of janizaries, spahis, and timariots. See *JANIZARY, SPAHI, and TIMARIOT*.

Royal ARMY. See the article *ROYAL*.

ARNODI*, in antiquity, the same with Rhapsodi. See *RHAPSODI*.

* The word is compounded of the Greek ἀρνός, a lamb, which was their usual reward; and ἀδός, song, or singing.

ARNOLDISTS, ARNALDISTS, a kind of sectaries in the XIIIth century; thus called from their chief, Arnold of Brescia, who was a great declaimer against the wealth and vices of the clergy; and who is also charged with preaching against baptism and the eucharist.

After raising great disturbances at Brescia and Rome, he was burnt at this latter place in 1155, and his ashes cast into the Tiber.—His disciples were also called *Publicani* or *Peplecani*.

AROMATIC*, AROMATICUS, is understood of a drug, plant

plant, or the like, which yields a brisk, fragrant smell, and a warm spicy taste.

* The word is formed of the Greek *ἀρωμα*, which is compounded of *ἀρω* very, and *σμός* or *σμος*, smell; or rather derived from *ἀρω*, to make fit, accommodate; in regard spices, which are all *aromatics*, are used for the seasoning and preparing of meats.

AROMATICIS, or **AROMATIC Medicines**, are either simple or compound.—To this class belong most cardiac, cephalic, and carminative remedies, with many stomachic ones.

Of this kind are frankincense, storax, benjoin, cinnamon, mace, cloves, nutmeg, pepper, &c.—Such also are lavender, marjoram, sage, thyme, rosemary, &c.

Aromaticis are of particular service in cold cachectic habits, where the load of humours has been forced away by strong detergents and cathartics; as they tend to strengthen the fibres, and prevent a relapse.—Hence also they become of necessary use after-purging, and carrying off the waters of a dropsy; or in the intervals thereof, to fortify the springs, and prevent a filling again.

The **Aromaticum Rosatum** is a compound officinal powder, made of red roses, liquorice, aloes wood, yellow Sanders, cinnamon, cloves, mace, gum tragacanth, nutmegs, cardamoms, galangals, spikenard, ambergrace and musk, all mixed together.—It is chiefly prescribed in cordial and cephalic bolus's and electuaries, to strengthen the stomach and head, which all *aromatics* have a tendency to.

Some writers give the title **Aroma Germanicum** to juniper-berries, on account of the great esteem they are in among that people, for their spicy, warm qualities, in which respect they are by many preferred to ginger itself.

AROMATICUM Vinum, } see the articles { **VINUM**.

AROMATICUM Calamus, } **CALAMUS**.

ARONDE, in fortification. See **DOVETAIL**, and **QUEUE d'Arondé**.

AROURA, *Aoura*, a Grecian measure, of 50 foot. Suid.
AROURA was more frequently used for a square measure, the half of the plethron.

The Egyptian *aroura* was the square of 100 cubits. Arbuth. tab. 9.
ARPA GIUS*, or rather **HARPA GIUS**, in some ancient inscriptions, signifies a person who died in the cradle, at least in early youth.—

* The word is formed from the Greek *ἀρπαγή*, *rapio*, I snatch.—It occurs but rarely in Latin writings: yet we meet with it in Gruter, p. 682. *Infrip*. 9. in the epitaph of Marcus Aurelius, who died at the age of 9 years, 2 months, and 13 days.—But even this inscription was found in Gaul, where they often made use of a barbarous Greek.

The Romans made no funerals for their *arpagii*.—They neither burnt their bodies, nor made tombs, monuments, or epitaphs for them; which occasioned Juvenal to say,

—Terra clauditur infans
Et minor igne rogi.

In after times it became the custom to burn such as had lived to the age of forty days, and had cut any teeth; tho' these they also called *ἀρπακτοί*, or *ἀρπακταί*, q. d. *rapiti*, ravished.

The usage seems to have been borrowed from the Greeks, among whom, Eustathius assures us, it was the custom never to bury their children either by night or full day, but at the first appearance of the morning; and that they did not call their departure by the name of death, but by a softer appellation, *ἡμῶν ἀρπαγή*, importing that they were ravished by Aurora, or taken away to her embraces.

ARPENT. See the article **ACRE**.

ARQUEBUSS*, or **HARQUEBUSS**, a large hand-gun, something bigger than our musquet; and called by some a caliver. See **HARQUEBUSS**.

* The word is derived from the Italian *arcebusso*, or *arcebusso*, formed of *arco*, a bow, and *busso*, a hole; because of the touch-hole of an *arquebus*, which succeeds to the use of the bow among the ancients.

ARQUEBUSS a Croc is a sort of small fort-arm, which carries a ball of about three half ounces; now only used in old Castile, and some garisons of the French.

ARRACK. See the article **ARACK**.

ARRAIATIO Peditum, the ranging or arraying of foot-soldiers. See **MARTIAL LAW**.

ARRAIGN*, or **ARRAIGN**, in law, signifies to set a thing in order, or in its place.

* Spelman is of opinion that the word should be written *arrame*, from *arramare*, derived from the old French *arramer*, i. e. *jurare*, promise, *sollemniter profiteri*. Yet in the register we find no such word as *arramare*; but in all the writs of affize, the year-books, &c. it is *arraignavit*: the more natural derivation is from the French *arraigner*, i. e. *ad rationem ponere*, to call a man to answer in form of law; which comes from the barbarous Latin *ad rationem*, i. e. *placitum*.—In which sense, to *arraign* a criminal, is *ponere eum ad rationem*.

Thus, he is said to *arraign* a writ of novel disseisin, who prepares and fits it for trial before the justices of the circuit.

To *arraign* the affize is to cause the defendant to be called to make the plaint, and to set the cause in such order, as the tenant may be forced to answer thereto.

A prisoner is also said to be *arraigned*, when he is indicted and brought forth to trial.

ARRAIGNMENT, in law, the act of *arraigning*, that is, of arranging, or setting a thing in order.

ARRANGEMENT, or **RANGEMENT**, the disposition of the parts of a whole, in a certain order.

The modern philosophy shews us, that the diversity of the colours of bodies depends entirely on the situation and *arrangement* of the parts, which reflect the light differently; the diversity of tastes and smells on the different *arrangements* of the pores, which render them differently sensible; and the general diversity of bodies on the different *arrangement* of their parts.

The happy *arrangement* of words makes one of the greatest beauties of discourse.

ARRAS-HANGINGS, a sort of rich tapestry, made at Arras in the county of Artois in Flanders. See **TAPESTRY**.

ARRAY*, in law, the ranking or ordering a jury or inquest of men impanelled on any cause.

* The word may be derived either from the obsolete French *array*, order, or from *rege*, a line, stroke, &c.

Hence to *array* a pannel, ann. 3 Hen. V. &c. is to set forth the men impanelled one by another.—The *array* shall be quashed, *ib.*—By the statute, every *array* in affize ought to be made four days before.—Hence also, to challenge the *array*. See **CHALLENGE**.

Battle-ARRAY. See **TACTICS**.

ARRAYERS, or **ARRAJERS**, **ARRAITORES**, is used in some ancient statutes, for such officers as had care of the soldiers armour, and saw them duly accounted in their kinds.

In some reigns, commissioners have been appointed for this purpose. Such were the commissioners of *array*, appointed by king Charles I. in the year 1642.

ARREARS*, **ARREARAGES**, **ARRERAGIUM**, or **ARRIERAGIUM**; the remains of an account; or a sum of money remaining in the hands of an accomptant.

* The word is derived from the French *arreger*, which is formed from *arriver*, and that again from *retro*, behind.

ARREARS, is also used more generally for a remainder of rents or monies unpaid at the due time; whether they be rents of manor, or any other thing reserved: called also in some writers *arrieragium firmarum*.

Reins ARREAR in law. See **RIENS**.

ARRENTATION, in the forest law, the licensing an owner of lands in the forest, to enclose them with a low hedge and small ditch, in consideration of a yearly rent.

Saving the arrentations denotes a power reserved to give such licences for a yearly rent.

ARREST*, in common law; the apprehending or restraining of one's person, in execution of the command of some court, or officer of justice.

* The word *arrest*, is originally French, and is used in that language for a decree, or determination of a cause debated to and fro: in which sense it seems derived from the Greek *αἴρεσις*, *placitum*, the pleasure of the court.

Hence, when a person is legally stopped, apprehended, and restrained of his liberty for debt, &c. he is said to be *arrested*, or put under an *arrest*; which is the beginning of imprisonment.

To *move* or *plead in arrest* of judgment is, to shew cause why judgment should be stayed, though there be a verdict in the cause.

To *plead in arrest* of taking the inquest is, to shew cause why an inquest should not be taken.

ARRESTANDIS Bonis ne dissipentur, a writ which lies for him whose cattle or goods are taken by another, who, during the controversy, makes, or is like to make them away, and will hardly be able to give satisfaction for them afterwards.

ARRESTANDO ipsum, qui pecuniam recepit ad proficiendum in obsequium regis, &c. is a writ which lies for the apprehension of him that hath taken prest-money to serve in the king's wars, and hides himself when he should go.

ARRESTO factio super bonis mercatorum alienigenarum, &c. is a writ which lies for a denizen against the goods of strangers or Persons of another country found within this kingdom, in recompence of goods taken from him in that country, after he hath been denied restitution there.

This answers to what among the ancient civilians was called *clargatio*, now barbarously *reprisalia*. See **REPRISAL**.

ARRETED, **ARRECTATUS**, is sometimes used in our ancient law-books, for imputed, or laid to.—As, no folly may be *arreted* to one under age.

ARRHABONARI*, a sect in religion, who held that the eucharist is neither the real flesh and blood of Christ, nor yet the sign of them, but only the pledge or earnest thereof.

* The word is derived from the Greek *ἀρραβών*, *arriba*, earnest.

ARRHÆ, or **Argentum Dei**. See **EARNEST**, &c.

ARRHAPHORIA*, a feast among the Athenians, instituted in honour of Minerva, and Herse daughter of Cecrops.

* The word is Greek, *ἀρρηφωρία*, which is composed of *ἀρρηφω*, mystery, and *φωρία*, I carry, on account of certain mysterious things which were carried in procession at this solemnity.

Boys, or as some say, girls, between seven and twelve years of

age, were the ministers that assisted at this feast; and were denominated *Ἀγῶνοποι*.

This feast was so called *Erisphoria*, *Ἐρισφορία*, from *Herse* the daughter of *Cecrops*, on whose account it is said to have been first established.

ARRIERE, a French term, literally signifying the *hind*, or *posterior* part of any thing; usually wrote in English, abridgedly, *rear*.

ARRIERE-BAN*, or **ARRIERE-Ban**, in the French customs, is a general proclamation, whereby the king summons to the war all that hold of him; both his vassals, *i. e.* the noblesse, and the vassals of his vassals.

* *M. Cafeneuve* takes the word to be composed of *arrière* and *ban*: the *ban*, according to him, denotes the convening of the noblesse or vassals, who hold fees immediately of the king; and *arrière*, those who only hold of the king mediately.—

To the provost of Paris belongs the convoking and commanding of the *arrière-ban*.

ARRIERE-FEE, or **FIEF**, is a fee dependant on some other superior one.

Arrière fees commenced at the time when the counts and dukes, rendering their governments hereditary in their families, distributed to their officers certain parts of the royal domains which they found in their provinces; and even permitted those officers to gratify the soldiers under them, with parts thereof.

ARRIERE-GUARD. See the article **REAR-GUARD**.

ARRIERE Vassal, or **Tenant**, the vassal or tenant of another vassal or tenant. See **VASSAL**.

ARROGATION. See **ADROGATION**.

ARRONDIE, in heraldry. *Cross-Arrondie*, or *rounded*, is that whose arms are composed of sections of a circle, not opposite to each other, so as to make the arm bulge out thicker in one part than another; but both the sections of each arm lie the same way, so that the arm is every where of an equal thickness; and all of them terminating at the edges of the escutcheon, like the plain cross.

ARROW, a missile weapon of offence, slender, pointed and barbed, made to be cast or shot with a bow. See **BOW**, and **ARCHERY**.

We say, a flight of *arrows*: *arrows* are also called *shafts*.

ARROW-makers are called *fletchers*, who were formerly, as well as bowyers, persons of great consequence in the commonwealth.—*Arrow-heads* and *quarrels* were to be well boched or braced, and hardened at the points with steel; the doing of which seems to have been the business of the *arrow-smith*. *Vid. Stat. 7. H. 4. c. 7.*

ARROW, in astronomy, trigonometry, &c. See **SAGITTA**. **Wildfire ARROWS**. See **WILDFIRE**.

ARS Notoria. See the article **NOTORIUS**.

ARSENAL*, a royal or public magazine, or place appointed for the making, and keeping of arms necessary either for defence, or assault.

* The word, according to some, is derived from *ars*, *art*, *fortress*; by others from *ars*, an engine; this being the place where the engines of war are preserved.—Some will have it compounded of *ars* and *senatus*, as being the defence of the senate; others fetch it from the Italian *arsenale*, or from the modern Greek *arsenalis*; but the most probable opinion is, that it is derived from *arsenaa*, which, in the Arabic, signifies an *arsenal*.

The *arsenal* of Venice is the place where the galleys are built and laid up.—The *arsenal* of Paris is that where the cannon or great guns are cast. It has this inscription over the gate—*Vulcania tela ministrat.*

Tela Gigantæos debellaturæ furores.

There are also *arsenals*, or store-houses, appropriated to naval furniture and equipments.—At *Marfeilles* is the *arsenal* for the galleys; and at *Toulon*, *Rochefort* and *Brest*, are those for the men of war.

ARSENIC*, **ARSENICUM**, in natural history, a ponderous mineral substance, volatile and unflammable, which gives a whiteness to several metals in fusion, and proves extremely caustic, or corrosive, to animals, so as to become a violent poison.

* The word is compounded of the Greek *arsen*, man, or *arsen*, male, and *nikanai*, I overcome, or kill; alluding to its poisonous quality.

In an ancient manuscript ascribed to the sibyls, is a verse which plainly intimates *arsenic*.—*Tetrasyllabus sum; prima pars mei virum, secunda victoriam significat.*

Arsenic is by some ranked in the class of sulphurs.

There are divers kinds of *arsenic*; *viz.* yellow, red; and crystalline, or white.

Orpiment is called *Native* or *Yellow ARSENIC*, it is of a yellow, or orange-colour; whence it is also denominated *auripigmentum*.

It is chiefly found in copper-mines, in a sort of gables or stones, of different figures and sizes. Its colour, though always yellow, yet admits of divers shades and mixtures, as a golden yellow, reddish yellow, greenish yellow, &c. It is found to contain a portion of gold, but so little, as not to quit the cost of separating it; but there is beside this a yellow factitious *arsenic* made of the white *arsenic* and sulphur,

Red ARSENIC, is a preparation of the white or crystalline *arsenic*, made by adding to it sulphur and copper.

White or Crystalline ARSENIC is the kind chiefly used among us.

Arsenic is made by sublimation from cobalt: the method of which, as practised in Hungary, is given us by Dr. Krieger, in the *Philosophical Transactions*, N^o 293.—The cobalt being beat to powder, and the light sandy part washed off, by a current of water, they put what remains into the furnace; the flame of which passing over the powder, takes along with it the *arsenic* part, in form of a smoke; which being received by a chimney, and carried thence into a close wooden channel, sticks by the way to the sides; and is scraped off, in form of a whitish or yellowish powder.—From what remains of the cobalt, they proceed to make *smalt*. See **SMALT**.

The smallest quantity of *crystalline arsenic*, being mixed with any metal, renders it friable, and absolutely destroys its malleability.

Hence, the refiners dread nothing so much as *arsenic* in their metals; nor could any thing be so advantageous to them, were such a thing to be had, as a menstruum that would absorb, or act on *arsenic* alone; for then their metals would be readily purified, without flying off, or evaporating.

A single grain of *arsenic* will turn a pound of copper into a beautiful white metal looking like silver. This hint many persons have endeavoured to improve on, for the making of silver, but in vain, as the mixture could never be brought to sustain the hammer: some have been hanged for coining species of this spurious silver.

The chymists furnish several preparations of *arsenic*, which all turn on repeated ablations and sublimations, to blunt the corrosive salts thereof, and change it into a safe medicine, after the manner of sublimate.—Such are *ruby of arsenic*, &c. But it scarce appears worth the pains; and whatever some may urge, *arsenic* ought never to be used inwardly in any form, as gnawing and tearing the vessels, and occasioning mortal convulsions.—Its fume taken into the lungs, kills instantly: and the other it is sublimed, says Boerhaave, the ranker it grows.—Butter and cow's milk taken in large quantities, prove good antidotes against *arsenic*. See **SUPPLEMENT** article **ARSENIC**.

Regulus of ARSENIC is the most fixed and compact part thereof, prepared by mixing it with pot-ashes and soap, then fusing the whole, and casting it into a mortar; upon which the heaviest part falls to the bottom.

Caustic oil of ARSENIC, is a butyrous liquor, like butter of antimony, prepared of *arsenic* and corrosive sublimate.—It serves to eat off fungous flesh, and to cleanse carious bones, &c.

ARSENICAL Magnet, *magnes arsenicalis*, is a preparation of antimony, with sulphur and white *arsenic*.

ARSENOTHELÏS*, among the ancient naturalists, the same with *hermaphrodite*.

* The Greeks used the word both in speaking of men and beasts.—It is formed from *arsen* and *thelais*, male and female.

ARSIS and *Thesis*, in prosody, are names given to the two proportionable parts into which every foot, or rhythm is divided. See **FOOT**, &c.

By *arsis* and *thesis* are usually meant no more than a proportional division of the metrical feet, made by the hand or foot of him that beats the time.

As in measuring the quantities of words, the hand is lifted up, as well as let fall; part of the time taken up in measuring the foot, by lifting the hand up, is termed *arsis*, or *elevatio*; and the part, where the hand is let fall, *thesis*, or *positio*. *Vid. Augustin. de Musica*, l. 2. c. 10. *In plaudendo enim quia elevatur & ponitur manus, partem pedis sibi elevatio vendicat, partem positio.*

Fugha per ARSIS & THESIS. See **FUGUE**.

ART, **ARS**, is defined by the schoolmen, a habit of the mind operative or effective according to right reason; or, somewhat more intelligibly, a habit of the mind prescribing rules for the due production of certain effects; or the introducing of changes in bodies from some foreknowledge and design in a person endued with a principle or faculty of acting.

* The word *art* is derived from the Greek *arsen*, virtue, strength.—This is the opinion of Donatus, on the first scene of *Terence's Andria*: *ars autem virtus arsenis, dicta est per syncope*; and is followed by Scaliger. Others derive *art* from *arsen*, utility, profit; which is found in that sense in *Ætchylus*.

On this footing, *arts* are divided into *active* and *passive*.—Such as leave no external effect after their operation, as dancing, fiddling, &c. are called *active* or *practical arts*: those which do leave an effect behind them, as painting, &c. are called *passive*, or *effective arts*. *Magn. Metaph. lib. 1. cap. 35.*

ART is better defined, after my lord Bacon, a proper disposal of the things of nature by human thought and experience, so

as to make them answer the designs and uses of mankind.

Nature, according to that philosopher, is sometimes free, and at her own disposal; and then she manifests herself in a regular order: as we see in the heavens, plants, animals, &c.—Sometimes she is irregular, and disorderly, either through some uncommon accident, or depravation in matter, when the resistance of some impediment perverts her from her course; as in the production of monsters.—At other times she is subdued and fashioned by human industry, and made to serve the several purposes of mankind.—This last is what we call *art*.—In which sense, *art* stands opposed to nature.

Hence, the knowledge of nature may be divided into the history of generation, of prætergeneration, and of *arts*.—The first considers nature at liberty; the second, her errors; and the third, her restraints.

ART is also used for science or knowledge reduced into practice.

Several of the schoolmen hold logic and ethics to be *arts*; inasmuch as they do not terminate in mere theory, but tend to practice.

In this sense, some branches of the mathematics also are *arts*; others, matters of doctrine, or science.—Statics is wholly scientific, as it takes up with the mere contemplation of motion: mechanics, on the contrary, is an *art*, as it reduces the doctrine of statics into practice.

ART is principally used for a certain system or collection of rules, precepts, and inventions or experiments, which, being duly observed, make the things a man undertakes succeed, and render them advantageous and agreeable.

In this sense, *art* is opposed to science, which is a collection of speculative principles, and conclusions.

The nature and origin of *art*, and its distinction from science, are farther considered in the preface to this work.

Arts, in this sense, may be divided, with respect to their scope and object, into *human*, as medicine; and *divine*, as theology.

Human, again, may be subdivided into *civil*; as laws, politics, &c. *military*, as fortification, &c. *physical*, as agriculture, chymistry, anatomy, &c. *metaphysical*, as logic, pure mathematics, &c. *philological*, as grammar, criticism, &c. *mercantile*, to which belong the mechanical arts and manufactures. See each in its place.

Arts are more popularly divided into *liberal* and *mechanical*.

Liberal Arts are those that are noble, and ingenuous; or which are worthy of being cultivated without any regard to lucre arising therefrom.—Such are *poetry*, *music*, *painting*, *grammar*, *rhetoric*, the *military art*, *architecture*, and *navigation*.

Mechanical Arts are those, wherein the hand and body are more concerned than the mind; and which are chiefly cultivated for the sake of the profit they bring with them.—Of which kind are most of those which furnish us with the necessities of life, and are popularly known by the name of *trades*.—Such are *weaving*, *turnery*, *brewing*, *masonry*, *clock-making*, *carpentry*, *joinery*, *foundry*, *printing*, &c.

The *mechanical arts* take their denomination from *μηχανή*, machine; as being all practised by means of some machine or instrument.

With the *liberal arts* it is otherwise; there being several of them which may be learnt and practised without any instrument all: as *logic*, *eloquence*, *medicine* properly so called, &c.

The *arts* which relate to the sight and hearing, my lord Bacon observes, are reputed liberal, beyond those which regard the other senses, which are chiefly employed in matters of luxury.

It has been well noted by philosophers, that, during the rise and growth of states, the *military arts* chiefly flourish; when arrived at their height, the *liberal arts*; and when on the declining hand, the *vouluptuary arts*.

There are also divers particular *arts*; as the *art* of memory, the *art* of deciphering, the *art* of flying, of swimming, *art* of diving, &c.

Democritus maintained, that men learnt all their *arts* from brutes; that the spider taught them weaving, the swallow building, the nightingale music; and several kinds of medicine.

Term of ART. See the article **TERM**.

Bachelor of ARTS. See the article **BACHELOR**.

Master of ARTS. See **MASTER**, **DEGREE**, **FACULTY**.

ART is also applied to divers imaginary, and even superstitious, doctrines and inventions.—Such are,

Lully's ART, or the *transcendental ART*, this is an art by means whereof a man may dispute whole days on any topic in nature without understanding the least title of the thing in dispute; thus called from its inventor Raymond Lully.

It consists chiefly in disposing the several forms of beings into divers scales or climates, to be run down in a definite.

ending progression.—Thus; whatever were proposed to be talked on, they would say, first, it is a being, and consequently, one, true, good, perfect: then, it is either created, or increased. Again, every created being is either body or spirit, &c.

Angelical ART, or the *ART of spirits*, is a method of attaining to the knowledge of any thing desired; by means of angels, or rather of demons.

Under this come the *arts of magic, sorcery, witchcraft*, &c.

Ars Notoria is a pretended manner of acquiring sciences by infusion, without any other application than a little fasting and performing a few ceremonies.

They who make profession of this art, affirm that it was by means hereof that Solomon, in one night's time, acquired all his knowledge.—Delrio shews it to be a criminal curiosity, and founded on a secret compact with the devil. *Disquis. Mag.* p. 11. It was solemnly condemned by the Sorbonne, in 1320.

St. Anselm's ART is a superstitious manner of curing wounds, by barely touching the linen wherewith those wounds had been covered.

Delrio, in his *Disquisitiones Magice*, observes, that some Italian soldiers, who practised this *art*, attributed the invention thereof to St. Anselm; but he assures us withal, that it was really invented by Anselm of Parma, a celebrated magician.

St. Paul's ART is a branch of the *ars notoria*, so called as being supposed to have been taught by St. Paul, after his being taken up into the third heaven.

ART and Part, is a phrase used in the north end of England, and in Scotland.—When any one is charged with a crime, they say he is *art and part* in committing the same; that is, he was both the contriver, and acted a part in it.

Hermetical ART. See the article **HERMETICAL**.

Hyssopic ART. See the article **HYSSOPIC**.

ARTERIA Aspera. } See the articles } **ASPERA**

ARTERIA Sacra. } **SACRA.**

ARTERIAL, or **ARTERIOUS**, in anatomy, something that relates to the arteries. See **ARTERY**.

The *arterial blood* is supposed more warm, florid, and spiritous than the venal.

ARTERIOSA Vena, *ὄψα ἀρτηριώδης*, or *arterial vein*, a denomination given to the pulmonary artery, or that vessel whereby the blood is conveyed from the right ventricle of the heart to the lungs.

Canalis ARTERIOSUS is a tube in the heart of a fetus; which, with the foramen ovale, serves to maintain the circulation of the blood, and to divert it from the lungs.

ARTERIOTOMY *, *ἀρτηριότομος*, in chirurgery, &c. the operation of opening an artery; or of letting blood with a lancet by the arteries; practised in some extraordinary cases.

* The word is formed of *ἀρτηρία*, and *τομή*, *seco*, I cut.

Arteriotomy is a very dangerous operation, and is seldom used with design, except in the forehead, the temples, and behind the ears, where the arteries are easily closed again by reason of the cranium underneath, which would be very difficult to effect in any other part.—In the other parts it usually proves fatal; and we have numerous instances of persons killed in bleeding, by the opening an artery instead of a vein.

Fernelius (2. 18.) Severinus (*Effic. Med. part.*) Tulpus (*Obs.* 1. 48.) and Catherwood labour hard to introduce *arteriotomy* in apoplectic cases, as much preferable to venesection; but they are not much followed.

ARTERY *, *ἀρτηρία*, in anatomy, a hollow fistulous canal, appointed to receive the blood from the ventricles of the heart, and distribute it to all parts of the body, for the maintenance of heat and life, and the conveyance of the necessary nutriment.—See *Tab. Anat.* (Angiel) fig. 1.

* The word is Greek, *ἀρτηρία*: which some imagine derived from *ἀρτ*, *art*, the air, and *ῥησις*, *servo*, to keep; but others, who understand the use of the part better, derive it from *ἀρσ*, *I lift*, because of its continual throbbing or beating.

The *arteries* are ordinarily composed of three coats or membranes. The first or outermost, nervous or tendinous; being a thread of fine blood-vessels with nerves, for nourishing the other coats. The second muscular, and made up of circular, or rather spiral fibres; of which there are more or fewer frata according to the bigness of the *artery*: these fibres have a strong elasticity, by which they contract themselves with force, when the power by which they have been stretched out ceases. The third and inmost coat is a fine, dense, transparent membrane, which keeps the blood within its channels, which otherwise upon the dilatation of an *artery*, would easily separate the spiral fibres from one another. As the *arteries* grow smaller, these coats grow thinner.

All the *arteries* are conical, *i. e.* they begin with the trunk, and, growing less and narrower, end in branches so minute, that they escape the sight, unless assisted with microscopes; by

by which, in the tails of tadpoles and very small eels, the extremities of the *arteries* seem, by the swift uninterrupted course of the blood, to be inoculated or continued to the originations of the veins: though by the transparency of those vessels, the actual continuation be not visible.

The coats of the *arteries* are of a very dense, close texture; by which means the blood not being visible through them, they generally appear white. Add, that the blood proceeding from a greater capacity to a less, is thereby somewhat obstructed in its passage; but being forced on by the motion of the heart, it defends the coats, and thereby occasions a salient motion, called the *pulse*.—By this thickness and whiteness of the *arteries*, with the pulsation observed therein, *arteries* are distinguished from veins.

The pulse of the *arteries*, like that of the heart, consists of two reciprocal motions, a systole or contraction, and a diastole or dilatation: but they keep opposite times; the systole of the one answering to the diastole of the other.

All the *arteries* of the body, we have observed, arise in two large trunks, from the two ventricles of the heart. That from the right ventricle is called the *pulmonary artery*, serving to carry the blood into the lungs: that from the left, the *aorta*, or *great artery*; which, by its numerous ramifications, furnishes all the rest of the body, as far as the remotest stages of circulation.

The *great artery*, after it leaves the heart, divides into two large trunks, called the *ascending*, or upper; and *descending*, or lower trunks.

The ascending trunk, or *aorta ascendens*, conveys the blood to the head, and other upper parts of the body, and is sub-divided into three branches.—The first, the right *subclavian*, whence arise the *carotid*, *vertebral*, *cervical*, *right axillary*, &c.—The second, is the left *carotid*.—The third, the left *subclavian*; whence arise the left *cervical*, *vertebral*, and *axillary*.—See each described in its proper article, SUBCLAVIAN, CAROTID, VERTEBRAL, CERVICAL, AXILLARY, &c.

The descending trunk, or *aorta descendens*, carries the blood to the trunk, and the lower parts of the body.

Out of this arise the *bronchial*, *intercostals*, *cæliac*, *phrenic*, *mesenteric*, *emulgent*, *spermatic*, *iliac*, *umbilical*, *epigastric*, *hypogastric*, *crural*, &c. with their several ramifications.—See each in its place.

A draught of the several *arteries*, with their divisions and subdivisions, in their natural order and position, as taken from the life; see in plate *anatomy*, (Angeiol. fig. 6.)

ARTERY is also applied to that fistulous tube, composed of cartilages and membranes, which descends from the mouth to the lungs, for the conveyance and reconveyance of the air, in respiration.

This is particularly called the *aspera arteria*, or *trachea*, and popularly the *wind-pipe*.

ARTHEL, something cast into a court, in Wales, or the marches thereof; whereby the court is letted or discontinued for the time.—The casting of *artbel* is prohibited, 26 H. 8. c. 6.

ARTHRITIS*, *Ἀρθριτις*, in medicine, a disease better known under the name of the *gout*.

* The word is formed from the Greek *ἄρθρον*, *articulus*; joint; in regard the chief seat of that distemper is in the joints.

ARTHRITIC Waters. See the article WATER.

ARTHRODIA*, *Ἀρθρῶδια*, in anatomy, a species of articulation, wherein a flat head of one bone is received into a shallow socket of another.

* The word is formed from the Greek *ἄρθρον*, *articulus*, and *δέχομαι*, *recipio*, I receive.

Such is the articulation of the humerus with the scapula.

ARTHRODIUM in mineralogy, a genus of crystal. See SUPPLEMENT.

ARTHROSIS*, in anatomy, a juncture of two bones, designed for motion; called also *articulation*.

* The word is formed from the Greek *ἄρθρον*, *articulus*.

ARTICLE, **ARTICULUS**, a little part or division of a book, writing, or the like.—Aquinas divides his sum of theology into several questions; and each question into divers *articles*.—Such an account consists of so many *articles*.

ARTICLE is also applied to the several clauses or conditions of a contract, treaty of peace, or the like.

In this sense we say, *articles* of marriage, *articles* of capitulation, preliminary *articles*, &c.—The establishment of an East India company at Offend is a direct breach of the eighth and ninth *articles* of the treaty of Munster.

ARTICLES of the clergy, **ARTICULI cleri**, are certain statutes touching persons and causes ecclesiastical, made under Edward II. and III.

ARTICLE of faith is by some defined a point of Christian doctrine, which we are obliged to believe, as having been revealed by God himself, and allowed and established as such by the church.

ARTICLE, **Articular**, in anatomy, denotes a joint, or juncture, of two or more bones of the body. See ARTICULATION.

ARTICLE of death, **Articulus mortis**, the last pang, or agony of a dying person.

The pope usually sends his benediction to the cardinals, &c. in *articulo mortis*.

ARTICLE, in arithmetic, signifies the number 10, or any number justly divisible into ten parts; as 20, 30, 40, &c.—These are sometimes called *decads*, and sometimes *round numbers*. Harris.

ARTICLE, in grammar, denotes a particle used in most languages for the declining of nouns, and denoting the several cases and genders thereof.

The use of *articles* arises chiefly hence, that in languages which have not different terminations, to express the different states and circumstances of nouns, there is something required to supply that office.

The Latins have no *articles*; but the Greeks, and most of the modern languages, have had recourse hereto, for fixing and ascertaining the vague signification of common and appellative names.

The Greeks have their *ι*, the eastern tongues their *be emphaticum*; the Italians their *il*, *lo*, and *la*.—The French their *le*, *la*, and *les*.—The Germans their *der*, *das*, *dat*.

The English also have two *articles*, *a*, and *the*: which, being prefixed to substantives, apply their general signification to some particular thing.—Thus we say, *a man*; that is, some man or other: *the man*, that is, that certain man.

Hence it appears, that *a* is used in a larger, and more general sense being applied indifferently to any particular person or thing.—Whereas the distinguishes individually, and shews what particular thing is spoke of.—If the substantive to which the particle *a* is affixed, begin with a vowel, or with an *h*; we write and speak it, *an*; so we say, *an eye*, *an hour*, &c.

Some grammarians make the *article* a distinct part of speech: others will have it a pronoun; and others, with Mr. Greenwood, a noun adjective. See SPEECH, PRONOUN, ADJECTIVE, &c.

Articles are things of great service in a language, as they contribute to the more neat and precise expressing of several properties and relations which must otherwise be left. And hence one great disadvantage of the Latin, above other languages which have *articles*; in that the *article* being either expressed, or left out, makes an alteration in the sense, which the Latins cannot distinguish.—Thus when the devil said to our Saviour, *si tu es filius Dei*, it may either be understood, *if thou art a son of God*, or, *if thou art the son of God*.—Scaliger, from the want of *articles* in the Latin, has concluded them useless.

The Italians even prefix *articles* to proper names, which do not naturally need any, in regard they do of themselves signify things individually.—Thus they say, *il Arigio*, *il Tasso*, *il Petrarca*.—Even the French join the *article* to the proper names of kingdoms, provinces, &c. as *la Suede*, *la Normandie*.—And we ourselves do it to the names of certain mountains and rivers; as the *Rhine*, the *Danube*, the *Alps*, &c.

Indefinite ARTICLE. The *article a* is said to be *indefinite*, because applied to names taken in their more general and confused signification; as, he travelled with the port and equipage of a prince; where the words *a prince* may be understood of any prince in the general.

Definite ARTICLE. The *article the* is said to be *definite*, or *demonstrative*, as fixing the sense of the word it is put before, to one individual thing. See DEFINITIVE.

Pa. Buffier distinguishes a third kind of *articles* in the French, which he calls *intermediate*, or *partitive*; serving to denote part of the thing expressed by the substantives they are added to: as, *des scavans ont cru*, some learned men have supposed, &c. I want, *de la lumiere*, some light, &c.

The use and distinction of the definite and indefinite *articles le* or *la*, and *de* or *du*, make one of the greatest difficulties in the French tongue, as being utterly arbitrary, and only to be acquired by practice.—We may add, that in the English, though the *articles* be so few, yet they are of such frequent use, that they easily discover any stranger, from a natural Englishman.

ARTICULARIS, **ARTICULAR**, in medicine, an epithet applied to a disease which more immediately infects the articuli, or joints.

The *marbus articularis*, is the same with the Greek *ἄρθρις*, and our *gout*. See GOUT.

ARTICULATE sounds are those which express the letters, syllables, &c. of any alphabet, or language. See INARTICULATE.

Brutes cannot form *articulate* sounds, or they cannot *articulate* the sounds of their voice; excepting some few birds, as the parrot, pye, raven, starling, &c.

ARTICULATION, *Articulatio*, in grammar, a distinct pronunciation of words and syllables.

Articulation is that part of grammar, which treats first of sounds, and letters; then of their combinations, for the compounding of syllables and words. Hence he who pronounces his words clearly, and distinctly, is said to pronounce them *articulately*.

ARTICULATION, in anatomy, a juncture or connection of two bones, designed for motion.

There are various forms and kinds of this *articulation*, suited to the several sorts of motion and action.—That which has a notable and manifest motion is called *diarthrosis*.—This is subdivided into *enarthrosis*, *arthrodia*, and *ginglymus*. See each in its place, *ENARTHROSIS*, *ARTHRODIA*, and *GINGLYMUS*.

That which only admits of an obscure motion is called *synarthrosis*. It is subdivided into *symphysis*, *sutura*, *harmonia*, *syssarcosis*, *synchondrosis*, *synneurosis*, *syntenosis*, and *synmenesis*. See *SYMPHYSIS*, *SUTURA*, *HARMONIA*, &c.

ARTICULORUM anima. See the article *ANIMA*.

ARTIFICIAL, *Artificialis*, something made by art; not produced naturally, or in the common course of things.

* Art is usually considered as a thing very different from nature; and artificial things from natural ones: whence arises another more grievous error, *viz.* that art is supposed a different principle built upon nature, and of such power, as to be able, either to perfect what nature had begun, to rectify and amend her when disordered, or to free her when confined; though not utterly to divert or transmute her.—But the truth is, artificial things do not differ from natural ones in nature or form, but only in the efficient: man has no power over nature, beside what he has by motion; in virtue whereof, he can apply natural bodies to, or remove them from, one another. Where such application, or joining of active things to passive ones, is practicable, there may men do any thing; where it is not, nothing. Gold we sometimes see purified by the chemist's fire; and sometimes find it perfectly pure in the sands, nature herself having done the business: so the rainbow is sometimes formed on high in the water of a cloud; and sometimes here below by a sprinkling of water. Nature, therefore, governs all things; under this subordination, of the course of nature, the latitude or evagation of nature, and art, or man super-added to her other works.* Bacon de Augmen. Scient. lib. II.

ARTIFICIAL is also frequently used for *factitious*.

Thus we have *artificial* sal-armoniac, *artificial* borax, &c.

ARTIFICIAL Arbours. See the article *ARBOUR*.

ARTIFICIAL Arguments, in rhetoric, are all such proofs or considerations as arise from the genius, industry, or invention of the orator.

Such are definitions, causes, effects, &c. which are thus called, to distinguish them from laws, authorities, citations, and other arguments of that nature, which are said to be *inartificial* arguments.

ARTIFICIAL Baths.

ARTIFICIAL Camphor.

ARTIFICIAL Cinnabar.

ARTIFICIAL Colcothar.

ARTIFICIAL Conduits.

ARTIFICIAL Day.

ARTIFICIAL Divination.

ARTIFICIAL Earthquakes.

ARTIFICIAL Eye.

ARTIFICIAL Fire.

ARTIFICIAL Fire-works are compositions of inflammable materials; chiefly used on solemn occasions, by way of rejoicing.

ARTIFICIAL Flying.

ARTIFICIAL Forms.

ARTIFICIAL Foundation.

ARTIFICIAL Fountain.

ARTIFICIAL Globe, Sphere, &c. See *GLOBE*, *SPHERE*, &c.

ARTIFICIAL Horizon. See *HORIZON*.

ARTIFICIAL Lacca. See the article *LACCA*.

ARTIFICIAL Lines, on a sector or scale, are certain lines so contrived, as to represent the logarithmic sines and tangents; which, by the help of the line of numbers, will solve all questions in trigonometry, navigation, &c. pretty exactly.

ARTIFICIAL Litharge. See the article *LITHARGE*.

ARTIFICIAL Numbers are *secants*, *sines*, and *tangents*.—See *SECANT*, *SINE*, and *TANGENT*.

ARTIFICIAL Phosphori.

ARTIFICIAL Ports.

ARTIFICIAL Postures.

ARTIFICIAL Precipitation.

ARTIFICIAL Rainbow.

ARTIFICIAL Road.

ARTIFICIAL Saltpetre.

ARTIFICIAL Star.

ARTIFICIAL Vermillion.

ARTIFICIAL Vertex.

ARTILLERY, the heavy equipage of war; compre-

hending all sorts of great fire-arms, with their appurtenances; as cannons, mortars, bombs, petards, musquets, carbines, &c.

In this sense, the word *artillery* coincides with what we otherwise call *ordnance*.

There was no attacking such a place for want of heavy *artillery*.—The Persians, we are told in the embassy of Figueroa, would never, in 1518, have either *artillery* or infantry in their armies, by reason they hindered their charging and retreating with so much nimbleness; wherein their chief military address and glory lay.

The term *artillery* is sometimes also applied to the ancient instruments of war, as the catapultæ, battering rams, &c. See *ARIES*, &c.

Park of ARTILLERY is that place in a camp set apart for the *artillery*, or large fire-arms.

Trails or Train of ARTILLERY is a set or certain number of pieces of ordnance, mounted on carriages, with all their furniture fit for marching. To this frequently belong mortar-pieces, with bombs, carcasses, &c. It is under the direction of the master of the *artillery*.

There are trains of *artillery* in most of the king's magazines; as in the Tower, at Portsmouth, Plymouth, Windsor, &c.

ARTILLERY Company is a band of infantry, consisting of 600 men, making part of the militia or city-guard of London.

Their officers are a leader, two lieutenants, two ensigns, three gentlemen of arms, two sergeants, and a provost marshal *Chamberl.*

ARTILLERY is also used for what we otherwise call *pyrotechnia*, or the art of fire-works, with the instruments and apparatus belonging thereto.

The writers upon *artillery* are, Casimir Simonowits, a Pole; Buchnerus, Braupius, Mieth, and S. Remy in his *Memoires d'Artillerie*, which contain an accurate description of all the machines and instruments of war now in use, with every thing that relates thereto.

ARTILLERY foot-level. See the article *LEVEL*.

ARTOTYRITES, or *ARTOTYRITÆ*, a sect in religion; being a branch of the ancient Montanists, who first appeared in the second century, and infected all Gallia.

They used bread and cheese in the Eucharist, or perhaps bread baked with cheese*.—Their reason was, that the first men offered to God not only the fruits of the earth, but of their flocks too.

* Hence according to St. Augustin, came their name, which is Greek; being composed of *αἶσος*, bread, and *τύσος*, cheese.

ARVALES* Frates were priests in ancient Rome, who assisted in the sacrifices of the Ambarvalia offered every year to Ceres and Bacchus for the prosperity of the principal fruits of the earth, *viz.* the corn and wine.

* The word is originally Latin, and is formed from *arvum*, a field; because in their ceremonies, they went in procession around the fields; or, according to Gellius, because they offered sacrifice for the fertility of the fields. Others say, because they were appointed arbitrators of all differences relating to the limits of fields and land-marks.

They were instituted by Romulus, and were twelve in number; all of them persons of the first distinction; the founder himself having been of the body.—They made a college, called *collegium fratrum arvalium*.

The mark of their dignity was a garland, composed of ears of corn, tied with a white ribbon: this, Pliny says, was the first crown in use at Rome.

According to Fulgentius, Acca Laurentia, Romulus's nurse, was the first founder of this order of priests: she, it seems, had twelve sons, who used to walk before her in procession to the sacrifice; one of whom dying, Romulus, in favour of his nurse, promised to take his place; and hence, says he, came this sacrifice, the number twelve, and the name of brother.—Pliny (l. 17. c. 2.) seems to indicate the same thing, when he mentions that Romulus instituted priests of the fields, after the example of Acca Laurentia his nurse.

ARUNDELIAN Marbles. See the article *MARBLE*.

ARUSPICES*, an order of priests among the ancient Romans, who foretold things to come, chiefly by inspecting the entrails of beasts which were killed in sacrifice.

* The word seems more properly written *haruspices*; as being derived from *haruga*, which signifies the entrails of victims; and *aspicer*, to view or consider.

Or, as others think, from *hara*, *hostia*, a victim: though some defend the orthography of *aruspices*, deriving the word from *arasa*, and *ispicer*, to inspect the altars.—Pa. Pezron is positive it was originally formed of the Celtic *aru*, liver; and *spicio*, I look; whence *aspex*: which being a word somewhat rude of pronunciation, they thence formed *aruspen*.

apex. In Festus we meet with *haruiga*, or *hardiga*, which he defines to be a victim whose viscera are considered while yet remaining together. Upon which Mr. Dacier observes, that *haruiga* is formed from *apē, aries*, by inserting the Æolic digamma, before the *i*. It was properly, therefore, at first a ram they sacrificed; but afterwards the name became common to all victims. See VICTIM.

The doctrine or discipline of the *aruspices*, was formed into a precise art, called *aruspicina*.

Cato, who was an Augur, used to say, he wondered how one *aruspex* could look at another without laughing in his face. By which you see what opinion he had of the solidity of the *aruspicina*.

ARYTENOIDES*, in anatomy, the third and fourth cartilages of the larynx, situate under the thyroids: called also *gustales*.

* The *arytenoides* are thus called on account of the figure of an *aputana*, ewer; which, together, they somewhat resemble: and the name is compounded of that word, and *αιος*, shape, or figure.

ARYTENOIDEUS, in anatomy, one of the muscles serving to close the larynx; otherwise called little *arytenoides*, and *aryartenoideus*, as deriving its origin from the posterior and inferior part of the *arytenoides*.

The *arytenoides* has its head in one *arytenoid* cartilage, and its tail in the other; and serves to bring them together, and shut the rima or glottis.

ARYTHMUS*, or ARYTHMUS, in medicine, is used by some for a sinking, or failure of the pulse, so as it can no longer be felt; but it more properly denotes an irregularity, or want of due order and proportion of the pulse.

* The word is formed from the privative particle *a*, and *ρυθμος*, modulus, or measure.

AS*, among antiquaries, sometimes signifies a particular weight; in which sense the Roman *as* is the same with the Roman *libra*, or pound.

* The word is by some derived from the Greek *αις*, which, in the Doric dialect, is used for *αις*, one, *q. d.* an entire thing; though others will have this money named *as*, quasi *as*, because made of brass.—Bodinus has wrote nine books *de asse*, & *dei partibus*, of the *as* and its parts.

The *as* had several divisions.—The principal were, the *uncia*, or ounce; which was the twelfth part of the *as*: *sextans*, the sixth part of the *as*, or two ounces: *quadrans*, the fourth part of the *as*, or three ounces: *triens*, the third part of the *as*, which was four ounces: *quincunx*, was five ounces: *semis*, half the *as*, that is six ounces: *sestunx*, seven ounces: *bes*, two thirds of the *as*, or eight ounces: *dodrans*, three fourths of the *as*, or nine ounces: *dextans*, ten ounces: and *deunx*, eleven ounces.

As was also the name of a Roman coin, which was made of different matters, and different weights, in different ages of the commonwealth.

Under Numa Pompilius, according to Eusebius, the Roman money was either of wood, leather, or shells.—In the time of Tullus Hostilius, it was brass, and was called *as*, *libra*, *libella*, or *pondo*, because actually weighing a pound, or twelve ounces.

Four hundred and twenty years after, the first Punic war having exhausted the treasury, they reduced the *as* to two ounces. In the second Punic war, Hannibal pressing hard on them, the *asses* were farther reduced to an ounce a-piece.—Lastly, by the Papirian law, they took away half an ounce more, and reduced the *as* to a bare half ounce: and it is generally thought that it rested here all the time of the commonwealth, and even till Vespasian's reign.

This last was called the *Papirian as*, in regard the law just mentioned was passed in the year of Rome 563, by C. Papirius Carbo, then tribune of the people. Thus, there were four different *as*'s in the time of the commonwealth.

The figure stamped on the *as*, was at first a sheep, ox, or fow. (Plutarch. *Poplic. Plin.* 18. 3.) And from the time of the kings, a Janus with two faces on the one side, and the rostrum, or prow of a ship on the reverse.*

* The *triens* and *quadrans* of copper had the figure of a small vessel called *ratii*, on the reverse. Thus Pliny: *Nota arii, [i. e. arii] fuit ex altera parte Janus geminus, ex altera rostrum navis: in triente vero & quadrante raties*. Hist. Nat. l. 33. c. 3.—Hence these pieces were sometimes called *Ratiti*.

As was also used to denote any integer, or whole.—Whence the English word *ace*.

Thus *as*, signified the whole inheritance; whence *heres ex asse*, the heir to the whole estate.

So the *jagerum*, or Roman acre of land, being reckoned the integer, was called *as*, and divided like it into 12 *unciae*. See JUGERUM.

The *as*, and its parts, or divisions, stand thus:

1	As	12	Unciæ	1	Semis	6	Unciæ
12	Deunx	11	12	Quincunx	5		
11	Dextans	10	11	Triens	4		
10	Dodrans	9	10	Quadrans	3		
9	Bes	8	9	Sextans	2		
8	Septunx	7	8	Uncia	1		

ASAPPES*, or AZAPES, an order of soldiers in the Turkish army, whom they always expose to the first flock of the enemy; to the end that being thus fatigued, and their swords blunted, the Saphi's and Janizaries may fall on and find an easy conquest.

* The word is derived from the Turkish *saph*, which signifies rank, file, order; from whence they have formed *asphaps*, to range in battle.

The *Asappes* are said to be held of so little value, that they frequently serve as bridges for the cavalry to pass over, in bad roads, and as fascines to fill up the ditches of places besieged.—The greatest part of them are natural Turks; they travel on foot, and have no pay, but the plunder they can get from the enemy.

ASARABACKA, or ASSARA-BACARA, a plant supposed to be mentioned by Pliny and Dioscorides, under the name of *baccharis*, or *nardus rustica*; by us called *islarum*.

Avicenna relates, that it used to be brought from China; that its roots resemble those of gramen, or dog's-grass; but that it has a pretty brisk smell, and bites the tongue when tasted.

—Its leaves were anciently much in use, as an emetic, and cathartic; and in some authors we find a superstitious observance in regard to the gathering of them: they allege, that if the plant be pulled up forward, it becomes vomitive, but if backwards, purgative: Ruilandus and Fernelius frequently prescribe it as a diuretic.

But it is chiefly used among us as a sternutatory, in order to which, it is dried and reduced to a powder, to be taken as a snuff; in which quality it drains the head of mucous humours. See SUPPLEMENT, article ASARUM.

ASBESTINE, something incombustible, or that partakes of the nature, and qualities of the lapis asbestos. See ASBESTOS.—Hence we read of

ASBESTINE Paper and Cloth, which will burn in the fire, be purified by it, and yet not consume.

The ancients are said to have made napkins and towels of it, which, when foul, instead of washing, they threw into the fire to cleanse.

ASBESTOS*, a mineral substance, of a whitish, or silver colour, and a woolly texture; consisting of small threads or delicate fibres, endued with the wonderful property of resisting fire, and remaining unconsumed in the intensest heat.

* The word *ασbestos*, *asbestos*, properly signifies an incombustible body; it is formed of the primitive particle *a*, and *σβωπος*, *extinguis*.

This languinous mineral is sometimes also call'd *amianthus*, and sometimes *salamandra*, or *salamander's wool*, from the candlewicks said to be made anciently of it. From a pungent quality, which Agricola says it has on the tongue, tho' without atrangency, it has been by some call'd *alumen*, having the epithet of *plumeum* added to it, taken from its downy filaments, to distinguish it from the other allums; though it is to be observed, the true plume allum is another sort of body, being a real efflorescence of allum.

From its light grey colour, it is called *polia* and *corfoide*; and from its likeness to the hoary fibres of some sorts of mat-weed, *spartopolia*. From the capacity it has of being spun into thread, it is called *linum*, with some distinguishing epithet, taken either from its quality, as *linum asbestinum vivum*, or *incombustibile*; or from the place where it is found, as *linum fissile*, *linum Indicum*, *Creticum*, *Cyprium*, and *Carpathium*, or *Carystium*. Besides the places whence it borrows names, it is also found in Tartary, at Namur in the Low Countries, in Thuringia, among the mines in the Old Noricum, in Egypt, in the mountains of Arcadia, at Putoli in the island of Corfica, in the island of Anglesey in Wales, and in Aberdeenshire in Scotland, at Montauban in France, and in the kingdom of Siberia.

Naturalists generally reckon it among the stones, whence its appellation of *lapis Asbestos*, &c. but Dr. Plot rather judges it a *terra lapidesca*, or middle substance, between stone and earth. As to its generation, the same author takes it to be a mixture of some salt, and a pure earth without sulphur, co-agulated in the winter, and hardened by the heats in summer. The salt, J. Helius pretends, is a liquid allum of a milky substance, inclining to yellow, that sweats out of the earth, and smells like rotten cheese.

The *Asbestos*, or *lapis asbestos*, is really a sort of native, fissile stone, which one may split into threads or filaments, very fine, brittle, yet somewhat tractable, silky, and of a greyish silvery colour, not unlike talc of Venice.

It is almost insipid, so the taste, indissoluble in water; and, exposed to the fire, it neither consumes nor calcines.—A large burning-glass, indeed, reduces it into little glass globules, in proportion as the filaments separate; but common fire only whitens it.

These filaments are of different lengths, from one inch to ten.—The stone is usually found inclosed within other very hard stones; though sometimes growing to the surfaces of them, and sometimes detached or separate from any.

The *Asbestos*, applied to any part of the body, excites an itching; and yet we read of it as anciently prescribed for diseases

of the skin; and particularly for the itch: unless it were rather the *alumen plumbum* that was meant hereby; for even at this day, they are frequently confounded.

The industry of mankind has found a method of working this untoward mineral, and employing it in divers manufactures, chiefly cloth, and paper.

The manufacture is undoubtedly difficult enough. Pliny calls the *Asbestos, inventum, textu difficilimum*: Wormius assures us, that the method of making cloth of *Asbestos* is now entirely unknown: in reality, one would scarce imagine the thing practicable, without the mixture of some other pliant matter, as wool, hemp, or flax, along with the *Asbestos*, the filaments of this latter appearing too coarse, and brittle, to make any tolerable fine work. However this be, Bapt. Porta assures us that, in his time, the spinning of *Asbestos* was a thing known to every body at Venice.

Sig. Cattagnatta, superintendent of some mines in Italy, is said to have carried the manufacture to such perfection, that his *Asbestos* was soft, and tractable, much resembling lamb-skin dressed white: he could thicken and thin it at pleasure, and thus either make it into a very white skin, or a very white paper.

This kind of linen-cloth was highly esteemed by the ancients; though then better known, and more common than among us; being held equally precious with the richest pearls: nor is it now of mean value even in the country where it is most generally made, a China cover, (*i. e.* a piece of twenty-three inches and three quarters long) being worth eighty tale, *i. e.* 36l. 13s. 4d. Pliny says, he himself had seen napkins thereof, which, being taken foul from the table, after a feast, were thrown into the fire, and by that means were better scowered than if they had been washed in water, &c. But its principal use, according to Pliny was, for the making of shrouds for royal funerals, to wrap up the corpse, so as the ashes might be preserved distinct from that of the wood, &c. whereof the funeral pile was composed: and the princes of Tartary, according to the accounts in the Philosophical Transactions, still use it at this day in burning their dead. Some of the ancients are said to have made themselves clothes of it, particularly the Brachmans among the Indians. The wicks for their perpetual lamps, according to Dr. Lister, were also made of it; and some to this day use it for the wicks of such lamps as they would not have any trouble with; because the *Asbestos* never wastes, there is no occasion for shifting the wick. Septalla canon of Milan had thread, ropes, nets, and paper made of the *Asbestos*. A handkerchief or pattern of this linen was long since presented to the Royal Society, a foot long, and half a foot broad. This gave two proofs of its resisting fire; though in both experiments it lost above three drams in its weight. When taken out red-hot, it did not burn a piece of white paper, on which it was laid. Mr. Villetie pretends, that his large burning concave usually vitrifies the *Asbestos*. See SUPPLEMENT, article ASBESTUS.

ASCARIDES *, *Ascaridis*, in medicine, a slender sort of worms, found in the intestinum rectum, chiefly of children, and frequently voided with their faeces; sometimes also adhering to the fundament, or even pendant from it.

* They are thus called from the Greek *ασκαρίδις*, I leap, on account of their continual troublesome motion, causing a most intolerable itching.

Ascarides are said to be often the occasion of a prolapsus ani. See PROLAPSIDIA.

ASCENDANT, **ASCENDENT**, or **ASCENDING Line**, in genealogy, is understood of ancestors, or such relations as have gone before us; or are nearer the root of the family.

Such are father, grandfather, great uncle, &c.—They are thus called in contradistinction to descendants, or the descending line.

Marriage is always forbid between the *ascendants* and descendants, in a direct line.

ASCENDANT, in astrology, denotes the horoscope; or the degree of the ecliptic which rises upon the horizon, at the time of the birth of any one.

This is supposed to have an influence on the person's life and fortune, by giving him a bent and propensity to one thing more than another.

In the celestial theme, this is also called the *first house*, the *angle of the East*, or *Oriental angle*, and the *significator of life*.

—Such a planet ruled in his *ascendant*.—Jupiter was in his *ascendant*, &c.

Hence the word is also used in a moral sense, for a certain superiority which one man has over another, from some unknown cause.

ASCENDENS Obliquus. See the article **OBLIQUUS**.

ASCENDING, in astronomy, is understood of those stars, or degrees of the heavens, &c. which are rising above the horizon, in any parallel of the equator.

VOL. I.

ASCENDING Latitude is the latitude of a planet when going towards the north pole.

ASCENDING Node is that point of a planet's orbit, wherein it passes the ecliptic, to proceed northward.

This is otherwise called the *northern node*, and is represented by this character Ω . See **NODE**, &c.

ASCENDING, *Ascendens*, in matters of genealogy, &c. See **ASCENDANT**.

ASCENDING Signs, among astrologers, are those which are upon their ascent or rise, from the nadir or lowest part of the heavens, to the zenith or highest.

ASCENDING, in anatomy, is applied to such vessels as carry the blood upwards, or from lower to higher parts of the body.

The *ascending aorta*, *aorta ascendens*, is the superior trunk of the artery, which furnishes the head.

The *ascending cava*, *cava ascendens*, is a large vein formed by a meeting or union of the iliacs of one side, with those of the other. See *Tab. Anat. (Splanchn.) fig. 1. lit. o.* (Angeiol.) *fig. 6. lit. cc.*

Many of the ancient anatomists called this the *descending cava*; as imagining that the blood descended from the liver by this vein, to supply the parts below the diaphragm. But the moderns have shewn that it has a quite contrary use, and serves for the conveyance of the blood from the lower parts to the heart; whence its appellation *ascendant*.

ASCENSION, **ASCENSIO**, a rising, or moving upward.

ASCENSION is particularly used for that miraculous elevation of our Saviour, when he mounted to heaven, body and soul, in the sight of his Apostles.

Several errors and heresies relating to the *ascension* of Christ's human body are briefly touched by Tertullian: *Ut illi erubescant qui adfirmant carnem in caelis vacuum sensu, ut vocinam, exemptis Christo sedere; aut qui carnem et animam tantundem, aut tantummodo animam, carnem vero non jam.*—The apostles taught, that Christ left his body dissolved in the air, (St. Austin says in the earth) and so ascended into heaven without it: as he did not, say they, bring his body from heaven, but received it from the elements of the world; so he returned it again to the world.—The Selenciani and Hermiani taught, that the body of Christ ascended no farther than the sun, in which it was deposited: from that passage of the Psalms, "in the sun has he placed his tabernacle." Which opinion Greg. Nazianzen also attributes to the Manichees.

ASCENSION-Day, popularly called *Holy-Thursday*, a festival of the church, held ten days before Whitsuntide, in memory of our Saviour's *ascension*.

ASCENSION, in astronomy, is either *right* or *oblique*.

Right ASCENSION of the sun, or of a star, is that degree of the equinoctial, accounted from the beginning of Aries, which rises with the sun or star, in a *right sphere*.

Or, *right ascension* is that degree and minute of the equinoctial, counted as before, which comes to the meridian with the sun or star, or other point of the heavens.

The reason of thus referring it to the meridian, is, because that is always at right angles to the equinoctial, whereas the horizon is only so in a *right* or *direct sphere*.

The *right ascension* stands opposed to the *right declension*.

Two fix'd stars, which have the same *right ascension*, *i. e.* are at the same distance from the first point of Aries in a *right sphere*; or, which amounts to the same, are in the same meridian; rise at the same time.—If they be not in the same meridian, the difference between the time when they rise is the precise difference of their *right ascension*.—In an oblique sphere, where the horizon cuts all the meridians obliquely, different points of the meridian never rise or set together; so that two stars on the same meridian never rise or set at the same time; and the more oblique this sphere, the greater is the interval of time between them.

To find the *right ascensions* of the sun, stars, &c. trigonometrically, say, As radius is to the cosine of the sun's greatest declination, so is the tangent of the distance from Aries or Libra, to the tangent of *right ascension*.

—To find the *right ascensions* mechanically by the globe; see **GLOBE**.

The *arch of right ascension* is that portion of the equator intercepted between the beginning of Aries, and the point of the equator which is in the Meridian: or it is the number of degrees contained therein.—This coincides with the *right ascension* itself.—The *right ascension* is the same in all parts of the globe.

We sometimes also say, the *right ascension* of a point of the ecliptic, or any other point of the heavens.

The difference between the *right* and *oblique ascensions* is called the *ascensional difference*. See **ASCENSIONAL**.

Angle of Right ASCENSION. See the article **ANGLE**.

Oblique ASCENSION is an arch of the equator intercepted between the first point of Aries, and that point

of the equator which rises together with a star, &c. in an oblique sphere.

The oblique *ascension* is numbred from west to east; and is more or less according to the different obliquity of the sphere.

To find the oblique *ascensions* of the sun, either trigonometrically, or by the globe. See *ASCENSIONAL Difference*, and *GLOBE*.

The *arch of oblique-ascension* is an arch of the horizon intercepted between the beginning of Aries, and the point of the equator which rises with a star or planet in an oblique sphere.—This coincides with the oblique *ascension* itself.—The oblique *ascensions* change according to the latitude of the places.

Refraction of ASCENSION and DEFENSION. See *REFRACTION*.

ASCENSIONAL Difference is the difference between the right and oblique *ascension* of the same point on the surface of the sphere.

To find the *ascensional difference* trigonometrically; having the latitude of the place, and the sun's declination given, say, As radius is to the tangent of the latitude, so is the tangent of the sun's declination to the sine of the *ascensional difference*.

If the sun be in any of the northern signs, and the *ascensional difference*, as D O, be subtracted from the right *ascension* D, (Tab. *Astronomy*, fig. 63.) the remainder will be the oblique *ascension* O.—If he be in a southern sign, the *ascensional difference* being added to the right *ascension*, the sum is the oblique *ascension*: and thus may tables of oblique *ascensions* be constructed for the several degrees of the ecliptic, under the several elevations of the pole.

ASCENSORIUM sometimes occurs in our ancient writers for a stair or step. See *STAIRS*.

ASCENT, *ASCENSUS*, the motion of a body tending from below upwards; or the continual recess of a body from the earth.

In this sense the word stands opposed to *descent*.

The Peripatetics attribute the spontaneous *ascent* of bodies, to a principle of levity inherent in them.

The moderns deny any such thing as spontaneous levity, and shew, that whatever *ascends*, does it in virtue of some external impulse or extrusion. Thus it is that smoke, and other rare bodies, *ascend* in the atmosphere; and oil, light woods, &c. in water: not by any external principle of levity, but by the superior gravity or tendency downwards of the parts of the medium wherein they are.

The *ascent* of light bodies in heavy mediums is produced after the same manner as the *ascent* of the lighter scale of a balance.

—It is not that such scale has an internal principle whereby it immediately tends upwards; but it is impelled upwards by the preponderancy of the other scale; the excess of the weight of the one having the same effect by augmenting its impetus downwards, as so much real levity in the other: by reason the tendencies mutually oppose each other, and that action and reaction are always equal.—See this further illustrated under the articles *SPECIFIC Gravity*, and *FLUID*.

Ascent of Bodies on inclined Planes. See the doctrine and laws thereof, under the article *Inclined PLANE*.

Ascent of Fluids is particularly understood of their rising above their own level between the surfaces of nearly contiguous bodies, or in slender capillary glass tubes, or in vessels filled with sand, ashes, or the like porous substances.

This effect happens as well in vacuo as in the open air, and in crooked as well as straight tubes.—Some liquors, as spirit of wine, and oil of turpentine, *ascend* swifter than others; and some rise after a different manner from others. Mercury does not *ascend* at all, but rather subfides.

The phenomenon, with its causes, &c. in the instance of capillary tubes, will be spoke of more at large under the article *CAPILLARY Tube*.

As to planes.—Two smooth polished plates of Glass, metal, stone, or other matter, being so disposed as to be almost contiguous, have the effect of several parallel capillary tubes; and the fluid rises in them accordingly: the like may be said of a vessel filled with sand, &c. the divers little interstices whereof form, as it were a kind of capillary tubes. So that the same principle accounts for the appearance in them all. And to the same may probably be ascribed the *ascent* of the sap in vegetables.

Thus Sir I. Newton.—If a large pipe of glass be filled with sifted ashes well pressed together, and one end dipped into stagnant water, the fluid will *ascend* slowly in the ashes, so as in the space of a week or fortnight, to reach the height of thirty or forty inches above the stagnant water. This *ascent* is wholly owing to the action of those particles of the ashes which are upon the surface of the elevated water; those within the water attracting as much downwards as upwards: it follows, that the action of such particles is very strong; though, being less dense and close than those of glass, their action is not equal to that of glass, which keeps quicksilver suspended to the height of sixty or seventy inches, and therefore acts with a force which would keep water suspended

to the height of about sixty feet.—By the same principle, a sponge sucks in water, and the glands in the bodies of animals, according to their several natures and dispositions, imbibe various juices from the blood. *Optics*, p. 367. If a drop of oil, water, or other fluid, be laid on a glass plane perpendicular to the horizon, so as to stand without breaking or running off; and another plane, inclined to the former so as to meet a-top, be brought to touch the drop; it then will the drop break, and *ascend* towards the touching end of the planes: and it will *ascend* the faster in proportion as it is higher, by reason the distance between the planes is constantly diminishing.—After the same manner, the drop may be brought to any part of the planes, either upward or downward, or sideways, by altering the angle of inclination.

Lastly, if the same perpendicular planes be so placed, as that two of their sides meet and form a small angle, the other two being only kept a-part by the interposition of some thin body; and thus immersed in a fluid tinged with some colour: the fluid will *ascend* between the planes, and this the highest where the planes are nearest; so as to form a curve line, which is found to be a just hyperbola, one of the asymptotes whereof is the line of the fluid, the other being a line drawn along the touching sides.—The physical cause, in all these phenomena, is the same power of attraction.

Ascent of Vapour. See the article *CLOUD*.

The *ascent of the vapours of gunpowder*, in an exhausted receiver, is a phenomenon, the solution of which nobody, I think, has yet attempted. *V. Philof. Transact.* N^o. 347. p. 420.

ASCENT, in astronomy, &c. See *ASCENSION*.

ASCENT, in logic, denotes a kind of argumentation, wherein we rise from particulars to universals.

As, when we say, this man is an animal, and that man is an animal, and the other man, &c. therefore every man is an animal.—Or fire, water, air, and earth, are four; therefore the number of elements is four.

*ASCETIC**, *ασκητις*, an ancient appellation given to such persons as, in the primitive times, devoted themselves more immediately to the exercises of piety and virtue in a retired life; and particularly to prayer, abstinence, and mortification.

* The word is derived from the Greek *ασκος*, *exercet*, I exercise.

Afterwards, when the monks came in fashion, this title was bestowed upon them; especially upon such of them as lived in solitude.

ASCETIC is also a title of several books of spiritual exercises.—As, the *ascetics*, or devout treatises of St. Basil, archbishop of Cæsarea in Cappadocia.

We also say the *ascetic life*, meaning the exercise of prayer, meditation, and mortification.

A *SECRETIS*. See the article *SECRETARY*.

ASCETERIUM, *ASSISTERIUM*, *ARCHISTERIUM*, &c. are words frequently used among our ancient writers for a monastery.

*ASCII**, in geography, are those inhabitants of the globe, which, at certain times of the year, have no shadow.

* The word is formed of the privative particle *a*, and *σκια*, *umbra*, shadow.

Such are the inhabitants of the torrid zone; by reason the sun is sometimes vertical to them.—To find on what days the people of any parallel are *ascii*. See *GLOBE*.

*ASCITE**, in antiquity, a sect or branch of Montanists, who appeared in the second century.

* The word is derived from the Greek *ασκος*, a bag or bottle:

The *Ascites* were so called, because they introduced a kind of Bacchanals into their assemblies, who danced round a bag or skin blown up; saying, they were those new bottles filled with new wine, whereof Jesus Christ makes mention. *Matth.* ix. 17.—They are sometimes also called *Ascodrogites*.

*ASCITES**, *ασκίτης*, in medicine, a species of dropsy, affecting chiefly the abdomen, or lower belly.

* The word is borrowed from the Greek *ασκος*, *uter*, bag or bladder.

The *Ascites* is the ordinary water-dropsy. See *DROPSY*.

ASCLEPIAD, *ASCLEPIADEUS*, a Greek or Latin verb of four feet, containing a spondee, a choriambus, and two dactyls; or, which amounts to the same, a spondee, two choriambus's, and a pyrrhæus.

Such is the verse, *Mæcenat atavis edite regibus*. Or, *Sublimi feriam sidera vertice*.

ASCODRUTÆ, in antiquity, a sect of heretics, in the second century, who rejected all use of symbols and sacraments, on this principle, that incorporeal things cannot be communicated by things corporeal, nor divine mysteries by any thing visible.

ASCOLIA, in antiquity, a feast which the peasants of Attica celebrated in honour of Bacchus. They sacrificed a he-goat to him (as being the destroyer of vines) and of the victim's skin made a foot-ball, which they blew

blew up, and anointed with some unctuous matter: or, as Potter thinks, they made a bottle of it, which they filled with oil and wine. The young people playing at this, and keeping themselves always on one foot, whilst the other was suspended in air, by their frequent falls, gave occasion of diversion to the spectators.—Hence this feast took its name; *aspas*, signifying a bag or budget.

ASELLII Pancreas. See the article PANCREAS.

ASELLUS, in natural history. MILLEPEDES.

ASHLAR, a term used among builders: by which they mean common or free stones, as they come out of the quarry, of different lengths and thicknesses.

ASHLERING, among builders, signifies quartering, to tack to, in garrets, about 2½, or 3 foot high, perpendicular to the floor, up to the underside of the rafters.

ASH, in building. See the article TIMBER.

ASH-WEDNESDAY, the first day of Lent; supposed to have been so called from a custom in the church, of sprinkling ashes that day on the heads of penitents then admitted to penance.

ASHES, *Cineres*, the terrene or earthy part of wood, and other combustible bodies, remaining after they are burnt or consumed with fire.

Ashes are properly the earth, and fixed salts of the fuel, which the fire cannot raise; all the other principles being gone off in the smoke.

The chymists frequently call the *ashes* of a body its *calx*.

—*Ashes*, if well burnt, are usually pure white, by reason the oil to which they owe their blackness when in a coal, is supposed quite evaporated. The *ashes* of kali, fern, or the like, are a principal matter in the composition of glass.

The *ashes* of all vegetables are found to contain iron, inasmuch that M. Geoffroy makes it a chymical problem, which he proposes to the public, to find *ashes* without any particles of iron therein.—Whether the metal existed in the plants themselves, or is produced in them by the operation of calcination, is a point very ingeniously controverted between Mess. Geoffroy and Lemery the younger, in the memoirs of the royal academy. See the substance of the dispute under the article METAL.

Ashes are of considerable use in making lixiviums, or lyes, for the purposes of medicine, for bleaching, and for sugar-works*, &c.

* White *ashes* were forbid to be exported, 2 & 3 Ed. 6. c. 26. on account of their necessary use in the making of soap, and saltpetre; as well as for the whitening of linen, and the dying and covering of woollen cloth.

In the bills of entry we find divers sorts of *ashes* imported from abroad: as pot-*ashes*, pearl-*ashes*, from Germany; wood or soap-*ashes*, and weed-*ashes*. See POTASHES, &c.

The ancients preserved the *ashes* of their dead ancestors with great care and piety, in urns made for the purpose. See FUNERAL URN, BURNING, &c.

Ashes of all kinds, in virtue of their salt, make an excellent manure for cold and wet grounds.—Hence that of Virgil,

—Ne pudeset,

Effusos cinerem immundum jactare per agros.

POT-ASHES. See the article POT-ASHES.

In the Philosph. Transact. No. 21, we have an account of a shower of *ashes* in the Archipelago, which held several hours, and extended to places distant above an hundred leagues. See SHOWER, and RAIN.

ASIATIC Style. See the article STYLE.

ASIDE, in the drama.—An *ASIDE*, *seorsim*, is something which an actor speaks a-part, or, as it were, to himself, for the instruction of the audience, by discovering some sentiment which otherwise did not appear, and which is to be concealed from the rest of the actors then present.

The severer critics condemn all *asides*; and with some reason; as they are a manifest breach of probability.—Accordingly, they are never to be used but at a pinch, which a good author will scarce suffer himself to be brought to.

ASKING in the Church, 5 6 Ed. 6. c. 12. See BANNS.

ASPALATH, *ASPALATHUM*, in pharmacy, the wood of a foreign tree, heavy, oleaginous, somewhat sharp and bitter to the taste, and of a strong smell and purple colour.

The *aspalath* is otherwise called *lignum Rhodium*, or *rosewood*; and by some *Cypressi-wood*; the former on account of its sweet smell, or growth in the island of Rhodes; the latter from its being also found in the island of Cyprus. Though some will have *aspalathum* a different wood from the *lignum Rhodium*.

Aspalath was anciently in much repute, as an astrigent, strengthner, and dryer, but is now much diffused in internal practice.

In virtue, taste, smell, and weight, it resembles the *figum albes*; and in phytic they are frequently substituted the one for the other.

There are four kinds of *aspalath*.—The first is of the colour of box; hard, solid, heavy, and of a smell like roses, whence

its appellation *rosewood*.—The second, is red, like yew, and of a very agreeable smell.—The third, hard, twisted, and knotty; it has a rank smell, like that of a goat, and a disagreeable taste.—The fourth has an ash-coloured bark, and is a wood of a purple dye.

Aspalathum affords an oil of an admirable scent; reputed one of the best of perfumes; it is chiefly used in scenting pomatums and liniments.

ASPECT, *ASPECTUS*, in gardening, is used for what we otherwise call *exposure*.

ASPECT, in astronomy, is used for the situation of the stars, or planets, in respect of each other; or a certain configuration, and mutual relation between the planets, arising from their situations in the zodiac, whereby their powers are supposed to be mutually either increased or diminished, as they happen to agree or disagree, in their active or passive qualities.

Though such configurations may be varied, and combined a thousand ways, yet only a few of them are considered.—Hence, Wolfius more accurately defines *aspect* the meeting of luminous rays emitted from two planets, to the earth, either situate in the same right line, or including an angle which is one or more quota parts of four right angles.

The doctrine of *aspects* was introduced by the astrologers, as the foundation of their predictions.—Hence Kepler defines *aspect* an angle formed by the rays of two planets meeting on the earth, able to excite some natural power or influence.

The ancients reckoned five *aspects*, viz. conjunction, denoted by the character \odot , opposition by \odot , trine by Δ , quadrature by \square , and sextile \ast .

Conjunction and opposition are the two extremes of the *aspects*; the first being the beginning, and the second the highest or ultimate term. See CONJUNCTION, and OPPOSITION.

Trigon, or trine, is the third part of a circle, or the angle measured by AB. (Tab. Astron. fig. 3.)

Tetragon, or quadrature, is the fourth part of a circle, or the angle measured by the quadrant AD: sextile, which is the sixth part of a circle, or angle, is measured by the sextant AG. See TRIGON, &c.

The *aspects* are divided with regard to their supposed influences into benign, malign, and indifferent.

The quadrature *aspect* and opposition are reputed malign; or *malific*; trine and sextile, benign, or *friendly*; and conjunction, an *indifferent aspect*.

To the five ancient *aspects*, the modern writers have added several more; as *decile*, containing the tenth part of a circle; *tridecile*, three tenths; and *biquintile*, four tenths, or two fifths.—Kepler adds others, as he tells us, from meteorological observations; as the *semi-sextile*, containing the twelfth part of a circle; and *quincunx*, containing five twelfths.—Lastly, to the astrological physicians we owe *astile*, containing one eighth; and *tristile*, containing three eighths. Some have also added *quintile*, containing a fifth part of the circle; and *biquintile*, or two fifths.

The angle intercepted between two planets in the *aspect* of conjunction is 0° ; in the semi-sextile *aspect*, 30° ; in decile, 36° ; in octile, 45° ; in sextile, 60° ; in quintile, 72° ; in quartile, 90° ; in tridecile, 108° ; in trine, 120° ; in tri-ocile, 135° ; in biquintile, 144° ; in quincunx, 150° ; in opposition, 180° .

These angles, or intervals, are reckoned on the secondary circles; or according to the longitudes of the planets; so that the *aspects* are the same, whether a planet be in the ecliptic, or out of it.

The *aspects* are usually divided into *partile* and *platic*.

Partile ASPECTS are when the planets are just so many degrees distant, as is above expressed.—These alone are the proper *aspects*.

Platic ASPECTS are when the planets do not regard each other from these very degrees; but the one exceeds as much as the other comes short.—So that the one does not cast its rays immediately on the body of the other, but only on its orb or sphere of light.

Double ASPECT is used in painting, where a single figure is so contrived, as to represent two or more different objects, either by changing the position of the eye, or by means of angular glasses.—Instances hereof, see under the articles MIRROR, CATOPTRIC, CISTULA, and ANAMORPHOSIS.

ASPER, in grammar.—*Spiritus ASPER*, a character, or accent in form of a α ; placed over certain letters, in the Greek tongue, to shew they are to be strongly aspirated, and that the breath is here to supply the place of an *h*.

ASPER, or *ASPRE*, also signifies a little Turkish silver coin, wherein most of the grand signior's revenues are paid.

The *asper* is worth something more than an English half-penny.—The only impression it bears, is that of the prince's name under whom it was struck.—The pay of the Janizaries is from two to twelve *aspers* per diem.

ASPERSA *Arteria*, in anatomy, the *wind-pipe*; otherwise called the *trachea*.

The *aspera arteria* is a canal situate in the middle and fore-part of the neck, before the *oesophagus*: its upper end is called the *larynx*; from whence it descends to the fourth vertebra of the back, where it divides and enters the lungs.—See *Tab. Anat. Angelic. fig. 2. & lit. c. Splanch. fig. 12. lit. tt. & f.*

It is formed of annular cartilages ranged at small and equal distances from one another, and growing smaller and smaller, as they approach the lungs; those of the bronchia being so close to one another, that, in expiration, the second enters within the first, and the third within the second, and the following always enters the preceding. Betwixt the larynx and the lungs, these cartilages make not complete rings; being flat on one side, and not finishing the whole circle, but representing the figure of the ancient Greek sigma; whence they are also denominated *sigmoides*.—Their hind part, which is contiguous to the *oesophagus*, is membranous, that they may better contract and dilate, and give way to the food as it passes down the gullet.

The cartilages of the bronchia are completely annular, yet their capillary branches have no cartilages, but instead of them small circular ligaments, which are at pretty large distances from one another.—The use of the cartilages is to keep the passage for the air open; but in the capillary bronchia, they would hinder the subsiding of the vessels.

These cartilages are tied together by two membranes, external and internal: the external is composed of circular fibres, and covers the whole trachea externally; the internal is of an exquisite fene, and covers the cartilages internally: it is composed of three distinct membranes; the first woven of two orders of fibres; those of the first order being longitudinal, for the shortening the trachea; these make the cartilages approach and enter one another: the other order is of circular fibres, for contracting the cartilages.

When these two orders of fibres act, they assist, together with the external membrane, in expiration, in coughing, and in altering the tone of the voice.

The second membrane is altogether glandulous; and the excretory vessels of its glands, opening into the cavity of the trachea, secrete a liquor for moistening the fame, and defending it from the acrimony of the air.—The last is a net of veins, nerves, and arteries; the veins are branches of the *vena cava*, the nerves of the recurrent; and the arteries, are sprigs of the carotides.

Transverse sections of the *aspera arteria* have been commonly reputed mortal. Yet in the modern practice we find many instances to the contrary*. In some dangerous cases of quinzies, &c. they are even obliged to cut open this part. This operation is called *bronchotomy*, or *laryngotomy*.

* In the *Philosoph. Transact.* is a letter by Mr. John Keen, recommending the more frequent use of bronchotomy, or opening the wind-pipe upon pressing occasions; which he urges from a remarkable case of a person who had the trachea, or wind-pipe, cut quite through beneath the *pomum Adami*, cured by stitching the wound, and using proper medicines.

ASPERIFOLIOLUS, in botany, one of the divisions or classes of plants; so denominated, because usually rough-leaved. The characters of the *asperifolius* kind are, that the leaves stand alternately, or without any certain order on the stalks: the flowers are monopetalous, but they have the margin cut into five divisions, sometimes deep, sometimes shallow; and the upper spike or top of the plant, is often curv'd back, something like a scorpion's tail.

In the place of each flower, there usually succeed four seeds: Mr. Ray supposes the cerinthe the only plant of this genus, that hath less than four seeds at the base of each flower: this, indeed, hath but two.

To the class of *herbæ asperifoliae* belong the *pulmonaria maculosa*, *cynoglossa*, *borage*, *buglossa*, *anchusa*, *echium*, *linum umbilicatum*, *heliotropium majus*, *aparine major*, *consolida major*, *lithospermum*, *echium scorpioides*, and *cerinthe*.

ASPERITY, *ASPERITAS*, implies the inequality or roughness of the surface of any body; whereby some parts of it do so stick out beyond the rest, as to hinder the hand, &c. from passing over it easily and freely.

Asperity, or roughness stands opposed to smoothness, evenness, politure, &c.—From the *asperity* of the surfaces of contiguous bodies, arises friction.

According to the relations of Vermaufen, the blind man so famous for distinguishing colours by the touch, it should appear that every colour has its particular degree and kind of *asperity*. He makes black the roughest, as it is the darkest of colours; but the others are not smoother in proportion as they are lighter; i. e. the roughest do not always reflect the least light: for, according to him, yellow is two de-

grees rougher than blue, and as much smoother than green. Boyle of colours.

ASPERSION*, the act of sprinkling with water, or some other fluid.

* The word is formed of the Latin *aspergere*, to sprinkle; of *as*, to, and *pergo*, I cater.

Some contend for baptism by *asperision*, others by immersion.

ASPHALITES*, in anatomy, the fifth vertebra of the loins.

* It is thus called because conceived as the support of the whole spine of the loins; from the privative *a* and *σπῆλαια*, I supplant.

ASPHALTOS, or **ASPHALTUM**, a solid, brittle, black, inflammable, bituminous substance, resembling pitch, brought from the east, and particularly from Judea; whence it is also called *Jews-pitch*.

The *asphaltos* of the Greeks is the *bitumen* of the Latins. Modern naturalists, who make a class of bitumens, generally place *asphaltos* at the head of it; as being the most matured and concocted of the whole tribe; but consisting of the same simple principles as the rest.

It is chiefly found swimming on the surface of the *lacus asphaltites*, or dead sea, where anciently stood the cities of Sodom and Gomorrah.—It is cast up from time to time, in the nature of a liquid pitch, from the earth which lies under this sea; and being thrown upon the water, it there swims like other fat bodies, and condenses by little and little, through the heat of the sun, and the salt that is in it: it burns with great vehemence; in which it resembles *naphtha*, but is firmer as to consistence.

The Arabs use it to pitch their ships withal, as we do common pitch.—Besides this use, there was a deal of it employed in the unbalming of the ancients.

It is supposed to fortify and resist putrefaction; and to resolve, attenuate, cleanse, and cicatrize wounds: but it is little used among us either externally or internally.

It is usual to sophisticate the *asphaltos*, by mixing common pitch along with it; the result whereof makes the factitious *pisifasphaltum*, which the coarseness of the black colour, and the fetid smell easily discover. There is, however, besides this, a native *pisifasphaltum*.

ASPHALTUM also denotes a kind of bituminous stone, found near the ancient Babylon, and lately in the province of Neuschâtel; which, mixed with other matters, makes an excellent cement, incorruptible by air, and impenetrable by water; this was supposed to be the mortar so much celebrated among the ancients, wherewith the walls of Babylon were laid.

It yields an oil which defends ships from water, worms, &c. much better than the ordinary composition; and which is also of good service for the cleansing and healing of ulcers, &c. See SUPPLEMENT, article ASPHALTUM.

ASPIC—Oil of **ASPIC**. See the article OIL.

ASPIRATE, *ASPIRATIO*, in grammar, a character used to denote an aspiration.

The *aspirate*, by the Greeks called *spiritus asper*, and marked over their vowels, seems as if of a very different nature from the letters; but is nevertheless a true letter, as well as the rest, and a real consonant.—By letters we do not mean the characters of the alphabet, which are changeable according to the languages and the people, and among the same people, according to time and custom; and even according to the fancy of particular persons.—Thus, some, for instance, write the *aspirates*, or letters *aspirated*; which, by others are omitted; though both the one and the other pronounce alike; as in *huomo*, *huomini*, and Italian word frequently written *uomo*, *uomini*.

But, by letters, we mean articulate sounds, formed by the organs of speech, viz. the throat, mouth, tongue, palate, teeth, &c.

These sounds are of two kinds, the one *simple*, and the other *compound*, or modified.—*Simple* are those pronounced by a single motion of the organ; such are the vowels.

Compound sounds are those same simple sounds modified by a motion of the organ superadded to the motion necessary to pronounce the simple sound; of which kind are the consonants.

Now an *aspirate* is an effect or consequence of a motion made by some of the organs of speech; and therefore it must either be a vowel or a consonant.—The former it cannot be, as not being a simple sound, or a sound that may be pronounced by it self. It must therefore be a modificative, or consonant; and in effect it has all the properties of one.

For, 1st, it results from a motion of the organ, which, of it self, produces no sound. Thus the *spiritus* of the Greeks, our *b aspirate*, as well as that of the French, and other people, has no more sound of it self, than *b*, *c*, *d*, &c. and the same thing may be observed of the *aleph*, *bbeth*, and *caph*, of the eastern languages.

2^{dly}, On the contrary, our *h*, the *spiritus* of the Greeks, and the other *aspirates* just mentioned, are pronounced with all the vowels, in the same manner as consonants are.—They modify

modify those vowels, and are effects of a motion of the organ superadded to the motion necessary to form the vowel. Thus, to pronounce *ba*, two motions of the organ are required as well as for *ba*, or *ca*, &c. One for *a* which itself is a sound; the other for *b*, which yields no sound, no more than *h*; but adds something to *a* which modifies it, and makes that *ba* is not mere *a*, nor *ba*, nor *ca*, &c. And this must hold still more sensibly in the stronger aspirates, as those of the oriental tongues פ, ב, מ, נ, ו, י, ל, ז, ש, &c. in all which, there are evidently two motions, the one to express the vowel, and the other to modify it: now this being the nature and essence of a consonant, it follows, that let them be denoted in what manner they will, whether as our *b*, as the orientals do, *i. e.* by proper characters in the course of the words themselves; or, as the Greeks do some of theirs, by a sign of aspiration placed over the vowel; it matters not. The aspirate is no less a consonant in *αἶμα*, than in *χαῖμα*; in *ἰω*, than in *χω*; in *ἀω*, than in *χω*; and so of others.

The third and last reason is, that the eastern languages, which do not express the vowels, do yet express the aspirates.

Add, that the aspirate is frequently changed into a consonant, and expressed by a consonant. Thus, of *ἡ* is made *sex*; of *ἡ*, *septem*; of *ἡ*, *vesperus*, &c. of the Hebrew פ, *duos*, and thence *vinum*, &c. Nay, even in the same language, Hesiod, speaking of Hercules's buckler, uses *ἡ* for *οἶνον*; making no difference between a *o* and an aspirate. See CONSONANT.

Hence it evidently follows, that aspirates are real consonants; and that it must be an error to rank *h*, פ, ב, מ, נ, &c. of the eastern languages, among the vowels; and to exclude the *h* in ours, out of the number of letters. See H.

ASPIRATION, the act of aspirating, *i. e.* of pronouncing any syllable, or word, strongly; with a good deal of breath, and vehemence.

This we do, for instance, in those words which have the letter *b* before them; as *harangue*, *hook*, *holland*, *hero*, &c. whereas the like syllables are sounded much softer and easier without the *b*; as in the ear, eat, &c. See H.

ASPRE. See the article ASPER.

ASSA-DULCIS, a name sometimes given to *benzoin*. See BENZOIN.

ASSA-FORTIDA, or **ASA-FORTIDA**, a gum or resin, brought from the East-Indies, of a brownish colour, a sharp taste, and a very strong offensive smell; whence it is also called *stercus diaboli*, or devil's dung.

It is the product of an umbelliferous plant, and flows either naturally or by incision from its root, in very considerable plenty.—They who after the ancients suppose it drawn from the *laser*, or *laserpitium*, would be hard put to it to get clear of those many disputes which have so often divided the botanists on the subject of the true *laser*, and the *succus cyreniacus*, so infinitely prized among them. Indeed there seems but little resemblance between the gum described by M. Furetiere, out of Pliny, *lib. xix. c. 3.* and our *assa-fortida*; if they be the same, it is certain we are not acquainted with half its virtues.

The modern *assa-fortida*, which is a very offensive drug in its smell, is a gum said to distil, during the summer's heat, from a plant frequent in Media, Persia, Assyria, and Arabia.—It is at first white, bordering on yellow, then red, and lastly on violet; and melts under the fingers like wax.—It is of known efficacy in some uterine disorders; but the rankness of its smell occasions it to be seldom used; yet in the East-Indies it makes an ingredient in their ragouts.

ASSACH, or **ASSATH**, a kind of purgation, anciently used in Wales, by the oaths of 300 men.

ASSAILANT, one that assails, or sets upon another. See ASSAULT, ATTACK, &c.

ASSARABACCA. See ASARABACCA.

ASSART, **ASSARTUM**, in law, an offence committed in the forest, by pulling up, by the roots, woods which serve as thickets and covert for the deer, and making them plain as arable land.

This is, the greatest trespass that can be committed in the forest, being more than a waste. For whereas waste of the forest is but the felling and cutting down the coverts, which may grow again; *assart* is a total extirpation thereof. See WASTE.—What we call *assartum*, is elsewhere termed *dispositio*.

ASSART was also used for a parcel of land assarted. See ES-SART.

ASSART-Rents were those formerly paid to the crown for the forest lands assarted. See RENT.

ASSASIN*, or **ASSASSIN**, a person who kills another with the advantage either of an inequality in the weapons, or by means of the situation of the place, or by attacking him at unawares.

* The word *assassin* is said, by some, to have been brought from the Levant, where it took its rise from a certain prince of the family of the *Assasides*, popularly called *Assasins*, living in a castle between Antioch and Damascus.

VOL. I.

and bringing up a number of young men, ready to pay a blind obedience to his commands; whom he employed in murdering the princes with whom he was at enmity.—The Jew Benjamin, in his itinerary, places these *Assasins*, near mount Libanus; and calls them in Hebrew from the Arabic *اَشَّاسِيْن*, *el assas*; which shews that the name did not come from *arsicide*, but from the Arabic *اَشَّاسِيْن*, *assas*, infideliary, a person who lies in ambush.—The *Assasins*, or *Assesimians*, *Assesins*, above-mentioned, possessed eight or twelve cities about Tyre: they chose themselves a king, whom they called the *old man of the mountain*. In 1213, they assassinated Louis of Bavaria. They were Mahometans, but paid some tribute to the knights-templars.—The favourers of the *Assasins* were condemned by the council of Lyons, and under Innocent IV. in 1231.—The Tartars overcame them, and killed their senior of the mountain in 1257; upon which the faction became extinct.

There was a certain law of nations; an opinion received in all the republics of Greece and Italy, whereby he that assassinated an usurper of the supreme power was declared a virtuous man. At Rome especially, after the expulsion of the kings, the law was formal and solemn, and instances of it admitted. The commonwealth armed the hand of any citizen, and created him magistrate for that moment. *Confid. sur les Loix. de la Grand. des Rom. c. 11. p. 121.*

ASSASSION, the preparing or dressing of medicaments, or foods, in their own juices; by an external heat without addition of any foreign moisture.

*Assation**, in respect of culinary matters, is more frequently called *roasting*; and, in pharmacy, *assion*, or *torrefaction*.

* The word is formed of the Latin *assare*, to roast.

ASSAULT, in the art of war, an attack made upon a camp, fortress, or post, in order to carry or become master thereof.

An *assault* is properly a general furious attack, wherein the assailants do not screen themselves by any works.—We say, to give an *assault*, to be commanded to the *assault*, to stand an *assault*, to repulse an *assault*, to carry by *assault*, &c.

While an *assault* lasts, and both parties are mixed, the fire of the batteries ceases; and there is no use of caution on either side; for they are afraid of destroying their own men thereby.

A governor was formerly obliged to sustain three *assaults* before he gave up the place.—It is very difficult saving a town from pillage that is carried by *assault*.—The *enfants perdus* always march first to the *assault*.

Few places of late years stand *assaults*: M. de Feuquiere finds but three in his time. The first was Neuhaefel, in 1683, commanded by the Turkish Bakhaw: it was taken, as most others must be, because the column of infantry that marched to the breach consisted of more ranks, than that of the infantry which defended it.—The second was Buda, the bakhaw of which was killed in the attack. He had some flanking works remaining, whose fires had not been entirely ruin'd by the artillery of the besiegers.—The third was the castle of Namur, defended by M. de Boufflers; which was not carried, by reason the column of infantry which attacked the breach, marched from too far off unsheltered. Add, that it is almost impossible to carry a place by *assault* or storm, when the breach may be defended by the fires of works not yet destroyed. In reality, it should be defended by no other fires, but those which are opposed to it in front, or from the breach itself. *Feuq. Mem. c. 99.*

Such obstinacy in defending places to the last extremity is no longer found, except among the Turks; among whom it is a point of religion not to surrender to the Christians, by capitulation, any place where they have once had a mosque.—Though of late they have sometimes departed from this maxim. *Id. ibid.*

ASSAULT, **ASSULTUS**, or **Insultus**, in law, an offer, or attempt to hurt the person of another.

Or, it is a violent injury offered to a man's person; of a larger extent than battery, for that it may be committed by only offering to give a blow; or even, according to some, by a threatening speech, by presenting a pistol, or the like.—Though some, it is to be observed, deny that words can amount to an assault.

To rebuke a collector with foul words; so that he depart for fear, without doing his office, has been adjudged an *assault*; and to strike a man, though he be not hurt, or sometimes even not hit, with the blow, is reputed the same. For, in trespasses for *assault* and battery, a man may be found guilty of the *assault*, and excused of the battery. 25 *Edw. 3. c. 4.*

The *assaulting* a person with offensive weapons, with a design to rob (though no robbery ensue) is punished with transportation for 7 years. 7 *G. 2. c. 21.*

ASSAY, **ESSAY**, or **SAY**, in metallurgy, the proof or trial of the goodness, purity, value; &c. of metals, and metaline substances.

In ancient statutes this is called *touch*; and those who had the care of it, *keepers of the touch*.—Under Henry 6. divers

cities were appointed to have *touch* for wrought silver-plate. 2 H. 6. c. 14.—By this, one might imagine they had no better method of *assaying* than the simple one, by the touchstone; but the case is far otherwise. In the time of king Henry II. the bishop of Salisbury, then treasurer, considering that though the money paid into the king's exchequer for his crown rents did answer *numero & pondere*, it might nevertheless be mixed with copper or brass: wherefore a constitution was made, called, the *trial by combustion*; which differs little or nothing from the present method of *assaying* silver. See a description of it in the Black-book in the exchequer, written by *Gervase of Tilbury*, c. 21.—This trial is also there called *assaium*, and the officer who made it is named *fufor*. Vid *Levand. Eff. Amend. Silo. Cain*, p. 5. & 155.

ASSAYING, *ars docimastica*, in its extent, comprehends particular manners of examining every ore, or mixed metal, according to its nature, with the best adapted fluxes; so as to discover, not only what metals, and what proportions of metal are contained in ores, but likewise how much sulphur, vitriol, alum, arsenic, finial, &c. may be obtained from every ore respectively.

Assaying is more particularly used by monies and goldsmiths, for the making a proof, or trial by the cuppel, or test, of the fineness or purity of the gold and silver to be used in the coining of money, and manufacture of plate, &c. or that have been already used therein.

There are two kinds of *assaying*; the one before metals are melted, in order to bring them to their proper fineness; the other after they are struck, to see that the species be standard.

For the first *assay*, the *assayers* use to take fourteen or fifteen grains of gold, and half a drachm of silver; if it be for money: and eighteen grains of the one, and a drachm of the other, if for other occasions.

As to the second *assay*, 'tis made of one of the pieces of money already coined, which they cut in four parts.

Method of ASSAYING Gold.—The *assayer* having weighed the gold he intends to make the trial in, very exactly, with scales that will turn with the hundredth part of a grain, and noted down the weight, he adds twice as much fine silver thereto; though this should be in proportion to the fineness the gold seems to be of, the basest gold requiring the least silver. The gold and silver thus weighed and mixed, are wrapped up in a piece of paper, to prevent their losing any thing of their weight, which would disturb the accuracy of the *assay*.

While the *assayer* is weighing his matters, a reverberatory fire is lighted in a furnace, furnished with a muffle, and a cuppel, or test, set therein to heat. This done, a little bullet of lead is put in the cuppel, of a weight proportionable to the quantity and quality of the gold to be *assayed*. When the lead is well melted, and appears very clean and bright; they put in the mixture of gold and silver, and let it fuse till it appear of an opal colour, and have fixed itself in a little lump to the bottom of the cuppel.

This done, the cuppel is left to cool in the furnace itself; after which the lump is separated very exactly from the place where it stuck to the vessel; and beaten or hammered on the anvil; heating it again and again, on the coals, to promote the stretching.

When sufficiently hammer'd, they roll it up in form of a cornet, or coffin, and thus put it in a glass matrafs, capable of containing four spoonfuls of water; and having added to it a quantity of *aqua fortis*, well corrected, that is, mixed with near one third of the quantity of river water; they boil it over a wood fire, till such time as the *aqua fortis* yields no more red fumes.

This first water being poured off, and the cornet left alone at the bottom of the matrafs, they fill the matrafs again, but with pure *aqua fortis*; which, after boiling, is poured off in its turn, at such time as the fumes are become white.—This done, they fill up the matrafs with river water, to wash the cornet.

When washed, they put it dry in a crucible, with a cover over it, and heat it till it become of a cherry-colour.

This done, the *assay* is finished; and there remains nothing but to weigh it against the same weight of fine gold, as was used at first, before the *assay*: for by comparing the first weight of the gold, ere it was put in the fire, and the *aqua fortis*, with what it retained after it had thus undergone the test; they judge, from the greater or less loss it has sustained, of the quantity of alloy mixed with it.

Method of ASSAYING Silver.—The process is much the same, as in gold; only less difficult, and shorter. The silver is weighed, as before; and the same furnace, and muffle, the same fire, the same cuppel used. Add, that lead is likewise put in the cuppel, proportioned to the quantity and quality of the silver to be *assayed*.

The lead being well melted, and clear, the silver is put in; and after it is brought to an opal colour, and fixed in a lump at the bottom of the cuppel, which happens in about half

an hour; they let it cool, and cleanse it: and lastly, weigh it again, as in gold. And from its diminution, they estimate the quantity of alloy.

ASSAYING of Lead.—The *assay* of gold and silver being performed by means of lead; 'tis of the utmost importance the lead be free of any mixture of either of the two metals: otherwise the *assay* will be false; by reason the gold and silver mixed with the lead will not evaporate like other kinds of alloy, but unite with the metal under *assay*.

To prevent this disorder, and assure the operation, there is no way but first to *assay* the lead itself.

This *assay* is performed in the same furnace, and with the same cuppels, as these of gold and silver: but the process is incomparably more simple. All here required, when the cuppel is heated, being to put in the piece of lead to be *assayed*. If this lead evaporate entirely, it is fit for the purpose. On the contrary, if there remain any little grain of silver, &c. at the bottom, it must be set aside. See SUPPLEMENT article **DOCIMASTIC ART.**

ASSAYING of Tin. See the article **TIN.**

ASSAY-MASTER, an officer, under certain corporations, intrusted with the care of making true *touches*, or *assays*, of the gold and silver brought to him; and giving a just report of the goodness or badness thereof.

Such is the *assay-master* of the mint in the Tower, called also *assayer* of the king.

The *assay-master* of the goldsmith's company is a sort of assistant-warden, called also a *touch-warden*, appointed to survey, *assay*, and mark all the silver-work, &c. committed to him.—There are also *assay-masters* appointed by statute, at York, Exeter, Bristol, Chester, Norwich, and Newcastle, for assaying wrought plate.—The *assay-master* is to retain 8 grains of every pound Troy of silver brought to him; 4 whereof are to be put in the *pix*, or box of deal, to be re-assayed the next year; and the other 4 to be allowed him for his waste and spillings. 12 & 13 W. III. c. 4. 1 An. c. 9. See **PIX**.

Note. The number of penny-weights *set down* in the *assay-master's* report is to be accounted as *per pound*, or so much in every pound of 12 ounces Troy.—For every twenty penny-weight, or ounce Troy, the silver is found by the *assay* to be worse than standard, or sterling, six-pence is to be deducted: for that every ounce will cost so much to reduce it to standard goodness, or to change it for sterling. *Touchst. of gold and silver ware*, p. 41.

In gold, for every carat it is set down to be worse than standard, you must account, that in the ounce Troy it is worse by so many times 3s. 8d.—And for every grain it is set down worse, you must account it worse by so many times 11d. in the ounce Troy.—And for every half grain 5d. 4. for so much it will cost to make it of standard goodness, &c. *Id. ibid.*

ASSAY of weights and measures signifies the trial or examination of common weights and measures, by the clerk of the market. See **CLERK of the market.**

ASSEMBLAGE, the joining or uniting of several things together; or, the things themselves so joined, or united.

The *assemblage* of two bones for motion, is called *articulation*. See **ARTICULATION.**

Carpenters and joiners have various kinds and forms of *assemblage*; as, with mortises and tenons, with dove-tails, &c. See **MORTISE, DOVE-TAIL, &c.**

The Europeans admire the carpentry of some Indians, where the *assemblage* is made without either nails or pins. *Herrera*. See **CARPENTRY.**

ASSEMBLAGE is also used in a more general sense, for a collection of several things, so disposed together, as that the whole has an agreeable effect.—It is with discourse as with bodies, which owe their chief excellency to the just *assemblage* and proportion of their members.

ASSEMBLY*, a meeting of several persons in the same place, and with the same common design.

* The word is formed of the Latin *adsumulare*; compounded of *ad*, to, and *sumul*, together.

Assemblies of the clergy are called convocations, synods, councils; though that annual one of the kirk of Scotland retains the name *general assembly*, &c.—The *assemblies* of judges, &c. are called *courts*, &c.—The *assemblies* of the Roman people were called *comitia*.—The *assembly* of a preacher, &c. is his audience.—The academies have their *assemblies*, or days of *assembly*.—The *assemblies* of dissenters, &c. are frequently, by way of reproach, called *conventicles*.

Under the Gothic governments, the supreme legislative power was lodged in an *assembly* of the states of the kingdom, held annually for the like purposes as our parliament.

Some feeble remains of this usage still subsist in the annual *assemblies* of the states of Languedoc, Bretagne, and a few other provinces of France; but there are no more than shadows of the ancient *assemblies*. It is only in Great-Britain,

Sweden, and Poland, that such *assemblies* retain their ancient powers and privileges.

ASSEMBLIES of the *campus Martii*, or *Maii*, of the field of *Mars*, or *Moy*. See *FIELD of Mars*, &c.

REBELLIOUS ASSEMBLY. } See **REBELLIOUS.**

UNLAWFUL ASSEMBLY. } See **UNLAWFUL.**

ASSEMBLY is particularly used in the *beau-monde*, for a stated and general meeting of the polite persons of both sexes; for the sake of conversation, gallantry, news, and play.

Quarter or Place of ASSEMBLY, in a camp, &c. See **QUARTER of assembly**.

ASSEMBLY is also used in the military art, for the second beat of the drum, being that before the march.

On hearing this, the soldiers strike their tents, roll them up, and then stand to their arms.—The third beating is called the *march*, as the first is called the *general*.

ASSENSU Regio. } See the articles **REGIO.**

DOWER ex ASSENSU Patris. } See the articles **DOWER.**

ASSENT, **ASSENSUS**, an agreement or acquiescence of the mind to something proposed, or affirmed.—Thus, to *assent* to any proposition is to allow it true, or to perceive its truth.

The schoolmen observe, that to every proposition, how compound or complex soever it be, there only goes one *assent* of the mind.—Thus, in the conditional proposition, if the sun shines it is day; there is only one *assent* of the mind, which regards the connexion of the effect with the condition. So in the disjunctive proposition, Peter either studies, or does not study; the mind does not give a twofold *assent* to the two parts thereof, it being enough that Peter do either the one or the other, for the proposition to be true.

Assent is distinguished, like faith, into *implicite*, or *blind*; and *explicite*, or *seeing*, &c.—Others distinguish it into *actual* and *habitual*.

Actual ASSENT is a judgment whereby the mind perceives a thing to be true.—

Habitual ASSENT consists in certain habits of believing or acquiescing, induced in the mind by repeated acts.

To this belongs faith, which is an *assent* arising from the authority of the person who speaks.—Such also is opinion, which is defined an *assent* of the mind *cum formidine oppositi*, &c.

For the measures and degrees of **ASSENT**, see **PROBABILITY**, **EVIDENCE**, **DEMONSTRATION**, &c.

Father Malebranche lays it down as an axiom, or principle of method, never to allow any thing for truth, from which we can forbear our *assent* without some secret reproach of our own reason.

Royal ASSENT. See the article **ROYAL**.

ASSERTION, **ASSERTIO**, in the language of the schools, a proposition which a person advances; and which he avows to be true, and is ready to maintain in public.

ASSESSOR*, **ASSESSOR**, an inferior or subordinate officer of justice, chiefly appointed to assist the ordinary judge with his opinion and advice.

* The word is Latin, formed of *ad*, to, and *sido*, I sit.

In this sense, the matters in chancery are *assessors* of the lord chancellor.

There are two kinds of *assessors* in the imperial chamber, ordinary and extraordinary.—The ordinary are now in number forty one, whereof five are elected by the emperor, viz. three counts or barons, and two juriconsulti, or civil lawyers. The electors appoint ten, the six circles eighteen, &c. They act in quality of counsellors of the chamber, and have salaries accordingly.

ASSESSOR is also used for a person who *assesses*, or lays *assessments* of taxes, and other public dues.

In this sense, *assessors*, among us, are inhabitants of a town, or village, elected by the community, to *assess*, or settle the taxes, and other impositions of the year, to fix the proportion which each person is to bear, according to his estate, and to see the collection made.—These are also called in our law *assjors*.—By the stat. 16 & 17 Car. 2. two inhabitants in every parish were made *assessors* for the royal aid.

ASSEVERATION, an earnest affirmation, or avouching.

ASSIDEANS, or rather **HASIDEANS**, in antiquity, a sect among the Jews; thus called from the Hebrew, חסידים *hassidim*, merciful, righteous.

The *Assideans* are recorded as holding works of supererogation necessary.—They were the fathers and predecessors of the Pharisees; and from them likewise arose the Esseni. See **PHARISEE**, and **ESSENI**.

The Jesuits Serrarius and Drusus, have wrote against each other upon the subject of the *Assideans*, on occasion of a passage in Joseph Ben Gorion; the first maintaining, that by the name *Assideans* he means Esseni, and the latter Pharisees.

ASSIENTO, or **ASSENTA**, in matters of commerce, a contract or convention between the king of Spain and other powers, for furnishing the Spanish dominions in America, with negro slaves.

The term is originally Spanish, and signifies a bargain: accordingly the first *assiento* was a treaty or contract made with the French Guinea company, whereby they were put in possession of this privilege, in consideration of a certain duty which they were to pay to the king of Spain's farms, for every negro thus furnished.—

This contract was signed in the year 1702, it was to last ten years, with a further liberty allowed the *assentists* of two years more, in case they had not furnished the whole number stipulated before.—The two principal articles regarded, first, the number of negroes to be provided, which was 3800 while the war should last, and 4800 in case of peace. Secondly, the duty to be paid the king of Spain, during the term, or *assiento*; which was fixed at 33 escudos, pieces of eight, per head, or *piensa de India*.

By the treaty of Utrecht, Philip V. being acknowledged king of Spain by the allies; it was one of the articles of the peace between England and France, that the *assiento* contract should be transferred to the English.—Accordingly a new instrument was signed in May 1713, to last 30 years; and the furnishing of negroes to the Spanish America was committed to the South-Sea company, just then erected.

In virtue hereof, they were yearly to furnish 4800 negroes; for which they were to pay at the same rate as the French, with this condition, that during the first 25 years, only half the duty shall be paid for such as they shall import beyond the stated number.

The last article gives them a further privilege not enjoyed by the French; which is, that the English *assentists* shall be allowed, every year, to send to the Spanish America a ship of 500 tons, loaden with the same commodities as the Spaniards usually carry thither; with a licence to sell the same, concurrently with them, at the fairs of Porto Bello, Carthagen, and Vera Cruz.—This additional article is supposed as advantageous to the company, as the whole contract besides; being granted contrary to the usual Spanish policy, which has ever solicitously preserved the commerce of their America to themselves.

Some new articles have been since added to the ancient *assiento*; as, that the English shall send their register-ship yearly, even though the Spanish flota and galleons do not go; and that for the first ten years, the said ship may be of 650 ton.

The manner of valuing the negroes, in order to settle the king of Spain's duty, is the same as delivered under the article **NEGRO**.

ASSIGN, in common law, a person to whom a thing is *assigned*, or made over.

The word *assign* is said to have been introduced in favour of bastards; who, because they cannot pass by the name of *heirs*, are comprised under that of *assigns*.

ASSIGNEE, in law, a person to whom a thing is appointed or *assigned*, to be occupied, paid, or done.

An *assignee* differs from a *deputy* in this, that the *assignee* possesses or enjoys the things in his own right; and a deputy in the right of another.

Assignee may be so either by deed or by law.

ASSIGNEE by deed is, when a lessee of a term sells and assigns the same to another: that other is his *assignee by deed*.—

ASSIGNEE by law is he whom the law so makes, without any appointment of the person.—

Thus, an executor is *assignee by law* to the testator, who dies possessed of a lease made to him and his *assigns*.

ASSIGNING is used for the act of appointing a deputy; or the making over a right to another.

In this sense we say, such lands or estates were *assigned* or made over to such persons for such uses, &c.—In the stat. 20 Edw. I. we read of justices *assigned* to take *assises*, &c.

ASSIGNING also signifies pointing out or setting forth.—Thus we say, to *assign* the real cause of such an event, &c.

To *assign error* is to shew in what part of a process at law an error is committed.

To *assign false judgment*, *verdict*, &c. is to declare how and where judgment, verdict, or the like, is unjust.

To *assign waste* is to shew especially wherein the waste is committed.

ASSIGNMENT, the act of *assigning*, or transferring the interest or property a man has in any thing; or of appointing and setting over a right to another.

The *assignment of a dower* is the setting out of a woman's marriage-portion by the heir.

Novel ASSIGNMENT. See the article **NOVEL**.

ASSIMILATION*, the act of *assimilating*; an act whereby a thing is rendered similar, or like to another.

* The word is compounded of *ad*, to, and *similis*, like.

ASSIMILATION, ASSIMILATIO, in physics, is properly a motion whereby bodies convert other duly disposed bodies into a nature like, or homogenous to their own.

Some philosophers call it, *the motion of multiplication*, meaning, that bodies are hereby multiplied not in number, but in bulk; but this might be more properly expressed by the *motion of augmentation*, or *accretion*.

Instances of this *assimilation* we see in flame, which converts the oily or other particles of fuel into its own fiery and luminous nature. The like also appears in air, smoke, and spirits of all kinds.

The like we see in vegetables, where the watery juices imbibed from the earth, being further prepared and digested in the vessels of the plant, become of a vegetable nature, and augment the wood, leaves, fruit, &c. thereof.

So also, in animal bodies, we see the food *assimilated*, or changed into an animal substance, by digestion, chylickation, and the other operations necessary to nutrition.

ASSISA, or **ASSISIA**; see the articles **ASSISE**, and **TALLAGE**.

ASSISA cadere, to fall from the *assise*, in law, is to be non-suited.

ASSISA cadit in Juratam is where the thing in controversy is so doubtful, that it must necessarily be tried by a jury. See **JURY**.

ASSISA capi in modum assise, is when the defendant pleads directly to the assise, without taking any exception to the count, declaration, or writ.

ASSISA continuanda is a writ directed to the justices, to take an assise for the continuance of a cause, where certain records alleged cannot in time be procured by the party. See **WRIT**.

ASSISA nocuamenti is an assise of nuisance.

ASSISA panis & cerevisie denotes the power or privilege of assigning, or adjusting the weight and measure of bread and beer.

ASSISÆ judicium, in law, signifies a judgment of the court, given either against the plaintiff or defendant, for default.

ASSISA preroganda is a writ directed to the justices of assise, for the stay of proceedings, by reason of the king's business, wherein the party is employed.

Tenentibus in ASSISA non onerandis.

ASSISE, or **ASSIZE***, *assisa*, in law, a fitting of judges, or justices; for the hearing and determining of causes.

* The word is French, *assise*, of *assis*, seated; formed of the Latin *assides*, I sit by; which is compounded of *ad*, to, and *sedes*, I sit.

Clerk of ASSISE: See the article **CLERK**.

ASSISE, or **ASSISES**, was anciently used for certain extraordinary sittings of superior judges, in the inferior courts depending on their jurisdiction; to enquire whether the subaltern judges and officers did their duty; to receive the complaints preferred against them; and take cognizance of appeals from them. These are also called *mercatorial assises*.

ASSISE was also a court or assembly, composed of several great persons of the realm; held occasionally in the king's palace, for the final decision of all affairs of importance. See **COURT**.

This is more usually called, among our writers, *placita, malla publica, or curie generales*. Yet there is some difference between *assises*, and *placita*.—The vicounts, or sheriffs, who originally were only lieutenants of the comites, or counts, and rendered justice in their place, held two kinds of courts, the one ordinary, held every day, and called *placitum*; the other extraordinary, called *assise*, or *placitum generale*; at which the count himself assised for the dispatch of the more weighty affairs.

Hence the term *assise* came to be extended to all grand days of judgment, at which the trials and pleadings were to be solemn and extraordinary.

The modern constitution of *assises* is pretty different from that hitherto spoke of.—Our *assise* may be defined a court, place, or time where and when writs and processes, either civil or criminal, or both, are considered, dispatched, decided, &c. by judges and jury.

In this sense, we have two kinds of *assises*; general and special.

General ASSISES, or **ASSIZES**, are those held by the judges twice a year, in their several circuits.

The nature of these *assises* is explained by my lord Bacon, who observes, that all the counties of the kingdom are divided into six circuits; through each of which two learned men, assigned by the king's commission, ride twice a year, called *justices* or *judges of assise*, who have several commissions, by which they sit, viz.

1^o, *A commission of oyer and terminer*, directed to them; and many others of the best account in their respective circuits. In this commission, the judges of *assise* are of the quorum; so that without them there can be no proceeding. This commission gives them power to deal with treasons, murders, felonies, and other misdemeanors.

The second is of *goal-delivery*, which is only to the judges themselves, and the clerk of the *assise* allocate.—By this commission they have to do with every prisoner in goal, for what offence soever.

The third is directed to themselves, and the clerk of the *assise*, to take writs of possession, called also *assises*; and to do right and justice thereupon.

The fourth is to take *nisi prius*, directed to the justices, and the clerks of *assises*; whence they are also called *justices of nisi prius*.

The fifth is a *commission of peace*, in every county of their circuit; and all the justices of the peace, having no lawful impediment, are bound to be present at the *assises*, to attend the judges.

The sheriff of every shire is also to attend in person, or by a sufficient deputy allowed by the judges, who may fine him if he fail.

This excellent constitution of judges, circuits, and *assises*, was begun in the time of Henry II. though somewhat different from what it is now.

Special ASSISE is a particular commission granted to certain persons, to take cognizance of some one or two causes, as a disseisin, or the like.—This was very frequently practised among our ancestors. Bracton, lib. 3. c. 12.

ASSISE is also used for a writ directed to the sheriff, for the recovery of possession of things immovable, whereof a man's self, or ancestors, have been disseised.

Littleton, and others, suppose these writs of *assise* to have given the denomination to the *assises*, or courts so called; and they assign several reasons of the name of the writ; as,

First, Because such writs settle the possession, and right, in him that obtains by them. *Secondly*, Because originally they were executed at a certain time and place appointed; for, by the Norman law, the time and place must be known forty days before the judges sit; and by our law there must be fifteen days preparation, except they be tried in the standing courts at Westminster.—But, it is more natural to suppose the writs denominated from the courts; and that they were called *assises*, because anciently tried at special courts of *assises*, set and appointed for that purpose.—Though, of latter days, these are dispatched at the general *assise*, along with the commission of Oyer and Terminer, &c.

This writ is as well of things corporeal, as incorporeal rights, being of four sorts, viz.

ASSISE of novel disseisin, *Assisa novæ disseisinæ*, which lies where a tenant in fee-simple, fee-tail, or for life, is lately disseised of his lands and tenements, rent-service, rent-fee, or rent-charge, common of pasture, common way, &c.

To this may be added, the bill of fresh force, directed to the officers or magistrates of cities or towns-corporate; being a kind of *assise* for recovery of possession in such places, within forty days after the force, as the ordinary *assise* is in the county.

ASSISE of mort d'ancestor, *Assisa mortis antecessoris*, lies where my father, mother, brother, uncle, &c. dies seized of lands, tenements, rents, &c. held in fee-simple; and, after their death, a stranger abates. It is good as well against the abator, as any other in possession.

ASSISE of darrein presentment, *Assisa ultimæ presentationis*, lies where I or my ancestor have presented a clerk to a church; and after the church becomes vacant by the death, or otherwise, a stranger presents his clerk to the same church, in my disturbance.

These three *assises* were instituted by Henry II. in the place of duels*; which till then, had obtained on these occasions. See **DUEL**.

* *Magna assisa est regale beneficium, clementia principis de concilio procerum populi indultum; a quo vitæ hominum & status integritati tam salubriter consulitur, ut in jure quod quis in libero soli tenemento possidet, retinendo, duello casum homines declinare possunt*, &c. Glanvil. lib. 2. cap. 7. See **COMBAT**, &c.

ASSISE of Utrum lies for a parson against a layman, or for a layman against a parson, for a land or tenement, doubtful whether it be in lay-fee, or free-alm. See **TITLE**.

ASSISE is also used, according to Littleton, for a jury.—This, that author supposes to be by a metonymia effecti, the jury being so called, because summoned by virtue of the writ of *assise*.

Yet it must be observed, that the jury, summoned upon a writ of right, is likewise called the *assise*; but this may be said to be *καταχρηστικῶς*, or abusively so termed.—*Assise*, in this signification, is divided into *magna* & *parva*. See **JURY**.

Assise is further used, according to Littleton, for an ordinance, or statute regulating the weight, size, or dimensions of certain commodities.—Thus the ancient statute of bread and ale, *anno 51 Hen. 3.* is termed the *assise of bread and ale*, *assisa panis & cerevisie*.

Assise is further used for the scolding, or quantity it self, prescribed by the statute.—When wheat is of such or such price, bread shall be of such *assise*. See **BREAD**.

We have divers statutes for fixing the *assise* of fish, cloths*, wood, billets, faggots, and the like. *Vid.* 34 & 35. H. 8. c. 3. 9 A. c. 15. 10 A. c. 6. 19 Car. 2. c. 3. 4 Jac. 1. c. 2. 1 Geo. 1. stat. 2. c. 18.

* Fixing any *assise* of cloth, or prescribing what length, breadth, weight, &c. it shall have, Sir Josiah Child thinks, does more hurt than good. As the fashions and humours of mankind are variable, to supply all markets at all times, we must have of all sorts, cheap and light, as well as heavier and better.—Stretching with tenters is essential to our drapery, and the precise degree or quantity of it cannot without injury be prescribed by any law; but must be left to the vender's or exporter's discretion. *Child, Disc. of Trade*, p. 143.

Assise of the forest is a statute or condition containing orders to be observed in the king's forest.—It is called an *assise*, because it sets down and appoints a certain measure, rate, or order in the things it concerns.

Assise, again, is used for the whole process in court, founded on a writ of *assise*; and sometimes for a part of it, *viz.* the issue, or verdict of the jury.

Thus we read, that '*assises* of novel disseisin shall not be taken but in their thiries; and after this manner, &c.' *Mag. Chart. cap. 12.*—So in *Merton, cap. 4. Hen. III.* we meet with, '*certified by assise, quitted by assise*,' &c.

Continuance of Assise. } **CONTINUANCE.**
Justices of Assise. } **JUSTICE.**
Limitation of Assise. } See the article **LIMITATION.**
Rents of Assise. } **RENT.**

ASSISER, or **ASSIZER** of weights and measures, is an officer who has the care and oversight of those matters. See **CLERK of the market**.

ASSISIS.—*Non ponendo in assis.* See **NON-PONENDO**.

ASSISOR, the same with *assessor*. See **ASSESSOR**.

In Scotland, *assisors* are the same with our *jurors*. See **JUROR**.

ASSISTANCE. See the article **AID**.

ASSISTANT is used for a person or officer appointed to attend another principal officer, for the more easy and regular discharge of his function.—Such a bishop or priest had seven or eight *assistants*.

ASSISTANT, in Roman Catholic countries, is particularly applied to a kind of counsellors, or controllers, added to the generals or superiors of monasteries, &c. to take care of the affairs of the community.

The general of the Jesuits has five *assistants*, of consummate experience, chosen by him out of all the provinces of the order, and denominated from the kingdoms or countries to which they belong, *i. e.* Italy, Spain, Germany, France, and Portugal.

In a like sense, most of our trading companies have their courts of *assistants*.

ASSISTANTS are also those condemned to *assist* in the execution of a criminal. See **ABSOLUTION**.

ASSIZE, or **ASSISE**. See the article **ASSISE**.

ASSOCIATE*, an adjunct, partner, or member. See **ADJUNCT**.

* The word is compounded of the Latin *ad*, and *socius*, fellow, companion.—The *associates* of Dr. Bray for conversion of the Negroes, &c.

ASSOCIATION, **ASSOCIATIO**, the act of associating or forming a society, or company.

Association is properly a contract or treaty of partnership, whereby two or more persons unite together, either for their mutual assistance, or for the joint carrying on of an affair; or even for a more commodious manner of life.—The closest of all *associations* is that made by the band of matrimony.

ASSOCIATION of Ideas is where two or more ideas constantly and immediately follow or succeed one another in the mind, so that one shall almost infallibly produce the other; whether there be any natural relation between them, or not.

Where there is a real affinity or connection in ideas, it is the excellency of the mind, to be able to collect, compare, and range them in order, in its enquiries: but where there is none, nor any cause to be assigned for their accompanying each other, but what is owing to mere accident or habit; this unnatural *association* becomes a great imperfection, and is, generally speaking, a main cause of error, or wrong deductions in reasoning.

Thus, the idea of goblins and sprites has really no more affinity with darkness than with light; and yet let a foolish maid inculcate these ideas often on the mind of a child, and raise them there together, it is possible he shall never be able

VOL. I.

to separate them again so long as he lives, but darkness shall ever bring with it those frightful ideas.—Let custom, from the very childhood, have joined the idea of figure and shape to the idea of God, and what absurdities will that mind be liable to, about the Deity?

Such wrong combinations of ideas, Mr. Locke shews, are a great cause of the irreconcilable opposition between the different sects of philosophy and religion: for we cannot imagine, that all who hold tenets different from, and sometimes even contradictory to one another, should wilfully and knowingly impose upon themselves, and refuse truth offered by plain reason: but some loose and independent ideas are by education, custom, and the constant din of their party, so coupled in their minds, that they always appear there together: these they can no more separate in their thoughts, than if they were but one idea, and they operate as if they were so. This gives sense to jargon, demonstration to absurdities, consistency to nonsense, and is the foundation of the greatest, and almost of all the errors in the world.

ASSOCIATION, in law, is a patent sent by the king, either of his own motion, or at the suit of a party plaintiff, to the justices of assise; to have other persons associated to them, in order to take the assise. See **JUSTICE**, and **ASSISE**. Upon this patent of *association*, the king sends his writ to the justices of the assise, by it commanding them to admit them that are so sent.

Commission of Association. See **COMMISSION**.

ASSOILE, in our ancient law-books, signifies to absolve, deliver, or set free from an excommunication. See **ABSOLUTION**.

ASSONANCE, in rhetoric and poetry, a term used where the words of a phrase, or a verse, have the same sound or termination, and yet make no proper rhyme. These are usually vicious in English; though the Romans sometimes used them with elegance: as, *Militem comparavit, exercitum ordinavit, aciem levavit*. The Latins call it *similitudo desinens*; and the Greeks *ἰσοσυνη*.

ASSONANT Rhymes is a term particularly applied to a kind of verses common among the Spaniards, where a resemblance of sound serves instead of a natural rhyme. Thus, *ligera, cubierta, tierra, mesa*, may answer each other in a kind of *assonant* rhyme, in regard they have each an *e* in the penultimate syllable, and an *a* in the last.

ASSUMPSIT, in law, a naked contract; or a voluntary promise, by word of mouth, by which a man *assumes* and takes upon him to perform, and pay any thing to another. See **CONTRACT**.

This term comprehends any verbal promise; and is variously expressed by the civilians, according to the nature of the promise: sometimes by *pañum*; sometimes by *promissio*, *pollicitatio*, or *constitutum*.

Where a man sells goods to another, the law makes the *assumpsit*; and promises that he shall pay for them.

ASSUMPTION*, **ASSUMPTIO**, a feast celebrated in the Romish church, in honour of the miraculous ascent of the Holy Virgin, as they describe it, body and soul, into heaven.

* The word is compounded of the Latin *ad*, to, and *sumo*, I take.

This feast is held with great solemnity both in the eastern and western churches.—Yet is not the *assumption* of our lady any point of faith. The ancient martyrologies all speak of it with a great deal of reserve, as a thing not yet fully ascertained: though a divine who should now deny it among them, would be obliged to retract.

The Sorbonne, in the year 1696, in the condemnation of Mary of Agreda, protested, among other things, that they believed that the Holy Virgin was *assumed*, or taken into heaven, body and soul.

ASSUMPTION was also, among our ancestors, used for the day of the death of any saint: *Quia ejus anima in caelum assumitur*. See **ANNIVERSARY**.

ASSUMPTION, in logic, is the minor, or second proposition, in a categorical syllogism.

ASSUMPTION is sometimes also used for a consequence drawn from the propositions whereof an argument is composed. See **CONSEQUENCE**.

Thus we say, the premises are true, but the *assumption* is captious.

ASSUMPTIVE Arms, in heraldry, are such as a man has a right to assume of himself, in virtue of some gallant action.

As, if a man who is no gentleman of blood, nor has coat armour, takes a gentleman, lord, or prince, prisoner in any lawful war; he becomes entitled to bear the shield of such prisoner, and enjoy it to him and his heirs.—The foundation hereof is that principle in military law, that the dominion of things taken in lawful war passes to the conqueror.

ASSURANCE, in logic. See **CERTAINTY**, **EVIDENCE**, and **DEMONSTRATION**.

ASSURANCE, or **INSURANCE**, in commerce. See **INSURANCE**.

Policy of ASSURANCE is a kind of contract whereby one or more persons oblige themselves to make good any damages which a ship, a house, or the like, may undergo, by sea, fire, or the like dangers.—The nature and laws hereof, see under the article of **POLICY of assurance**.

We have several offices of *assurance* from fire.—As the Royal Exchange *assurance*; the Sun-fire-office; the Hand-in-hand fire-office; the London *assurance*; the Phoenix-office, &c. some for houses, others for goods, and some for both.

We have also *assurances for life*, in virtue whereof, when the person assured dies, a sum of money becomes payable to the person in whose behalf the *policy of assurance* was granted.

Collateral ASSURANCE. See the article **COLLATERAL**.

ASSUROR, a merchant, or other person, who assures, or makes out a policy of insurance for a ship, house, life, or the like.

Assurors are not answerable for what damages arise through the negligence, or other fault of the master or seamen; or even those which arise from any vice or defect in the thing assured.

ASTATI*, Ἀσταί, a sect of heretics in the ninth century, the followers of one Sergius, who renew'd the errors of the Manichees.

* The word is derived from the Greek privative *a*, and *στα*, *sto*, to stand firm, and signifies any thing unstable and inconsistent.

They prevailed much under the emperor Nicephorus; but his successor, Michael Curopalates, curbed them with very severe laws.

ASTERISK*, a character in form of a small star*, set over any word, or sentence, to make it the more conspicuous, or to refer to the margin, or elsewhere, for a quotation, explanation, or the like.

* The word is derived from a diminutive of the Greek *αστρον*, a star.

ASTERISM*, **ASTERISMUS**, in astronomy, the same with *constellation*.

* The word comes from the Greek *αστρον*, *stella*, star. See **STAR**.

ASTHMA*, Ἀσθμα, in medicine, a disease of the lungs, accompanied with a shortness and difficulty of respiration.

* The word is Greek, formed of the verb *ασπναι*, *aspnāi*, I breathe.

An *asthma* is a difficulty of breathing, arising from a disorder of the lungs; and usually attended with violent motions of the diaphragm, abdominal and intercostal muscles, to the very scapula and the pinnæ of the nostrils; as also with a rattling in the throat.

If respiration be only thick and quick, without the other symptoms, it is called a *dyspnœa*.—And if it be so intense as to occasion a violent motion of the muscles of the thorax, so that the patient cannot be tolerably easy, except in an erect posture; it is called an *orthopnœa*.

The *asthma* is usually divided into *moist* and *dry*, or *manisist* and *occuli*, or *pneumonic* and *convulsive*: the first is attended with an expectoration of purulent matter; the latter is without.

The true or *pneumonic asthma* is occasioned by an abundance of serosities, or of gross, viscous, or purulent humours, collected in the cavities of the lungs, which stop up or straiten the passages of the air, and compress the bronchia.

Asthma's may also be owing to empyema's, phthisis's, poly-pus's, crudities in the stomach, cachexies, &c.

That kind called the *convulsive asthma* is supposed to be occasioned by an irregular motion of the animal spirits; and happens when the spirits do not flow fast enough, or in sufficient quantity, into the muscles of the breast, either by reason of an obstruction, or of some other obstacle: the necessary consequence whereof is a violent and painful respiration.—The *asthma*, again, is either continual, or periodical, and intermitting; which last returns chiefly when a sober regimen is not observed.

The *asthma* is found to be the most violent when the patient is in bed, and in a prone posture; the contents of the lower belly, in that case, bearing against the diaphragm, so as to lessen the capacity of the breast, and to leave the lungs less room to move.

The cure of the true or *pneumonic asthma* is by bleeding; after which emetics may be used; and, if the paroxysm returns, epipastics, with glysters instead of purges.—Infusions of fennel, squin, or the juice thereof, being detensive and attenuating, are reputed excellent. Linctus's also give some relief, millepedes, spirit of gum armoniac, with fennel, coffee, tincture of sulphur, &c. are also greatly commended in *asthmatic* cases.

For the convulsive kind, the cure is attempted by antiepileptics, antihysterics, antispasmodics, opiates, &c.—The *asthma*

is called by Seneca, *meditatio mortis*. See **SUPPLEMENT**, article **ASTHMA**.

ASTRAGAL, Ἀστραγάλος, in anatomy, a bone of the heel, having a convex head, articulated with the tibia, by ginglymus. See *Tab. Anat. (Osteol.) fig. 7. a. a. fig. 3. n. 25. 25.*

The *astragalus*, called also *talus*, and popularly *os basilæ*, is the first bone of the tarsus, and the highest of all those that belong to the foot.

Some also apply the name *astragalus* to the vertebrae of the neck.—Homer, in his *Odyssey*, uses the term in this sense.

ASTRAGAL, in architecture, is a little round member, in form of a ring, or bracelet; serving as an ornament at the tops, and bottoms of columns.—See *Tab. Architect. fig. 40. lit. f. & fig. 2.—26. lit. y. d. fig. 28. & 32. lit. f. fig. 24. lit. b. g.*

The *astragal* is sometimes also used to separate the fasciæ of the architrave; in which case it is carved chaplet-wise, with beads and berries.

It is also used both above and below the listel, adjoining immediately to the square, or dye of the pedestal.

ASTRAGAL, in gunnery, is a kind of ring or moulding on a piece of ordnance, at about half a foot's distance from the mouth; serving as an ornament to the piece, as the former does to a column.

ASTRAGAL Tyles. See the article **TYLE**.

ASTRAL*, something belonging to the stars, or depending on the stars.

* The word comes from the Latin *astrum*, of the Greek *αστρον*, star.

ASTRAL, or *siderial year*. See **SIDERAL**, and **YEAR**.

ASTRICTIOR Toga. See the article **TOGA**.

ASTRINGENS *Crocus Martis*. See the article **CROCUS**.

ASTRINGENTS, **ADSTRINGENTIA**, in medicine, binding remedies; or such as have the power of contracting the parts, and diminishing the pores thereof.

Astringents chiefly act either by the asperity of their particles, whereby they corrugate the membranes, and make them draw up closer; or by thickening the fluids, whereby they cannot run off so fast as before.

Hence, *astringents* are of the class of strengtheners, or corroborants; the nature and operation whereof, see under the article **STRENGTHENER**.

Astringents naturally stand opposed to *laxatives*. They only differ from what are called *symplics*, in degree of efficacy.

Among simples, mint, red roses, nettles, fennel, berberies, quinces, pomegranates, floss, cinnamon, blood-stone, allum, chalk, boles, coral, &c. are the principal *astringents*.

ASTROITES, *Lapis ASTROITES*, or **ASTERIA**, in natural history, a kind of figured stone, found in divers places*, and bearing the resemblance of a star.

* Particularly at Shugburg in Warwickshire, near Belvoir-castle in Lincolnshire, and in several parts of the north of England.

The form thereof is very uniform and regular; consisting of several thin pentagonal joints set one over another, so as to form a kind of five-angled column.—The usual figures, as given by Dr. Lister, are represented in *Tab. Nat. Hist. fig. 14*. But the name is also given to stones which have fossil corals in them. The *Asterie*, as now found, are all fragments, consisting of from one to twenty-five joints.—The matter or substance thereof, when broken, is sparry, of a dark shining politure, very soft, and easily corroded by an acid menstruum.—They creep, like the cornu ammonis, in vinegar; but a stronger spirit, as that of nitre, agitates them with considerable violence.

The protuberant parts represented under the top joint of the first figure are not found in all; but only in those which are deep-jointed.—They are always five in number. Dr. Lister calls them *wyvers*; and compares them to the antennæ of lobsters.

It is controverted among naturalists, to what species of bodies the *astroites*, *trochites*, *entrochi*, &c. are to be referred? Some will have them native stones, others rock-plants, and others petrifications of plants. They are properly, however, parts of a marine animal of the starfish kind, petrified. See **SUPPLEMENT**, article **ASTERIA**.

ASTROLABE, **ASTROLABIUM**, was originally used for a system or assemblage of the several circles of the sphere, in their proper order and situation with respect to each other.

The ancient *astrolabes* appear to have been much the same with our armillary spheres.

The first and most celebrated of this kind was that of Hipparchus, which he made at Alexandria, the capital of Egypt, and lodged in a secure place, where it served for divers astronomical operations.—Ptolemy made the same use of it; but as the instrument had several inconveniences, he bethought himself to change its figure, though perfectly natural and agreeable to the doctrine of the sphere; and to re-

duce the whole *astrolabe* upon a plane surface, to which he gave the denomination of *planisphere*. See *PLANISPHERE*.—Hence,

ASTROLABE is used among the moderns for a planisphere; or a stereographic projection of the circles of the sphere upon the plane of some great circle thereof.

The usual planes of projection are that of the equinoctial, the eye being supposed in the pole of the world; that of the meridian, the eye being supposed in the point of intersection of the equinoctial and horizon; and that of the horizon.

Stoffler, Gemma Frisius, and Clavius, have treated at large of the *astrolabe*.—For a further account of the nature and kinds hereof, see the article *PLANISPHERE*.

ASTROLABE*, or *Sea ASTROLABE*, more particularly denotes an instrument chiefly used for taking the altitude of the pole, the sun, or stars, at sea.

* The word is formed from the Greek *αστρον*, star, and *λαβειν*, capio, I take.—The Arabs call it in their tongue, *astharlab*; a word formed by corruption from the common Greek name: though some of them have endeavoured to give it an Arabic original. But the learned are generally satisfied that the Arabs borrowed both the name, and the use of the instrument from the Greeks. Nafireddin Thousi has a treatise in the Persian language, entitled, *Bait Babihfi Astharlab*, wherein he teaches the structure and the application of the *astrolabe*.

The common *astrolabe* represented *Tab. Navigation*, fig. 22. consists of a large brass ring, about fifteen inches in diameter, whose limb, or a convenient part thereof, is divided into degrees and minutes; fitted with a moveable index, or label, which turns upon the centre and carries two sights.—At the zenith is a ring A, to hang it by in time of observation.

To use the *astrolabe*, turn it so to the sun, as that the rays may pass freely through both the sights F and G; in which case the edge of the label cuts the altitude in the divided limb.

The *astrolabe*, though now grown into disuse, is at least equal to any of the other instruments used for taking the altitude at sea; especially between the tropics, when the sun comes near the zenith.—There are a great many other uses of the *astrolabe*; whereof Clavius, Henricus, &c. have wrote entire volumes.

ASTROLOGICAL fate. See the article *FATE*.

ASTROLOGY*, *ASTROLOGIA*, the art of foretelling future events, from the aspects, positions, and influences of the heavenly bodies.

* The word is compounded of the Greek *αστρον*, star, and *λογος*, discourse; whence, in the literal sense of the name, *astrology* should signify no more than the doctrine or science of the stars; which we read was its original acceptation, and made the ancient *astrology*; though, in course of time, an alteration has arose; that which the ancients called *astrology* being afterwards termed *astronomy*. See *ASTRONOMY*.

Astrology may be divided into two branches, *natural* and *judiciary*.

To the former belong the predicting of natural effects; as, the changes of weather, winds, storms, hurricanes, thunder, floods, earthquakes, &c.

To this part our countryman Gbad chiefly keeps, in his two volumes of *astrology*; wherein he pretends, that inundations may be foretold, and an infinity of phenomena explained from the contemplation of the stars.—Accordingly, he endeavours to account for the diversity of seasons, from the different situations and habitudes of the planets, from their retrograde motions; the number of fixed stars in the constellations, &c.

This art properly belongs to physiology, or natural philosophy, and is only to be deduced a posteriori from phenomena and observations.

Its foundation and merits the reader may gather from what we have said under the articles *AIR*, *ATMOSPHERE*, and *WEATHER*.

For this *astrology*, Mr. Boyle has a just apology in his *History of the Air*.—Generation and corruption being the extremes of motion, and rarefaction and condensation the mean; he shews, that the effluvia of the heavenly bodies, as we find them immediately contribute to the latter, must also have a mediate influence on the former; and consequently, all physical bodies must necessarily be affected thereby.

It is evident, that the properties of moisture, heat, cold, &c. employed by nature to produce the two great effects of rarefaction and condensation, almost wholly depend on the course, motion, position, &c. of the heavenly bodies.—And it is also clear, that every planet must have its own proper light, distinct from that of any other; light not being a bare visible

quality, but endued with this specific power. The sun, we know, not only shines on all the planets, but by his genial warmth calls forth, excites, and raises the motions, properties, &c. peculiar to them; and his rays must share or receive somewhat of the tincture thereof; and thus tinged be again reflected into the other parts of the world, and particularly the adjacent bodies of the planetary system. Whence, according to the angle the planets make with that grand luminary, and the degree wherein they are enlightened, either by his direct or his oblique rays; together with their distance and situation in respect of our earth; the powers, effects, or tinctures, proper to each, must be transmitted hitherto, and have a greater or less effect on sublunary things. See *Mead de imperio solis et lune*, &c.

Judiciary, or *Judicial ASTROLOGY*, which is what we commonly call *astrology*, is that which pretends to foretell moral events; i. e. such as have a dependance on the free will and agency of man; as if that were directed by the stars.

The professors hereof maintain, "That the heavens are one great volume or book, wherein God has wrote the history of the world; and in which every man may read his own fortune, and the transactions of his time.—"The art, say they, had its rise from the same hands as "astronomy itself: while the ancient Assyrians, whose serene unclouded sky favoured their celestial observations, were intent on tracing the paths and periods of the heavenly bodies, they discovered a constant, settled relation, or analogy, between them and things below; and hence were led to conclude, these to be the *Parce*, the destinies, so much talked of, which preside at our births, and dispose of our future fate.

The laws therefore of this relation being ascertained by a series of observations, and the share each planet has therein; by knowing the precise time of any person's nativity, they were enabled, from their knowledge in astronomy, to erect a theme or horoscope of the situation of the planets, at that point of time: and hence, by considering their degrees of power and influence, and how each was either strengthened or tempered by some other; to compute what must be the result thereof."

Thus the *astrologers*.—But the chief province now remaining to the modern professors, is the making of calendars or almanacs.

Judicial astrology, is commonly said to have been invented in Chaldaea, and thence transmitted to the Egyptians, Greeks, and Romans.—Though some will have it of Egyptian origin, and ascribe the invention to Cham. But it is to the Arabs that we owe it. At Rome the people were so infatuated with it, that the *astrologers*, or, as they were then called, the *mathematicians*, maintained their ground in spite of all the edicts of the emperors to expel them out of the city. See *GENETHLIACI*.

Add, that the Bramins, who introduced and practised this art among the Indians, have hereby made themselves the arbiters of good and evil hours, which gives them a vast authority: they are consulted as oracles; and they have taken care never to sell their answers but at good rates.

The same superstition has prevailed in more modern ages and nations. The French historians remark, that, in the time of queen Catherine de Medicis, *astrology* was in so much vogue, that the most inconsiderable thing was not to be done without consulting the stars. And in the reigns of king Henry III. and IV. of France, the predictions of *astrologers* were the common theme of the court conversation.

This predominant humour in that court was well rallied by Barclay, in his *Argenis*, lib. II. on occasion of an *astrologer*, who had undertook to instruct king Henry in the event of a war then threatened by the faction of the Guises.

"You maintain, says Barclay, that the circumstances of life and death depend on the place and influence of the celestial bodies, at the time when the child first comes to light; and yet you own that the heavens revolve with such vast rapidity, that the situation of the stars is considerably changed in the least moment of time.—What certainty then, can there be in your art; unless you suppose the midwives constantly careful to observe the clock; that the minute of time may be conveyed to the infant as we do his patrimony? How often does the mother's danger prevent this care? and how many are there who are not touched with this superstition? But suppose them watchful to your wish: if the child be long in delivery; if, as is often the case, a hand or the head come first, and be not immediately followed by the rest of the body; which state of the stars is to determine for him? that, when the head made its appearance; or when the whole body was disengaged? I say nothing of the common errors of clocks, and other time-keepers, sufficient to elude all your cares! Again, why are we to regard only the stars at his nativity, and not those rather which shone when the foetus was animated

"animate in the womb? and why must those others be excluded which predated while the body remained tender, and susceptible of the weakest impression, during gestation?

"But setting this aside; and supposing, withal, the face of the heavens accurately known: whence arises this dominion of the stars over our bodies and minds, that they must be the arbiters of our happiness, our manner of life, and death? Were all those who went to battle, and died together, born under the same position of the heavens? and when a ship is to be cast away, shall it admit no passengers but those doomed by the stars to suffer shipwreck? Or rather, do not persons born under every planet go into the combat, or aboard the vessel; and thus, notwithstanding the disparity of their birth, perish alike? Again, all who were born under the same configuration of the stars do not live or die in the same manner. Are all who were born at the same time with the king, monarchs? or are they all even alive at this day? View M. Villeroy, here; nay view yourself: were all that came into the world with him as wife and virtuous as he; or all born under your own stars, astrologers like you? If a man meet a robber, you will say he was doomed to perish by a robber's hand; but did the same stars which when the traveller was born subjected him to the robber's sword, did they likewise give the robber, who perhaps was born long before, a power and inclination to kill him? for you will allow it as much owing to the stars that the one kills, as that the other is killed. And when a man is overwhelmed by the fall of a house, did the walls become faulty because the stars had doomed him to die thereby; or rather, was not his death owing to this, that the walls were faulty?

"The same may be said with regard to honours and employments: because the stars that shone at a man's nativity promised him preferment, could those have an influence over other persons not born under them, by whose suffrages he was to rise? or how do the stars at one man's birth annul or set aside the contrary influences of other stars, which shone at the birth of another?

"The truth is, supposing the reality of all the planetary powers; as the sun, which visits an infinity of bodies with the same rays, has not the same effect on all, but some things are hardened thereby, as clay; others, softened, as wax; some seeds cherished, others destroyed; the tender herbs scorched up, others secured by their coarser juice: so, where so many children are born together, like a field tilled so many different ways, according to the various health, habitude, and temperament of the parents, the same celestial influx must operate differently. If the genius be fuitable and towards, it must predominate therein: if contrary, it will only correct it. So that, to foretell the life and manners of a child, you are not only to look into the heavens, but into the parents, into the fortune which attended the pregnant mother, and a thousand other circumstances utterly inaccessible.

"Further, does the power that portends the new-born infant a life, for instance, of forty years; or perhaps a violent death at thirty; does that power, I say, endure and reside still in the heavens, waiting the destined time, when, descending upon earth, it may produce such an effect? or is it infused into the infant himself; so that being cherished, and gradually growing up together with him, it bursts forth at the appointed time, and fulfils what the stars had given it in charge? persist in the heavens it cannot; in that depending immediately on a certain configuration of the stars; when that is changed, the effect connected with it must cease, and a new, perhaps a contrary one, take place. What repository then have you for the former power to remain in, till the time come for its delivery? If you say it inheres or resides in the infant, not to operate on him till he be grown to manhood; the answer is more preposterous than the former: for this, in the instance of a shipwreck, you must suppose the cause why the winds rise, and the ship is leaky, or the pilot, through ignorance of the place, runs on a shoal or a rock. So the farmer is the cause of the war, that impoverishes him; or of the favourable season which brings him a plenteous harvest.

"You boast much of the event of a few predictions, which, considering the multitude of those your art has produced, plainly confess its impertinency.—A million of deceptions are industriously hidden and forgot in favour of some eight or ten things which have succeeded. Out of so many conjectures it must be preternatural if some did not hit; and it is certain, that, considering you only as guessers, there is no room to boast you have been successful therein. Do you know what fate awaits France in this war; and yet are not apprehensive what shall befall yourself? Did not you foresee the opposition I was this day to make you? If you can say whether the king shall vanquish his enemies; find out first, whether he will believe you."

COELESIAL Observations.

The astronomical observations of the ancients, among which those of Hipparchus make a principal figure, are carefully preserved by Ptolemy in his almagest.

In the year 880, Albategni, a Saracen, applied himself to the making of observations: in 1457, Regiomontanus undertook the province at Norimberg; and his disciples J. Wernerus, and Ber. Waltherus, continued the same from 1475 to 1504. Their observations were published together in 1544.—In 1509, Copernicus, and after him the landgrave of Hesse, and with them Tycho, at Uranibourg, from 1582 to 1601.—All the observations hitherto rehearsed, together with Tycho's apparatus of instruments, are contained in the *Historia Cœlestis*, published in 1672, by order of the emperor Ferdinand.—Soon after, Hevelius, with a still more magnificent and better contrived apparatus of instruments, described in his *Machina Cœlestis*, began a course of observations. It is objected to him that he only used plain sights, and could never be brought to take the advantage of telescopic ones; which occasioned Dr. Hook to write animadversions on Hevelius's instruments, printed in 1674; wherein he too rashly despises them on account of their inaccuracy: but Dr. Halley, who at the instance of the Royal Society went over to Dantzick in the year 1679, to inspect his instruments, approved of their justness, as well as of the observations made with them. See SIGHTS.

Jer. Horrox, and Will. Crabtree, two of our own countrymen, are famous for their observations from the years 1635 to 1645.—They were followed by Flamsteed, Cassini the father and son, Halley, de la Hire, Roemer, and Kirchius.—See further under the articles OBSERVATORY, CATALOGUE, &c.

ASTRONOMICAL Place, of a star or planet, is its longitude, or place in the ecliptic, reckoned from the beginning of Aries, in consequentia, or according to the natural order of the signs.

ASTRONOMY*, ASTRONOMIA, the doctrine of the heavens, and the phenomena thereof.

* The word is compounded of the Greek *αστρον*, star, and *νομος*, law, rule.

Astronomy is properly a mixed mathematical science, whereby we become acquainted with the celestial bodies, their magnitudes, motions, distances, periods, eclipses, &c.

Some understand the word astronomy in a more extensive sense; including under it the theory of the universe, and the primary laws of nature: in which sense it rather seems a branch of physics than of mathematics.

The heavens may be considered two ways; either as they appear to the naked sense, or as they are discovered by the understanding: and hence astronomy is divided into two branches, *spherical* and *theoretical*.

Spherical ASTRONOMY. } See the article } SPHERICAL.
Theoretical ASTRONOMY. } THEORETICAL.

The invention of astronomy has been variously assigned; and several persons, several nations, and several ages have laid claim to it.—From the accounts given us by the ancient historians, it appears that kings were the first inventors and cultivators of it; thus, Belus, king of Assyria; Atlas, king of Mauritania; and Uranus, king of the country situate on the shore of the Atlantic ocean; are severally recorded, as the persons to whom the world owes this noble science.

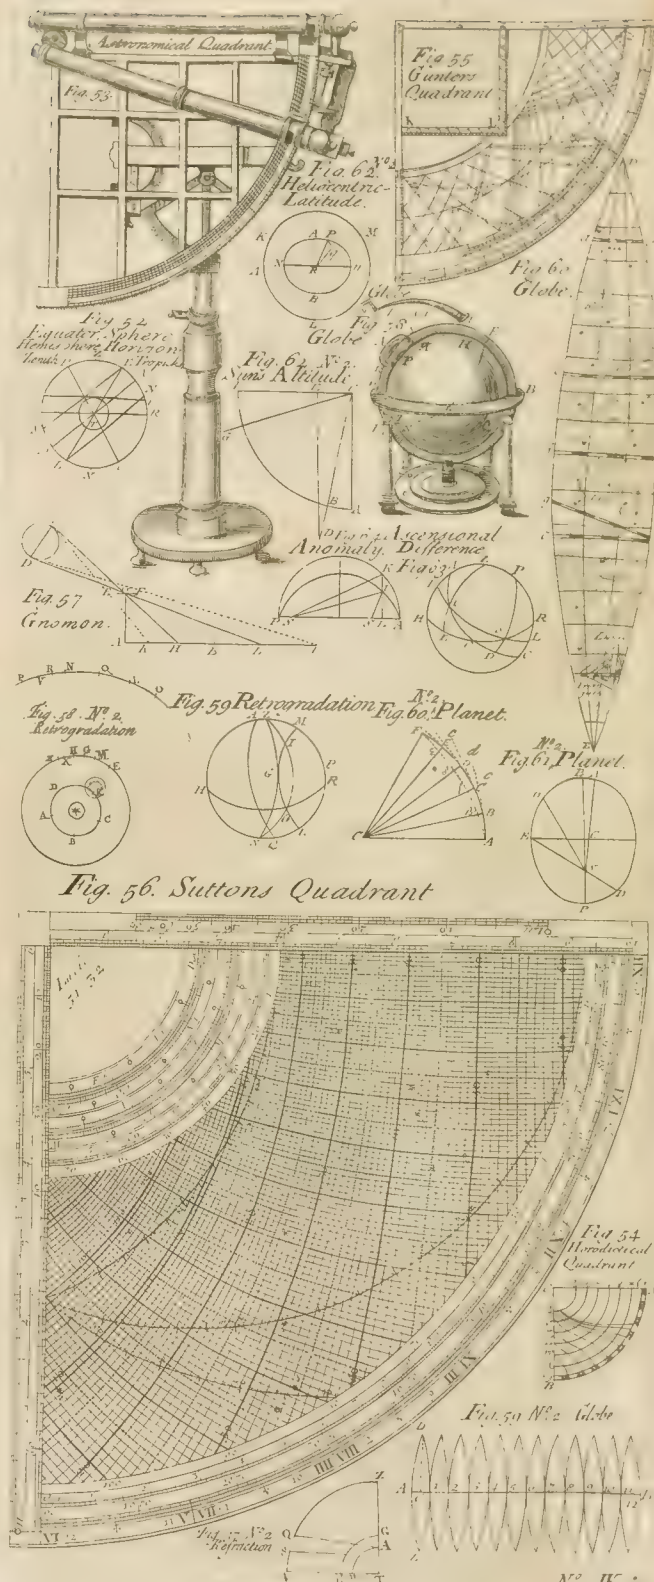

This, at least, is pretty evident, that it was known to those nations long before it came into Greece: agreeably to which, Plato tells us, it was a Barbarian who first observed the heavenly motions; to which he was led by the clearness of the weather in the summer season; as in Egypt and Syria, where the stars are constantly seen, there being no rain or clouds to interrupt the prospect. And the want of this clearness of atmosphere the same author lays down as the reason why the Greeks came so late to the knowledge of astronomy.

The

TAB. ASTRONOMY.

The best Globes of 3 1/2 17 27 Inches Diameter from the latest observations & improvements Made and Sold by Henry Jones over against St. Dunstons church in Fleetstreet London. All her Globes may be known from all others, by having Buyers letters of reference inserted on the External, & the Rhumb lines on the Terrestrial, besides other improvements

The generality of writers fix the origin of *astronomy* and *astrology* in Chaldaea; and accordingly among the ancients we find the word *Chaldaean* frequently used for *astronomers*.—Some chuse however to attribute the invention to the ancient Hebrews; and some, even to the first men; building on the authority of Josephus, and what he mentions about Seth's pillars.—The Mussulmans, with some Jews as well as Christians, ascribe it to Enoch, and other of the Orientals to Cain.—But these opinions appear scarcely probable to others, in regard they find no terms of *astronomy* in the language of those first people, that is, in the Hebrew language; which, on the contrary, are very frequent in the Chaldaean; though it must be owned we have something of this kind in Job, and the books of Solomon.

We do not know whether it is worth noting, that Rudbeck, in his *Atlantica*, maintains *astronomy* to have been invented by the Swedes: his reasons are, the great diversity in the length of the days in that country, which must naturally lead the people to conclude the earth round, and that they lived near one of its extremes: a conclusion which the Chaldaean, and other inhabitants of the middle parts of the globe, had no such easy way of coming at. The Swedes, adds our author, prompted hereby to enquire further into the great opposition of seasons, soon discovered that the sun bounds his progress by a certain space in the heavens, &c.—But we have no historical facts to support this reasoning, which at best only proves that something might be so.

By Porphyry's account, *astronomy* must have been of a very ancient standing in the east; for he tells us, that when Babylon was taken by Alexander, there were brought thence celestial observations for the space of 1903 years, which therefore must have commenced within 115 years of the flood, or within fifteen years of the building of Babel.—Epigenes, according to Pliny, affirmed that the Babylonians had observations of 720 years, engraven on bricks.—Achilles Tatius ascribes the invention of *astronomy* to the Egyptians; and adds, that their knowledge therein was engraven on columns, and by that means transmitted to posterity.

From the Egyptians, *astronomy* is commonly supposed to have passed to the Greeks: Laertius tells us, that Thales, first, about the ninetieth olympiad, and after him Eudoxus and Pythagoras, travelled into Egypt, to be instructed herein; and that this last, in particular, living in a close community with the Egyptian priests for seven years, and being initiated into their religion, was here let into the true system of the universe; which he afterwards taught in Greece and Italy.—He was the first, among the Europeans, who taught that the earth and planets turn round the sun, which stands immovable in the centre; and that the diurnal motion of the sun and fixed stars is not real, but apparent, arising from the earth's motion round its own axis, &c.

Yet Vitruvius represents the introduction of *astronomy* into Greece somewhat differently; maintaining, that Berofus, a Babylonian, brought it thither immediately from Babylon itself; and opened an *astronomical* school in the island of Cos. Plin. lib. 7. c. 37. adds, that, in consideration of his wonderful predictions, the Athenians erected him a statue in the gymnasium, with a gilded tongue.—If this Berofus be the same with the author of the Chaldaean histories, he must have been before Alexander.

After Pythagoras, *astronomy* sunk greatly into neglect; most of the celestial observations brought from Babylon were lost, and it was but a very small number that Ptolemy, in his time, was able to retrieve.—However, some few of his followers continued to cultivate *astronomy*; among whom were Philolaus and Aristarchus Samius.

At length, those patrons of learning, the Ptolemys, kings of Egypt, founding an academy of *astronomy* at Alexandria, there arose several eminent *astronomers* from the same; particularly Hipparchus, who, according to Pliny, undertook what would have been a great work even for a God to achieve, viz. to number the stars, and leave the heavens as an inheritance to posterity: he foretold the eclipses both of the sun and moon for 600 years, and on his observations is founded that noble work of Ptolemy, intitled *μυστήριον σφαιρῶν*. The Sarazens, on their conquest of Egypt, got a tincture of *astronomy*, which they carried with them out of Africa into Spain; and by this means *astronomy* after a long exile, was at length introduced afresh into Europe.

From this time, *astronomy* began to improve very considerably; being cultivated by the greatest genius, and patronized by the greatest princes.—Alphonfus, king of Castile, enriched it with those tables which still bear his name. See TABLE. Copernicus re-established the ancient Pythagorean system; and Tycho Brahe published a catalogue of 770 fixed stars, from his own observations.

Kepler, from Tycho's labours, soon after discovered the true theory of the world: and the physical laws by which the heavenly bodies move.

Galileo first introduced telescopes into *astronomy*, and by their means discovered the satellites of Jupiter; the various

VOL. I.

phases of Saturn, the mountains of the moon, the spots in the sun, and its revolution about its axis. See TELESCOPE, and SATELLITE.

Add, that Hevelius, from his own curious observations, furnished a catalogue of fixed stars, much more complete than Tycho's.—Huygens and Cassini discovered the satellites of Saturn and his ring.—And Gaffendus, Horrox, Bullialdus, Ward, Ricciolus, Galkoign, &c. each contributed very considerably to the improvement of *astronomy*.

The immortal Newton first demonstrated, from physical considerations, the great law that regulates all the heavenly motions, sets bounds to the planets orbs, and determines their greatest excursions from the sun, and their nearest approaches to it.—It was he first taught the world whence arose that constant and regular proportion observed by both primary and secondary planets in their circulation round their central bodies; and their distances compared with their periods.—He has also given us a new theory of the moon, which accurately answers all her inequalities, and accounts for them from the laws of gravity and mechanism. See NEWTONIAN. See also ATTRACTION.

Dr. Halley obliged the world with the *astronomy* of comets, and with a catalogue of the stars in the southern hemisphere; and was a very great benefactor to *astronomy*, by his observations: to which it may be added, that he put in the press a new set of astronomical tables, more accurate than any before published.

Mr. Flamsteed upwards of forty years watched the motions of the stars; and has given us a great number of curious observations of the sun, moon, and planets; besides a noble catalogue of 3000 fixed stars; which is more than double the number in that of Hevelius.—Nothing now seemed wanting to *astronomy*, but an universal and complete theory of the celestial phenomena, explained according to their true motions and physical causes, which has been performed by Dr. Gregory.

ASTRONOMY is sometimes divided, with respect to its different states, into *new* and *old*.

Ancient astronomy is such as the art stood under Ptolemy, and his followers; with all the apparatus of solid orbs, epicycles, excentrics, deferents, trepidations, &c.

The ancient *astronomy* is delivered by Claud. Ptolemy, who died A. D. 147, in his *μυστήριον σφαιρῶν*; translated in 827, into Arabic; and by G. Trapezantius into Latin. An epitome of it, for the use of learners, was made by Purbachius and his scholar Regiomontanus, in 1550; containing the whole doctrine of the heavenly motions, their magnitudes, eclipses, &c.—On the model hereof, Albatagni the Arab compiled another work, on the knowledge of the stars, published in Latin in 1537.

New astronomy is such as the art has been since Copernicus; by whom those fictitious machines were thrown out; and the constitution of the heavens reduced to more simple, natural, and certain principles.

The modern *astronomy* is delivered by Copernicus in his fix books of *Celestial Revolutions*, published about the year 1566; wherein, by retrieving Pythagoras's and Philolaus's dogma of the motion of the earth, he laid the foundation of a juster system.—Kepler's *Commentaries of the motions of Mars*, published in 1609; wherein, in lieu of the circular orbits admitted by all former astronomers, he proposed the elliptic theory; which, in his epitome of the Copernican *astronomy*, published in 1635, he applied to all the planets.—

1st. Bullialdus's *Astronomia Philolaica*, published in 1645, wherein he endeavoured to amend Kepler's theory, and render the calculus more exact and geometrical: some errors committed by Bullialdus were pointed out by Dr. Seth Ward, in his *Inquiry into the Philolaic astronomy*, *Inquisitio in astronomia Philolaica fundamenta*, published in 1653; and corrected by himself in his *Foundations of the Philolaic astronomy more clearly explained*, in 1657.—Ward's *Astronomia geometrica*, published in 1656; wherein a geometrical method is proposed of computing the planets motions; though not consistent with the true laws of their motions established by Kepler. The same was proposed the year following by the count de Pagan. The truth is, Kepler himself does not seem to have been ignorant thereof; but he rather chose to set it aside, as finding it contrary to nature.—Vin. Wing's *Astronomia Britannica*, published in 1669; wherein, going on Bullialdus's principles, he gives just examples of all the precepts in practical *astronomy*, well accommodated to the capacity of learners.—Newton's *Astronomia Britannica*, published in 1657; and Street's *Astronomia Carolina*, in 1661; both upon Ward's hypothesis.

In Ricciolus's *Almagestum novum*, published in 1651, we have the several hypotheses of all the astronomers, ancient as well as modern.—And in Dr. Gregory's *Elementa astronomiae physicae & geometricae*, in 1702, the whole modern astronomy, as founded on the discoveries of Copernicus, Kepler, and Sir Isaac Newton.—The marrow of the old *astronomy* is given by Tacquet, and of the new *astronomy* by Whiston in his *Prælectiones*.

lectiones astronomicæ, in 1707.—For novices in the art, Mercator's *Institutiones astronomicæ*, published in 1676; which contains the whole doctrine, both according to the ancients and moderns; and Dr. Keill's *Introductio ad veram astronomicam*, in 1718, which only takes in the modern, are the best calculated.

ASTYNOMI. See AGORANOMOUS.

ASYLUM*, *ἄσυλον*, a sanctuary or place of refuge, where a criminal who shelters himself is deemed inviolable, and not to be touched by any officer of justice.

* The word is Greek *ἄσυλον*, compounded of the privative particle *α*, and *σύναιω*, I take out, or I hurt; because no person could be taken out of an *asylum* without sacrilege. See SACRILEGE.

The first *asylum* was established at Athens, by the descendants of Hercules, to shelter themselves from the fury of his enemies.

The temples, altars, statues, and tombs of heroes, were, anciently the ordinary retreat of those who found themselves aggrieved by the rigour of the laws, or oppressed by the violence of tyrants; but, of all others, temples were held the most sacred and inviolable refuge. It was supposed that the gods took upon them to punish the criminal who thus threw himself upon them; and that it would be a great impiety in man to take vengeance out of the hands of the immortals.

The Israelites had their cities of refuge, which were of god's own appointment; where the guilty, who had not committed any deliberate crime, found safety and protection.—As to the heathens, they allowed refuge and impunity, even to the vilest and most flagrant offenders, some out of superstition, and others for the sake of peopling their cities; and it was by this means, and with such inhabitants, that Thebes, Athens, and Rome, were first stocked.—We even read of *asylums* at Lyons and Vienne among the ancient Gauls; and there are some cities in Germany which still preserve the ancient right of *asylum*.

Hence, on the medals of several ancient cities, particularly in Syria, we meet the inscription, *ἈΣΥΛΟΙ*, to which is added, *ΙΕΡΑΙ*. For instance, *ΤΥΡΟΣ ΙΕΡΑΣ ΚΑΙ ἈΣΥΛΟΣ ΕΙΔΩΝΟΣ ΙΕΡΑΣ ΚΑΙ ἈΣΥΛΟΥ*.—This quality of *asylum* was given to them, according to M. Spanheim, in regard to their temples, and of the gods revered by them.

The same qualities have also been given to deities: thus Diana of Ephesus is called *ἄσυλος*.—Add that the camp formed by Romulus and Remus was called *asylum*, and afterwards became a city, in which was a temple erected to the god *Asylæus*, *Θεὸς ἀσυλίου*.

The emperors Honorius and Theodosius granting the like immunities to churches, the bishops and monks laid hold of a certain tract or territory, without which they fixed the bounds of the secular jurisdiction: and so well did they manage their privileges, that convents, in a little time, became next a-kin to fortresses; where the most glaring villains were in safety, and braved the power of the magistrate.

These privileges, at length, were extended not only to the churches and church-yards, but also to the bishops' houses, whence the criminal could not be removed without a legal assurance of life, and an entire remission of the crime.—The reason of the extension was, that they might not be obliged to live altogether in the churches, &c. where several of the occasions of life could not be decently performed.

But, at length, these *asylæ*, or sanctuaries, were also stripped of most of their immunities, in regard they served to make guilt and libertinage more daring and bold-faced. In England, particularly, they were entirely abolished. See the article SANCTUARY.

ASYMMETRY*, *Ἀσυνμετρία*, a want of proportion, or correspondence between the parts of a thing. See SYMMETRY.

* The word is derived from the privative particle *α*, *σύν*, with, and *μετρεω*, measure, q. d. without measure.

In mathematics, the term is particularly used for what we more usually call *incommensurability*; which is when between two quantities there is no common measure: as between the side, and diagonal of a square.—In numbers, surd roots, as $\sqrt{2}$, &c. are incommensurable to rational numbers.

ASYMPTOTE*, in geometry, a line which continually approaches nearer and nearer to another, yet will never meet therewith, tho' indefinitely prolonged. See LINE.

* The word is compounded of the privative particle *α*, *σύν*, with, and *πίπτω*, I fall; q. d. incoincident, or which never meet.—Some Latin Authors call these lines *intactæ*.

Bertinus rehearses divers sorts of *asymptotes*; some straight, others curve; some concave, others convex, &c. and further, proposes an instrument to describe them withal.—Though, in strictness, the term *asymptotes* seems appropriated to right lines.

ASYMPTOTES, then, are properly right lines, which approach nearer and nearer to some curve, of which they are said to be

the *asymptotes*; but which, though they and their curve were indefinitely continued, would never meet.

Asymptotes may be conceived as tangents to their curves at an infinite distance.

Two curves are also said to be *asymptotical*, when they thus continually approach, without a possibility of meeting.—Thus two parabolas, whose axes are in the same right line, are *asymptotical* to one another.

Of curves of the second kind, that is, the conic sections, only the hyperbola has *asymptotes*, which are two in number, long ago demonstrated by Apollonius Pergæus.

All curves of the third kind have at least one *asymptote*, but they may have three; and all curves of the fourth kind may have four *asymptotes*.

The conchoid, cissoid, and logarithmic curve, though not reputed geometrical curves, have each also one *asymptote*.

The nature of *asymptotes* will be easily conceived in the instance of the *asymptote* of a conchoid.—Suppose M M A M, &c. (*Tab. Analysis*, fig. 1.) be a part of a conchoid, C its pole, and the right line BD, to draw that the parts Q M, E A, O M, &c. of right lines drawn from the pole C, are equal to each other: then will the line BD be an *asymptote* of the curve: because the perpendicular M I, &c. is shorter than M O, and M R than M Q, &c. so that the two lines continually approach; yet the points M, &c. and R, &c. can never coincide, in regard there is still a portion of a line to keep them asunder; which portion of a line is infinitely divisible, and consequently must be diminished infinitely ere it become nothing.

ASYMPTOTES of the hyperbola are thus described.—Suppose a right line DE (*Tab. Conici*, fig. 20.) drawn through the vertex A of the hyperbola, parallel to the ordinates M m, and equal to the conjugate axes, viz. the part DA, and that AE to the semi-axis: then, two right lines drawn from the centre C of the hyperbola, through the points D and E, viz. the right lines CF and CG, are *asymptotes* of the curve.

If the hyperbola G M R, (*fig. 12. n. 2.*) be of any kind whose nature with regard to the curve and its *asymptotes*, is expressed, by this general equation $x^m y^n = a^m + n$; and the right line PM be drawn any where parallel to the *asymptotes* CS, and the parallelogram P C O M, be completed: this parallelogram is to the hyperbolic space P M G B, contained under the determinate line PM, the curve of the hyperbola G M indefinitely continued towards G, and the part P B of the *asymptote* indefinitely continued the same way, as $m - n$ is to n : and so if m be greater than n , the said space is squareable; but when $m = n$, as it will be in the common hyperbola, the ratio of the foregoing parallelogram to that space is as 0 to 1; that is, the space is infinitely greater than the parallelogram, and so cannot be had: and when m is less than n , the parallelogram will be to the space, as a negative number to a positive one, and the said space is squareable, and the solid generated by the revolving of the indeterminate space G M O L about the *asymptote* CE, is double of the cylinder generated by the motion of the parallelogram P C O M about the axis CO.

ASYMPTOTE of a logarithmic curve.—If MS (*fig. 33.*) be the logarithmic curve, PR an *asymptote*, PT the subtangent, and MP an ordinate; then will the indeterminate space R P M S = P M × P T; and the solid, generated by the rotation of this curve about the *asymptote* V P, will be $\frac{1}{2}$ of a cylinder whose altitude is equal to the length of the subtangent, and the semidiameter of the base equal to the ordinate Q V.

ASYMPTOTIC Spaces. See HYPERBOLA.

ASYNDETON*, *Ἀσυνδeton*, a figure in grammar, implying a defect, or want of conjunctions in a sentence.

* The word is derived from the privative *α*, and *σύνδω*, colligē, I bind together.

As, in the instance, *veni, vidi, vici*, I came, I saw, I conquered; where the copulative *et*, and, is omitted: or in that of Cicero concerning Catiline, *abijt, exijt, evajst, erupit*: or in that verse of Virgil,

Ferte citi flammæ, date vela, impellite remos.

Asyndeton stands opposed to *polyjndeton*, where the copulatives are multiplied.

ATARAXY*, *Ἀταξία*, a term much used by the Sceptics, and Stoics, to denote that calmness, and tranquillity of mind, and that firmness of judgment which sets us free from any agitations or emotions arising from self-opinion, and the knowledge we imagine ourselves possessed of.

* The word is purely Greek, compounded of *αταρ*, but; and *ταξίς*, order.

In this *ataraxy*, they supposed the sovereign good, or highest bliss in this life to consist.

ATAXY*, *Ἀταξία*, a want of order or regularity.

* The word is compounded of the privative *α*, and *ταξίς*, order.

Ataxia is chiefly used in medicine, where the order of the critical days, or other phenomena of a disease, is inverted.

The

The physicians have frequent recourse to an *atony*, or irregularity of the spirits, when at a loss to account for any disorder in the body. The spirits, Dr. Drake observes, being always at hand, are forced to bear the blame of a thousand things they are innocent of.

ATCHEVEMENT *, in heraldry, the coat of arms of any person or family, duly marshalled with its external ornaments or supporters, helmet, wreath, crest and motto.

* The word is formed of the French, *achevement*, finishing, consummation, perfection.

Such are those usually hung out on the fronts of houses after the death of some considerable person; now corruptly called *hatchments*.

ATELLANÆ, in antiquity, a kind of comic and satyric pieces, presented on the Roman theatre; somewhat less ludicrous than the farces on the English stage, and yet less grave and serious than the Greek and Latin comedies and tragedies.

The *atellane*, or *fabule atellane* of the Romans, answered to the *satyræ* among the Greeks.

They were thus called from *Atella*, a city of Tuscany, where they were first represented; and from whence, on account of their mirth and humour, they were introduced into Rome.

But they became at length so licentious, and impudent, that the senate was obliged to suppress them.

ATHAMADULET *, or **ATHEMADAULET**, the prime or chief minister in the Persian empire.

* The word, according to Kempter, is properly written in the Persian *athemaad dauleh*: according to Tavernier, *athemadulet*: according to Sanfon, *elmadulet*.—Authors suppose it originally Arabic, and compounded of *itimad* and *daulet*, that is, the trust of majesty; or according to Tavernier, the support of riches; according to Kempter, the prop and refuge of the court.

The *athamadulet* is much the same with the grand vizier in Turkey: excepting that he has not the command of the army, which the vizier has.

The *athamadulet* is great chancellor of the kingdom, president of the council, superintendent of the finances; and has the charge of all foreign affairs.—He is in effect vice-roy, or administrator of the kingdom: he issues the king's mandates, or orders, in this stile, *Bende derga ali il alia ethamadulet*, that is, I who am the support of the power, the creature of this port, the highest of all ports, &c.

ATHANASIAN Creed. See **CREED**, and **TRINITY**.

ATHANATI *, an order of soldiers among the ancient Persians.

* The word is originally Greek, and signifies *immortal*; being compounded of the privative *a*, and *thanatos*, death.

The *Athanati* were a body of cavalry, consisting of ten thousand men, always complete, because, when any one of them died, another was immediately put into his place.—It was for this reason that they were called *athanati* by the Greeks, by the Latins *immortales*.

ATHANOR *, in chymistry, a large immoveable furnace, built of brick and earth, and covered with a tower at the top; proper to maintain a temperate and equal degree of heat for a considerable time.

* The word *athanor* is borrowed from the Arabs, who call an oven, *tannour*, from the Hebrew תַּנּוּר, *tannour*, an oven, or furnace; whence, with the additional particle אל, אֶתְנָנֹר, *athanour*, &c.—Others chuse to derive the name from the Greek ἀθάνατος, *immortal*, because of its durable fire.

The heat of the *athanor* is intended or remitted by opening or shutting a register. It is made to communicate its heat by tubes or apertures at the side of the hearth or fire-plate, to several adjacent vessels; by which means different operations are carried on at the same time.

The *athanor* is also called *piger Henricus*, *slow Harry*; because chiefly used in the flower operations; and because, when once filled with coals, it keeps burning a long time; whence the Greeks call it ἀσπός, *g. d.* giving no trouble, as it does not need to be continually attended.—It is also called the *philosophical furnace*, or *furnace of archæa*; sometimes *uterus chymicus*, or *spagyricus*; and popularly the *tower furnace*, *furnus turritus*.

ATHEIST *, *Atheos*, a person who denies the Deity; who does not believe the existence of a God, nor a providence; and who has no religion true nor false.

* The word is derived from the privative *a*, and *theos*, God.

In general, a man is said to be an *atheist* who owns no being superior to nature, that is, to men and the other sensible beings in the world.

In this sense, Spinoza may be said to be an *atheist*; and it is an impropriety to rank him, as the learned commonly do, among *deists*; since he allows of no other God beside nature, or the universe, of which mankind makes a part; and there is no *atheist* but allows of the existence of the world, and of his own existence in particular.

Plato distinguishes three kinds of *atheists*.—Some, who deny absolutely that there are any gods; others who al-

low the existence of gods, but maintain that they do not concern themselves with human affairs, and so deny a providence; and others who believe there are gods, but think they are easily appeased with a little prayer, or the like; and that they remit the greatest crimes for the smallest supplication.

Some distinguish *speculative atheists*, or those who are so from principle, and theory—from *practical atheists*, whose wicked lives lead them to believe, or rather to wish, that there were no God.

Cicero represents it as a probable opinion, that they who apply themselves to the study of philosophy believe there are no gods.—This must doubtless be meant of the academic philosophy, to which Cicero himself was attached; and which doubted of every thing: on the contrary, the Newtonian philosophers are continually recurring to a deity, whom they always find at the end of their chain of natural causes*. Some foreigners have even charged them with making too much use of the notion of a God in philosophy, contrary to the rule of Horace: *Nec deus interit, nisi dignus vindice nodus*.

* Among us, the philosophers have been the principal advocates for the existence of a deity.—Witness the writings of Boyle, Ray, Cheyne, Nieuentit, &c. To which may be added divers others, who, though of the clergy, (as was also Ray) yet have distinguished themselves by their philosophical pieces in behalf of the existence of a God. *e. gr.* Derham, Bentley, Whiston, Sam, and John Clark, Fenelon, &c.—So true is that saying of Lord Bacon, that though a smattering of philosophy may lead a man into atheism, a deep draught will certainly bring him back again to the belief of a God and Providence!

ATHELING *, among our Saxon ancestors, was a title of honour properly belonging to the heir apparent or presumptive to the crown.

* The word is formed from the Saxon *Ætheling*, of *Æthel*, noble.—It is sometimes also written *Adeling*, *Edling*, *Ethling*, and *Etheling*.

King Edward the confessor being without issue, and intending to make Edgar, to whom he was great uncle by the mother's side, his heir; first gave him the honourable appellation of *Atheling*.

Antiquaries observe, that it was frequent among the Saxons to annex the word *ling* or *ing* to a christian name, to denote the son, or younger; as Edmundling for the son of Edmund, Edgaring for the son of Edgar: on which footing some have thought *Atheling* might primarily import the son of a nobleman or prince.—But, in reality, *Atheling*, when applied to the heir to the crown, seems rather to denote a person endowed with noble qualities, than the son of a nobleman, and corresponds to the *nobilis Cæsar* among the Romans.

ATHENÆA, *Adonia*, a feast of the ancient Greeks, held in honour of Minerva, who was called *Adona*. See **FEAST**.

These were afterwards called *Panathenæa*: See **PANATHENÆA**.

ATHENÆUM *, in antiquity, a public place wherein the professors of the liberal arts held their assemblies, the rhetoricians declaimed, and the poets rehearsed their verses.

* The word is Greek, and is derived from *Athena*, a learned city, where many of these assemblies were held; or from the Greek name of Pallas, *Adona*, goddess of science; intimating that *Athenæum* was a place consecrated to Pallas, or set apart for the exercises over which the presides.

The *athenæa* were built in form of amphitheatres; and were all encompassed with seats, which Sidonius calls *cunei*.

The three most celebrated *athenæa* were those at Athens, at Rome, and at Lyons; the second of which, according to Aurelius Victor, was built by the emperor Adrian.

ATHEROMA, *Asyrops*, in medicine, a kind of tumour, of a pappy confidence, without pain, or discolouring the skin. The *atheroma* is contained in a cystis, or membranous bag; and does not give way when touched with the finger, nor retain any dent after pressure.

The *atheroma* is thus called from the Greek *asps*, a kind of pap or pulp, which the matter of this tumour resembles.—It is near a-kin to the Meliceris and Stomatia; and is cured like them by section.

ATHLETÆ *, in antiquity, persons of strength and agility, disciplined to perform in the public games.

* The word is originally Greek, *athletis*, formed from *adlos*, *certamen*, combat; whence also *adlos*, the prize or reward adjudged the victor.

Under *athletæ* were comprehended wrestlers, boxers, runners, leapers, throwers of the disk, and those practised in other exercises exhibited in the Olympic, Pythian, and other solemn sports; for the conquerors wherein, there were established prizes.

From the five usual exercises, the *athletæ* were also denominated *pentadon*, and by the Latins *quinguerones*; at least such as professed them all.

ATHLETIC Crown. See the article **CROWN**.

ATIA. See the article **ODIO** et **Atia**.

ATLANTIC Ocean. See the article **OCEAN**.

ATLANTIS,

ATLANTIS, in antiquity, an island spoke of by Plato, and many other writers, under some extraordinary circumstances; and rendered famous by a controversy among the moderns, concerning its place and existence.

- The *Atlantis* took its name from *Atlas*, Neptune's eldest son, who, they tell us, succeeded his father in the government thereof.

The most distinct account of this celebrated country, is given us in Plato's *Timæus*, and *Critias*; which amounts, in a few words, to what follows. "The *Atlantis* was a large island in the western ocean, situate before, or opposite to, the straits of Gades. Out of this island there was an easy passage into some others, which lay near a large continent exceeding all Europe and Asia. Neptune settled in this island, which he distributed among his ten sons; to the youngest fell the extremity of the island called *Gadir*, which in the language of the country signifies *fertile*, or *abundant in sheep*. The descendants of Neptune reigned here from father to son, for a great number of generations, in the order of primogeniture, during the space of 9000 years. They also possessed several other islands; and passing into Europe and Africa, subdued all Libya as far as Egypt, and all Europe to Asia Minor. At length the island sunk under water; and, for a long time afterwards, the sea thereabouts was full of flats and shelves."

The learned Rudbeck, professor in the university of Upsal, in an express treatise intitled, *Atlantica fve Manheim*, maintains, very strenuously, that Plato's *Atlantis* is Sweden and Norway; and attributes to his country, whatever the ancients have said of their *Atlantis* or *Atlantic* island.—But after the little abridgment we have given of Plato's account, the reader will be surprized to find Sweden taken for the *Atlantis*; and accordingly, though Rudbeck's work be full of uncommon erudition, the author passes for a visionary in this point. Others will have America to be the *Atlantis*; and hence infer, that the new world was not unknown to the ancients: but what Plato says, does by no means quadrate thereto.—America should rather seem to be the vast continent beyond the *Atlantis*, and the other islands mentioned by Plato.

Kircher, in his *Mundus subterraneus*, and Becman, in his *History of islands*, chap. 5. advance a much more probable opinion than that of Rudbeck.—The *Atlantis*, according to them, was a large island which extended from the Canaries to the Azores; and these islands are the remains thereof not swallowed up by the sea.

ATLAS, in architecture, is a name given to those figures, or half-figures of men, sometimes used instead of columns, or pilasters; to support any member of architecture, as a balcony, or the like.

These are otherwise called *Telamones*. See TELAMON.

ATLAS, in anatomy, the name of the first vertebra of the neck, which supports the head.—See *Tab. Anat. (Osteol.)* fig. 6.

It is so called in allusion to the celebrated mountain *Atlas*, in Africa, which is so high, that it seems to bear the heavens; and to the fable, in which, *Atlas*, the king of this country, is said to bear the heavens on his shoulders.

The *Atlas* has no spiny apophyses; because the motions of the head do not turn on this vertebra, but on the second. As it is obliged to turn about as often as the head moves round, had there been any spiny apophyses, it would have incommoded the motion of the muscles in the extension of the head.—It is also of a finer and firmer texture than the other vertebrae; and differs further from them in that those receive at one end, and are received at the other, whereas this receives at both extremes; for two eminences of the occiput are inserted within its two upper cavities, which makes its articulation with the head: and, at the same time, two other eminences of the second vertebra are received within its two lower cavities, by means of which they are articulated together.

ATLAS is also a title given to books of universal geography, containing maps of the known parts of the world; as if they were viewed from the top of that celebrated mountain, which the ancients esteemed the highest in the world; or rather on account of their holding the whole world like *Atlas*.

We have also *Atlas*'s of particular parts, *Isa-atlas*'s, &c.—

The first work under this denomination was the *Great Atlas* of Blaeuw.

ATMOSPHERE, ATMOSPHERA, an appendage of our earth; consisting of a thin, fluid, elastic substance, called *air*, which surrounds the terraqueous globe to a considerable height, gravitates towards its centre, and on its surface is carried along with it, and partakes of all its motions both annual and diurnal.

By *atmosphere* is usually understood the whole mass, or assemblage of ambient air: though, among some of the more accurate writers, the *atmosphere* is restrained to that part of the air next the earth, which receives vapours and exhalations; and is terminated by the refraction of the sun's light. The further or higher spaces, though perhaps not wholly destitute of air, are supposed to be possessed by a finer sub-

stance called *æther*; and are hence denominated the *æthereal* region, or space.

A late eminent author considers the *atmosphere* as a large chymical vessel, wherein the matter of all the kinds of sub-lunary bodies is copiously floating; and thus exposed to the continual action of that immense furnace the sun; whence innumerable operations, sublimations, separations, compositions, digestions, fermentations, putrefactions, &c.

For the nature, constitution, properties, uses, diversities, &c. of the *atmosphere*, see the article AIR.

We have a large apparatus of instruments, contrived for indicating and measuring the state and alterations of the *atmosphere*; as, barometers, thermometers, hygrometers, manometers, anemometers, &c. see each under its proper article, BAROMETER, THERMOMETER, HYGROMETER, &c.

The *atmosphere* insinuates itself into all the vacuities of bodies; and thus becomes the great spring of most of the mutations here below; as generation, corruption, dissolution, &c. See GENERATION, CORRUPTION, DISSOLUTION, &c. It is one of the great discoveries of the modern philosophers, that the several motions attributed by the ancients to a *fyga vacui*, are really owing to the pressure of the *atmosphere*. To the same is also in a great measure owing the cohesion of bodies.

Weight of the ATMOSPHERE.—Organical bodies are peculiarly affected by this pressure: to this, plants owe their vegetation; and animals their respiration, circulation, nutrition, &c. To this also we owe several considerable alterations in the animal economy, with regard to health, life, disease, &c.

And hence, a calculus of the precise quantity of this pressure becomes a point worthy of attention.—Our bodies, then, are equally pressed on by the incumbent *atmosphere*; and the weight they sustain is equal to a cylinder of air, whose base is equal to the superficies of our bodies.—Now, a cylinder of air of the height of the *atmosphere* is known to be equal to a cylinder of water of the same base, and thirty-five foot high; or a cylinder of mercury, twenty-nine inches high; as appears from the Torricellian experiment; as also from the height to which water ascends in pumps, siphons, &c. Hence it follows, that every foot square of the superficies of our bodies, is pressed upon by a weight of air equal to thirty-five cubical feet of water; and a cubical foot of water, being found by experiment to weigh seventy-six pound Troy weight, therefore the compass of a foot square upon the superficies of our bodies sustains a quantity of air equal to 2260 pound: for $76 \times 29 = 2260$; and so many foot square as the superficies of our body contains, so many times 2260 pound does that body bear.

Hence, if the superficies of a man's body, contain fifteen square feet, which is pretty near the truth, he will sustain a weight equal to 33900 pound, for $2260 \times 15 = 33900$, which is above thirteen tun for the ordinary load.

The difference of the weight of the air which our bodies sustain at one time more than at another, is also very great.

—The whole weight of air which presses upon our bodies, when the mercury is highest in the barometer, is equal to 39900 pounds. Whence, the difference between the greatest and the least pressure of air upon our bodies, may be proved to be equal to 3982 pounds.

The difference of the air's weight, at different times, is readily measured by the different height to which the mercury is raised in the barometer; and the greatest variation of the height of the mercury being three inches, a column of air of any assignable base equal to the weight of a cylinder of mercury of the same base, and of the altitude of three inches, will be taken off from the pressure upon a body of an equal base, at such times as the mercury is three inches lower in the barometer; so that every inch square of the surface of our bodies, is pressed upon at one time more than another, by a weight of air equal to the weight of three cubical inches of mercury.—Now a cubical foot of water being seventy-six pound; a cubical foot of mercury is 1064 pound $= 102144$ drams: and as 102144 drams is to a cubical foot, or, which is all one, 1728 cubical inches, so is $59 \frac{1}{2} \frac{2}{3}$ drams, to one cubical inch. So that a cubical inch of mercury being very near 59 drams; and there being 144 square inches in a foot square, therefore a mass of mercury of a foot square, $= 144$ square inches, and if three inches high, must contain 432 cubical inches of mercury, which $\times 59$ (the number of drams in a cubical inch of mercury) makes 25488 drams.—And this weight does a foot square of the surface of our bodies, sustain at one time more than at another.

Suppose again, the superficies of an human body $= 15$ foot square; then would the body sustain at one time more than at another, a weight $= 15 \times 25488 = 382230$ drams $(= 47790$ ounces) $= 3890 \frac{1}{2}$ pound Troy.

Hence, it is so far from being a wonder that we sometimes suffer in our health by a change of weather, that it is the greatest wonder we do not always suffer.—For when we consider that our bodies are sometimes pressed upon by near a tun and a half weight more than at another, and that this variation is often

often very sudden; it is surprising that every such change does not entirely break the frame of our bodies to pieces. In effect, the vessels of our bodies being so much straightened by an increased pressure, would stagnate the blood up to the very heart, and the circulation would quite cease, if nature had not wisely contrived, that when the resistance to the circulating blood is greatest, the impetus by which the heart contracts, should be so too.—For, upon an increase of the weight of the air, the lungs will be more forcibly expanded, and thereby the blood will be more intimately broken and divided, so that it becomes fitter for the more fluid secretions, such as that of the nervous fluid; by which the heart will be more strongly contracted. And the blood's motion towards the surface of the body being obstructed, it will pass in greater quantity to the brain, where the pressure of the air is taken off by the cranium; upon which score also, more spirits will be separated, and the heart on that account too be more enabled to carry on the circulation, through all passable canals, whilst some others, towards the surface, are obstructed. The most considerable alteration made in the blood, upon the air's greater or lesser pressure on the surface of our bodies, is its rendering the blood more or less compact, and making it crowd into a less, or expand into a greater space, in the vessels which it enters.—For the air contained in the blood always keeps itself in equilibrium with the external air that presses upon our bodies; and this it does by a constant assiduity to unbend it self, which is always proportionable to the compressing weight by which it was bent: so that if the compression or weight of the circumambient air be ever so little abated, the air contained within the blood unfolds its springs, and forces the blood to take up a larger space than it did before.

The reason we are not sensible of this pressure is well explained by Borellus, *de mot. nat. a grav. fac. prop. 29, &c.*—After shewing that sand perfectly rammed in a hard vessel is not capable by any means of being penetrated or parted, not even by a wedge; and likewise that water contained in a bladder compressed equally on all sides, cannot yield or give way in any part; he proceeds, “in like manner, within the skin of an animal are contained a diversity of parts, some hard, as bones; others soft, as muscles, nerves, membranes, &c. others fluid, as blood, fat, &c. Now it is not possible the bones should be broke or displaced in the body, unless the weight lay heavier on one part than on another, as we sometimes see in porters. If the pressure be subdivided, so that it lie equally all around, upwards, downwards, and sideways, and no part of the skin be exempt therefrom, it is evidently impossible any fracture or luxation should follow. The same may be observed of the muscles and nerves; which, though soft, yet being composed of solid fibres, do mutually sustain each other, and resist the common weight. The same holds of blood, and the other humours; and as water does not admit any manifest condensation, so the animal humours contained in their vessels may suffer an attrition from an impulse made in one or more particular places, but can never be forced out of their vessels by an universal compression.—It follows, that as none of the parts undergo either separation, luxation, confusion, or any other change of situation; it is impossible any sense of pain should ensue, which can only be the effect of a solution of continuity.” This is confirmed by what we see in Divers, &c.

The same is farther confirmed by Mr. Boyle; who including a young frog in a vessel half full of water, and intruding so much air as that the water may sustain eight times the weight it otherwise would; yet the animalcule, notwithstanding the great tenderness of its skin, did not seem to be at all affected thereby.

For the effects of the removal of the pressure of the atmosphere, see AIR-pump.—For the cause of the variations in the weight and pressure of the atmosphere, see BAROMETER.

Height of the ATMOSPHERE.—The height of the atmosphere is a point about which the modern naturalists have been very solicitous.—Had not the air an elastic power, but were it every where of the same density, from the surface of the earth to the extreme limit of the atmosphere, like water, which is equally dense at all depths; it being above observed that the weight of the column of air, reaching to the top of the atmosphere, is equal to the weight of the mercury contained in the barometer; and the proportion of weight likewise being known between equal bulks of air and mercury; it were easy to find the height of such column, and consequently that of the atmosphere itself.—For a column of air one inch high, being to an equal column of mercury, as 1 to 10800; it is evident, that 10800 such columns of air, that is, a column 900 foot high, is equal in weight to one inch of mercury: and consequently, the 30 inches of mercury sustained in the barometer require a column of air 27000 foot high, on which footing the height of the atmosphere would only be 27000 foot, or little more than five English miles high.

But the air, by its elastic property, being liable to expand and contract; and it being found by repeated experiments in

England, France, and Italy, that the spaces it takes up, when compressed by different weights, are reciprocally proportional to those weights themselves; or, that the air takes up the less space, the more it is pressed: it follows, that the air in the upper regions of the atmosphere, where the weight is so much less, must be much rarer than nearer the surface of the earth; and consequently, that the height of the atmosphere must be much greater than is above assigned.

If we suppose the height of the whole atmosphere divided into innumerable equal parts; the density of the air in each of the said parts being as its quantity, and the weight of the atmosphere being also as the quantity of the whole incumbent air; it is evident, the weight of the incumbent air is every where as the quantity of air contained in the subjacent part, which makes a difference between every two contiguous parts of incumbent air.—Now, we have a theorem in geometry, that where the differences of magnitudes are geometrically proportionable to the magnitudes themselves, those magnitudes are in continual arithmetical proportion: wherefore if, according to the supposition, the altitude of the air, by the continual addition of the new parts into which it is divided, do increase in a continual arithmetical proportion; its density will be diminished, or, which amounts to the same, its gravity increased, in continual geometrical proportion.

From such a series it is easy, by making two or three barometrical observations of the rarity of the air at two or three different heights, to find its rarity at any other height, or the height corresponding to any rarity; and consequently the altitude of the whole atmosphere, supposing the utmost degree of rarity known, beyond which the air cannot go. See the articles BAROMETER, SERIES, PROGRESSION, &c. See also Greg. *astron. phys. geom. leg. 5. prop. 3.* and Hally in Philosoph. Transact. N^o 181.

It must not be here omitted, that some observations made by Cassini, and his associates, seem to render this method precarious.—In continuing the meridian line of the observatory at Paris, they measured the altitudes of several mountains with great accuracy; noting the height of the barometer at the top of each; and found, that the rarefactions of the air, as you ascend from the level of the earth, are much greater than they ought to be, according to this proportion.

Suspecting, therefore, the justness of the experiments, the royal academy made divers others, under great dilatations of air, far exceeding the rarities found on the tops of the mountains; the result whereof was, that they all exactly answered the proportion of the incumbent weights. Whence it should follow, that the higher air about the tops of mountains is of a different nature, and observes a different law from that near the earth.

The reason hereof may be owing to the great quantity of gross vapours and exhalations here, more than there; which vapours being less elastic and not capable of so much rarefaction as the pure air above: the rarefactions of the pure air increase in a greater ratio than the weights diminish.—M. Fontenelle, however, from some experiments made by M. de la Hire, accounts for the phenomenon in a different manner; alledging, that the elastic power of air is increased by the admixture of humidity therewith; and consequently, that the air near the tops of mountains, being moister than that below, becomes thereby more elastic, and rarefies in a greater ratio than naturally and in a drier state it would.—But Dr. Jurin shews, that the experiments produced to support this system are by no means conclusive. *Append. ad Varenii geograph.*

Be this as it will, the rarities of the air at different heights proving not to bear any constant proportion to the weights wherewith they are pressed; experiments made with barometers at the feet and tops of mountains cannot give the height of the atmosphere: since our observations are all made near the earth; whereas the greater part of the atmosphere is far beyond; and the farther from us, the farther does it seem to recede from the nature and laws of ours.—M. de la Hire, therefore, after Kepler, has recourse to the more ancient, simple, and secure way of ascertaining the height of the atmosphere; viz. from the consideration of the crepusculum.

It is allowed by astronomers, that when the sun is 18° below the horizon we begin or cease to see the twilight: now the ray whereby we see it can be no other than a horizontal line, or a tangent to the earth in the place where the observer is. But this ray cannot come directly from the sun, which is under the horizon; and must therefore be a ray reflected to us by the last inner and concave surface of the atmosphere. We are to suppose that the sun, when 18° below the horizon, emits a ray which is a tangent to the earth, and strikes upon this last surface of the atmosphere, and is thence reflected to our eye, being still a tangent, and horizontal.—If there were no atmosphere, there would be no crepusculum; and consequently, if the atmosphere were not so high as it is, the crepusculum would begin and end when the sun is at a less distance from the horizon than 18°, and contrarily.—Hence we gather, that the largeness of the arch, by which the sun is depressed when the crepusculum begins or ends, determines the height of the atmosphere. We are to note however, that

32 must be subtracted from the arch of 18° , for the refraction which raises the sun so much higher than he would be; and $16'$ more for the height of the upper limb of the sun, which is supposed to send the ray, above his centre, which is supposed to be $13''$ low. The remaining arch, therefore, which determinates the height of the *atmosphere*, is only $17^\circ 12'$. Two rays, one direct, and the other reflected, but both tangents to the earth, must necessarily meet in the *atmosphere* at the point of reflection, and comprehend an arch between them of $17^\circ 12'$, whereof they are tangents.—Hence it follows from the nature of the circle, that a line drawn from the centre of the earth, and cutting the arch in two, will go to the point of concurrence of those two rays; and as it is easy finding the excess of this line above the semidiameter of the earth, which is known, it is easy to find the height of the *atmosphere*, which is only that excess.—On this principle M. de la Hire discovers the height of the *atmosphere* to be 37223 fathoms, or near 17 French leagues. The same method was also made use of by Kepler, who only rejected it, because it gave the height of the *atmosphere* 20 times greater than he otherwise allowed it.

It must be added, that in this calculus the direct and reflected rays are supposed to be right lines; whereas in fact they are curves, formed by the perpetual refraction the rays undergo in passing through a series of different densities of air.—Computing then upon them, as two similar curves; or rather as a single curve, one extremity whereof is a tangent to the earth; its vertex, equally distant from both the extremes, determinates the height of the *atmosphere*; which therefore, will be found somewhat lower than in the former case; the point of concurrence of two right lines, which are here only tangents to the curve, the one at one end, and the other at the other, being higher than the vertex of the curve. On this footing, M. de la Hire finds the *atmosphere* 35362 fathoms, or 16 leagues. *Hist. de l'Acad. Roy. des sciences. an. 1713. p. 71.* See the articles REFRACTION, CREPUSCULUM, &c.

Lunar ATMOSPHERE.—That the moon is surrounded, like the earth, with a changeable *atmosphere*, see evinced under the article MOON.

The reality of the *atmospheres* of the other planets, see also under the article PLANE.

For the *atmospheres* of comets, and the sun, see COMET and SUN.—See also MACULÆ.

ATMOSPHERE of the Sun. See SUN, and ZODIACAL Light.

ATMOSPHERE of solid or consistent bodies is a kind of sphere formed by the effluvia, or minute corpules, emitted from them.

Mr. Boyle endeavours to shew that all bodies, even the hardest and most coherent, as gems, &c. have their *atmospheres*. See GEM.

ATOM*, *ἄτομος*, in philosophy, a part, or particle of matter, so minute as to be indivisible.

* The word is Greek, *ἄτομος*; formed of the privative *a*, and *τομή*, I cut, I divide.

Atoms are properly the *minima naturæ*, the last or ultimate particles into which bodies are divisible; and are conceived as the first rudiments, or component parts of all physical magnitude; or the pre-existent and incorruptible matter whereof bodies were formed.

The notion of *atoms* arises hence, that matter is not divisible in infinitum.

And hence the Peripatetics are led to deny the reality of *atoms*, together with that of mathematical points: an *atom*, say they, either has parts, or it has none: if it have none, it is a mere mathematical point: if it have, then do these parts also consist of others, and so on to infinity.

But this is to recede from the genuine character of *atoms*, which are not esteemed indivisible, because of their want of bigness, or parts; (for all physical magnitude must have three dimensions, length, breadth, and thickness; and all extension is divisible) but they are indivisible on account of their solidity, hardness, and impenetrability, which preclude all division, and leave no vacancy for the admission of any foreign force to separate or disunite them.

As *atoms* are the first matter, it is necessary they should be indivisible, in order to their being incorruptible.—Sir Isaac Newton adds, that it is also required they be immutable, in order to the world's continuing in the same state, and bodies being of the same nature now as formerly.

Hence the ancients were also led to maintain *atoms* eternal; for that what is immutable must be eternal.

They also added gravity, and, in consequence thereof, motion, to their *atoms*: and further, observing that *atoms* thus falling perpendicularly could not join or unite together; they super-added a fortuitous or side motion, and furnished them with certain hooked parts, in order to enable them to catch and hang the better together.—And from a casual or fortuitous jumble of these famous *atoms*, they supposed the whole universe to be formed.

ATOMICAL Philosophy denotes the doctrine of atoms; or a method of accounting for the origin and formation of

all things, from the supposition of atoms, endued with gravity and motion.

The *atomical* philosophy was first broached and taught by Mæchus, a Sidonian, some time before the Trojan war.—Leucippus and Democritus probably learnt it from him.—But it was most cultivated and improved by Epicurus; whence it became also denominated the *Epicurean* philosophy. See EPICUREAN.

It has been since retrieved by Gassendus, and others; and is now espoused and adhered to by a great part of the philosophical world, under the denomination of the *corpuscular philosophy*. See CORPUSCULAR Philosophy.

ATONEMENT. See EXPIATION, LUSTRATION, PROPITIATION, and SACRIFICE.

ATONY*, *Atonia*, in medicine, &c. a want of tone or tension; or a relaxation of the solids of a human body; occasioning a loss of strength, faintings, &c. See TENSION, SOLID, FIBRE, RELAXATION, &c.

* The word is compounded of the privative *a*, and *τῆσι*, tone, of *τῆσι*, *tense*, I stretch.

ATRABILARIE Capsula. See CAPSULÆ.

ATRABILIS, in the ancient medicine, black or adust bile.

Atrabilis was one of the great humours of the ancient physicians; whence arose the *atrabilary*, one of their temperaments; answering to what we call *melancholy*. See HUMOUR, and TEMPERAMENT.

ATROPHY*, *Ἀρρεφία*, a disease wherein the body, or some of its parts, do not receive the necessary nutriment, but dwindle or waste incessantly.

* The word is compounded of the privative particle *a*, and *τροφῆ*, I feed, nourish: *q. d.* privation of nourishment.

Under *atrophy* may be reduced what we commonly call *consumptions*, *phthises*, &c. An *atrophy* is natural in old age, and this is called *atrophia senilis*.

ATTACHING*, or **ATTACHMENT**, in law, the taking or apprehending a person or thing either by commandment or writ.

* The word is formed of the French *attacher*, to fasten, tie; and that from the corrupt Latin *attachare*, of *attexere*, to weave to; or rather, as others think, from the Celtic *tach*, a nail; and *tacha*, to nail.

Lambard makes this difference between an *arrest* and an *attachment*; that an *arrest* proceeds out of an inferior court by precept only, and an *attachment* out of a higher court, either by precept or writ; and that a precept to *arrest* hath these formal words, *duci facias*, &c. and a writ of *attachment* these, *precipimus tibi quod attaches talem, & habeas eum coram nobis*.

By this it appears, that he who *arrests* carries the party arrested to another higher person, to be disposed of forthwith; whereas he that *attaches* keeps the party attached, and presents him in court at the day assigned in the *attachment*.

There is this further difference, that an *arrest* lies only upon the body of a man; and an *attachment* sometimes on his goods too: for a man may be attached by an hundred sheep.

ATTACHMENT by writ differs from *distress* in this, that an *attachment* does not reach lands, as a *distress* does; and that a *distress* does not touch the body, which an *attachment* does.—Yet the two are frequently confounded together.

In the most common use, an *attachment* is an apprehension of a man by his body, to bring him to answer the action of the plaintiff.—A *distress*, with a writ, is the taking of a man; a *distress*, without a writ, is the taking of a man's goods for some real cause, as rent, service, &c.

ATTACHMENT out of the Chancery is had of course, upon an affidavit made that the defendant was served with a subpoena, and appears not; or it issueth upon not performing some order or decree.

After the return of this *attachment* by the sheriff, *quod non est inventus in balliva sua*; another *attachment*, with proclamation, issues: and if he appear not thereupon, a commission of rebellion.

ATTACHMENT of the Forest is one of the three courts held in the forest.

The lowest court is called the court of *attachment*, or woodmote-court, the mean swanc-mote, the highest, the justice in eyre-feat.

The court of *attachments* seems so called, because the verderors of the forest have therein no other authority, but to receive the *attachments* of offenders against vert and venison taken by the foresters, and to inroll them, that they may be presented or punished at the next justice-feat.

This *attachment* is by three means; by goods and chattels; by body, pledges, and mainprize; or by body only.—This court is held every forty days throughout the year: whence it is also denominated *forty days court*.

ATTACHMENT of Privilege is, by virtue of a man's privilege, to call another to that court whereto he himself belongs, and in respect whereof he is privileged to answer some action.

Foreign ATTACHMENT is an *attachment* of goods or money found

found within a liberty or city, to satisfy some creditor within such city or liberty.

By the custom of some places, particularly of London, a man may attach money or goods in the hands of a stranger: as, if A. owes B. 10*l.* and C. owes A. 10*l.* B. may attach the 10*l.* in the hands of C. to satisfy himself.

ATTACHAMENTS *Benorum*, in our ancient law-books, denotes a distress taken upon the goods or chattels of any person, sued for a personal estate, or debt, by the legal attachiators or bailiffs, as a security to answer the action.

ATTACHAMENTS *de spinis et bosco* signifies an ancient privilege granted to the other officers of forests, to take to their own use, thorns, brush, and windfalls, within their own precincts or liberties.

ATTACK, an attempt upon any person or thing; or the act of beginning a combat, or dispute.

ATTACK, in the military art, is an attempt or engagement to force a post, a body of troops, or the like.

We say to begin, to make, to sustain an *attack*, &c. Several authors have wrote of the art of attacking and defending. See **DEFENCE**.

ATTACK of a siege is an effort made by the besiegers with trenches, mines, galleries, &c. to make themselves masters of a fortress, in attacking one of its sides. See **SIEGE**, and **FORTIFICATION**.

'Tis a rule, always to attack on the weakest side; unless there be superior reasons for the contrary—as was the case at the siege of Lille: where the part where prince Eugene made his attack was the strongest in the whole place. *Savin, Nouv. Eccl. Milit. p. 338, seq.*

In sieges, there are sometimes one, sometimes two, or at most three *attacks*.—The *attacks*, where they are several, ought to have a communication.

False ATTACK is that which is not so vigorously prosecuted; serving only to make a diversion among the besieged, and to oblige them to divide their forces, that the true *attack* may be carried on with greater success.

To **ATTACK in flank** is to attack both sides of the bastion.

Line of ATTACK. See the article **LINE**.

ATTAINER, in law, is when a man has committed felony, treason, or other crime, and judgment is passed upon him for the same.

The children of a person attainted of treason cannot be heirs to him, or any other ancestor; and, if he were noble before, his posterity are hereby degraded and made base: nor can this corruption of blood be saved but by an act of parliament, unless the judgment be reversed by a writ of error.

Our ancient laws make this difference between *attainder* and *conviction*, that a man was said to be convicted presently upon the verdict; but not attainted till it appeared he was no clerk, or being a clerk, and demanded by his ordinary, could not purge himself.—Add, that attainer is more extensive than conviction; conviction being only by the jury, whereas *attainder* may also be by outlawry, confession of the party, or the like.

A man is attainted two ways; by appearance, or by process.

Attainder by appearance is either by confession, by battle, or by verdict.—Confession, whereof attainder grows, is twofold; one at the bar before the judges, when the prisoner, upon his indictment read, owns himself guilty, never putting himself on his jury. The other is before the coroner, in sanctuary; where he, upon his confession, was in former times constrained to abjure the realm; which is also called *attainder by abjuration*.

Attainder by battle is when the party appeal'd by another, chusing rather to try the truth by combat than by jury, is vanquished.

Attainder by process, otherwise called *attainder by default*, or *attainder by outlawry*, is where a party flies, or does not appear after being five times publicly called in the county-court; and at last, upon his default, is pronounced or returned outlawed.

Attainder by verdict is when the prisoner at the bar, answering not guilty to the indictment, hath an inquest of life and death passed on him, and is by the verdict of the jury pronounced guilty.

Bill of ATTAINER is a bill brought into parliament, for attainting, condemning, and executing a person for high-treason.

ATTAINT, ATTINGA, in law, a writ which lies after judgment, against a jury that hath given a false verdict, contrary to the evidence, in any court of record; be the action real or personal, if the debt or damages exceed 40*s.*

If the verdict be found false, the judgment anciently was, that the jurors meadows should be ploughed up, their houses broken down, their woods grubbed up, and their lands and tenements forfeited to the king.

If it passed against him that brought the *attaint*, he shall be imprisoned, and grievously ransomed at the king's will.

ATTAINT, among farriers, signifies a knock or hurt in a horse's leg; proceeding either from a blow on the lower part of the foot, or from an over-reach in frost weather, when a horse, being rough-shod, or having shoes with long calkers, strikes his hinder feet against his fore-leg. The farriers distinguish *upper attaints*, given by the toe of the hind-foot upon the finew of the fore-leg.—And *rather attaints*, or over-reaches on the pastern-joint, which are little bladders like wind-galls, coming either by a wrench, a strain, an over-reach, or the like. The usual place is in the heel or frith.

ATTAINTED, ATTAINTUS, or ATTINGTUS, in law, is used for a person found guilty of some crime or offence, particularly of felony or treason, by due course of law.

Yet a man is said to be *attainted* of perjury, *attainted* of dissimulation; and so it is used in French: as, *estre atteint, et vaincu en aucun cas*, is to be cast in any cause.

ATTELLANJE. See **ATTELLANCE**.

ATTENDANT, or ATTENDENS, in a general sense. See **ASSISTANT, RETINUE, and SATELLITES**.

ATTENDANT, ATTENTION, in law, signifies one that owes duty or service to another, or depends in some manner upon him.

Thus if there be lord mesne, and tenant; and the tenant hold of the mesne by a penny; and the mesne hold over by two pence: if the mesne release to the tenant all his right in the land, and the tenant die, his wife shall be endowed of the land, and shall be *attendant* to the heir, of the third part of the penny, not of the third part of the two pence; she being to be endowed of the best possession of her husband.

Where the wife is endowed by the guardian, she shall be *attendant* to the guardian, and to the heir at his full age.

ATTENTION, ATTENTIO, a due application of the ear, or the mind, to any thing said, or done, in order to acquire a knowledge thereof.

* The word is compounded of *ad*, to; and *tenso*, of *tendo*, I stretch.

Attention of mind is not properly an act of the understanding, but rather of the will, by which it calls the understanding from the consideration of other objects, and directs it to the thing in hand.

Attention, in respect of hearing, is the stretching or straining the membrana tympani, so as to make it more susceptible of sounds, and better prepared to catch even a feeble agitation of the air. Or it is the adjusting the tension of that membrane to the degree of loudness or lowness of the sound we are attentive to.

ATTENUANTS, or ATTENUATING medicines, are such as subtilize and break the humours into finer parts; and thus dispose them for motion, circulation, excretion, &c.

Attenuants stand opposed to *incrassants*, or thickeners, medicines which condense, inspissate, &c.

ATTENUATION*, ATTENUATIO, the act of attenuating; that is, of making any fluid thinner, and less consistent than it was before.

* The word is compounded of the Latin *ad*, and *tennis*, thin, slender, weak.

Attenuation is defined more generally by Chauvin, the dividing or separating of the minute parts of any body, which before, by their mutual nexus or implication, formed a more continuous mass.—Accordingly, among alchemists, we sometimes find the word used for pulverization, or the act of reducing a body into an impalpable powder, by grinding, pounding, or the like.

ATTESTATION*, the giving testimony, or evidence of the truth of any thing; especially in writing.

* The word is compounded of the Latin *ad*, to; and *testis*, witness.

Miracles need be well attested, to gain credit.

ATTIC, ATTICUS, something relating to Attica, or the city of Athens.—In matters of philology we use, *attic salt*, *sals atticæ*, meaning a delicate, poignant kind of wit and humour, peculiar to the Athenian writers.—*Attic witnesses*, *atticus testis*, was a witness incapable of corruption: so an *attic mule* was an excellent one, &c.

ATTIC is also used in architecture for a kind of building, wherein there is no roof or covering to be seen; thus called because usual at Athens.

ATTIC, or ATTIC-Order, is also a kind of little order, after the manner of a pedestal, raised upon another larger order; by way of crowning, or to finish the building.—See *Tab. Architect. fig. 35*.

An *attic* is sometimes also used for the conveniency of having a wardrobe, or the like; and instead of regular columns, has only pilasters of a particular form; and sometimes no pilasters at all.

There are also *attics* used for high altars.—The order takes its name from Athens, where it was first practised.

ATTIC of a roof is a little story or pedestal, either of stone or wood

wood covered with lead, serving as a kind of parapet to a terrace, platform, or the like.

ATTIC Base is a peculiar kind of base, used by the ancient architects, in the Ionic order; and by Palladio, and others of the moderns, in the Doric.

The *attic* is the most beautiful of all the bases. See **BASE**.

ATTIC continued is that which encompasses the whole circumference of a building, without any interruption; following all the jets, the returns of the pavilions, &c.

ATTIC interspersed is that situate between two tall stories, sometimes adorned with columns, or pilasters.

ATTIRE, in botany, is used by some to denote the third part or division of the flower of a plant; the other two being the empalement and the foliation.

The *attire* is of two kinds; seminiform, and florid.—The seminiform *attire* consists of two parts; chives, or stamina; and fummits, or apices; one upon each stamen. See **STAMINA**, and **APICES**.

The florid *attire* is usually called the *thrums*, as in the flowers of marigold, tanfy, &c.—Those thrums are called *suits*, which consist of two, but most times of three pieces.—And the outer part of the suit is the *foret*, whose body is divided at the top, like a cowslip flower, into five parts or distinct leaves.

ATTIRE, in hunting, denotes the head or horns of a deer. See **HEAD**.

The *attire* of a stag, if perfect, consists of bur, pearls, beam, gutters, antler, fur-antler, royal, fur-royal, and croches.—Of a buck, of the bur, beam, brow-antler, advancer, palm, and speller.

ATTITUDE*, in painting and sculpture, the posture, or gesture, of a figure, or statue; or the disposition of its parts, by which we discover the action it is engaged in, and the very sentiment supposed to be in the mind of the person represented.

* The word comes from the Italian *attitudine*, which signifies the same; and is from the Latin *aptitudo*, fitness.

The representing of this action and sentiment in a strong and lively manner makes what they call a *good expression*.

ATTOLLENS*, in anatomy, a name common to several muscles, whose office or action is to raise the parts they belong to.

* The word is compounded of the Latin *ad*, to; and *tollere*, I lift.

The *attollents*, or *attollent* muscles, are otherwise called *levators* and *elevators*.

ATTORNEY*, **ATTURNATUS**, or **ATTORNATUS**, in law, a person appointed by another to do something in his stead; particularly to solicit and carry on a lawsuit.

* The word is compounded of the Latin *ad*, to; and the French *tourner*, to turn; *q. d.* to turn a business over to another.—The ancient Latin name according to Bracton, is *responsalis*.

Attorneys in common law are much the same with procurators, proctors, or syndics, in the civil law.

Attorneys are properly those who sue out writs, or process, or commence, carry on, and defend actions or other proceedings, in the names of other persons, in any of the courts of common law.—They are distinguished from *solicitors* who do the like business in courts of equity; as the chancery, equity court in the exchequer, chamber court of the duchy, or the like.

None are to be admitted to act either as the one or the other, without having served a clerkship of five years, taken the oath provided in that case, and been enrolled.—Judges of the said courts of law are to examine into the capacity of the *attorneys*, and those of the courts of equity, into the capacity of the *solicitors*. 2 G. 2. c. 23.

Anciently, those of authority in courts had it in their power whether or no to suffer men to appear or sue by another than themselves; as appears from Fitz. *de Nat. Brev.* in the writ, *De dūm potestatem ad attornato faciendū*; where it appears, that men were driven to procure the king's writs, or letters patent, to appoint *attorneys* for them: but it is since provided by parliament, that it shall be lawful to appoint an *attorney* without any circuition; as appears by several statutes, 20 Hen. 3. cap. 10—6 Edw. 1. cap. 8. &c.

There is a great diversity of writs in the table of the register, wherein the king commands the judges to admit of *attorneys*; whereby there arose so many unskilful *attorneys*, and so many mischiefs thereby, that for restraining them it was enacted, 4 Hen. 4. cap. 18. that the judges should examine them, and displace the unskilful; and again 33 Hen. 6. cap. 7. that there should be but a certain number of *attorneys* in Norfolk and Suffolk.

Attorney is either *general* or *special*.

ATTORNEY General is he who is appointed to manage the affairs, or suits of a community; or rather he who is appointed to conduct all the suits in general, whether of a community, or a particular person.

Such is the *attorney general* of the king, who is the same as the *procurator cæsaris* in the Roman empire. See **PROCURATOR**.

To him come warrants for making out patents, pardons, &c.

He is at the head of managing all law-affairs of the crown, either in criminal prosecutions or otherwise; especially in matters of treason, sedition, &c. In all courts he pleads within the bar; but when a privy counsellor, he cannot plead in any court, but on the king's affairs, without obtaining a privy seal for so doing.

ATTORNEY Special is he who is employed in one or more causes particularly specified.

Attorneys are also distinguished with respect to the courts, into *attorneys at large*, and *attorneys special*, belonging to this or that court only.

ATTORNEY of the dutchy court of Lancaster, *Attornatus curiæ ducatus Lancastriæ*, is the second officer in that court, being there, for his skill in law, placed as assessor to the chancellor of the court.

Letter of ATTORNEY. } See the articles { **LETTER.**
Warrant of ATTORNEY. } **WARRANT.**

ATTOURNMENT, or **ATTORNMENT**, in law, a transferring of duty and service to another lord; or an acknowledgement which a tenant makes of homage and service to a new lord.

Thus, when one is tenant for life, and he in reversion grants his right to another, it is necessary the tenant for life agree thereto, which is called *attournment*; and without which nothing passes by the grant.—If the grant be by fine, in court of record, the tenant shall be compelled to *attourn*. Stat. 27 Hen. 8.

The words used in *attournment* are these; *I agree me to the grant made to you; or more commonly, I attourn to you by force of the same grant; or, I become your tenant; or deliver to the grantee a penny by way of attournment.* Littl. lib. 3.

Attournment is either by word, or by act; voluntary, or compulsory; by the writ *Per quæ servitia*, or by distress.—It may be made to the lord himself, or to his steward in court.

There is also *attournment* in deed, and *attournment* in law.

Attournment in law is an act, which though it be not an express *attournment*, yet in intendment of law is of equal force. Coke on Littl.

ATTRACTION*, **ATTRACTIO**, or **TRACTIO**, in mechanics, the act of a moving power, whereby a moveable is drawn, or brought nearer to the mover.

* The word is compound of *ad*, to, and *trahere*, I draw.

As action and re-action are always equal, and contrary; it follows, that, in all *attraction*, the mover is drawn towards the moveable, as much as the moveable towards the mover.

ATTRACTION, or **ATTRACTIVE force**, in the ancient physics, denotes a natural power supposed to be inherent in certain bodies, whereby they act on other distant bodies, and draw them toward themselves.

This, the Peripatetics call the *motion of attraction*; and on many occasions, *suction*; and produce various instances where they suppose it to obtain.—Thus the air, in respiration, is taken in, according to them, by *attraction* of suction; so is the smoke through a pipe of tobacco; and the milk out of the mother's breasts: thus also it is that the blood and humours rise in a cupping-glass, water in a pump, and smoke in chimneys; so vapours and exhalations are attracted by the sun; iron by the magnet, straws by amber, and electrical bodies, &c.

But the later philosophers generally explode the notion of *attraction*; asserting, that a body cannot act where it is not; and that all motion is performed by mere impulsion.—Accordingly, most of the effects which the ancients attributed to this unknown power of *attraction*, the moderns have discovered to be owing to more sensible and obvious causes; particularly the pressure of the air.

To this are owing the phenomena of inspiration, smoke-ing, sucking, cupping-glasses, pumps, vapours, exhalations, &c.

For the phenomena of magnetical and electrical *attraction*, see **MAGNETISM**, and **ELECTRICITY**.

The power opposite to *attraction* is called *repulsion*; which is also argued to have some place in natural things. See **REPULSION**.

ATTRACTION, or **ATTRACTIVE power**, is more particularly used in the Newtonian philosophy, for a power or principle, whereby all bodies, and the particles of all bodies, mutually tend towards each other.—Or, more justly, *attraction* is the effect of such power, whereby every particle of matter tends towards every other particle.

Attraction, its laws, phenomena, &c. make the great hinge of Sir Isaac Newton's philosophy. See **NEWTONIAN Philosophy**.

It must be observed, that though the great author makes use of the word *attraction*, in common with the school philosophers; yet he very studiously distinguishes between the ideas.

—The ancient *attraction* was supposed a kind of quality, inherent

herent in certain bodies themselves; and arising from their particular or specific forms.

The Newtonian *attraction* is a more indefinite principle; denoting, not any particular kind or manner of action, nor the physical cause of such action; but only a tendency in the general, a *conatus accedendi*; to whatever cause, physical or metaphysical, such effect is owing: whether to a power inherent in the bodies themselves, or to the impulse of an external agent.

Accordingly, that author, in his *Philosoph. Nat. Prin. Math.* notes, "that he uses the words *attraction*, *impulse*, and *propension* to the centre, indifferently; and cautions the reader "not to imagine that by *attraction* he expresses the modus "of the action, or the efficient cause thereof; as if there "were any proper powers in the centres, which in reality "are only mathematical points; or, as if centres could attract." *Lib. I. p. 5.*—So he "considers centripetal powers "as *attractions*; though, physically speaking, it were perhaps more just to call them impulses." *Ib. p. 147.* He adds, "that what he calls *attraction* may possibly be effected by impulse, though not a common or corporeal impulse; or after some other manner unknown to us." *Optic. p. 322.*

Attraction, if considered as a quality arising from the specific forms of bodies, ought, together with sympathy, antipathy, and the whole tribe of occult qualities to be exploded. But when we have set these aside, there will remain innumerable phenomena of nature, and particularly the gravity or weight of bodies, or their tendency to a centre, which argue a principle of action seemingly distinct from impulse; where, at least, there is no sensible impulsion concerned. Nay, what is more, this action, in some respects, differs from all impulsion we know of; impulse being always found to act in proportion to the surfaces of bodies; whereas gravity acts according to their solid content, and consequently must arise from some cause that penetrates or pervades the whole substance thereof.—This unknown principle, (unknown we mean in respect of its cause, for its phenomena and effects are most obvious) with all the species and modifications thereof, we call *attraction*; which is a general name, under which all mutual tendencies, where no physical impulse appears, and which cannot, therefore, be accounted for from any known laws of nature, may be ranged.

And hence arise divers particular kinds of *attractions*; as, gravity, magnetism, electricity, &c. which are so many different principles, acting by different laws; and only agreeing in this, that we do not see any physical causes thereof: but that, as to our senses, they may really arise from some power or efficacy in such bodies, whereby they are enabled to act, even upon distant bodies; though our reason absolutely disallows of any such action.

Attraction may be divided, with respect to the law it observes, into two kinds.—1^o. That which extends to a sensible distance.—Such are the *attraction* of gravity, found in all bodies; and the *attraction* of magnetism, and electricity, found in particular bodies.—The several laws and phenomena of each, see under their respective articles, GRAVITY, MAGNETISM, and ELECTRICITY.

The *attraction* of gravity, called also among mathematicians the *centripetal force*, is one of the greatest and most universal principles in all nature.—We see and feel it operate on bodies near the earth, and find, by observation, that the same power, (i. e. a power which acts in the same manner, and by the same rules; viz. always proportionably to the quantities of matter, and as the squares of the distances reciprocally) does also obtain in the moon, and the other planets primary and secondary, as well as in the comets: and even that this is the very power whereby they are all retained in their orbits, &c. And hence, as gravity is found in all the bodies which come under our observation, it is easily inferred, by one of the settled rules of philosophizing, that it obtains in all others; and as it is found to be as the quantity of matter in each body, it must be in every particle thereof; and hence, every particle in nature is proved to attract every other particle, &c. See the demonstration hereof laid down at large, with the application of the principle to the celestial motions, under the articles, NEWTONIAN PHILOSOPHY, SUN, MOON, PLANET, COMET, SATELLITE, CENTRIPETAL, CENTRIFUGAL, &c.

From this *attraction* arises all the motion, and consequently all the mutation, in the great world.—By this, heavy bodies descend, and light ones ascend; by this projectiles are directed, vapours and exhalations rise, and rains, &c. fall. By this rivers glide, the air presses, the ocean swells, &c.

In effect, the motions arising from this principle make the subject of that extensive branch of mathematics, called *mechanics*, or *statics*; with the parts or appendages thereof, *hydrostatics*, *pneumatics*, &c. See MECHANICS, STATICS, HYDROSTATICS, PNEUMATICS. See also MATHEMATICS, PHILOSOPHY, &c.

2^o. That which does not extend to sensible distances.—Such

is found to obtain in the minute particles whereof bodies are composed, which attract each other at, or extremely near, the point of contact, with a force much superior to that of gravity; but which at any distance therefrom decreases much faster than the power of gravity.—This power, a late ingenious author chuses to call the *attraction of cohesion*; as being that whereby the atoms or insensible particles of bodies are united into sensible masses.

This latter kind of *attraction* owns Sir Isaac Newton for its discoverer; as the former does, for its improver.—The laws of motion, percussion, &c. in sensible bodies under various circumstances, as falling, projected, &c. as ascertained by the later philosophers, do not reach to those more remote, intestine motions of the component particles of the same bodies, whereon the changes of the texture, colour, properties, &c. of bodies depend: so that our philosophy, if it were only founded on the principle of gravitation, and carried so far as that would lead us, would necessarily be very deficient.

But, beside the common laws of sensible masses, the minute parts they are composed of are found subject to some others, which have been but lately taken notice of, and are even yet very imperfectly known. Sir Isaac Newton, to whose happy penetration we own the hint, contents himself to establish, that there are such motions in the minima nature; and that they flow from certain powers or forces, not reducible to any of those in the great world.—In virtue of these powers, he shews, "That the small particles act on one another even at a distance; and that many of the phenomena of nature are the result thereof. Sensible bodies, we have already observed, act on one another divers ways; and as we thus perceive the tenour and course of nature, it appears highly probable, that there may be other powers of the like kind; nature being very uniform and consistent with herself.—Those just mentioned reach to sensible distances, and so have been observed by vulgar eyes: but there may be others, which reach to such small distances as have hitherto escaped observation; and it is probable electricity may reach to such distances, even without being excited by friction."

The great author just mentioned proceeds to confirm the reality of these suspicions from a great number of phenomena and experiments, which plainly argue such powers and actions between the particles, *e. gr.* of salts and water, oil of vitriol and water, aqua fortis and iron, spirit of vitriol and salt petre.—He also shews, that these powers, &c. are unequally strong between different bodies; stronger, *e. gr.* between the particles of salt of tartar, and those of aqua fortis, than those of silver; between aqua fortis and lapis calaminaris, than iron; between iron than copper, copper than silver, or mercury. So spirit of vitriol acts on water, but more on iron or copper, &c.

The other experiments which countenance the existence of such principle of *attraction* in the particles of matter are innumerable; many of them the reader will find enumerated under the articles MATTER, ACID, SALT, MENSTRUUM, &c.

These actions, in virtue whereof the particles of the bodies abovementioned tend towards each other, the author calls by a general, indefinite name, *attraction*, which is equally applicable to all actions, whereby distant bodies tend towards one another, whether by impulse, or by any other more latent power: and from hence he accounts for an infinity of phenomena, otherwise inexplicable, to which the principle of gravity is inadequate.—Such are cohesion, dissolution, coagulation, crystallization, the ascent of fluids in capillary tubes, animal secretion, fluidity, fixity, fermentation, &c. See the respective articles, COHESION, DISSOLUTION, CRYSTALLIZATION, ASCENT, SECRETION, SPHERICITY, FIXITY, and FERMENTATION.

Thus, (adds our immortal author) will nature be found very conformable to herself, and very simple; performing all the great motions of the heavenly bodies, by the *attraction* of gravity, which intercedes those bodies, and almost all the small ones of their parts, by some other attractive power diffused through the particles thereof.—Without such principles, there never would have been any motion in the world; and without the continuance thereof, motion would soon perish, there being otherwise a great decrease or diminution thereof, which is only supplied by these active principles." *Optics*, p. 373.

We need not say how unjust it is in the generality of foreign philosophers, to declare against a principle which furnishes so beautiful a view; for no other reason, but because they cannot conceive how a body should act on another at a distance.—It is certain, philosophy allows of no action but what is by immediate contact and impulsion: (for how can a body exert any active power there, where it does not exist? to suppose this of any thing, even the Supreme Being himself, would perhaps imply a contradiction,) yet we see effects without seeing any such impulse; and where there are effects,

we can easily infer there are causes, whether we see them or no. But a man may consider such effects, without entering into the consideration of the causes; as, indeed, it seems the business of a philosopher to do: for to exclude a number of phenomena which we do see, will be to leave a great chasm in the history of nature; and to argue about actions which we do not see, will be to build castles in the air.—It follows, therefore, that the phenomena of attraction are matter of physical consideration, and as such entitled to a share in a system of physics; but that the cause thereof will only become so, when they become sensible; *i. e.* when they appear to be the effect of some other higher causes (for a cause is no otherwise seen than as it self is an effect, so that the first cause must from the nature of things be invisible,) we are therefore at liberty to suppose the causes of attractions what we please, without any injury to the effects.—The illustrious author himself seems a little irresolute as to the cause; inclining, sometimes, to attribute gravity to the action of an immaterial cause, *Optics*, p. 343, &c. And sometimes to that of a material one. *Id.* p. 325.

In his philosophy, the research into causes is the last thing; and never comes in turn till the laws and phenomena of the effect be settled; it being to these phenomena that the cause is to be accommodated.—The cause even of any, the grossest, and most sensible action, is not adequately known: how impulse or percussion it self works its effect, *i. e.* how motion is communicated by body to body, confounds the deepest philosophers; yet is impulse received not only into philosophy, but into mathematics; and accordingly the laws and phenomena of its effects make the greatest part of common mechanics.

The other species of attraction, therefore, when their phenomena are sufficiently ascertained, have the same title to be promoted from physical to mathematical consideration; and this, without any previous enquiry into their causes, which our conceptions may not be proportionate to: let their causes be occult, as all causes ever will be; so as their effects, which alone immediately concern us, be but apparent. See CAUSE. Our noble countryman, then, far from adulterating philosophy with any thing foreign, or metaphysical; as many have reproached him with doing; has the glory of opening a new source of sublimer mechanics, which, duly cultivated, might be of infinitely more extent than all the mechanics yet known: it is hence alone we must expect to learn the manner of the changes, productions, generations, corruptions, &c. of natural things; with all that scene of wonders opened to us by the operations of chymistry.

Some of our own countrymen have prosecuted the discovery with laudable zeal: Dr. Keil, particularly, has endeavoured to deduce some of the laws of this new action, and applied them to solve divers of the more general phenomena of bodies, as cohesion, fluidity, elasticity, softness, fermentation, coagulation, &c. And Dr. Friend, seconding him, has made a further application of the same principles, to account at once for almost all the phenomena that chymistry presents.—So that the new mechanics should seem already raised to a complete science; and nothing can now turn up, but we have an immediate solution of, from the attractive force.

But this seems a little too precipitate; a principle so fertile, should have been further explored; its particular laws, limits, &c. more industriously detected and laid down, ere we had gone to the application.—Attraction, in the gross, is so complex a thing, that it may solve a thousand different phenomena alike: the notion is but one degree more simple and precise than action it self; and till more of its properties are ascertained, it were better to apply it less, and study it more.—It may be added, that some of Sir Isaac Newton's followers have been charged with falling into that error, which he industriously avoided: *viz.* of considering attraction as a cause or active property in bodies, not merely as a phenomenon, or effect.

As a specimen of the extent of the principle, and the manner of applying it, we shall here subjoin the principal laws and conditions thereof; as deduced by Sir Isaac Newton, Dr. Keil, Dr. Friend, &c.

Theor. I. Besides that attractive power whereby the planets and comets are retained in their orbits; there is another, by which the several particles whereof bodies consist, attract, and are mutually attracted by, each other; which power decreases in more than a duplicate ratio of the increase of the distance.

This theorem, we have already observed, is demonstrable from a great number of phenomena.—We shall here only mention a few easy and obvious ones; as, the spherical figure assumed by the drops of fluids, which can only arise from such principle: the uniting and incorporating of two spheres of quicksilver into one, upon the first touch, or extremely near approach of their surfaces: the rising of water up the sides of a glass bubble immersed therein, higher than the level of the other water, or of mercury up a sphere of iron, or the like.

As to the just law of this attraction, it is not yet determined; only this we know in the general, that the force, in receding from the point of contact is diminished in a greater propor-

tion than that of the duplicate ratio of the distances, which is the law of gravity. For that, if the diminution were only in such duplicate ratio, the attraction at any small assignable distance would be nearly the same as at the point of contact: whereas experience teaches, that this attraction almost vanishes, and ceases to have any effect, at the smallest assignable distance.—But whether to fix on a triplicate, quadruplicate, or some other proportion to the increasing distance, is not ascertained by experiment.

II. The quantity of attraction, in all bodies, is exactly proportional to the quantity of matter in the attracting body; as being in reality the result or sum of the united forces of the attractions of all those single particles of which it is composed; or, in other words, attraction in all bodies is, *ceteris paribus*, as their solidities.

Hence, 1^o. At equal distances the attractions of homogeneous spheres will be as their magnitudes.—And, 2^o. At any distance whatever, the attraction is as the sphere divided by the square of the distance.

This law, it must be noted, only holds in respect of atoms, or the smallest constituent particles, sometimes called particles of the last composition; and not of corpuscles or compositions made up of these; for they may be so put together, as that the most solid corpuscles may form the lightest particles, *i. e.* the unfinest of their surfaces for intimate contact may occasion such great interstices, as will make their bulks large in proportion to their matter.

III. If a body consist of particles, every one whereof has an attractive power decreasing in a triplicate, or more than a triplicate ratio of their distances; the force wherewith a particle is attracted by that body in the point of contact, or at an infinitely little distance from the contact, will be infinitely greater than if that particle were placed at a given distance from the body.

IV. Upon the same supposition, if the attractive force at any assignable distance, have a finite ratio to its gravity, this force in the point of contact, or at an infinitely small distance, will be infinitely greater than its power of gravity.

V. But if in the point of contact the attractive force of bodies have a finite ratio to their gravity; this force in any assignable distance is infinitely less than the power of gravity, and therefore it becomes nothing.

VI. The attractive force of every particle of matter, in the point of contact, almost infinitely exceeds the power of gravity, but is not infinitely greater than that power; and therefore, in a given distance, the attractive force will vanish to nothing.

This attractive power, therefore, thus superadded to matter, only extends to spaces extremely minute, and vanishes at greater distances; whence, the motion of the heavenly bodies, which are at a prodigious distance from each other, cannot at all be disturbed by it, but will continually go on as if there were no such power in bodies.

Where this attracting power ceases, there, according to Sir Isaac Newton, does a repelling power commence; or rather, the attracting does thenceforward become a repelling power.

VII. Supposing a corpuscule to touch any body, the force whereby that corpuscule is impelled, that is, the force with which it coheres to that body, will be proportionable to the quantity of contact: for the parts, farther removed from the point of contact, contribute nothing towards its cohesion.

Hence, according to the difference in the contact of particles, there will be different degrees of cohesion: but the powers of cohesion are greatest when the touching surfaces are planes; in which case, *ceteris paribus*, the force by which one corpuscule adheres to others will be as the parts of the touching surfaces.

Hence it appears why two perfectly polished marbles, joined together by their plain surfaces, cannot be forced asunder, but by a weight which much exceeds that of the incumbent air.

Hence also may be drawn a solution of that famous problem concerning the cohesion of the parts of matter.

VIII. The power of attraction in the small particles increases, as the bulk and weight of the particles diminishes. For, the force only acting at or near the point of contact, the momentum must be as the quantity of contact, that is, as the density of the particles, and the largeness of their surfaces: but the surfaces of bodies increase or decrease as the squares, and the solidities as the cubes of the diameters. Consequently the smallest particles having the largest surfaces in proportion to their solidities, are capable of more contact, &c. Those corpuscles are most easily separated from one another, whose contacts are the fewest and the least, as in spheres infinitely small.

Hence we have the cause of fluidity.

IX. The force whereby any corpuscule is drawn to another nearly adjacent body suffers no change in its quantity, let the matter of the attracting body be increased or diminished; supposing the same density to remain in the body, and the distance of the corpuscule to continue the same.

For since the *attractives* powers of particles are diffused only through the smallest spaces; it is manifest that the remoter parts at C, D and E (*Tab. Nat. Hist. fig. 22.*) contribute nothing towards *attracting* the corpufcle A: and therefore the corpufcle will be attracted with the fame force towards B, whether thofe parts remain or be taken away; or, laftly, whether others be added to them.

Hence, particles will have different *attractive* forces, according to their different ftructure and compofition; thus a particle perforated will not attract fo ftrongly as if entire. So, again, the different figures into which a particle is formed, will occafion a diverfity of power: thus a fphere will attract more than a cone, cylinder, &c.

X. Suppofe a body of fuch a texture as that the particles of the laft compofition, by an external force, fuch as a weight compreffing them, or an impulfive given by another body, may be a little removed from their original contact, but fo as not to acquire new ones; the particles by their *attractive* force tending to one another, will foon return to their original contacts.—But when the fame contacts and pofitions of the particles which compofe any body, return; the fame figure of the body will alfo be refrored: and therefore bodies which have loft their original figures, may recover them by *attraction*.

Hence appears the caufe of elasticity.—For, where the contiguous particles of a body have by any external violence been forced from their former points of contact, to extremely fmall diftances; as foon as that force is taken off, the feparated particles muft return to their former contact: by which means the body will refume its figure, &c.

XI. But if the texture of a body be fuch that the particles by an imprefsed force being removed from their contacts, come immediately into others of the fame degree, that body cannot refore it felf to its original figure.

Hence, we underftand what texture that is wherein the foftnefs of bodies confifts.

XII. The bulk of a body heavier than water may be fo far diminifhed, that it fhall remain fufpended in water, without depending by its own gravity.

Hence it appears why faline, metallic, and other fuch-like particles, when reduced to fmall dimenfions, are fufpended in their menftrums.

XIII. Greater bodies approach one another with a lefs velocity than fmall.—For the force with which two bodies A and B (*Tab. Nat. Hist. fig. 23. No. 2.*) approach, refides only in the neareft particles; the more remote having nothing to do therein. No greater force, therefore, will be applied to move the bodies A and B, than to move the particles c and d; but the velocities of bodies moved by the fame force are in a reciprocal ratio of the bodies: wherefore the velocity with which the body A tends towards B is to the velocity with which the particle c detached from the body would tend towards the fame B, as the particle c is to the body A; confequently the velocity of the body A is much lefs than would be the velocity of the particle c detached from the body.

Hence it is that the motion of large bodies is naturally fo flow and languid that an ambient fluid and other circumjacent bodies generally retard them; whilst the leffer go on more briskly, and produce a greater number of effects: fo much greater is the *attractive* energy in fmall bodies than in the larger.—Hence again appears the reafon of that chymical axiom; *Salts do not aft till they are difolved*.

XIV. If a corpufcle placed in a fluid be equally attracted every way by the circumambient particles, no motion of the corpufcle muft enfue.—But if it be attracted by fome particles more than others, it will tend to that part where the attraction is the greateft; and the motion produced will correspond to the inequality of the attraction, viz. the greater the inequality, the greater the motion, and *vice verfa*.

XV. Corpufcles floating in a fluid, and attracting each other more than the particles of the fluid that lie between them, will force away the particles of the fluid, and ruft to one another with a force equal to that by which their mutual attraction exceeds that of the particles of the fluid.

XVI. If a body be immerged in a fluid whole parts more ftrongly attract the particles of the body than they do one another; and if there be a number of pores or interftices in the body pervious to the particles of the fluid; the fluid will immediately diffufe itfelf through thofe pores. And if the connexion of the parts of the body be not fo ftrong, but that it may be overcome by the force of the particles rufting within it; there will be a diffolution of the body.

Hence, for a menftrum to be able to diffolve any given body, there are three things required.—1^o. That the parts of the body attract the particles of the menftrum more ftrongly than thofe attract each other. 2^o. That the body have pores or interftices open and pervious to the particles of the menftrum. 3^o. That the cohesion of the particles which confitute the body, be not ftrong enough to refift the irruption of the particles of the menftrum. See MENSTRUM.

XVII. Salts are bodies endued with a great attractive force, though among them be interfperfed many interftices, which lie open to the particles of water; thefe are therefore ftrongly attracted by thofe faline particles, fo that they forcibly

ruft into them, feparate their contacts, and diffolve the coherent texture of the falts. See SALT.

XVIII. If the corpufcles be more attracted by the particles of the fluid than by each other; they will recede from each other, and be diffused through the whole fluid.

Thus, if a little falt be diffolved in a deal of water, the particles of the falt, though fpecifically heavier than water, will evenly diffufe themfelves through the whole water; fo as to make it as faline at top as bottom.—Does not this imply that the parts of the falt have a centrifugal, or repulfive force, by which they fly from one another; or rather, that they attract the water more ftrongly than they do one another? for as all things afcend in water which are lefs attracted than water by the gravity of the earth, fo all the particles of falt floating in water, which are lefs attracted by any particle of falt than water is, muft recede from the particle, and give way to the more attracted water. *Newt. Opt. p. 363.*

XIX. Corpufcles, or little bodies fwimming in a fluid, and tending towards each other; if they be fuppofed elastic, will fly back again after their congrefs, till ftriking on other corpufcles, they be again reflected towards the firft; whence will arife innumerable other conflicts with other corpufcles, and a continued feries of percuffions and reboundings.—But, by the attractive power, the velocity of fuch corpufcles will be continually increafed; fo that the intestine motion of the parts will at length become evident to fenfe. See *INTERSTINE Motion*.

Add, that in proportion, as the corpufcles attract each other with a greater or lefs force, and as their elasticity is in a greater or lefs degree, their motions will be different, and become fenfible at various times, and in various degrees.

XX. If corpufcles that attract each other happen mutually to touch, there will not arife any motion, becaufe they cannot come nearer. If they be placed at a very little diftance from each other, a motion will arife; but if further removed, the force wherewith they attract each other will not exceed that wherewith they attract the particles of the intermediate fluid, and therefore no motion will be produced.

On thefe principles depend all the phenomena of fermentation and ebullition.

Hence appears the reafon why oil of vitriol, when a little water is poured on it, works and grows hot: for, the faline corpufcles are a little difjointed from their mutual contact, by the infufed water; whence, as they attract each other more ftrongly than they do the particles of water, and as they are not equally attracted on every fide, there muft of neceffity arife a motion.

Hence alfo appears the reafon of that uncommon ebullition occafioned by adding ftel-filings to the aforefaid mixture. For the particles of ftel are extremely elastic; whence there muft arife a very ftrong reflection.

Hence alfo we fee the reafon why fome menftrums aft more ftrongly, and diffolve bodies fooner, when diluted with water.

XXI. If corpufcles mutually attracting each other have no elastic power, they will not be reflected back from each other, but will form congeries, or little mafles; whence a coagulum will arife. See COAGULATION.

If the gravity of the particles thus amafed exceed the gravity of the fluid, a precipitation will fucceed.—Precipitation may alfo arife from an increafe or diminution of the gravity of the menftrum wherein the corpufcles are immerged.

XXII. If corpufcles fwimming in a fluid, and mutually attracting each other, have fuch a figure, as that in fome given parts they have a greater attractive power than in others, and their contact greater in thofe parts than in others; thofe corpufcles will unite into bodies with given figures; and thence will arife cryftallization.

Particles immerged in a fluid moved with a fwift or a flow progrefive motion will attract each other in the fame manner as if the fluid were at reft; but if all the parts of the fluid do not move equally, the attractions will be difturbed. Hence it is that many falts will not cryftallize till the water wherein they are diffolved is cold.

XXIV. If between two particles of a fluid there happen to be a corpufcle whole two oppofite fides have a ftrong attractive power, that intermediate corpufcle will agglutinate or faften the particles of the fluid to itfelf.—And feveral fuch corpufcles diffused through the fluid will fix all its particles into a firm body; and the fluid will be froze or reduced into ice.

XXV. If a body emit a great quantity of effluvia, whole attractive powers are very ftrong; as thofe effluvia approach any other very light body, their attractive powers will overcome the gravity of that body, and the effluvia will draw it towards themfelves: and as the effluvia are clofer and more copious at little diftances from the emitting body, than at greater; the light body will be continually drawn towards the denfer effluvia, till fuch time as it comes to adhere to the emitting body itfelf.

And hence moft of the phenomena of electricity may be accounted for.

Centre of Attraction. See the article **CENTRE**.

ATTRACTIVE, ATTRACTIVUS, ATTRATRIX, something that has the power or faculty to attract. See **ATTRACTION**.

ATTRACTIVE Power, or Force, Vis attractiva. See **POWER**, and **ATTRACTION**.

The attractive virtue in loadstone is communicable, by touching to iron or steel. See **TOUCHING**.

ATTRACTIVES, or ATTRACTIVE Remedies, denote medicines which are to be externally applied, and which by their activity and warmth penetrate the pores, and mix with and rarely any obstructed matter, so as to render it fit for discharge, upon laying open the part by a caustic or incision.

Attrahents are the same with what we otherwise call *drawers, ripeners, maturants, and digestives*.

The principal simples belonging to this class are, the several kinds of fats or adipos, the dung of pigeons and cows, bran, yeast, herring, melilot, tobacco, oil, pitch, resin, frankincense, &c. See each under its proper article.

In many instances, as the matter rarefies and grows more fluid by means of such medicines, the reſtuent blood is apt to walk it back into the common maſs; which ſometimes does a deal of miſchief; or by making it take up more room upon its rarefaction, it occasions it to diſtend more the parts in which it is contained: upon which a ſenſe of pain is excited, and thereby a greater concourſe of fluid, and conſequently an increaſe of the tumour.—So that medicines under this denomination require the moſt careful management.

ATTRIBUTE, ATTRIBUTUM, in a general ſenſe, that which agrees to ſome perſon, or thing; or a quality, which determines ſomething to be after a certain manner.

Thus, underſtanding is an *attribute* of mind; figure, an *attribute* of body, &c.—Spinoza makes the ſoul and the body to be of the ſame ſubſtance; with this only difference, that the ſoul is to be conceived under the *attribute* of thought, and the body under that of extension.

Of the ſeveral *attributes* belonging to any ſubſtance, that which preſents itſelf firſt, and which the mind conceives as the foundation of all the reſt, is called its *eſſential attribute*.

Thus, extension is by ſome, and ſolidity by others, made the eſſential *attribute* of body or matter.

The other *attributes* are called *accidental* ones: *e. gr.* roundneſs in wood, or learning in a man.—Mr. Locke endeavours to prove, that thinking, which the Cartesiſians make the eſſential *attribute* of the mind, is only an accidental one.

ATTRIBUTE, in logic, is an epithet given to any ſubject; or it is any predicate thereof; or whatever may be affirmed or denied of any thing.

Every propoſition conſiſts of a ſubject, an *attribute*, and a copula, or conjunctive particle. See **PROPOSITION**.

Attributes are uſually divided into *poſitive*, which give a thing ſomewhat; as when we ſay of a man that he is *animate*; and *negative*; as when we ſay of a ſtone that it is *inanimate*.

Others, again, divide them into *common*, which agree to ſeveral different things; as *animal*, which agrees both to man and brute: and *proper*, as *thought*, &c. which agrees only to ſpirit, *rationality* to man, &c.

ATTRIBUTES, in theology, denote the ſeveral qualities, and perfections which we conceive in God; and which conſtitute his proper eſſence; as juſtice, goodneſs, wiſdom, &c. See **GOD**.

The heathen mythologiſts divided the deity into as many diſtinct beings as he has *attributes*: thus the power of God was called *Jupiter*; the wrath and vengeance of God, *Juno*; the abſolute will of God, *Fate*, or *Deſtiny*, to which even his very power is ſubject.

ATTRIBUTES, in painting and ſculpture, are ſymbols added to figures and ſtatues, to denote their particular office and character.

Thus the club is an *attribute* of Hercules; the palm is an *attribute* of victory; the peacock of Juno; the eagle of Jupiter, &c.

ATTRITION*, ATTRITIO, triture, or friſion, expreſſes ſuch a motion of bodies againſt one another, as ſtrikes off ſome ſuperficial particles; whereby they gradually become leſs and leſs.

* The word is formed of *atterere*, to rub, wear; compounded of *ad*, to; and *tero*, I wear.

The grinding and poliſhing of bodies is performed by *attrition*.

The effects of *attrition* in exciting heat, light, electricity, &c. ſee under the articles **HEAT**, **LIGHT**, **FIRE**, and **ELECTRICITY**.

A feather, by being only drawn through the fingers, has been found by Mr. S. Grey to acquire a degree of electricity, and would be attracted by the finger when held near it; a human hair, after having paſſed three or four times between the finger and thumb, would fly to his finger at the diſtance of half an inch; and the hair of a dog's

ear, and the threads of ſilk would do the like. The like was found in pieces of ribbon of ſeveral colours, half a yard long; the hand, held at the lower-end of any of which, would attract them at the diſtance of five or fix inches. But if they had imbibed the moiſture of the air, the electricity would be much weakened thereby; in which caſe, the fire never failed to give them a ſtrong one. In effect, the ſame author found woollen, paper, leather, wood-shavings, parchment, and gold-beater's ſkin, to be electrical; and that they not only came to the hand, or any other ſolid body, but attracted ſmall bodies to them, ſometimes at the diſtance of eight or ten inches: ſome of theſe, alſo, appeared luminous upon friction. See *Philoph. Tranſact.* N^o 366.

ATTRITION is alſo frequently uſed for the friction or rubbing of ſuch ſimple bodies one againſt another, as will not wear out, but will occaſion ſome particular determinations of the fluids they contain.

Thus, the various ſenſations of hunger, pain, or pleaſure, are ſaid to be occaſioned by the *attritions* of the organs form'd for ſuch impreſſions.

ATTRITION, among divines, denotes a ſorrow or regret for having offended God; ariſing from a ſenſe of the odiousneſs of ſin, and the apprehenſions of puniſhment; *i. e.* of the loſs of heaven, and the pains of hell.

Attrition is eſteemed the loweſt degree of repentance, being a ſtep ſhort of contrition, which ſuppoſes the love of God an ingredient or motive of our ſorrow and repentance. See **CONTRITION**.

ATTURNATO faciendo vel recipiendo, a writ which a man owing ſuit to a county, hundred, or other court, deſiring to make an attorney appear for him there, whom he doubts the ſheriff or ſteward will not otherwiſe admit; purchaſeth, to command him to receive ſuch attorney, and admit his appearance by him.

Admittenda Clamea in itinere per ATTURNATUM. See **CLAMEA**.

AVANT, a French prepoſition, ſignifying *before*, or *any* priority either in reſpect of time, or place; ſometimes uſed, in compoſition, in our language, but more uſually contracted, and wrote *vant*, or *vant*, or even *van*. See **VAN**.

AVANT Foſſe, &c. } See { **VAN Foſſe**.

AVANT Guard, &c. } See { **VAN Guard, &c.**

AVARIA*, in the Turkiſh and Perſian dominions, a ſum of money exacted from the Chriſtians or Europeans, to be quit of ſome falſe accuſation framed on purpoſe. *Rauwolf. Trav.* p. 182.

AVAST*, a term frequently uſed on board a ſhip, ſignifying to ſtop, hold, or ſtay.

* The word is formed of the Italian *vaſta*, or *baſta*, it is enough, it ſuffices.

AVAUNCHERS, among hunters, the ſecond branches of a hart's horn. See **HEAD**.

AUBAINE*, in the French cuſtoms, a right veſted in the king, of being heir to a foreigner, who dies within his dominions.

* The word is formed of *aubain*, a foreigner; which Menage derives further from the Latin, *alibi natus*; Cojas, from *ad-vena*; which is the name foreigners bear in the capitularies of Charlemaign; du Cange from *Albanus*, a Scot, or Iriſhman; by reaſon theſe were anciently much given to travelling and living abroad.

The king of France, by the right of *aubaine*, claims the inheritance of all foreigners in his dominions; excluſive of all other lords, and even of any teſtament the deceased could make. An embaiſſador, though not naturalized, is not ſubject to the right of *aubaine*. The Swiſs, Savoyards, Scots, and Portugueſe, are alſo exempted from the *aubaine*, as being reputed natives and regnicoles.

AUCTION, AUCTION, this was originally a kind of ſale among the ancient Romans, performed by the public cryer *ſub haſta*, that is, under a ſpear ſtuck up on that occaſion, and by ſome magiſtrate, who made good the ſale by delivery of the goods.

This was termed *auſtio*, *q. d.* increaſe; becauſe, according to Sigiſmius, the goods were ſold to him, *qui plurimum rem auget*, who would bid moſt for them.

AUCTION by inch of candle. See the article **CANDLE**.

AUDIENCE*, in a general ſenſe. See **HEARING**.

* The word is formed from the corrupt Latin, *audientia*, of *audire*, to hear.

AUDIENCE is alſo uſed for the ceremonies praſtiſed in courts, at the admiſſion of embaiſſadors, and public miniſters, to a hearing.

Such an embaiſſador ſent to demand *audience*; took his *audience* of leave to depart, &c.

In England, *audience* is given to embaiſſadors in the preſence-chamber; to envoys and reſidents, in a gallery, cloſet, or any place where the king chances to be.

At their admiſſion, the way, in all courts, is to make three bows; after which they cover and ſit down, the king firſt covering

covering and sitting down, and giving them the sign to put on their hats.—When the king cares not to have them be covered and sit, he continues uncovered himself, and standing all the while: which is taken as a slight and affront.—After the first audience, it does not look well to be too haughty in demanding another.

At Constantinople, ministers usually have audience of the prime vizir: in his absence, the calimacan admits them to audience.

AUDIENCE is also the name of a court of justice, established by the Spaniards in the West-Indies; answering in effect to the parliaments of France.

They judge without appeal, and have each a certain district, which ordinarily takes in several provinces, called also audiences, from the names of the tribunal to which they belong.

Hence Sanfon divides Spain into as many of these audiences as there are of those tribunals.—New Spain comprehends three audiences; those of Gaudalajara, Mexico, and Guatimala.

AUDIENCE is also the name of one of the ecclesiastical courts in England, which is held where-ever the archbishop calls a cause to his own hearing.

The court of audience is chiefly concerned in differences arising upon elections, consecrations, infitutions, marriages, &c.

Chamber of AUDIENCES. See the article CHAMBER.

AUDIENDO & terminando, a writ, or rather commission, directed to certain persons, when an insurrection or great misdemeanour is committed in any place, for the appealing and punishment thereof.

AUDIENTES, or AUDITORES, in church-history, an order of catechumens; consisting of those who were newly instructed in the mysteries of the Christian religion, and not yet admitted to baptism.

AUDIT, a regular hearing and examining of an account, by officers appointed for that purpose. See AUDITOR.

AUDITA querela, a writ which lies against him, who, having taken a statute-merchant, or recognizance in the nature of a statute-faile, or a judgment, or a recognizance of another; and craving, or having obtained, execution of the same from the mayor and bailiffs, before whom it was entered; at the complaint of the party who entered the same, upon suggestion of some just cause why execution should not be granted; as a release, or other exception.

This writ is granted by the lord chancellor, upon view of the exception suggested, to the judges of either bench, willing them to grant summons to the sheriff of the county where the creditor is, for his appearance at a certain day before them.

AUDITOR, a hearer, or one who listens or attends to any thing.

AUDITOR is also used for several officers, appointed to audit, to hear accounts, pleadings, &c.

Anciently the word auditor was also used for judge, and even for an inquisitor, appointed by judges to examine and find out the truth of some matter in contest. Notaries are also frequently called auditors.

AUDITOR, in our law, is an officer of the king, or some other great person, who yearly, by examining the accounts of under-officers accountable, makes up a general book, with the difference between the receipts and charge, and their allowances or allocations.

AUDITORS of the Revenue, or of the Exchequer, are officers who take the accounts of those who collect the revenues, taxes, &c. raised by parliament; as also of the sheriffs, ecclesiastical collectors, tenants, and customers, and set them down, and perfect them.

AUDITORS of the Press, or Imprist, are officers in the exchequer, who take and make up the great accounts of Ireland, Berwick, the mint, customs, wardrobe, first-fruits, naval and military expences, and of all moneys impressed to any man for the king's service.

AUDITOR of the Receipts is an officer of the exchequer, who files the tellers bills, and makes an entry of them, and gives the lord treasurer a certificate of the money received the week before; who presents the estimate or balance to the king.

He makes debentures to every teller, before they receive any money, and takes their accounts. He keeps the black book of receipts, and the treasurer's key of the treasury, (where the ancient leagues of the realm, and many records of the king's bench and common pleas are deposited) and fees every teller's money lock'd up in the new treasury.

There are also auditors of the first-fruits, of the principality of Wales; of the duchy of Cornwall, &c. See FIRST-FRUIT, &c.

AUDITOR of the Rota, the apostolic chamber, the chatelet, &c. See ROTA, CHAMBER, &c.

AUDITORS, Conventual, Collegiate, &c. were officers formerly appointed among the religious, to examine and pass the accounts of the house.

AUDITORY, in an adjective sense, something belonging to the sense of hearing. See HEARING.

VOL. I.

AUDITORY, AUDIENCE, is also a collective name, denoting an assembly of persons, hearing or attending to a person who speaks in public.

AUDITORY is also used for the seat or bench where a magistrate, or judge, hears causes.

At Rome, the several magistrates had auditories or seats of justice according to their dignity.—Those of the superior officers were called tribunals; those of the inferior, subcella.

The pedanei had their benches or auditories in the portico of the imperial palace.—Those of the Hebrews, at the gates of cities.—The judges appointed by the ancient lords distributed justice under an elm, which was usually planted before the manor-house, and served them for an auditory.

AUDITORY, AUDITORIUM, in the ancient churches, was that part of the church where the audientes stood to hear, and be instructed.

The auditorium was that part now called navis ecclesiae. See NAVE.

In the primitive times, the church was so strict in keeping the people together in that place, that the person who went from thence in sermon-time was ordered by the council of Carthage to be excommunicated.

MEATUS AUDITORIUS, or AUDITORY passage in anatomy, called also aurium above, on account of the cerumen collected in it. See MEATUS Auditorius.

AUDITORY Nerves, in anatomy, a pair of nerves arising from the medulla oblongata, and distributed, the one to the ear, the other to the tongue, eye, &c.—See Tab. Anat. (osteol.) fig. 5. lit. pp.

The soft and spongy branch of the auditory nerve being diffused through the labyrinth and tympanum of the ear, is the immediate organ of the sense of hearing.

The auditory nerves make the seventh conjugation, according to the way of reckoning of the moderns; and the fifth according to the ancients.

Anatomists observe a singular mark of the wisdom and contrivance of the creator in the auditory nerves being thus dispatched to different parts; an admirable and useful consent being hereby established between them.—Hence it is that most animals upon hearing any uncouth sound, are found to erect their ears, and prepare them to catch it; to open their eyes, to stand upon the watch; and to be ready with the mouth to call out, or testify their danger: accordingly most animals when surprized or terrified, shriek or cry out, &c.

Dr. Willis (anat. cerebr. c. 17.) observes a further use of this nervous communication between the ear and the mouth; which is, that the voice may correspond with the hearing, and be a kind of echo thereof; that what is heard with one of the two nerves may be readily expressed with the voice, by the help of the other.

AVELLANE, or Cross AVELLANE, in heraldry, a form of cross which resembles four filberts in their husks or cases, joined together at the great end. See CROSS.

Hence its name; a filbert in Latin being *nux avellana*.—Syl. Morgan says, it is this cross which ensigns the mound of authority, or the sovereign's globe.

AVE-MARIA, or AVE-MARY, the angel Gabriel's salutation of the virgin, at his bringing her the tidings of the incarnation; thus called, as beginning with those words, Ave Maria, q. d. Hail Mary.

The ave-mary is a prayer or formula of devotion very usual in the Romish church.—Their chaplets and rosaries are divided into so many ave-marys, and so many pater-nosters: And hence the beads themselves, which indicate them, are also called ave's, or ave-mary's.

AVENAGE*, in law, a certain quantity of oats, paid to a landlord, in lieu of some other duties; or, as a rent, from the tenant.

* The word is French, formed of the Latin, *avena*, oats.

AVENOR, an officer under the master of the horse; who, by order or warrant from him, swears in all the officers belonging to the royal stables. See MASTER of the Horse.

The avenor also makes up the accounts of the stables, and issues debentures for paying the officers and servants.

In a stat. Car. II. we find the avenor mentioned as an officer who provides oats for the stables.—In the Rot. Parl. Edw. III. we also read of avenor of the queen, of the prince, &c.

AVENTURÆ, in our ancient writers, signify turnaments, or military exercises on horseback. See TURNAMENT.

ADVENTURE, or rather ADVENTURE, in our law-books, a mischance, causing the death of a man, without felony; as, when he is suddenly drowned, or burnt by an accident or mischance, falling into the water or fire. See MISADVENTURE, and CHANCE-MEDLY.

AVENUE*, in fortification, an opening or inlet into a fort, bastion, or the like place, or the paths and ways to and from it. See FORT, and BASTION.

* The word is formed of the French *avvenir*, or *advenir*, to come to, to arrive at.

AVENUE, in gardening, is a walk, planted on each side with trees, and leading to some place.

All *avenues*, Mortimer says, should lead to the front of an house, garden-gate, highway-gate, or wood, and terminate in a prospect.—In an *avenue* to an house, whatever the length of the walk is, it ought to be as wide as the whole breadth of the front; and if wider, it is so much better.

AVERAGE*, **AVERAGIUM**, in law, that duty or service which the tenant is to pay the king, or other lord, by his beasts and carriages.

* The word is derived from the base Latin *averia*, cattle; or the French, *avoirs*, work.

AVERAGE, or **AVERIDGE**, is also used in navigation and commerce, for the damage which a vessel, or the goods and loading thereof, sustains, from the time of its departure to its return: as also, for the charge or contributions raised on the proprietors, towards defraying such damages.

A late author, who has wrote a treatise exprels upon *average*, distinguishes two kinds thereof; *simple* or private, and *gross* or common.

To the first, the particular things which suffer, alone contribute; to the second, all both the ship and the merchandizes contribute in common.

Of the first kind are all extraordinary and unforeseen expences and accidents, befalling either the ship, or the goods, or both: the loss in which cases is to be wholly defrayed by the thing or things which occasioned it.—Such as the loss of cables, anchors, masts, and sails, by reason of storms, &c. As also damages accruing to goods through their own defects, by wasting, rotting, wetting, storms, pirates, &c. The sailors wages while the ship is extraordinarily detained by embargo's, provided she be hired for the whole voyage, and not *per* month. All these are *simple* or private *averages*, and not to be charged to the common account.

For *gross* or common *average* to have place, the author just mentioned, shews, 1^o. That something must have been cast into the sea, and this out of absolute necessity. 2^o. That the commander have had the consent of the owners for so doing. 3^o. That it have only been done for the safety of the whole ship, and that the ship have been saved in consequence thereof.—In such case, all those for whose interest the thing was cast into the sea, are to contribute to indemnify the person whose property it was: and every thing is to be taxed hereto, so much as jewels, gold, &c. notwithstanding they do not any way burthen the ship; and even the vessel itself, but not passengers, nor provisions. Rainold. Christ, a Derschau in *Nov. Lit. Mar. Bal.* 1700.

To the occasions of common *average* may be added, compositions with pirates for the ransom of the ship; as also cables, masts, anchors, &c. lost or abandoned for the common good; the food and physic of the sailors wounded in defence of the ship; and the pay and provisions of the crew when the ship is arrested or put under embargo by order of a prince, provided it were hired for the month, and not for the whole voyage.

AVERAGE is more particularly used for the quota or proportion which each merchant or proprietor in the ship or loading is adjudged, upon a reasonable estimation, to contribute to a common *average*.

Such sum shall be divided among the several claimers, by way of *average*, in proportion to their respective interests and demands. 10 A. c. 17.

AVERAGE is also a small duty which those merchants who send goods in another man's ship pay to the masters thereof, for his care of them, over and above the freight.

Hence, in bills of lading it is expressed—Paying so much freight for the said goods, with primage and *average* accustomed.

AVÉ-CORN, in ancient writings, such corn as by custom is brought by the tenant's carts or carriages, to the lord's granary, or barn.

AVÉDUPOIS Pound. } See the article { **POUND**.

AVÉDUPOIS Weight. } See the article { **WEIGHT**.

AVERIA, in our law-books, properly signify oxen or horses used for the plough; but, in a general sense, any cattle.

When mention is made of one beast, they say, *quidam equus*, vel *quidam bos*: when of two, or more, they do not say *equi* or *boves*, but *averia*.

Replegiare de AVERIIS. See the article **REPLEGIARE**.

AVÉMENT, in law, usually signifies an offer of the defendant to make good or justify an exemption, pleaded in abatement or bar of the plaintiff's action.

The word also sometimes signifies the act, as well as the offer, of justifying the exception.

Averment is two-fold, *general* and *particular*.

General AVÉMENT is the conclusion of every plea to the writ, or in bar of replications or other pleadings; (for counts, or avowries in nature of counts, need not to be *averred*;) containing matter affirmative; and ought to be with these words, *hoc paratus est verificare*.

Particular AVÉMENT is, when the life of a tenant for life, or

tenant in tail, is *averred*, &c.—An *averment* contains as well the matter as the form thereof.

AVERNI*, among the ancient naturalists, certain lakes, grotto's, and other places, which infect the air with poisonous steams or vapours; called also *mephitæ*.

* The word is Latin, formed of the Greek privative *a*, and *epus*, bird; as intimating that birds could not fly over them, but dropped down dead. *Avernus*, q. d. *avornus*, locus sine avibus.

Avèrni are said to be frequent in Hungary, on account of the abundance of mines therein.

The grotta del Cani, in Italy, is a famous one. See **GROTTA**, and **EXHALATION**.

But the most celebrated *avèrni* was, a lake near Baize, in Campania, by the modern Italians called *Lago di Tripe-gia*.

—The fumes it emitted are represented by the ancients as being of so malignant a nature, that birds could not fly over it, but sunk down dead; which some later writers have chose to attribute to this, that the sulphurous effluvia hereof not being of confidence to sustain the birds, they dropped by their own weight. This circumstance, joined with the great depth of the lake, occasioned the ancients to take it for the gate or entrance of hell; and accordingly Virgil makes Æneas descend this way to the Inferi*.—Vibius Sequester says, there is no bottom to be found of it; *Immensæ altitudinis cujus ima pars apprehendi non potest*. See **HELL**.

* Next to the Baize, says Strabo, lies the Lucrine bay; and within it the lake *Avèrni*. It was here the ancients believed that Homer had described Ulysses as conversing with the dead, and consulting Tiresias's ghost: for here they said was the oracle sacred to the shades, which Ulysses came and consulted concerning his return. The *Avèrni* is a deep dark-some lake, with a narrow entry from the outer bay: it is surrounded with steep banks that hang threatening over it, and is only accessible by the narrow passage through which you fall in. These banks were anciently quite overgrown with a wild wood, impenetrable by a human foot. Its gloomy shade impressed an awful superstition upon the minds of the beholders; whence it was reputed the seat of the Cimmerians, who dwelt in perpetual night.

Whoever failed hither, first did sacrifice; and endeavoured to propitiate the infernal powers, with the assistance of some priests who attended upon the place, and directed the mystic performance. Within, a fountain of pure water broke out just over the sea; but no creature ever tasted of it, believing it to be a vein of the river Styx: somewhere near this fountain was the oracle; and the hot waters, frequent in these parts, made them think they were branches of the burning Phlegethon. Enquiry into the Life, &c. of Homer, sect. 11.

AVERPENY, q. d. *Average-peny*, money contributed towards the king's averages; or money given to be freed thereof. See **AVERAGE**.

AVERRUNCATION, in agriculture, the act of cutting or lopping off the superfluous branches of trees. See **PRUNING**.

AVERRUNCI*, in antiquity, an order of deities among the Romans, whose peculiar office was to avert dangers and evils.

* The Greeks called this species of gods, ἀλγῆκακοι, or ἀποτροπαιοι; and their feast ἀποτροπαιή: sometimes, ἀποτροπαιοι.

The Egyptians had also their *dii averrunci*, or *apotropæi*, who were pictured in a menacing posture, and sometimes with whips in their hands.—This was a divinity of this kind; as is shewn by Kircher. See *Oedip. Egypt.* T. III. p. 487.

AVERSION*, abhorrence, dislike. See **ANTI-PATHY**.

* The word is compounded of *a*, from; and *aversus*, to turn.

AVERY, a place where oats, or provender are kept for the king's horses. See **AVERIA**.

AUGES, in astronomy, two points in a planet's orbit, otherwise called *apsides*. See **APSES**.

One of the *auges* is particularly denominated the *apogee*, the other *perigee*.

AUGMENT, **AUGMENTUM**, in the Greek grammar, an accident of certain tenes; being either the prefixing of a syllable, or an increase of the quantity of the initial vowels.

There are two kinds of *augmenta*.—*Temporale*, or of a letter, when a short vowel is changed into a long one; or a diphthong into another longer one: thus called by reason the time of its pronunciation is now lengthened.

Augmentum syllabicum, or of a syllable, is when a letter, viz. *u*, is added at the beginning of the word; so that the number of syllables is increased.

AUGMENTS, in mathematics. See **FLUXIONS**, and **MOMENTS**.

AUGMENTATION, *Augmentum*, in a general sense, the act of *augmenting*; that is, of adding or joining something to another, to render it larger, or more considerable.

The governors of the bounty of queen Anne, for the *augmentation of the maintenance of the poor clergy*, by virtue of the several acts of parliament, made for that purpose, are empowered to augment all livings not exceeding 50*l.* per annum: and the number of livings following have been certified to be capable of *augmentation*.

- 1071 Livings not exceeding 10 *l.* per annum, which may be augmented (with the bounty alone) six times each, pursuant to the present rules of the governors, which will make 6426 augmentations. } 6426
- 1467 Livings above 10 *l.* and not exceeding 20 *l.* per annum, may be augmented four times each, which will make 5868 augmentations. } 5868
- 1126 Livings above 20 *l.* and not exceeding 30 *l.* per annum, may be augmented three times each, which will make 3378 augmentations. } 3378
- 1049 Livings above 30 *l.* and not exceeding 40 *l.* per annum, may be augmented twice each, which will make 2098 augmentations. } 2098
- 884 Livings above 40 *l.* and not exceeding 50 *l.* per annum, may be each once augmented, which will make 884 augmentations. } 884

5597 Total number of augmentations, which must be made (by the bounty alone) before the livings already certify'd will exceed 50 *l.* per annum. } 18654

Computing the clear amount of the bounty to make 55 augmentations yearly, it will be 339 years, from the year 1714, (which was the first year in which any livings were augmented) before all the small livings already certified can exceed 50 *l.* per annum: and if it be computed, that one half of such augmentations may be made in conjunction with other benefactors (which is very improbable) it will require 226 years before all the livings already certified will exceed 50 *l.* per annum.

AUGMENTATION is also used for the *augment*, i. e. for the additament, or the thing added. Such a minister petitioned the king for an augmentation of salary, wages, &c.

Court of AUGMENTATION of the king's revenues is the name of a court erected under Henry VIII., in 1536, to the end the king might be justly dealt with, touching the profit of such religious houses, and their lands, as were given him by act of parliament the same year.—This court was dissolved under queen Mary, by the parliament held the first year of her reign; but the office of augmentation remains to this day, in which are many valuable records.

The court took its name hence, that the revenues of the crown were thought to be much augmented by the suppression of the said houses; many of which the king reserved to the crown.

AUGMENTATIONS, in heraldry, are additional charges to a coat-armour frequently given as particular marks of honour, and generally borne either on an escutcheon, or a canton.—Such are the arms of Ulster, borne by all the baronets of England.

AUGRE, or AWORE, a carpenter's and joiner's instrument, serving to bore large, round holes.

The *augre* consists of a wooden handle, and an iron blade, terminated at bottom with a steel bit. *Vid. Mex. Mech. Exerc. p. 94.*

AUGSBURG Confession. See AUGUSTAN.

AUGUR *, in antiquity, a minister of religion among the Romans, appointed to take *auguries*: or presages concerning futurity from birds, beasts, and the appearances of the heavens.

* The word is by some derived from *avis*, bird, and *garrulus*, chattering; on which footing, the original office of the *augur* is supposed to have been to observe, and take indications from, the noise, calling, singing, chirping, and chattering of birds. Agreeably to which, *augur* is commonly distinguished from *auspex*, as the latter was supposed employed in observing the flight of birds. See *AUSPEX*.—Pezron derives it from the Celtic *au*, liver, and *gar*, man; so that according to him an *augur* was properly a person who inspected the entrails, and divined by means of the liver. On which principle, *augur* would have been the same with *auspex*.

The *augurs* made a college or community, which at first consisted of three persons, (one for each tribe:) then of four, (when Servius Tullius increased the tribes to that number:) then of nine (four of them patricians, and five plebeians:) lastly, Sylla made the number fifteen—Cato was of the college of *augurs*.

They bore an *augural* staff, or wand, called *linus*, as the ensign of their office and authority. No affair of moment could be resolved on, without first consulting them; and their advice, be it what it would, was, by a decree of the senate, appointed to be exactly and religiously observed.

Some will have *augurs* to have differed from *auspices*, and *augury* from *auspicy*, in that the former was in strictness confined to the chirping of birds, and the latter to their flying, feeding, &c.—But this is a distinction often dispensed withal.

AUGURY, AUGURIUM, the discipline of the *augurs*, or the practice of consulting the gods, and learning their will, by divers kinds of omens.

The observation of *auguries* is very ancient, as having been prohibited by Moses in Leviticus.—The cup put in Ben-

min's sack, in Egypt, was that used by Joseph to take *auguries* by.

AUGURY, in its more general signification, comprizes all the different kinds of divination; which Varro distinguishes into four species of *augury*, according to the four elements.—Pyromancy, or *augury* by the fire; aeromancy, or *augury* by the air; hydromancy, or *augury* by the water; and geomancy, or *augury* by the earth.

The particular branches are, *alestomancy*, *anthropomancy*, *belomancy*, *catoptromancy*, *capnomancy*, *gastrumancy*, *geomancy*, *aruspicina*, *libanomancy*, *lecanomancy*, *necrumancy*, &c. See each described under its proper article.

AUGUST, AUGUSTUS, in a general sense, something majestic, venerable, or sacred.

The title *augustus* was first given by the Roman senate to Octavius, after his being confirmed by them in the sovereign power.—It was conceived as expressing something divine, or elevated above the pitch of mankind, being derived from the verb, *auges*, I grow; encrease, *tantum supra humanam sortem auctus*.

The successors of Octavius assumed the same quality; so that thence-forward emperor and *augustus* were the same thing: they became synonymous terms. See EMPEROR.

The presumptive heir of the empire, or he who was destined to succeed to the dignity, was first created *cesar*; which was a step necessary to arrive at that of *augustus* or emperor.—Yet F. Pagi maintains the reverse; viz. that it was necessary to be *augustus*, previously to the being *cesar*. See CESAR.

M. Flechier observes, that the emperor Valentinian proclaimed his brother Valens, *augustus*; without first declaring him *cesar*: which had never been practised before.—It is added, that Marcus Aurelius, upon his succeeding to Antoninus, immediately created L. Verus, both *cesar* and *augustus*. This was the first time the Romans had known two *augusti* at once; for which reason the year when it was done, viz. 161, was marked in the Fasti with the consulate of the two *augusti*. It was a surprising spectacle to the people of Rome to see themselves governed by two sovereigns, after so much blood spilt for the choice of a single master.

The empresses also took the quality of *augusta*; and even some ladies of the imperial family, who had never been wives of emperors, but mothers or daughters.

On medals and coins, some of the ancient kings of France are also found with the appellation *augusti*; particularly Childerbert, Clothaire, and Clovis: add, that the wife of this last, Chrotechida, is also called by Heric, in his book of the miracles of St. Germain, indifferently, either *augusta*, or queen.

The *Historia Augusta* is the history of the Roman emperors from the time of Adrian to Carinus, that is from the year of our lord 157 to 284: composed by six Latin writers, *Æl. Spartianus*, *Julius Capitolinus*, *Æl. Lampridius*, *Vulcatius Gallicanus*, *Trebellius Pollio*, and *Flavius Vopiscus*. *Vid. Fabric. Bibl. Lat. c. 6.*

AUGUSTALES, or *Sacales Augustales*, or *Flamines Augustales*, were the priests of Augustus, appointed after the dedication of that emperor by Tiberius, to perform the service of the new god.

AUGUSTALIA, in antiquity, a feast instituted in honour of the emperor Augustus.

This festival was first established in the year of Rome 835, being the fourth after he had ended all his wars, and settled the affairs of Sicily, Greece, Asia, Syria, and the Parthians.—The day whereon he made his entry into Rome, being the 4th of the ides of October, was appointed to be kept a feast; and was called *Augustalia*.

AUGUSTALIA was also a name given to the games celebrated in honour of the same prince, on the 4th of the ides of October.

AUGUSTALIS, or *Præfatus Augustalis*, a Roman magistrate, who was appointed to govern Egypt with a power much like that of a proconsul in other provinces.

AUGUSTAN, relating to Augustus, or Augusta.

AUGUSTAN *Rpa*. See AETIAN.

AUGUSTAN Confession denotes a celebrated confession of faith, drawn up by Luther, and other ancient reformers, and presented in 1530 to the emperor Charles V. at the diet of Augusta or Augsborg, in the name the evangelic body.

AUGUSTINS, or AUGUSTINIANS, an order of religious; thus called from St. Augustin, whose rule they observe.

The *Augustins*, popularly also called *Austin friars*, were originally hermits, whom pope Alexander IV. first congregated into one body, under their general Lanfranc, in 1256.

The *Augustins* are clothed in black, and make one of the four orders of mendicants.

From these arose a reform, under the denomination of *bare-foot Augustins*, or *Minorites*, or *friars minors*.

There are also canons regular of St. Augustin, who are clothed in white, excepting their cope, which is black.

At Paris they are known under the denomination of, *religious of Genevieve*; that abbey being the chief of the order. See *GENEVIEVE*.

There are also *Augustines*, or nuns and canonesse, who observe the rules of St. Augustin.

THE AUGUSTIN, AUGUSTINUS, of Janfenius, is a celebrated treatise of that author, bishop of Ypres, entitled, *Cornelius Janfenii Episcopi Irensis, Augustinus*, in three volumes, folio, printed at Louvain in 1640; the first tome whereof contains a discourse against Pelagianism; and the second divers treatises of reason; the use of authority in theological matters; the state of innocence; fall of nature by sin; grace, &c. — From these several treatises were collected the five famous propositions, enumerated under the article JANSENISM.

AUGUY-PAN-NEUF, or AGUILLANNEUF. See MISLETO.

AVIARY *, a house or apartment kept for the keeping, feeding, and propagating of birds.

* The word is formed of the Latin *avis*, bird.

AVIGNON-Berry, called also *French Berry*, is the fruit of a shrub by some authors called *lycium*; growing plentifully near *Avignon*, and in other parts of France.

The berry is somewhat less than a pea; its colour is green, approaching towards a yellow; and it is of an astringent and bitter taste. — It is much used by the dyers, who stain a yellow colour with it; and by the painters, who, also make a fine golden yellow of it.

AVISO, an advice, piece of intelligence, or advertisement, to notify some event, or matter worthy of knowledge.

* The word is Italian, *avviso*, and is chiefly used in matters of commerce.

AUL. See the article AWL.

AULA, in our ancient law-books, signifies a court baron. — *Aula ibidem tertia quarta die Augusti*. &c.

Aula ecclesiæ is sometimes used for what we now call *navis ecclesiæ*. See NAVE.

AULIC, AULICA, an act which a young divine maintains in some foreign universities, upon the admission of a new doctor of divinity.

It is so called from the Latin, *aula*, a hall; it being in the hall of the university that this act is usually held.

The person who presides at the disputation is the same that is to take the doctor's cap.

AULIC, AULICUS, is also an appellation given to certain officers of the emperor, who compose a superior court or council, which has an universal jurisdiction, and without appeal, over all the subjects of the empire, in all processes entered therein.

We say, *aulic council*, the *aulic court* or chamber, *aulic counsellor*, &c.

The *aulic council* is established by the emperor, who nominates the officers; but the elector of Mentz has a right of visiting it. — It is composed of a president, who is a catholic; a vice-chancellor, presented by the elector of Mentz, and of eighteen assessors, or counsellors, nine whereof are Protestants, and nine Romanists.

They are divided into two benches, one whereof is taken up by nobles, and the other by lawyers. — They hold their assembly in the presence of the emperor; and for that reason are called *jussitium imperatoris*, the emperor's justice; and *aulic council*, because theirs follows the emperor's court, *aula*, and has its residence in the place where he is. — This court clothes a little with the imperial chamber of Spire; in that they are preventive of each other; it not being allowed to remove any cause from the one to the other.

Nor can the emperor himself hinder or suspend the decisions of either court; much less call any cause before himself which has once been before them; without the consent of the states of the empire. Yet, in some cases the same council forbears making any peremptory conclusion without the emperor's participation; and only decrees thus, *Fiat votum ad Cæsarem*; that is, make a report hereof to the emperor in his privy-council.

AULNEGER, or ALNAGER. See ALNAGER.

AULO, *Aulo*, a Grecian loan measure. See MEASURE.

AUMONE, or ALMS. See the article ALMS.

Tenure in AUMONE is where lands are given to a religious house or church, that some service may be paid for the good of the donor's soul.

AUMONIER, or ALMONER. See ALMONER.

AUNCEL-Weight, *quasi Hand/al-Weight*, an ancient kind of balance, consisting of scales hanging on hooks fastened at each end of a beam or staff, which a man lifts up on his hand or fore-finger, and so discovers the equality or difference between the weight and the thing weighed.

There being great deceits practised in these weights, they were prohibited by several statutes; and the even balance alone commanded.

The word is still used in some parts of England, to signify meat fold by poiling in the hand, without putting it into the scales.

AUNCESTOR—*Affixe of Mort d'AUNCESTOR*. See ASSISE.

AUNCESTREL Homage. See the article HOMAGE.

AUNCIENT Demain. See ANCIENT Demain.

AVOCATORIA, a mandate of the emperor of Germany, directed to some prince or subject of the empire, to stop his unlawful proceedings in any cause brought by way of appeal before him.

AVOIDANCE, in law, has two significations: the one when a benefice becomes void of an incumbent; the other, when we say in pleadings in chancery, confessed or avoided, traversed or denied, &c. See VOIDANCE.

AVOIRDUPOIS, or AVERDUPOIS Weight, a kind of weight used in England; the pound whereof contains sixteen ounces. See WEIGHT.

The proportion of a pound *averdupois* to a pound *troy*, is as 17 to 14.

All the larger and coarser commodities are weighed by *averdupois* weight; as groceries, cheese, wool, lead, haps, &c.

Bakers who live not in corporation towns, are to make their bread by *averdupois* weight; those in corporations by *troy* weight. — The apothecaries buy their drugs by *averdupois*, but sell their medicines by *troy*.

AVOWEE, ADVOCATUS: See ADVOWER, and ADVOCATE.

The *avowee* is he to whom the right of advowson of any church belongs, so that he may present thereto in his own name; he is thus called by way of distinction from those who sometimes present in another man's name, as a guardian who presents in the name of his ward; as also from those who only have the lands whereto an advowson belongs for term of life or years, by intrusion, or disseisin.

AVOWRY, in law, is where one takes a distress for rent, or other thing; and the other sues replevin. In which case the taker shall justify, in his plea, for what cause he took it; and if he took it in his own right, he is to shew it, and so *avow* the taking; which is called his *avowry*. If he took it in the right of another, when he has shewed the cause, he is to make confession of the taking, as being a bailiff or servant to him in whose right he did it.

AU-PIS-ALLER, a French phrase, sometimes used among English writers, signifying, at the worst.

AURA *, among phyliologists, an airy exhalation or vapour. See VAPOUR and EXHALATION.

* The word is Latin, derived from the Greek *αὔρα*, gentle wind.

AURATUS Equus. See EQUUS.

AUREA *Alexandrina*, in pharmacy, a kind of opiate, or antedote, which was in great fame among the ancient writers, composed of a great number of ingredients.

It is called *aurea*, from the gold (*aurum*) which enters its composition; and *alexandrina*, as having been first invented by a physician named Alexander. — It is reputed a good preservative against the colic and apoplexy.

AURELIA, a term used by natural historians for the first apparent change of the *eruca*, or maggot of any species of insects.

Aurelia is the same with what other writers call *chrysalis*, some *nympha*. See SUPPLEMENT, article CHRYSALIS.

AUREOLA, the crown of glory, given by painters and statuary to saints, martyrs, and confessors; as a mark of the victory which they have obtained.

F. Sirmond says, the custom hereof was borrowed from the heathens, who used to encompass the heads of their deities with such rays.

The word *aureola*, in its original, signified a jewel which was proposed as the prize of a dispute; and was given as the reward of victory.

Among the Romish school-divines, *aureola* is supposed to be a special reward bestowed on martyrs, for the victory they have obtained over the powers of the world; virgins over the temptations of the flesh; and doctors over the artifices and seductions of the devil.

AUREUS *, the roman gold coin, equivalent to 25 denarii or 100 sesterces. *Suet. in Oth. c. 4. Tacit. Hist. l. 1. Beverin. de Ponder. p. 33. seq.*

* In modern and middle-age writers, it is also called *solidus*, or *solidus aureus*. *Vid. Scalig. de Re Num. p. 52. Beverin. p. 252. seq.*

The *aureus*, according to Arbuthnot, generally weighed double the *denarius*: on which footing, it must have been worth, according to the first proportion of coinage mentioned by Pliny, 1 l. 4 s. 3 d. $\frac{1}{2}$ sterl. — According to the proportion that now obtains among us, 1 l. 0 s. 9 d. *Plin. l. 33. c. 3. — Arbuth. Tab. 25.* — Aynworth, however, makes the *aurei* (*denarii*) of the higher empire weigh only five penny-weight; and under the lower empire, little more than half so much.

AURICHALCUM, among modern writers, denotes a factitious metal, popularly called *brass*. See BRASS.

The *aurichalcum* is a mixture of copper and calamine-stone melted together by a very vehement fire, in furnaces made on purpose. See COPPER and CALAMINARIS.

AURICLE,

AURICLE*, **AURICULA**, in anatomy, the external ear; or that part of the ear which is prominent from the head.

* The word is a diminutive of *auris*, ear; *q. d.* little ear.

For the structure and variety of the *auricle*, with the several parts thereof, their names, &c. See **E.A.R.**

AURICLE is also applied to two appendages of the heart; being two muscular caps, covering the two ventricles thereof; thus called from the resemblance they bear to the external ear.

They move regularly like the heart; only in an inverted order; their systole corresponding to the diastole of the heart, and vice versa. See *Tab. Anat. (Splanchn.) fig. 12. tit. d.* See also further of their structure and office under the article **HEART**.

AURICULA Juda, or *Jew's ear*, a kind of fungus or mulroom, somewhat resembling in figure, a human ear. It grows on old elder-trees, which is the tree whereon, it is pretended by some, Judas hanged himself; which has, as they think, given occasion to the name.

This fungus steeped in water, and applied to the eyes, is said to free them of inflammations: but its chief use is garglewife in decoctions, against inflammations of the throat, or swelling of the tonsils.

AURICULÆ Alvearium. } See the article { **ALVEARIUM**.
AURICULAM Retrahens. } **RETRAHENS**.
AURICULAR, something that relates to the ears. See **E.A.R.**, **AURICULARIS**.

Thus we say, an *auricular witness*, *auritus testis*, a witness by hearsay. So,

AURICULAR Confession is that made in the ear, privately. See **CONFESSION**.

AURICULAR Medicines are such as are suited to the cure of the distempers of the ear.

AURICULARIS Abductor. See the article **ABDUCTOR**. The finger next the little finger is also called *auricularis*, by the Greeks *ovris*, because used in picking the ear.

AURIGA, in astronomy, the *waggoner*; a constellation of stars in the northern hemisphere; whose stars, in Ptolemy's catalogue are 14; in Tycho's 23; in Hevelius's 40; in the Britannic catalogue 68; the longitudes, latitudes, magnitudes, &c. whereof are as follow:

Names and situations of the stars.	Longitud. Sign.	Latitude. North.	Magn.
Preced. over the north. foot	21 22 20	14 52 35	6
Mid. and south. over the foot	11 49 45	14 1 48	6

AURIPIGMENTUM, called also *Orpiment*. See **ORPIMENT**.

AURIS, an ear. See the article **E.A.R.**

Abcisio AURIUM, cutting off the ears, was a punishment inflicted by the Saxon laws on those who robbed churches; and afterwards on every thief; and at length on divers other criminals.

AURIS Elevator. } See the article { **ELEVATOR**.
AURIS Externus. } **EXTERNUS**.
AURIS Obliquus. } **OBLIQUUS**.
AURIS Tinnitus. } **TINNITUS**.

AURISCALPIUM*, an instrument wherewith to pick and cleanse the ear from wax; and serving also for some other operations relating to disorders of that part.

* The word is compounded of the Latin *auris*, ear; and *scalpo*, I scratch, or pick.

AURORA*, the morning twilight; or that faint light which begins to appear in a morning, when the sun is within eighteen degrees of the horizon.

* Nicod. derives the word from *aurefce*, of *aureum*, *quia ab oriente solis aer aurefcit*.

The poets have personified, and even made it a goddess; representing her with a chariot, rosy fingers, &c.

AURORA Borealis, or **AURORA Septentrionalis**, the northern dawn, or light, is an extraordinary meteor, or luminous appearance, shewing itself in the night-time, in the northern part of the heavens. See **METEOR**.

It is usually of a reddish colour, inclining to yellow, and sends out frequent coruscations of pale light, which seem to rise from the horizon in a pyramidal undulating form, and shoot, with great velocity, up to the zenith.

The *aurora borealis* appears almost always in form of an arch; chiefly in the spring and autumn; after a dry year.—The arch is partly bright, partly dark; but generally transparent. Sometimes it produces an *iris*.—M. Godin judges, that most of the extraordinary meteors and appearances in the skies, related as prodigies by historians, *e. gr.* battles, and the like, may be probably enough reduced to the class of *auroræ boreales*. Vid. *Hist. Acad. R. Scienc. an. 1726. p. 405*.

This kind of meteor never appears near the equator, and was so rare in England, that none are recorded in our annals since that remarkable one, Novemb. 14, 1574. till the surprising *aurora borealis*, March 6, 1716. which appeared for three nights successively, but by far more strongly on the first.—Indeed, in the years 1707 and 1708, five small ones were observed in little more than eighteen months.

Hence it should seem that the air or earth, or both, are not at all times disposed to produce this phenomenon; for though it is possible it may happen in the day-time, in bright moonshine, or in cloudy weather, and so pass unobserved; yet that it should appear so frequent at some times, and so seldom at others, cannot well this way be accounted for.—That in March 1716, was visible to the west of Ireland, and the confines of Russia, and to the east of Poland; extending at least near 30° of longitude, and 50° in latitude, that is, over almost

all the north of Europe; and in all places at the same time, it exhibited the like wondrous appearances.

A sufficient number of observations have not yet been made by the curious, to enable them to assign the cause of this phenomenon, with any certainty.—Dr. Halley, however, imagines the watry vapours, or effluvia, rarified exceedingly by subterraneous fire, and tinged with sulphurous steams; which naturalists suppose to be the cause of earthquakes; may also be the cause of this appearance: or, that it is produced by a kind of subtle matter, freely pervading the pores of the earth, and which, entering into it nearer the southern pole, passes out again with some force into the æther at the same distance from the northern; the obliquity of its direction being proportioned to its distance from the pole. This subtle matter, by becoming some way or other more dense, or having its velocity increased, may be capable of producing a small degree of light, after the manner of effluvia from electric bodies, which, by a strong and quick friction, emit light in the dark: to which sort of light this seems to have a great affinity. *Phil. Transact. N° 347.*

M. de Macran in an express treatise on the *aurora borealis*, published in 1731, assigns its cause to be the zodiacal light, which, according to him, is no other than the sun's atmosphere, which happening on some occasions to meet the upper parts of our air, on this side the limits where universal gravity begins to act more forcibly towards the earth than towards the sun, falls into our atmosphere, to a greater or less depth, as its specific gravity is greater or less, compared to the air it passes through. *Vid. Tract. Phys. et Hist. del. Auroræ Borealis. Suite des Mem. del Acad. R. des Scienc. ann. 1731. p. 3. seg.*—See also ZODIACAL LIGHT.

AURUM, in natural history, denotes gold. See GOLD.

The word is chiefly used among us as applied to certain chymical preparations, whereof gold is the basis or principal ingredient.—Such are the *aurum potable*, *aurum fulminans*, &c. **AURUM fulminans**, is a preparation of gold; thus called, because when cast in the fire, it produces a violent noise, like thunder. It consists of gold dissolved in aqua regia, and precipitated by oil of tartar per deliquium, or volatile spirit of sal armoniac. The powder being wash'd in warm water, and dried to the consistence of a paste, is afterwards formed into little grains of the bigness of hemp-seed. It is inflammable, not only by fire, but also by a gentle warmth; and gives a report much louder than that of gunpowder.

Its effect is commonly said to be principally downwards; in opposition to gunpowder, which is chiefly upwards; but this rather seems a vulgar error.

A scruple of this powder acts more forcibly than half a pound of gunpowder: a single grain laid on the point of a knife, and lighted at the candle, goes off with a greater noise than a musket.—It is said to consume even to the very last atom.

AURUM musivum, or *musivum*, a preparation in pharmacy, thus called from its golden colour and appearance. It is made of mercury, tin, sal armoniac, and flowers of sulphur, by grinding, mixing, and then setting them three hours in a sand heat.—The dirty sublimate being taken off, the *aurum musivum* is found at the bottom of the matrafs. It is recommended in most chronic and nervous cases; and particularly convulsions of children.—Its dose is from 4 gr. to a scruple.

AURUM potable, potable gold, is a composition made of gold, by reducing it, without any corrosive, into a kind of gluten, or substance like honey, of the colour of blood; which being steeped in spirit of wine, gives it a ruby colour, and makes what is called *tincture of gold*.

An ounce of this tincture, mixed with sixteen ounces of another liquor, is called *aurum potable*, and is said to be a sovereign remedy against several diseases.

A modern physician has asserted, that gold is a resin drawn from the earth; and that the grand secret of rendering gold potable, does not consist in dissolving this resin by means of corrosives, but by a water, wherein it melts like ice or snow in hot water; and this water he says, must be nothing but a liquor extracted from gold, agreeable to an axiom that he lays down, which is, that matters of different natures have no ingress into one another; but that every menstruum or dissolvent ought to be taken from bodies of the same kind with those it is to act upon.

The same author observes, that blood and urine furnish a sal armoniac, which, mingled with aqua-fortis, acts upon gold: whence he conjectures, that there may be a conformity of nature between gold and blood; and that by consequence gold, well opened and subtilized, might produce a resin, and a fire that would augment the blood: but this is a wild sort of arguing.

AURUM Regium. See the article QUEEN GOLD.

AUSCULTARE, in ancient customs.—In regard the reading of prayers with a graceful tone or accent, make some impression on the hearers; was was anciently a person appointed, in monasteries, to hear the monks read and sing, who instructed them how to perform, before they were ad-

mitted to read or chant publicly in the church, or before the people.*—This was called *aufcultare*, q. d. to hear or listen.

* *Quicumque lecturus vel cantaturus est aliquid in monasterio; si necesse habebat ab eo, viz. cantore, priusquam incipiat debet aufcultare.* Lantfranc in Decret. pro Ord. Bened.

AUSPEX*, a name originally given to those who were afterwards denominated *augurs*. See AUGUR.

* In which sense the word is supposed to be formed from *avis*, bird; and *inspicere*, to inspect; *auspices*, q. d. *avspices*.

Some will therefore have *auspices* properly to denote those who foretold future events from the flight of birds.

AUSPICIUM, *AUSPICV*, the same with *augury*. See AUGURY.

Servius indeed distinguishes between *auspicy* and *augury*; making *auspicy* comprehend the consideration of all things; *augury* only of certain things: he adds, that the former was allowed a man any where abroad, whereas the latter might only be performed in his native place. *Auspiciari civis etiam peregrare licet: augurium agere nisi in patriis sedibus non licet.* And it is certain, that consuls, generals, and others, who took omens out of Rome, were properly said *auspiciari*: nevertheless, custom appears to have over-ruled this distinction.

AUSTERE*, implies a rough affringent taste; such as that of vitriol, allum, &c.

* The word comes from the Greek, *avresqes*, which signifies the same.

Austere things differ from *ater*, or four ones; in that they contringe the mouth and tongue somewhat less, and are devoid of acidity.

AUSTERITY, *AUSTERENESS* of taste, that which denominates aapid body, *austere*. See AUSTERE.

AUSTERITY, among moral writers, sometimes denotes rigour in the inflicting of punishments.

We say, *austerity* of manners; the *austerities* of the monastic life. The austerity of the Roman censors kept the people in their duty. The greatest *austerity* of the Carthulians is perpetual solitude.

AUSTRAL*, *AUSTRALIS*, the same with *southern*. See SOUTH.

* The word is derived from *auster*, south wind. See WIND.

Thus, *austrol signs* are the fix last signs of the zodiac; so called, because they are on the south-side of the equinoctial.

See SIGN.

AUSTRALIS PISCIS is a constellation of the southern hemisphere; not visible in our latitude.

AUTHENTIC, *Authenticus*, something of received authority. It also signifies something solemn, and celebrated; clothed in all its formalities; and attested by proper persons to whom credit has been regularly given.

In this sense we say, the truths of christianity are founded on *authentic* testimonies, &c.—*Authentic* papers, instruments, &c.

—The nobility and persons of rank were particularly called *authentic* persons, as being supposed more deserving of credit than others.

AUTHENTICATING* the punishing an adulteress, by public whipping, and shutting her up in a convent for two years; after which, if the husband be not willing to take her back, she is shaven, veiled, and shut up for life.

* It is thus called, as being the punishment prescribed in the Authentics.

If the husband die within the two years, she seems to have a right to petition the court for her liberty: at least, another man willing to marry her may petition, and probably obtain it.

AUTHENTICS, *Authenticæ*, in the civil law, is a name given to the novels of Justinian. See NOVEL.

The reason of the denomination is not well known.—Alciat will have it to have been first given them by Accursius. The novels were originally composed in Greek, and afterwards translated into Latin by the patrician Julian, who also reduced them into fewer words and less compass. And in the time of Bulgarius, there was a second version made, more exact and literal, tho' not quite so elegant as the former.

This translation, says the author just cited, being preferred by Accursius, he called it *authentica*, by way of preference over that of Julian, as being more conformable to the original.

AUTHOR*, *AUTOR*, properly denotes one who created or produced any thing; and is applied by way of eminence to the first cause, viz. God.

* The word is Latin, formed of the Greek *avres, ipse*, or rather from the Latin participle *avctus*, of *avges*, I increase.

We say the *author* of nature; *author* of the universe, &c.

The term *author* is sometimes also used in the same sense with *institutor*, or *inventor*.—Polydore Virgil has wrote eight books of the *authors* or inventors of things, &c. See INVENTION.—Pythagoras is held the *author* of the dogma of metempsychosis.

AUTHOR, in matters of literature, denotes a person who has wrote or composed some book, or writing.

We say the sacred *authors*; anonymous *authors*, ancient and modern *authors*; the Latin *authors* pillaged the Greeks, &c.—An original *author* is he who first treated of any point or subject; who did not follow any other person, imitate any model either

either in the matter or the manner of what he has wrote, See ORIGINAL.

AUTHORITATE *Parliamenti*. See CUSTODES.

AUTHORITY, *AUTORITAS*, in a general sense denotes a right or power to command, and make one self obeyed.

In this sense we say the supreme or sovereign authority; absolute or despotick authority; the royal authority; the episcopal authority; the authority of the church; of a father, &c. The authority of scripture, of a creed, confession, or the like.

AUTHORITY is also used for the testimony of an author, or writing.

The word is also particularly understood of an apophthegm, or sentence of some great or eminent person, quoted in a discourse, either by way of proof, or embellishment.

Authority also includes rules, laws, canons, decrees, decisions, &c. alleged in confirmation of a matter in dispute.

Passages quoted from Aristotle were of great authority in the schools: texts of scripture are of decisive authority.

Authorities make a species of arguments called by rhetoricians, *inautistic*, or *extrinsic* arguments.

For the use and effect of authorities, see PREJUDICE, EVIDENCE, REASON, PROBABILITY, FAITH, REVELATION, &c.

AUTO *da se*. See ACT or FAITH.

AUTOCEPHALUS*, a person who is his own ruler or master, and who has no other over him.

* The word is compounded of the Greek *αὐτός*, *ipse*, and *κεφαλή*, *caput*, head.

This denomination was given by the Greeks to certain archbishops, who were exempted from the jurisdiction of patriarchs.—Such was the archbishop of Cyprus, by a general decree of the council of Ephesus, which freed him from the jurisdiction of the patriarch of Antioch.

There were several other bishops in the east, who were *autocephali*; and, in the west, those of Ravenna pretended to the same right.—The sixth council, canon 39. says, that the *autocephali* have the same authority with patriarchs; but this is not to be understood in the full latitude of the words: but only as intimating, that the *autocephali* have the same authority over their bishops, that patriarchs had over their archbishops: in which sense only they are equal to patriarchs.

AUTOGRAPHUM*, *Αὐτογράφη*, the very hand-writing of any person: or the original of a treatise, or discourse.—The word is used in opposition to a copy.

* The word is formed of the two Greek words *αὐτός*, and *γραφή*, *scribo*.

AUTOMATON*, or **AUTOMATUM**, a self-moving engine; or a machine which has the principle of motion within it self.

* The word is Greek, *αὐτοματός*, compounded of *αὐτός*, *ipse*, and *μαρμαί*, I am excited, or ready; whence *αὐτοματός*, spontaneous.

Such were Archytas's flying dove, mentioned by Aulus Gellius, *Noct. At. l. 10. c. 12.* and Regiomontanus's wooden eagle, which, as historians relate, flew forth of the city, met the emperor, saluted him, and returned: as also his iron fly, which, at a feast, flew out of his hands, and taking a round, returned thither again. Hakew. *Apol. c. 10. § 1.*

Among *automata* are also reckoned all mechanical engines which go by springs, weights, &c. included within them; such are clocks, watches, &c. Vid. *Bapt. Port. Mag. Nat. c. 19. Scalig. Subtil. 326.*

AUTOPSY*, *Αὐτοψία*, ocular inspection; or the seeing a thing with one's own eyes.

* The word is compounded of *αὐτός*, one's self, and *ὥψις*, sight.

AUTUMN*, **AUTUMNUS**, the third season of the year; being that wherein the harvest, and the fruits of the summer are gathered.

* Some derive the word from *augere*, I encrease, *quod autumnus fragibus augeat.*

Autumn begins on the day when the sun's meridian distance from the zenith, being on the decrease, is a mean between the greatest and the least; which in these countries is supposed to happen when the sun enters Libra. Its end coincides with the beginning of winter.

Divers nations have computed the years by autumns; the English Saxons, by winters.—Tacitus tells us, the ancient Germans were acquainted with all the other seasons of the year, but had no notion of autumn. Lidyat observes of the beginning of the several seasons of the year, that

Det Clemens hyemem, dat Petrus oer cathedratus,

Estuat Urbanus, autumnat Bartholomæus.

Autumn has always been reputed an unhealthy season. Tertullian calls it *tentator valetudinum*: and the satyrist speaks of it in the same light.—*Autumnus Libitineæ quæstus acerba.*

AUTUMN, in alchymy, the time or season when the operation of the philosopher's stone is brought to maturity and perfection.

AUTUMNAL, something peculiar to autumn.

AUTUMNAL Point is one of the equinoctial points; being that from which the sun begins to descend towards the south pole.

AUTUMNAL Equinox is the time when the sun enters the autumnal point. See EQUINOX.

AUTUMNAL flowers. See the article FLOWER.

AUTUMNAL signs are those through which the sun passes during the season of autumn.

The autumnal signs are Libra, Scorpio, and Sagittarius: See LIBRA, SCORPIO, and SAGITARIUS.

AUXESIS, in rhetoric, a figure whereby any thing is magnified too much. See AMPLIFICATION.

AUXILIARY, **AUXILIARIS**, any thing that is helping or assisting to another. See AUXILIUM.

We say, *auxiliary books*; a prince is to trust more to his own soldiers, than to *auxiliary troops*, &c.

AUXILIARY Verbs, in grammar, are such as help to form or conjugate others; that is, are prefixed to them to form or denote the moods or tenses thereof.

Such, in English, are *have*, *am*, or *be*; in French, *estre*, and *avoir*; in Italian, *be*, and *sono*, &c.—The *auxiliary am* supplies the want of passives in our language. See PASSIVE.

All the modern languages we know of make use of *auxiliary verbs*.—The reason is, that the verbs thereof do not change their terminations or endings, as those of the Latin and Greek, to denote the different tenses or times of being, doing, or suffering; nor the different moods or manners of their signifying; so that to supply this defect, recourse is had to different *auxiliary verbs*.

Besides the perfect *auxiliary verbs*, we have several defective ones; as *do*, *will*, *shall*, *may*, *can*, and *have*; which by changing their own terminations save the necessity of changing those of the verbs they are added to.—Thus, instead of *ego uris*, *tu uris*, *ille urit*, &c. we say, *I do burn*, *thou dost burn*, *he doth burn*, &c.

AUXILIUM, in law. See the article AID.

AUXILIUM Curie signifies an order of court, for the summoning of one party at the suit of another.

AUXILIUM ad filium militem faciendum, vel filium maritandum, was a writ directed to the sheriff of every county, where the king or other lord had any tenants, to levy of them reasonable aid, towards the knight his eldest son, or the marriage of his eldest daughter.

AWARD, in law, the judgment of some person who is neither assigned by law, nor appointed by the judge; for ending a matter in controversy; but is chosen by the parties themselves that are at variance.

AWL, or **AUL**, a shoemaker's implement, wherewith holes are bored in leather, to facilitate the stitching or sewing the same.—The blade of the *awl* is usually a little flat, and crooked; and the point ground to an acute angle.

AWME, or **AUME**, a Dutch measure of capacity for liquids; containing 8 steckans, or 20 verges or vertels; answering to what in England is called a tierce, or $\frac{1}{2}$ of a ton of France, or $\frac{1}{4}$ of an English ton. *Arbuth. Tab. 33.* See also MEASURE, &c.

AWN, in botany, *arista*; the beard growing out of the husk of corn or grass. See ARISTA.

AWNING, on board a ship, is when a sail, a tarpaulin, or the like, is hung over any part of the ship, above the decks, to keep off the sun, rain, or wind.

In the long boat they make an *awning*, by bringing the sail over the yard and stay; and booming it out with the boat-hook.

AX, a carpenter's instrument, serving to hew wood.—The *ax* differs from the joiner's hatchet, in that it is made bigger, deeper, and heavier, as serving to hew large stuff; and its edge tapering into the middle of its blade.—It is furnished with a long handle or helve, as being to be used with both hands. *Max. Mech. Exere. p. 119.*

AXILLA*, or **ALA**, in anatomy, the cavity under the upper part of the arm; commonly called the *arm-pit*.

* The word is a diminutive of *axis*; *q. d.* little axis. See AXIS.

Abscesses in the *axilla* are usually dangerous, on account of the many blood-vessels, lymphatics, nerves, &c. thereabout, which form several large plexus's.—By the ancient laws, criminals were to be hanged by the *axilla*, if they were under the age of puberty.

AXILLA, in botany, is the space comprehended between the stems of plants and their leaves.

Hence we say, those flowers grow in the *axilla* of the leaves, *i. e.* at the base of the leaves, or just within the angle of their pedicles.

AXILLARY, **AXILLARIS**, in anatomy, something that belongs to the *axilla*, or lies near them. See AXILLA.

AXILLARY Artery, is a ramification of the trunk of the subclavian artery; which, passing under the arm-pits, changes its name, and is called *axillary*.

AXILLARY Vein is one of the subclavian veins; which, passing under the arm-pits, divides itself into several branches, superior, inferior, external, internal, &c. which are spread over the arm.—See *Tab. Anat. (Angeiol.) fig. 6. lit. m.*

The second *vertebra* of the back is sometimes also called the *axillary vertebra*; in regard to it nearest to the arm-pits.

AXILLARY Glands. See HIRCUS.

AXINOMANCY*, AXINOMANTIA, an ancient species of divination, or a method of foretelling future events by means of an ax or hatchet.

* The word is formed from the Greek *axin*, *securi*, and *phantasia*, *divinatio*.

This art was in considerable repute among the ancients; and was performed, according to some, by laying an agat-stone on a red-hot hatchet.

AXIOM, AXIOMA, a self-evident truth; or a proposition whose truth every person perceives at first sight.

Thus, that the whole is greater than a part; that a thing cannot give what itself has not; that a thing cannot be and not be at the same time; that from nothing, nothing can arise, &c. are axioms.

By axioms, called also maxims, are understood all common notions of the mind, whose evidence is so clear and forcible, that a man cannot deny them without renouncing common sense and natural reason.

The rule of axioms is this, that whatever proposition expresses the immediate clear comparison of two ideas without the help of a third, is an axiom.—On the other hand, a truth which does not arise from an immediate comparison of two ideas, is no axiom.

Wolffius assigns the essence of an axiom thus: whatever proposition arises immediately from the consideration of a single definition, is an axiom.—Thus it necessarily following from the genesis of a circle, that all right lines drawn from the centre to the circumference thereof, are equal; inasmuch as they all represent the same line in different situations; this is an axiom.

Hence, the truth of axioms being perceived by the mere intuition of a definition; they need no demonstration: since they are necessarily as true, as the definition is just.

Several authors abuse this property of axioms, and obtrude for axioms the premises of syllogisms, which they are not able to prove.—Euclid himself lies liable to exception on this account, having assumed the equality of figures which mutually agree, or are congruous to each other, as an axiom.

Axioms, in effect, strictly speaking, are no other than identical propositions.—Thus, to say that all right angles are equal to each other is as much as to say, all right angles are right angles: each equality being implied in the very definition, or the very name.

My lord Bacon proposes a new science, to consist of general axioms, under the denomination of *philosophia prima*.

For the reason of the evidence of axioms: it may be observed, that knowledge being only the perception of the agreement or disagreement of ideas; where that agreement or disagreement is perceived immediately by itself, without the intervention or help of any other ideas, there our knowledge is self-evident: which being so, not only those usually allowed for axioms or maxims, but an infinite number of other propositions, partake equally with them in this self-evidence. Thus, that a circle is a circle, or that blue is not red, are as self-evident propositions, as those general ones, what is, is; and it is impossible for the same thing to be, and not to be. Nor can the consideration of these propositions add anything to the evidence or certainty of our knowledge of them. As to the agreement or disagreement of co-existence, the mind has an immediate perception of this but in very few. And therefore in this sort we have very little intuitive knowledge; though in some few propositions we have. Two bodies cannot be in the same place, is a self-evident proposition: the idea of fitting a place equal to the contents of its superficies, being annexed to our idea of body.

As to the relations of modes, mathematicians have framed many axioms concerning that one relation of equality: as, that equals being taken from equals, the remainders will be equal, &c. which however received for axioms, yet have not a clearer self-evidence than these, that one and one are equal to two; that if from the five fingers of one hand you take two, and from the five fingers of the other hand two, the remaining numbers will be equal. As to real existence, since that has no connexion with any other of our ideas, but that of ourselves, and of a first being; we have not so much as a demonstrative, much less a self-evident, knowledge concerning the real existence of other beings. See EXISTENCE.

For the influence of axioms or general maxims on the other parts of our knowledge: the rules established in the schools, that all reasonings are *ex præcognitis* & *ex præconcessis*, seem to lay the foundation of all other knowledge in these maxims, and to suppose them to be præcognita; which implies two things, *viz.* that these axioms are those truths first known to the mind; and, that on them the other parts of our knowledge depend.—But, first, that these axioms are not the truths first known to the mind, is evident from experience: for

who knows not that a child perceives that a stranger is not its mother, long before he knows it impossible for the same thing to be, and not to be? and how many truths are there about numbers, which the mind is perfectly acquainted with, and fully convinced of, before it ever thought on those general maxims?

Hence it follows, that these magnified axioms are not the principles and foundations of all our other knowledge; for if there be a great many other truths as self-evident as they, and a great many that we know before them, it is impossible that they should be the principles from which we deduce all other truths.—Thus, that one and two are equal to three, is as evident, and easier known, than that the whole is equal to all its parts.—Nor, after the knowledge of this axiom, do we know that one and two are equal to three, better or more certainly, than we did before. For if there be any odds in these ideas the ideas of whole and parts are more obscure, or at least more difficult to be settled in the mind, than those of one, two, and three.

Either, therefore, all knowledge does not depend on præcognita, or general maxims, called principles; or else such as these (that one and one are two, that two and two are four, &c.) and a great part of numeration, are axioms. To these, if we add all the self-evident propositions that may be made about all our distinct ideas, principles will be almost infinite; and a great many innate principles, many men never come to know all their lives.

General maxims, or axioms, then, may be of use in disputes, to stop the mouths of wranglers; but they are of little in the discovery of unknown truths. Several general maxims are no more than bare verbal propositions, and teach us nothing but the respect and import of names one to another; as, the whole is equal to all its parts: what real truth doth this teach us more, than what the signification of the word *totum*, or *whole*, does of itself import? If rightly considered, we may say, that where our ideas are clear and distinct, there is little or no use at all of maxims, to prove the agreement or disagreement of any of them. He that needs any proof to make him certain, and give his assent to this proposition, that two are equal to two, or that white is not black; will also have need of a proof to make him admit, that what is, is; or, that it is impossible for the same thing to be and not to be. But as maxims are of little use, where we have clear and distinct ideas; so they are of dangerous use, where our ideas are confused, and where we use words, that are not annexed to clear and distinct ideas. Locke.

AXIOM is also an established principle in some art or science.

Thus, it is an axiom in physics, that nature discovers herself most in the smallest subjects; also that nature does nothing in vain; that effects are proportional to their causes, &c. So it is an axiom in geometry, that things equal to the same third are also equal to one another; that if to equal things you add equals, the sums will be equal, &c. It is an axiom in optics, that the angle of incidence is equal to the angle of reflection, &c. It is an axiom in medicine, &c. that there is no sincere action in the human body, &c.

In this sense the general laws of motion are called axioms; as, that all motion is rectilinear, that action and re-action are equal, &c.

These particular axioms, it may be observed, do not immediately arise from any first notions or ideas, but are deduced from certain hypotheses: this is particularly observable in physical matters, wherein, as several experiments contribute to make one hypothesis, so several hypotheses contribute to one axiom.

AXIS properly signifies a line, or a long piece of iron or wood passing through the centre of a sphere, which is moveable upon the same.

In this sense we say, the axis of a sphere, or globe; the axis, or axle-tree of a wheel*, &c.

* There are now a sort of improved iron axle-trees made for coaches and chaises, which will go in all roads, wider or narrower. Some screw to the end, after the French manner.

AXIS of the world, in astronomy.—The axis of the world is an imaginary right line, which is conceived to pass through the centre of the earth, and terminating at each end in the surface of the mundane sphere.

About this line as an axis, the sphere, in the Ptolemaic system, is supposed daily to revolve.

This axis is represented by the line PQ, *Tab. Astron. fig. 52.*—The two extreme points hereof, in the surface of the sphere, *viz.* P and Q, are called its poles.

Axis of the earth, is a right line, upon which the earth performs its diurnal rotation, from west to east.

Such is the line PQ, *Tab. Geog. fig. 7.*—The two extreme points hereof are also called poles.

The axis of the earth is a part of the axis of the world.—It always remains parallel to itself, and at right angles with the equator.

equator. See PARALLELISM, INCLINATION, and ANGLE.

Axis of a planet is a line drawn through the centre thereof, about which the planet revolves.

The sun, moon, and all the planets, except Mercury and Saturn, are known, by observation, to move about their several *axis*; and the like motion is easily inferred of those two.

Axis of the horizon, the equator, ecliptic, zodiac, &c. are right lines drawn through the centres of those circles perpendicularly to the planes thereof. See CIRCLE. See also HORIZON, and ECLIPTIC.

Axis, in mechanics.—The *axis* of a balance is the line upon which it moves or turns.

Axis of oscillation is a right line parallel to the horizon, passing through the centre, about which a pendulum vibrates. See PENDULUM.

Axis, in geometry.—*Axis* of rotation, or circumvolution, is an imaginary right line, about which any plane figure is conceived to revolve, in order to generate a solid.

Thus a sphere is conceived to be formed by the rotation of a femicircle about its diameter or *axis*, and a right cone by that of a right-angled triangle about its perpendicular leg, which is here its *axis*.

Axis of a circle or sphere is a line passing through the centre of the circle or sphere, and terminating at each end, in the circumference thereof.

The *axis* of a circle, &c. is otherwise called the *diameter* thereof.—Such is the line AE. *Tab. Geom. fig. 27.* See DIAMETER.

Axis is yet more generally used for a right line proceeding from the vertex of a figure to the base thereof.

Axis of a Cylinder is properly that quiescent right line about which the parallelogram turns, by whose revolution the cylinder is formed.

Though, both in right and oblique cylinders, the right line joining the centres of the opposite bases is also called the *axis* of the cylinder.

Axis of a Cone is the right line or side upon which the right-angled triangle forming the cone makes its motion.

Hence it follows, that only a right cone can properly have an *axis*; in regard an oblique one cannot be generated by any motion of a plane figure about a right line at rest.

But in regard the *axis* of a right cone is a right line drawn from the centre of its base to the vertex; in analogy hereto the writers of conics do likewise call the like line drawn from the centre of the base of an oblique cone to the vertex, the *axis* thereof.

Axis of a Vessel is that quiescent right line passing through the middle thereof, perpendicularly to its base, and equally distant from its sides.

Axis of a Conic Section is a right line passing through the middle of the figure, and cutting all the ordinates at right angles, and into two equal parts.

Thus if AP, *Tab. Conics, fig. 31.* be drawn perpendicularly to FF, so as to divide the section into two equal parts; it is called the *axis* of the section.

Transverse Axis, called also the *first* or *principal Axis* of an Ellipsis, is the *axis* AP, last defined: being thus called in contradistinction to the conjugate or secondary *axis*.

The transverse *axis* in the ellipsis is the longest; and in the hyperbola it cuts the curve in the points A and P. *fig. 32.*

Conjugate Axis, or *second Axis* of the Ellipsis, is the line FF, *fig. 31.* drawn through the centre of the figure C, parallel to the ordinate MN, and perpendicularly to the transverse *axis* AP; being terminated at each extreme by the curve. See ELLIPSIS, and CONJUGATE.

The conjugate is the shorter of the two *axes* of an ellipsis; and is not only found in the ellipsis, but in the hyperbola.

Conjugate, or second Axis of an Hyperbola, is the right line FF, *fig. 32.* drawn through the centre parallel to the ordinates MN, MN, perpendicularly to the transverse *axis* AP.

The length of this *axis*, though more than infinite, may be found by this proportion, $\sqrt{AM \times PM} : AP :: 2MN : FF$. The *axis* of a parabola is of an indeterminate length, that is, infinite.—The *axis* of the ellipsis is determinate.—The parabola has only one *axis*; the ellipsis and hyperbola have two.

Axis in Optics.—*Optic axis*, or *visual axis*, is a ray passing through the centre of the eye; or it is that ray which, proceeding through the middle of the luminous cone, falls perpendicularly on the crystalline humour, and consequently passes through the centre of the eye.

Common or mean Axis is a right line drawn from the point of concourse of the two optic nerves, through the middle of the right line, which joins the extremity of the same optic nerves.

Axis of a Lens, or Glass, is a right line passing along the *axis* of that solid whereof the lens is a segment. See LENS, and GLASS.

Thus a spherical convex lens being a segment of some sphere, the *axis* of the lens is the same with the *axis* of the sphere; or it is a right line passing through the centre thereof.

Or, the *axis* of a glass is a right line joining the middle points of the two opposite surfaces of the glass.

Axis of Incidence, in dioptrics, is a right line drawn through the point of incidence, perpendicularly to the refracting surface. See INCIDENCE.—Such is the line DB, *Tab. Optics, fig. 56.*

Axis of Refraction, is a right line continued from the point of incidence or refraction, perpendicularly to the refracting surface, along the further medium. Such is the line BE.

Or it is that made by the incident ray, perpendicularly prolonged on the side of the second medium.

Axis of a Magnet, or magnetical Axis, is a line passing through the middle of a magnet, length-wise; in such manner, as that however the magnet be divided, provided the division be made according to a plane wherein such line is found, the load-stone will be made into two load-stones.

The extremes of such lines are called the poles of the stone.

Axis, in anatomy, is the second vertebra of the neck; reckoning from the skull.—See *Tab. Anat. (Osteol.) fig. 9.*

It is thus called by reason the first vertebra, with the head, move thereon, as on an *axis*. See CARO.

Spiral Axis, in architecture, is the *axis* of a twisted column, drawn spirally, in order to trace the circumvolutions without. See Twisted Column.

Axis of the Ionic Capital is a line passing perpendicularly through the middle of the eye of the volute.

The *axis* is otherwise called *cathetus*. See CATHETUS.

Axis in peritrochio is one of the five mechanical powers, or simple machines; contrived chiefly for the raising of weights to a considerable height.

It consists of a circle, represented AB, *(Tab. Mechanic, fig. 44.)* concentric with the base of a cylinder, and moveable together with it, about its *axis* EF.—This cylinder is called the *axis*; and the circle, the *peritrochium*; and the radii, or spokes, which are sometimes fitted immediately into the cylinder, without any circle, the *scytalæ*. See PERITROCHUM.—Round the *axis* winds a rope, whereby the weight, &c. is to be raised.

The *axis* in *peritrochio* takes place in the motion of every machine, where a circle may be conceived described about a fixed *axis*, concentric to the plane of a cylinder about which it is placed; as in crane-wheels, in mill-wheels, capstans, &c.

Doctrine of the Axis in peritrochio.—1. If the power, applied to an *axis* in *peritrochio*, in the direction AL, *fig. 7.* perpendicular to the periphery of the wheel, or to the scytala or spoke, be to a weight G, as the radius of the *axis*: CE is to the radius of the wheel CA, or the length of the spoke; the power will just sustain the weight, i.e. the weight and the power will be in æquilibrium.

2. If a power applied in F, pull down the wheel, according to the line of direction FD, which is oblique to the radius of the wheel, though parallel to the perpendicular direction; it will have the same proportion to a power which acts according to the perpendicular direction AL, which the whole line has to the sine of the angle of direction DFC. Hence, since the distance of the power in A, is the radius CA; the angle of direction DFC being given, the distance DC is easily found.

3. Powers applied to the wheel in several points, F and K, according to the directions, FD and KI, parallel to the perpendicular one AL, are to each other as the distances from the centre of motion CD and CI, reciprocally.

Hence, as the distance from the centre of motion increases, the power decreases; & *vice versa*.—Hence also, since the radius AC is the greatest distance, and agrees to the power acting according to the line of direction; the perpendicular power will be the smallest of all those able to sustain the weight G, according to the several lines of direction.

4. If a power acting according to the perpendicular AL, raise the weight G; the space passed through by the power will be to the space passed through by the weight, as the weight to the power.

For, in each revolution of the wheel, the power passes through its whole periphery; and in the same time the weight is raised a space equal to the periphery of the *axis*; the space of the power, therefore, is to the space of the weight, as the periphery of the wheel to that of the *axis*; but the power is to the weight, as the radius of the *axis* to that of the wheel. Therefore, &c.

5. A power, and a weight being given, to construct an *axis* in *peritrochio*, whereby it shall be sustained and raised.

Let the radius of the *axis* be big enough to support the weight without breaking. Then, as the power is to the weight, so make the radius of the wheel, or the length of the spoke, to the radius of the *axis*.

Hence, if the power be but a small part of the weight, the radius of the wheel must be vastly great.—e. gr. suppose the weight 3000, and the power 50, the radius of the wheel will be to that of the *axis* as 60 to 1.

This inconvenience is provided against by increasing the number of wheels and *axes*; and making one turn round another, by means of teeth or pinions.

AXLE-Tree. See the article *Axis*.

AXUNGIA*, a kind of fat, the hardest and dryest of any in the bodies of animals.

* The word is supposed to be formed, *ab axe rotarum quæ unguntur*, from its being used as the grease of wheels.

The Latins distinguish fat into *pinguedo*, and *adeps* or *sebum*; which last, when old, is particularly called *axungia*: but many of our modern writers confound them.

Physicians make use of the *axungia* of the goose, the dog, the viper, and some others, especially that of man, which is held by some to be of extraordinary service in the drawing and ripening of tumours, &c.

AXUNCIA of *Glass*, called also the *gall*, and *salt of glass*, is a scum taken from the top of the matter of glass before it be thoroughly vitrified.

AYEL, in law, a writ which lies where the grandfather being seized in his demesne the day he died, a stranger enters the same day, and disposses the heir.

AYRY, or **AERY** of hawks, a nest or company of hawks; so called from the old French word *aire*, which signifies the same. See **HAWK**.

AYSIAMENTA, or **AYZIAMENTA**. See **EASEMENTS**.

AZAMOGGLANS. See the article **AGEMOGGLANS**.

AZIMUTH*, in astronomy.—The *azimuth* of the sun, or a star, is an arch of the horizon, comprehended between the meridian of the place, and any given vertical.

* The word is pure Arabic, which signifies the same thing.

The *azimuth* is the complement of the eastern and western amplitude to a quadrant.

The *azimuth* is found trigonometrically, by this proportion; As radius is to the tangent of the latitude, so is the tangent of the sun's altitude to the cosine of the *azimuth* from the south, at the time of the equinox.—To find the *azimuth* by the globe, see **GLOBE**.

Magnetical AZIMUTH is an arch of the horizon contained between the sun's *azimuth* circle, and the magnetical meridian; or it is the apparent distance of the sun from the north or south point of the compass.

It is found, by observing the sun with an *azimuth* compass, when he is about 10 or 15 degrees high, either in the forenoon or afternoon.

AZIMUTH Compass is an instrument used at sea for finding the sun's magnetical *azimuth*. See **Magnetical AZIMUTH**. The description and use of the *azimuth* compass, see under the article **Azimuth COMPASS**.

AZIMUTH Dial is a dial whose style or gnomon is at right angles to the plane of the horizon.

AZIMUTHS, called also *vertical circles*, are great circles intersecting each other in the zenith and nadir, and cutting the horizon at right angles, in all the points thereof.

The horizon being divided into 360°; for this reason they usually conceive 360 *azimuths*.—These *azimuths* are represented by the rhumbs on common sea-charts.

On the globe these circles are represented by the quadrant of altitude when screwed in the zenith.

On these *azimuths* is reckoned the height of the stars and the sun; when he is not in the meridian; that is, the *azimuths* shew what distance these are at from the horizon.

AZONI, *Ἀζονί*, in mythology, a term anciently applied to such of the gods as were not the private divinities of any particular country or people, but were acknowledged as gods in every country, and worshipped by every nation. See **GOD**.

* The word is derived from the Greek privative *α*, and *ζών*, zone, country.

These *azoni* were a degree above the visible and sensible gods, which were called *zōnei*; who inhabited some particular part of the world, and never stirred out of the district or zone that was assigned them.

AZOTH, among the ancient chymists, signified the first matter of metals; or the mercury of a metal, more particularly that which they call the mercury of the philosophers, which they pretend to draw from all sorts of metallic bodies*.

* Paracelsus's *azoth*, which he boasted of as an universal remedy, is pretended to have been a preparation of gold, silver, and

mercury: a quantity of this he is said to have always carried with him in the pommel of his sword.

AZURE, the blue colour of the skies. See **BLUE COLOUR**, and **SKY**.

AZURE, in heraldry, signifies the blue colour in the coats of arms of all persons under the degree of a baron.

In the escutcheons of noblemen, blue is called *sapphire*; and in those of sovereign princes, *Jupiter*.—In engraving, it is represented by strokes or hatches drawn horizontally, as represented in *Tab. Heraldry*, fig. 3.

The French prefer this colour to all others, by reason the field of the arms of their kings is *azure*.

AZURE is also used for a mineral colour, better known by the name of *ultramarine*: this is prepared from the lapis lazuli. See **LAZULI**, and **ULTRAMARINE**.

In propriety, however, *azure* should rather denote a bright blue colour, made from the lapis armenus; by our painters more usually called *Lambert's blue*.

AZYGOS, *Ἀζυγος*, in anatomy, a vein arising out of the cava, otherwise called *vena sine pari*, because single. See *Tab. Anat.* (Splanch.) fig. 12. lit. bb. and also see **VEIN**. The *vena azygos* is the third branch of the ascending trunk of the cava.—It descends through the right side of the cavity of the thorax, and at its arrival at the eighth or ninth vertebra begins to keep the middle, and sends forth on each side intercostal branches to the interstices of the eight lower ribs; and there is divided into two branches, the larger of which is inserted sometimes into the cava, but oftener into the emulgent; the other enters the cava, commonly a little below the emulgent, but is seldom joined to the emulgent itself.

AZYMITES, they who communicate in bread not leavened, or fermented. See **AZYMUS**.

This appellation is given by Cerularius, to those of the Latin church, upon his excommunicating them in the eleventh century.

The Armenians and Maronites do also make use of *azymus*, or unleavened bread, in their office; on which account some Greeks call them *azymites*.

AZYMUS*, *Ἀζυμος*, something not fermented, or that is made without leaven.

* The word is Greek, composed of the privative *α*, and *ζυμω*, ferment.

The term *azymus* is much used in the disputes betwixt those of the Greek and Romish church; the latter of whom contend, that the bread in the mass ought to be *azymus*, unleavened, in imitation of the paschal bread of the Jews, and of our Saviour, who instituted the sacrament on the day of the passover; and the former strenuously maintaining the contrary, from tradition, and the constant usage of the church.

This dispute was not the occasion of the rupture between the Greek and Latin churches; Photius having broke with the Popes 200 years before.—The patriarch Cerularius, in the eleventh century, excommunicated the Latins for adhering to the use of *azymus* bread or consecrating in *azyms*.

St. Thomas, in 4 *Sent. dist.* 11. q. 2. art. 2. *questiunc.* 3. relates, that during the first ages of the church, none but unleavened bread was used in the eucharist, till such time as the Ebionites arose, who held, that all the observances prescribed by Moses were still in force: upon which, both the eastern and western churches took to the use of leavened bread; and, after the extinction of that heresy, the western church returned to the *azyms*; the eastern pertinaciously adhering to the former usage.

This account is controverted by Fa. Sirmond, in a dissertation express; wherein he shews, that the Latins had constantly communicated in leavened bread, till the tenth century. And cardinal Bona, *Rerum Liturgic.* c. 23. p. 185. owns a deal of distrust of what St. Thomas alleges.—In the council of Florence it was decreed, that the point lay at the discretion of the church; and that either leavened or unleavened bread might be used: the western church has preferred the latter.

B.

B THE second letter of our, and of most other alphabets.
B is the first consonant, and first mute, and in its pronunciation is supposed to resemble the bleating of a sheep; upon which account Pierius tells us, in his hieroglyphics, that the Egyptians represented the sound of this letter by the figure of that animal.

* This observation fails in the ancient Irish alphabet; where *B* is the first, and *A* the seventeenth: and in the Abyssinian, where *A* is the thirteenth. *V. Nichols, hist. pref. p. 12. O. Flahert, egg. 3. 30. Ludolph. gram. Arab. p. 2.*

B, is also one of those letters which the Eastern grammarians call *labial*, because the principal organs employed in its pronunciation are the lips. It has a near affinity with the other labials *P* and *V*, and is often used for *P* both by the Armenians, and other Orientals; as in *Betrus* for *Petrus*, *apfens* for *absens*, &c. and by the Romans for *V*, as in *amavit* for *amavit*, *berna* for *verna*, &c. whence arose that jest of Aurelian on the emperor Bonofius, *Non ut vivat natus est, sed ut bibat.* See *V*.

B requires an entire closure and pressure of the lips to pronounce it, and therefore can scarce ever end the sound of a word: but when you endeavour to pronounce it there, you are obliged to add an *E* to open the lips again; as in *Job*, which is sounded *Jobe*.

This letter also, if it pass through the nose, becomes an *M*; as appears in those who have the nostrils stopp'd by a cold or otherwise, when they endeavour to pronounce the letter *M*; for instance, *many men*, is by such a one sounded, *tany ben*. See *M*.

With the ancients, *B* stood for 300, as appears by this verse;
Et B trecentum per se retinere videtur.

When a line was drawn above it, *B*, it stood for 3000: and with a kind of accent below it, for 200; but among the Greeks as well as Hebrews, this letter signified only 2. *BF*, in the preface to the decrees or senatus-consulta, of the old Romans, signified *bonum factum*. It is often found on medals to mark the epocha or year.

Plutarch observes, that the Macedonians changed *Θ* into *B*, and pronounced *Bilip*, *Beronicæ*, &c. for *Philip*, *Rheronicæ*, &c. and that those of Delphos used *B*, instead of *Π*; as *Babius* for *παῖς*, *Βαῖος* for *παῖος*, &c. See *P*.

The Latins said *suppono*, *oppono*, for *subpono*, *obpono*, and pronounced *optimus*, though they wrote *optimus*, as Quintilian has observed.—They also used *B* for *PH*; thus, in an ancient inscription mentioned by Gruter, *OBRENDARIO* is used for *OFRENDARIO*. See *F*, &c.

BABYLONISH Hours. See the article *HOURS*.

BACCHANALIA, a religious feast in honour of Bacchus, celebrated with much solemnity among the ancients, particularly the Athenians, who even computed their years thereby, till the commencement of the Olympiads.

The *bacchanalia* are sometimes also called *orgia*, from the Greek *οργή*, fury, transport; by reason of the madness and enthusiasm wherewith the people appeared to be possessed at the time of their celebration.

They were held in autumn, and took their rise from Egypt; whence, according to Diodorus, they were brought into Greece by Melampus.

The form and disposition of the solemnity depended, at Athens, on the archon, and was at first exceedingly simple, but by degrees they became incumbered with a number of ridiculous ceremonies, and attended with a world of dissoluteness and debauchery; in somuch that the Romans, who grew ashamed of them, suppressed them by a senatus-consultum throughout all Italy.

The women had a great share in the solemnity, which is said to have been instituted on their account: for a great number of them attending Bacchus to the conquest of the Indies, and carrying in their hands the thyrsus, i. e. a little lance covered with ivy and vine-leaves, singing his victories and triumphs wherever they went, the ceremony was kept up after Bacchus's deification under the title of *bacchanalia*, and the women were installed priestesses thereof under that of *bacche* or *bacchantes*.

These priestesses at the time of the feast run through the streets and over the mountains covered with tygers skins, their hair dishevelled, their thyrsus in one hand, and torches in the

other, howling and shrieking; *Εὐαί αἰετοί, αὐτοὶ Βακχῆ, ὅς τ' ἔλθῃσι, ἢ τ' ἔλθῃσι, ἢ τ' ἔλθῃσι.*

Men and women met promiscuously at the feast, all perfectly naked, except only for the vine-leaves and clusters of grapes which bound their heads and hips; here they danced and jumped tumultuously, and with strange gesticulations sung hymns to Bacchus, till weary and giddy they tumbled down distracted.

BACCHIUS, in the Latin poetry, a kind of foot, consisting of three syllables; whereof the first is short, and the two latter long: as *igēstās*.

The *bacchus* is the reverse of a dactyl, and takes its name from that of Bacchus, because frequently used in the hymns composed in his honour. It was also called among the ancients, *anotrius*, *tripodius*, *faltans*, and by the Greeks *παρὰποδος*. *Dion. iii. p. 475.*

BACCIFEROUS Plants are such as bear berries, i. e. fruit covered with a thin membrane, wherein is contained a pulp, which grows soft and moist when ripe, and incloses the seed within its substance.

The *bacciferous* trees Mr. Ray divides into four kinds, 1. Such as bear a caliculate or naked berry; the flower and calix both falling off together, and leaving the berry bare; as the *salsafra* tree, &c.

2. Such as have a naked monoppyreneous fruit, that is, containing in it only one seed; as the *arbutus*, the *terebinthus*, *lentiscus*, &c.

3. Such as have a naked but a polypyreneous fruit, that is, containing two or more kernels or seeds within it; as the *jalsimum*, *ligustrum*, &c.

4. Such as have their fruit composed of many acini, or round soft balls set close together like a bunch of grapes; as the *uva marina*, the *rubus vulgaris*, *rubus idæus*, and the *rubus minor fructu cœruleo*.

BACHELOR, or **BACHELOR**, **BACCALARIUS**, in middle-age writers, was a denomination given to those who had attained to knighthood, but were not rich enough, or had not a sufficient number of vassals to have their banner carried before them in battle; or if they were of the order of bannerets, were not yet of age to display their own banner; but obliged to march to war under the banner of another.

Camden and others define *bachelor*, a person of a middle degree between a knight and an esquire; of less age and standing than the former, but superior to the latter.

Others will have *bachelor* to have been a common name for all degrees between a mere gentleman and a baron.—Thus we find the lord admiral, when he was neither an earl, nor baron, denominated a *bachelor*.—"Ant it is to weet, that when the admiral rideth to assemble a shippe of war, or other, for the busines and affairs of the realm, if he be a *bachelor*, he shall take for his day wages four shillings sterling; if he be an earl or baron, he shall take wages after his estate and degree."

BACHELOR was more peculiarly a title given to a young cavalier who made his first campaign, and received the military girdle accordingly.

BACHELOR was also a denomination given to him who had overcome another in a tournament, the first time he ever engaged.

Knights BACHELORS were anciently so called, *quasi bacchevaliers*, as being the lowest order of knights, and inferior bannerets, &c.

At present these are called *equites aurati*, from the gilt spurs that are put on them at the time of their creation.—The dignity was at first confined to the military men, but afterwards was conferred on men of the long robe.

The ceremony is exceedingly simple; the candidate kneeling down, the king touches him lightly with a naked sword, and says, *Sois chevalier, au nom de dieu*; and afterwards, *Avance chevalier.*

BACHELOR is also used, in a college sense, to denote a person possessed of the *baccalaureate*, which is the first degree in the liberal arts, or sciences.

The degree of *bachelor* was first introduced in the thirteenth century, by Pope Gregory IX. but it remains still unknown in Italy. At Oxford, ere a person be intitled to the degree of *bachelor of arts*, he must have studied there four years; three years

more to become *master of arts*; and seven more to commence *bachelor of divinity*.

At Cambridge, to commence *bachelor of arts*, he must have been admitted near four years; and above three years more before he commence *master*; and seven more still to become *bachelor of divinity*. He may commence *bachelor of law* after having studied it six years.

At Paris, to pass *bachelor in theology*, a person must have studied five years in philosophy and theology, and held an act of examination in the Sorbonne.—*Bachelors in the canon law* are admitted after three years study in the same, and sustaining an act according to the forms.

A *bachelor of physic* must have studied two years in medicine, have been four years master of arts in the university, and have stood an examination; after which he is invested with the fur, in order to be licensed.

In the university of Paris, before the foundation of divinity-professorships, those who had studied divinity six years were admitted to go through their course, whence they were called *baccalarii cursores*; and as there were two courses, the first employed in explaining the bible, during three successive years; the second, in explaining the master of the sentences for one year: those who were in their bible course, were called *baccalarii biblici*; and those arrived at the sentences, *baccalarii sententiarum*. And lastly, those who had gone through both, were denominated *baccalarii formati*, or formed *bachelors*.

At present, *formed bachelor* denotes a person who has taken the degree regularly, after the due course of study, and exercises, required by the statutes; by way of opposition to a *current bachelor*, who is admitted in the way of grace, or by diploma.

We also find mention of *bachelors of the church*, *baccalarii ecclesiæ*.—The bishop with his canons and *baccalarii*, cum concilio & consensu omnium canonicorum suorum & *baccalariorum*. There is scarce any word whose origin is more controverted among the critics than that of *bachelor*, *baccalarius*, or *baccalaureus*: the two different acceptations of the word, literary and military, above recited, have each of them their advocates, who assert each to be the primitive sense, and derive the word accordingly. The former is espoused by Martinus, who derives it from the Latin *baccalauria*, quasi *bacca laurea donatus*; in allusion to the custom that anciently obtained, of crowning the poets with laurel, *baccis lauri*, as Petrarch was at Rome in 1341; and Alciatus and Vives are of the same opinion. Rhennaus rather advises to derive it from *bacculus* or *bacillus*, a staff; because at their commencement, says he, a staff was put into their hands, as a symbol of their authority, of their studies being finished, and of the liberty they were restored to. Thus it was that the ancient gladiators had a staff given them, as a discharge, which Horace calls, *rude donatus*; but Spelman rejects this opinion, in regard there is no proof, that the ceremony of putting a staff in the hand was ever used in the creating of *bachelors*.

Among those who hold the military *bachelors* the primitive ones, are Cujas, who derives the word from *bucellarius*, a kind of cavalry anciently in great esteem. Du Cange deduces it from *baccalaria*, a kind of fees, or farms, consisting of several pieces of ground, each whereof contained 12 acres, or as much as two oxen would plough; the possessors of which *baccalaria* were called *bachelors*.

Lastly, Caleneuve, and Altaferra, derive *bachelor* from *baculus*, or *bacillus*, a staff, in regard the young cavaliers exercised themselves in fighting with staves.

BACILLI, or **BACULI**, in medicine, such compositions as are made up of a cylindrical figure, like a stick; thus called from the Latin *baculus*, a staff. See **LOZENGE**.

BACK. See the article **DORSUM**.

BACK-Bone. See the article **SPINE**.

BACKED-Column. See the article **COLUMN**.

BACK-Nails. See the article **NAIL**.

BACKS of a Hip. See the article **HIP**.

BACK-STAFF, in navigation, an instrument, by the French called the *English quadrant*; it was invented by Capt. Davis: and is of good use in taking the sun's altitude at sea.—It consists of three vanes, A, B, and C, and of two arches, (*Tab. Navigation*, fig. 6.) The vane at A called the *horizon-vane*; that at B the *shade-vane*; and that at C the *fight-vane*. The lesser arch B is of 60 degrees, and that of C (or FG) of 30 degrees.

To use the **BACK-STAFF**; the shadow-vane B is let upon the 60 arch, to an even degree of some altitude, less by 10 or 15 degrees than you judge the complement of the sun's altitude will be: the horizon-vane is put on at A, and the fight-vane on the 30 arch FG: the observer's back being then turned to the sun (whence the name of *back-staff* or *back-quadrant*) he lifts up the instrument, and looks through the fight-vane, raising or falling the quadrant, till the shadow of the upper edge of the shade-vane fall on the upper edge of the slit in the horizon-vane; and then if you can see the horizon through the said slit, the observation is well made: but if the sea appear instead of the horizon, move the fight-vane lower towards F: if the sky appear, move it upward towards G, and so try if it comes right: then observe how many degrees and minutes are cut by that edge of the fight-vane which answers to the fight-hole, and to them add the degrees cut by the

upper edge of the shade-vane: the sum is the sun's distance from the zenith, or the complement of his altitude. To find the sun's meridian, or greatest altitude on any day, continue the observation as long as the altitude is found to increase, which you will perceive by the appearance of the sea, instead of the horizon, removing the fight-vane lower: but when you perceive the sky appear instead of the horizon, the altitude is diminished; therefore desist from farther observation at that time, and add the degrees upon the 60 arch to the degrees and minutes upon the 30 arch, and the sum is the zenith distance, or co-altitude of the sun's upper limb.

And because it is the zenith distance, or co-altitude of the upper limb of the sun, not the centre that is given by the quadrant, in observing by the upper end of the shade-vane, add 16 minutes, the sun's semidiameter, to that which is produced by your observation, and the sum is the true zenith distance of the sun's centre. If you observe by the lower part of the shadow of the shade-vane; then the lower limb of the sun gives the shadow; and therefore you must subtract 16 minutes from what the instrument gives: but considering the height of the observer above the surface of the sea, which is commonly between 16 and 20 foot, you may take 5 or 6 minutes from the 16 minutes, and make the allowance but of 10 minutes, or 12 minutes, to be added instead of 16 minutes.

Mr. Flamsteed contrived a glass lens, or double convex, to be placed in the middle of the shade-vane, which makes a small bright spot on the slit of the horizon-vane, instead of the shade: which is a great improvement, if the glass be truly made; for by this means the instrument may be used in hazy weather, and a much more accurate observation made in clear weather than could be by the shadow.

BACK-STAYS of a ship are ropes belonging to the main-mast and fore-mast, and the masts belonging to them; serving to keep them from pitching forwards or over-board.—See *Tab. Ship*, fig. 1. n. 105, 63, 25.

BACULE, in fortification, a kind of portcullis or gate, made like a pit-fall with a counter-poise, and supported by two great stakes.—It is usually made before the corps-de-guard, advancing near the gate.

BACULI. See the article **BACILLI**.

BACULOMETRY, the art of measuring accessible and inaccessible lines, by the help of baculi, staves or rods.

BACULUS Divinatorius, or *virgula divina*, a branch of hazle-tree, of a forked figure, used for the discovery of mines, springs, &c. See *Virgula Divina*.

BADGER *, a licensed huckster, or person privileged to buy corn or other provisions, and to carry them from one place to another to make profit of, without being reputed an ingroffier.

* In the statutes, he is also called a *kidder*, or *lader of corn*, 5 & 6 Ed. 6. c. 14. 5 El. c. 12.—We also read of *badgers* or retailers of salt. 9 W. 3. c. 6.

BADGER-Hunting. See the article **HUNTING**.

BAG, in commerce, a term used to signify different quantities of certain commodities.

A bag of almonds, for instance, is about 3 hundred weight; of aniseeds, from 3 to 4 hundred; of pepper, from 1 ½ to 3 hundred; of goats-hair, from 2 to 4 hundred; of cotton-yarn, from 2 ½ to 4 ½, &c.

Oil BAG } See the articles } **OIL**.

Petty BAG } } **PETTY**, and **CLERK**.

Sand-BAGS. } See the articles } **SAND**.

BAGGING of Hops. } } **HOPS**.

BAGNIO, an Italian term signifying a bath; it is used by us for a house with conveniences for bathing, sweating, and otherwise cleansing the body: and often for worse purposes.

Bagnio is also become a general name in Turkey for the prisons where there slaves are inclosed; it being usual in those prisons to have baths.

BAGNOLENSIS, or **BAGNOLIANS**, a sect of heretics in the eighth century; who in reality were Manichees, though they somewhat disguised their errors.—They rejected the Old Testament, and part of the New; held the world to be eternal; and affirmed, that God did not create the soul when he infused it into the body.

* They derive their name from *Bageols*, a city in Languedoc, where they were chiefly found.

BAGPIPE, a musical instrument of the wind-kind, chiefly used in country places, especially in the North.—It consists of two principal parts; the first a leathern bag, which blows up like a foot-ball, by means of a port-vent, or little tube fitted to it, and stopped by a valve.

The other part consists of three pipes, or flutes; the first called the great pipe, or drone, and the second the little one; which pass the wind out only at the bottom: the third has a reed, and is played on by compressing the bag under the arm, when full, and opening or stopping the holes, which are eight, with the fingers. The little pipe is ordinarily a foot long, that played on 13 inches, and the port-vent six. The *bagpipe* takes in the compass of three octaves.

BAGUETTE, in architecture, a little round moulding, less than an astragal; sometimes carved and enriched with foliages, pearls, ribbands laurals, &c.—See *Tab. Archit.* fig. 2. and 11.

According to M. le Clerc, when the *boguette* is enticed with ornaments it changes its name, and is called chaplet. See **CHAPLET**.

BAIL, in law, the setting at liberty one arrested, or imprisoned upon an action either civil or criminal, under sureties taken for his appearance at a day and place assigned.

It is called *bail*, because hereby the party confined is *baillif*, delivered into the hands of those who bind themselves for his forthcoming: or from *bail*, used in the sense of a guardian, into whose hands the party is put for security sake.

Manwood distinguishes between *bail* and *mainprise* thus: he that is mainprised, is said to be at large, and to go about at his liberty, without ward, till the time of appearance; whereas he who is let to *bail* to two or more men, is always accounted by law, to be in their ward and custody for the time; and they may, if they please, actually keep him in prison.

Bail is either common, or special.

Common BAIL is that given in actions of small prejudice, or slight proof; in which cases any nominal sureties are taken; as John Doe, and Richard Roe: this being no other than a form of appearance.

Special BAIL is given in cases of greater moment, where it is required that the sureties be substantial men at the least, and according to the value of the matter in question.

It was enacted a few years ago, in compassion to the poor, that no persons should be held to special bail in any action brought for less than ten pounds.—This is observed as to writs issued out of the courts of Westminster-hall.—But the marshals court continues to arrest and hold to bail in actions for sums exceeding forty shillings.—What better are the poor of this metropolis for this provision, which has indeed taken them out of bad hands, but left them to be grafted to death by worse! — If there be any exception in the act in favour of that court, it was doubtless more owing to the degree of favour in which the superior officers of such court stood with certain great persons in parliament, than to any real reason there could be for it. *Season. Observ. on Declin. of Trade*, p. 76.

Clerk of the BAILS is an officer belonging to the court of king's-bench. He files the bail-pieces taken in that court, and attends for that purpose.

BAIL, or **BALE**, in the sea-language.—The seamen call lading or casting the water by hand out of a boat or ship's hold with buckets, cans, or the like, *bailing*.

When the water is thus *bailed* out, they say, *the boat is freed*. They also call those hoops that bear up the tilt of the boat, its *bails*.

BAILLEMENT, a term in law, signifying the delivery of things, whether writings or goods, to another; sometimes to be delivered back to the bailor, that is, to him who delivered them; sometimes to the use of him to whom they are delivered; and sometimes to a third person.

BAILIFF*, in a general sense, denotes an officer appointed for the administration of justice within a certain district, called *bailiwick*.

* The word is also written *bailif*, *baily*, *bayly*, *baylie*, and *baillif*, in Latin *ballivus*. — It is formed from the French *baillif*, of *bail*, an old word, denoting a guardian, or governor of a youth, originally derived from the Latin *bagulus*, which signified the same. See **BAJULUS**.

Faquier maintains, that *bailiffs* were originally a kind of commissioners, or judges delegate, sent into the provinces to examine whether or no justice were well distributed by the counts, who were then the ordinary judges. Loyseau, with more probability, refers the origin of *bailiffs* to the usurpation and idleness of the great lords, who having got the administration of justice into their own hands, and being weary of the burthen, turned it over to their deputies, whom they called *bailiffs*.

These *bailiffs* had at first the superintendence of arms, of justice, and of the finances; but abusing their power, they were by degrees stripped of it, and the greatest part of their authority transferred to their lieutenants, who were to be men of the long robe. It is true, in France they have still some prerogatives, as being reputed the heads of their respective districts: in their name justice is administered, contracts and other deeds passed, and to them is committed the command of the militia.

From thence it was that the English *bailiffs* originally took both their name, and their office; for as the French have eight parliaments, which are supreme courts, whence no appeal lies, within the precincts of the several parliaments, or provinces, and in which justice is administered by *bailiffs*, at least by their lieutenants; so in England are several counties where-in justice was administered by a viscount or sheriff, who appears likewise to have been called *bailiff*, and his district or county *bailiwick*. Further, the counties were again subdivided into hundreds; within which it is manifest justice was anciently rendered by officers called *bailiffs*. But those hundred-courts are now swallowed up by the county-courts, certain franchises alone excepted (see **COUNTY**, and **HUNDRED**) and the *bailiffs* name and office is grown into such contempt, at least these *bailiffs* of hundreds, that they are

now no more than bare messengers, and mandatories within their liberties, to serve writs, and such mean offices.

Bailiffs are of two kinds, viz. *bailiffs errant* or *itinerant*, and *bailiffs of franchises*.

BAILIFFS errant are those whom the sheriff appoints to go up and down the county to serve writs and warrants, summon county-courts, sessions, assizes, &c.

BAILIFFS of franchises are those who are appointed by every lord within his liberty, to do such offices therein, as the *bailiff errant* does at large in the county.

There are also *bailiffs of the forests*, and *bailiffs of manors*, who direct the husbandry, fell trees, gather rents, pay quit-rents, &c.

The word *bailiff* still retains some of its ancient significance; being applied also to the chief magistrates of several corporate towns, as Ludlow, Leominster, &c.—And again, the government of some of the king's castles is committed to persons called *bailiffs*; as, the *bailiff* of Dover castle.

Water BAILIFF. See the article **WATER**.

BAILIWICK, **BAILYWICK**, or **BAYLIWICK**, the territory of a bailiff; or the place within which his jurisdiction is terminated. See **BAILIF**.

BAIRAM*, a name given to the great annual feast of the Mahometans.

* The word is also written, by some authors, more conformably to the oriental orthography, *beiram*. It is originally Turkish, and signifies literally, a feast day, or holiday.

The Mahometans have two *baïrams*, the *great*, and the *little*, which Scaliger, Erpenius, Rycart, Hyde, Chardin, Bobovius, and other European writers, commonly interchange, giving the appellation *great*, to that which the Turks call *Leile*; and *vice versa*.

The *little baïram* holds for three days, during which no work is done; but presents pass from one to another, with many other manifestations of joy. If the day after Ramazan should prove so cloudy, as to prevent the sight of the new moon, the *baïram* is put off to the next day, when it begins, though the moon be still obscured. When they celebrate this feast, after numerous ceremonies, or rather strange mimickries, in their mosque, they end it with a solemn prayer against the infidels, to root out Christian princes, or to arm them one against another, that they may have an opportunity to extend the borders of their law.

BAIT. See **FISHING**.

BAJULUS, an ancient officer in the court of the Greek emperors; whereof there were several degrees: as the grand *bagulus*, who was preceptor of the emperor, and the simple *bajuli*, who were sub-preceptors.

Hence the Italians use the word *bagulus* of a kingdom, in the same sense with *protector* of a kingdom among the English.

BAKING, the art of preparing bread, or of reducing meals of any kind, whether simple or compound, into bread.

The forms of baking among us are very various, but may be reduced to two; the one for unleavened, the other for leavened bread.—For the first, the chief is *manchet-baking*, the process whereof is as follows.

The meal ground and bolted is put into a trough, and being opened in the middle, to a bushel is poured in about three pints of warm ale, with barm and salt to season it. This is kneaded together with the hands through the brake; or for want thereof with the feet through a cloth: after having lain an hour to swell, it is molded into manchet; which scotched in the middle, and pricked a-top to give room to rise, are baked in the oven by a gentle fire.

For the second, sometimes called *cheat-bread-baking*, it is thus: The meal being in the trough, some leaven (saved from a former batch, filled with salt, laid up to sour, and at length dissolved in warm water) is strained through a cloth into a hole made in the middle of the heap, and worked with some of the flour to a moderate consistence: this is covered up with meal, where it lies all night, and in the morning the whole heap is stirred up and mixt together with a little warm water, barm and salt, by which it is seasoned, stiffened, and brought to an even leaven; it is then kneaded or trodden, and molded and baked as before.

The learned are in great doubt about the time when *baking* first became a particular profession, and *bakers* were introduced. It is generally agreed, they had their rise in the east, and passed from Greece to Italy after the war with Pyrrhus, about the year of Rome 583. Till which time every housewife was her own *baker*; for the word *pistor*, which we find in Roman authors before that time, signified a person who ground or pounded the grain in a mill or mortar to prepare it for *baking*, as Varro observes. According to Athenæus, the Cappadocians were the most applauded *bakers*, after them the Lydians, then the Phœnicians.

To the foreign *bakers* brought into Rome, were added a number of freed-men, who were incorporated into a body, or, as they called it, a *collegium*; from which neither they nor their children were allowed to withdraw. See **COLLEGE**.—They held their effects in common, and could not dispose of any part of them. Each bake-house had a patronus, who had the superintendency thereof; and these patroni elected one out

of their number each year, who had the superintendence over all the rest, and the care of the college. Out of the body of the *bakers* were every now and then one admitted among the *fenators*.

To preserve honour and honesty in the college of *bakers*, they were expressly prohibited all alliance with comedians and gladiators; each had his shop or bake-house, and they were distributed into fourteen regions of the city. They were excused from guardianships and other offices, which might divert them from their employment. See *COLLEGE*. By our own statutes, *bakers* are declared not to be handicrafts. —No man for using the mysteries or sciences of *baking*, brewing, surgery, or writing, shall be interpreted a handicraft. 22 H. 8. c. 13.

BAKING of Porcelain. See the article *PORCELAIN*.
BALANCE. See the article *BALANCE*.

BALANI, in natural history, certain multivalve shells usually growing to the shells of the larger sort of sea-shell-fish: they are commonly called in English, center-shells. See *SUPPLEMENT*, article *BALANUS*.

BALANUS, or *GLANS*, is sometimes used by anatomists for the nut of the yard. See *GLANS*.

Sometimes also the clitoris is so called. See *CLITORIS*.
BALANUS is also sometimes used for a suppository. See *SUPPOSITORY*.

BALAUSTINES, *BALUSTIA*, in pharmacy, the flowers of the wild pomegranate, or *malus punica sylvestris*, which are very rough to the tongue and palate, and very astringent; and on that account are frequently used in diarrhoeas, and other fluxes, hernias, &c.

BALCONY *, in architecture, a jutting, or projecture in the front of a house or other building, supported by pillars, or consoles, and encompassed with a balustrade.

* The word comes from the Italian *balcone*, and that from the Latin, *palcus*; or the German *palk*, a beam. Covarruvias derives it from *balcanus*, *jacere*; asserting, that *balconies* were originally little turrets over the gates of citadels, whence darts, &c. were thrown on the enemy.

BALDACHIN *, or *BALDAQUIN*, a piece of architecture in form of a canopy; supported with columns, and serving as a crown or covering to an altar.

* The word comes from the Italian *baldacchino*, which signifies the same.

BALDNESS. See the article *CALVITIES*.

BALE, in commerce, denotes a pack or certain quantity of merchandize: as a bale of picery, of books, of thread &c. — A bale of cotton-yarn is from three to four hundred weight; of raw silk, it is from one to four hundred; of lockram or dowlas, either three, three and a half, or four pieces, &c.

BALISTA. See the article *BALLISTA*.

BALKERS, or *BALCORS*. See the article *CONDERS*.

BALKS, in agriculture, are ridges or banks between two furrows or pieces of arable land: the word is sometimes also used for the poles or rafters over out-houses or barns; and among bricklayers for great beams, such as are used in making scaffolds.

BALL and socket, a machine contrived to give an instrument full play, and motion every way.

It consists of a ball or sphere of brass, fitted within a concave semi-globe, so as to be moveable every way, both horizontally, vertically, and obliquely. It is carried by an endless screw, and is principally used for the managing of surveying instruments; to which it is a very necessary appendage.

The ancient balls and sockets had two concaves, or channels, the one for the horizontal, the other for the vertical direction.

BALLANCE, or *BALANCE*, *libra*, one of the six simple powers in mechanics, used principally for determining the equality, or difference of weights in heavy bodies, and consequently their masses or quantities of matter.

The ballance is of two kinds, *viz.* the ancient and modern.

The ancient or Roman, called also *statera Romana*, or *steel-yard*, consists of a lever or beam, moveable on a centre, and suspended near one of its extremes: on one side the centre are applied the bodies to be weighed, and their weight is measured by the division marked on the beam; on the other side is the place where a weight moveable along it keeps the ballance in equilibrium.

The modern ballance, now ordinarily in use, consists of a lever or beam suspended, exactly by the middle; to the extremes whereof are hung scales, or basons.

In each case, the beam is called the *jugum*, and the two moieties thereof on each side the *axis*, the *brachia*, or *arms*; and the handle whereby it is held, *trutina*; the line on which the beam turns, or which divides its brachia, is called the *axis*, and, when considered with regard to the length of the brachia, is esteemed but a point, and called the centre of the ballance; and the places where the weights are applied, the *points of suspension* or *application*. — That slender part perpendicular to the *jugum*, whereby either the equilibrium, or preponderancy of bodies is indicated, is called the *tongue* of the ballance.

In the Roman ballance, therefore, the weight used for a counterballance is the same, but the points of application are various; in the common ballance, the counterpoise is various, and the point of application the same.

The principle on which each is founded is the same, and may be conceived from what follows.

Doctrines of the BALLANCE. — The beam A B (*Tab. Mechanicæ*, fig. 9.) the principal part of the ballance, is a lever of the first kind, which (instead of resting on a fulcrum at C, its centre of motion) is suspended by somewhat fastened to C, its centre of motion. So that the mechanism of the ballance depends on the same theorem as that of the lever.

Hence, as the known weight is to the unknown, so is the distance of the unknown weight from the centre of motion, to the distance of the known weight, where the two weights will counterpoise each other; consequently, the known weights shew the quantity of the unknown.

Or thus; the action of a weight to move a ballance is by so much greater, as the point prest by the weight is more distant from the centre of the ballance; and that action follows the proportion of the distance of the said point from that centre. When the ballance moves about its centre, the point B describes the arch B b (*Fig. 10.*) whilst the point A describes the arch A a, which is the biggest of the two: therefore in the motion of the ballance, the action of the same weight is different, according to the point to which it is applied: hence it follows, that the proportion of the space gone through by the point at A is as A a, and at B as B b; but those arches are to one another as C B, C A.

Varieties in the application of the BALLANCE. — If the brachia of a ballance be divided into equal parts, one ounce applied to the ninth division from the centre will equiponderate with three ounces at the third; and two ounces at the sixth division act as strongly as three at the fourth, &c.

Hence it follows, that the action of a power to move a ballance is in a ratio compounded of the power itself, and its distance from the centre: for that distance is as the space gone through in the motion of the ballance.

It may be here observed, that the weight equally prests the point of suspension at whatever height it hangs from it, and in the same manner as if it was fixed at that very point; for the weight at all heights equally stretches the cord by which it hangs.

A ballance is said to be in *æquilibrium*, when the actions of the weights upon the brachia to move the ballance, are equal, so as mutually to destroy each other. When a ballance is in *æquilibrium*, the weights on each side are said to equiponderate: unequal weights may also equiponderate; but then the distances from the centre must be reciprocally as the weights. In which case, if each weight be multiplied by its distance, the products will be equal; which is the foundation of the steel-yard.

Thus in a ballance whose brachia are very unequal; a scale hanging at the shortest, and the longest divided into equal parts: if such a weight be applied to it, as at the first division shall equiponderate with one ounce in the scale; and the body to be weighed be put into the scale, and the above-mentioned weight be moved along the longest brachium, till the *æquilibrium* be found; the number of divisions between the body and the centre shews the number of ounces that the body weighs, and the sub-divisions the parts of an ounce. On the same principle also is founded the *deceitful ballance*, which cheats by the inequality of the brachia: for instance; take two scales of unequal weights, in the proportion of 9 to 10, and hang one of them at the tenth division of the ballance above-described, and another at the ninth division, so that there may be an *æquilibrium*; if then you take any weights, which are to one another as 9 to 10, and put the first in the first scale, and the second in the other scale, they will equiponderate.

Several weights hanging at several distances on one side may equiponderate with a single weight on the other side: to do this it is required, that the product of that weight, by its distance from the centre, be equal to the sum of the products of all the other weights, each being multiplied by its distance from the centre.

To demonstrate which, hang three weights, of an ounce each, at the second, third, and fifth divisions from the centre, and they will equiponderate with the weight of one single ounce applied to the tenth division of the other brachium; and the weight of one ounce at the sixth division, and another of three ounces at the fourth division, will equiponderate with a weight of two ounces on the other side at the ninth division.

Several weights unequal in number, on either side, may equiponderate: in this case, if each of them be multiplied by its distance from the centre, the sums of the product on either side will be equal; and if those sums be equal, there will be an *æquilibrium*.

To prove which, hang on a weight of two ounces at the fifth division, and two others, each of one ounce, at the second and seventh; and on the other side hang two weights, each also of one ounce, at the ninth and tenth divisions: and these two will equiponderate with those three.

To the justness of a ballance it is required, that the points of suspension be exactly in the same line as the centre of the ballance;

balance; that they be precisely equi-distant from that point on either side; that the brachia be as long as conveniently they may; that there be as little friction as possible in the motion of the beam and scales; and lastly, that the centre of gravity of the beam be placed a little below the centre of motion.

BALANCE of the air is used to denote the weight of that fluid, whereby, according to its known property, it presses where it is least resisted, till it be equally adjusted in all parts.

Hydrostatical BALANCE, is a machine for determining the specific gravities of bodies. See **HYDROSTATICAL**.

BALANCE of Trade denotes an equality between the value of commodities bought of foreigners, and the value of the native productions transported into other nations.

It is necessary that this *balance* be kept in trading nations; and if it cannot be made in commodities, it must in specie. Hereby it is, that we know whether a nation gains, or loses by foreign trade, or any branch thereof; and consequently, whether that nation grows richer or poorer.

There are divers *methods of arriving at this knowledge*.

1^o, That most received is, by taking a strict survey of what proportion the value of the commodities exported bears to those imported. If the exports exceed the imports, it is concluded that nation is in a *winning way*, it being supposed that the overplus is imported in bullion, and so increases the treasure of the nation.—But this method is very uncertain: by reason of the difficulty of obtaining a true account either of the exports or imports. (1.) Custom-house books are no rule in this case; by reason of the running of goods, especially many fine commodities of small bulk but great value: as point, lace, ribbonds, silks, jewels, fine linens, &c. also wines, brandies, teas, and the like. (2.) To which add various accidents which affect the value of the stock either sent out or brought in; as losses at sea, markets, bankrupts, seizures, &c. (3.) Then, as to particular trades, there are divers countries to which the manufactures we send out are inconsiderable, yet the goods we import are necessary to the carrying on our trade in general; as the trade to Norway, &c. for timber and naval stores. Also the East-India company, whose imports much exceed their exports, yet is their trade highly advantageous to the nation: as we sell much of these imports to foreigners, and wear others, *e. gr.* callico's and silks, in lieu of linens and silks from other countries, which would cost us dearer.

2^o, The second method is, by observing the course of exchange, which if generally above the intrinsic value or par of the coins of foreign countries; we not only lose by such exchanges, but the same is a proof that we lose by the general course of our trade.—But this method is imperfect; since we trade to many countries with which there is no settled course of exchange.

3^o, The third method (which is Sir Jos. Child's) is made from the increase or the diminution of our trade, and shipping in general: for if these diminish, whatever profit particular men may make, the nation loses: and vice versa. He lays it down as an infallible rule, that in all parts of the world wherever trade is great, and continues so, and grows daily greater, and the shipping increases for a succession of ages; that trade must be nationally profitable. Even in the case of a merchant, who, by driving a great trade, ruins himself; though he lose, what a multitude are gainers by him? as the king, and customhouse officers; besides ship-wrights, butchers, brewers, bakers, ropemakers, porters, carmen, manufacturers, mariners, &c.

4^o, A fourth way is, by observing the increase and diminution of our coin and bullion.—But this is the least obvious and palpable of any; for the money seems to vulgar eyes most plentiful when there is least occasion for it; and more scarce as the occasions for employing it are more numerous and advantageous: by which means we seem to have most money when we have least trade. Thus, *e. gr.* when the East-India company have a great sale to make, money is generally found to be scarce in London; because the occasion engages people to employ quantities which they had provided for that purpose. So a high rate of interest will make money seem scarce, because every man, as soon as he can make up a small sum, sends it to the goldsmith to be employed.

Child Disc. on Trade, c. 9.

BALANCE of a clock or watch is that part of either, which by its motion regulates and determines the beats.—The circular part of it is called the *rim*, and its spindle the *verge*: there belong to it also two *pallets* or *nuts*, which play in the fangs of the crown-wheel: in pocket watches, that strong stud in which the lower pivot of the verge plays, and in the middle of which one pivot of the crown-wheel runs, is called the *potence*: the wrought piece which covers the *balance*, and in which the upper pivot of the *balance* plays, is the *cock*: the small spring in the new pocket-watches is called the *regulator*.

BALLAST*, in navigation, any heavy matter used to sink a vessel to its proper depth in water, or to give it a just weight and counterpoise, and enable it to bear sail without overturning.

* The word comes from the Flemish *beloof*, formed of *be*, and *loft* or *left*. The French call it simply *left*. In the Mediterranean, *quartelago*. In Latin writers of the lower age it is denominated *lasiogium*.

The ordinary *ballast* is sand or stones, stowed in the bottom, or hold, next the false keel of a vessel: sometimes, lead, corn, or other heavy goods serve for *ballast*.—The *ballast* is sometimes one half, sometimes a third, and sometimes a fourth part of the burden of the vessel. Flat vessels require the most *ballast*.—Ships are said to be in *ballast*, when they have no other loading.

Masters of vessels are obliged to declare the quantity of *ballast* they bear, and to unload it at certain places. They are prohibited unloading their *ballast* in havens, roads, &c. the neglect of which has ruined many excellent ports.

Trench the BALLAST. See the article **TRENCH**.

BALLASTAGE. See the article **LASTAGE**.

BALLIAGE, a small duty paid to the city of London, by aliens, and even denizens, for certain commodities exported by them.

BALLISTA*, a military engine in use among the ancients, somewhat like our cross-bow, though much bigger and more forcible; it was used in the besieging of cities, to throw in stones, or sometimes darts and javelins.

* The word is also frequently written, less consistently with its etymon, *ballista*, sometimes *ballistra*. It is formed from the Greek *βαλάν, jacere*, being chiefly used in casting of darts, and arrows, in which it differed from the *catapulta*, which was used only for casting stones; in other respects they were alike, and were each bent in the same manner. See the article **CATAPULTA**.

Marcellinus describes the *ballista* thus; a round iron cylinder is fastened between two planks, from which reaches a hollow square beam placed cross-wise, fastened with cords, to which are added screws; at one end of this stands the engineer, who puts a wooden shaft with a big head, into the cavity of the beam; this done, two men bend the engine, by drawing some wheels: when the top of the head is drawn to the utmost end of the cords, the shaft is driven out of the *ballista*, &c.

BALLOON, or **BALLON**, denotes a large round short-necked matrafs, or vessel used in chymistry, to receive what is distilled or drawn off by means of fire.

BALLOON is also used in architecture, for a round ball, or globe placed a-top of a pillar, or the like, by way of acroter, or crowning.

BALLOTING, a method of voting at elections, &c. by means of little balls which are usually of different colours, by the French called *ballotes*; which are put into a box privately.

BALLS, or **BALLETS**, in heraldry, make a frequent bearing in coats of arms, though never so called; but having according to their several colours several names, as *besants* when the colour is or; *plates* when argent; *barts* when azure; *torteaux* when gules; *ponies* when vert; *pellets* or *agrestes* when sable; *golpes* when purple; *oranges* when tanne; and *guzes* when sanguine.

BALLS of silk. See the article **SILK**.

BALL-SOAP. See the article **SOAP**.

BALLUSTRADE, in architecture, an assemblage of one or more rows of ballusters, high enough to rest the elbow on, fixed upon a terrace, or the top of a building, by way of security; sometimes also to make a separation between one part and another, as those around altars, fountains, &c.

BALM, or **BALSAM**. See the article **BALSAM**.

BALM of Sulphur. See the article **SULPHUR**.

BALMING. See the article **EMBALMING**.

BALNEUM, is a word much used by chymists, generally signifying a vessel filled with some matter, as sand, water, or the like, in which another is placed that requires a more gentle heat than the naked fire.

BALNEUM Maria is by some so called, as being supposed to have been first invented by the blessed virgin; but by others, with more propriety, it is called *balneum maris*, or sea-bath, in regard the vessel here floats as it were in a sea.

Here the cucurbit is placed in hot water, which warms the matter contained, and disposes it for rising, or exhalation.

A sand-bath is sometimes also called *balneum fixum*, or *arenosum*.

BALNEUM vaporarium. See the article **VAPORARIUM**.

BALOTADE, a leap in which a managed horse offers to strike out with his hind legs, but does it not, only making an offer, and shewing the shoes of his hind feet.

BALSAM, **BALSAMUM**, properly denotes an oily, resinous, and odorous substance, oozing from incisions in certain plants; of sovereign virtue in the cure of wounds, and divers other disorders.

This amounts to the same with what we otherwise call *balm*, sometimes by way of distinction, a *native balsam*.

We say the *balsam* of Mecca, *balsam* of Peru, of Tolu, of Capaiba, of liquid amber, and a multitude of others.

BALSAM, or *bahn* of *Gilead*, is in the greatest esteem, though there are some who hold that of Peru equal to it in virtue. It is drawn by incision from a tree of the same name, growing in Egypt and Judea, but chiefly in Arabia Felix, and

which is held so precious, that it makes part of the special revenue of the grand signior, without whose permission none are allowed to be planted or cultivated.—The incision through which this admirable juice flows is made in the dog-days: Theophrastus says, it must be made with iron nails; Pliny says, with glass; because, says he, iron makes the plant die: Tacitus tells us, that when the branches of this tree are full of sap, their veins seem to apprehend the iron, and stop when an incision is made with that metal, but that they flow freely when opened with a stone, or a piece of broken glass, or of an earthen vessel: lastly, Marmol says, the veins must necessarily be opened with ivory or glass.—The juice is white at first, afterwards it becomes green, by degrees of a gold colour, and, when old, of the colour of honey. It is at first muddy, but by degrees grows clear, and of the consistence of turpentine.—Its smell is agreeable, and very brisk: its taste bitter, sharp, and aftringent; it easily dissolves in the mouth, and leaves no stain on woollen cloth.

It is supposed, that the juice brought to us for *balsam* is not properly the gum, or tears of the tree, flowing by incision, for that it yields but little that way; but that it is prepared from the wood and green branches of the tree distilled: and yet even this is frequently adulterated with Cyprus turpentine, and other resins and oils; also with honey, wax, &c.—Besides which, there is likewise a liquor extracted from the seed of the plant, which is frequently passed off for the true *balsam*, though its smell is much weaker, and its taste much bitterer. The *balsam* tree is about the height of a pomegranate tree; its leaves are like those of rue, always green; its flowers white, and in form of stars, whence spring out little pointed pods, inclosing a fruit like an almond, called *carpo-balsamum*, as the wood is called *xyle-balsamum*, and the juice *apo-balsamum*.

The fruit or *carpo-balsamum* enters the composition of Venice treacle, having little other use in medicine: it must be chosen of an aromatic taste and agreeable smell. The *xyle-balsamum*, which, like the other products of the *balsam*-tree, is brought from Cairo, is used in the troches of Hedy chrous. It is brought in little faggots, the bark is red, the wood white, resinous, and aromatic. See *XYLOBALSAMUM*.

There is likewise a *balsam* of Mecca, which is a dry, white gum, resembling white copperas, especially when old. It is brought from Mecca by the return of the Caravans of pilgrims and Mahometan merchants, who travel there out of devotion to the birth-place of their prophet. It has all the virtues of the *balm* of Gilead, or Judea; and is probably the same, only hardened, and its colour altered.

BALSAM of Pera is of three kinds; or rather, it is one and the same *balsam*, having three several names, viz. *balsam* of incision, which is a white glutinous resin, oozing at an incision in the tree, and afterwards thickened and hardened. This is excellent for green wounds, and much resembles the *opobalsamum*, excepting in smell, which distinguishes it.—*Dry balsam*, which is distilled from the tips of branches cut off, to which are fastened little vessels to receive the liquor, which at first is like milk, but reddens by being exposed to the sun. Its chief use is in the composition of the lac virginale, which is made much better with this, than with styrax or benzoin.—Lastly, the *balsam* of lotion, which is blackish, and is drawn from the bark, roots, and leaves of the tree minced and boiled together. This is used in wounds like the white *balsam*; and, on account of its excellent smell, by the perfumers.

BALSAM of Capiba, or Copivi, comes from Brazil, in earthen bottles. There are two sorts, the one bright and thin; the other thick; the first white, of a resinous smell: the other a little more on the yellow; both are admirable for wounds: the Jews use this *balsam* after circumcision to stop the blood.

BALSAM of Tolu is at first a liquid resin, which as it grows old becomes of the colour and consistence of Flanders glue. It comes by incision from some trees growing in New Spain; where the inhabitants receive it in little vessels of black wax: in taste and smell it resembles balm of Gilead; as it grows old it takes the consistence of a dry *balsam*.

BALSAM of liquid amber is a clear reddish resin, produced by a tree in New Spain, called by the natives *osofol*; in some degree resembling ambergrease in smell, whence its name. The new *balsam* is liquid; in which state it is called *oil of liquid amber*, and when old, *balsam of liquid amber*; it comes from both the Spains, in barrels, but the genuine is very rare among us.

It is found sovereign for wounds and ulcers, especially for fistulas in ano: it resembles *balsam* of Tolu in smell and colour, and is procured in the manner of oil of bays, from a red fruit in the island of St. Domingo.

BALSAM is also applied to certain factitious substances, made by chymists and apothecaries, chiefly of balsamic and healing ingredients, in imitation of the native *balsam*.

These are called by way of distinction, *factitious*, or *artificial balsams*.

We have two different compositions of *balsams*, in imitation of the true, or Egyptian *balsam*; one by Matthiolus, the

other by Euricus Cordus. Pomet has also given a method of imitating many of the native *balsams*.

BALSAM of sulphur is a solution of the flowers of sulphur in some oil, it is made by boiling the two together over a soft fire the space of an hour, or till the sulphur be totally incorporated with the oil into a red balsam.

It is recommended both for external and internal uses, as being warm and mollifying in case of wounds, sanious ulcers, fistulas, &c. and curative even of ulcers of the lungs. Helmont, its inventor, extols it for all diseases of the breast: yet Boerhaave rejects all internal use of it, as too hot, and acrimonious. Bartholin also observes, that it sometimes causes a cardialgy.

BALSAM of Saturn is a salt, or sugar of lead, dissolved in oil or spirit of turpentine, juniper, or the like, digested, till the matter have acquired a red tincture. This is found to resist the putrefaction of humours, and is good to cleanse and cicatrize ulcers.

BALSAM, or BALM, among alchymists, sometimes denotes the spirit of common salt extracted in a particular manner. The preparation is thus: they dissolve the salt, and place its dissolution, well clarified, in horse-dung to putrify, for the space of two or three months, and then distil it strongly with a sand-heat; upon which there arises a precious undecorosity, wherein things the most corruptible being steeped, are said to remain entire, eternally.

It is said, that it was by this means some of the ancients preserved dead bodies entire without reducing them to mummy; and particularly that of the woman mentioned by Volaterranus to be found in a mausoleum near Albano, in the time of pope Alexander VI. which was by his order thrown secretly into the Tiber, to prevent idolatry; she being found as fresh as when alive, though she had been dead 1300 years.

BALSAMIC, a term in physic, signifying that property in a medicine, whereby it is rendered soft, gently attenuating, and somewhat agglutinating.

BAN, and BANS. See the articles **BARRI**, and **BANNS**.

ARRIERE BANN. See the article **ARRIERE**:

BANC, BANCUS, or BANK, in law, denotes a seat, or bench of judgment.

Juri BANC, or the privilege of having a bench, was anciently only allowed to the king's judges *qui summam administrant justitiam*. Inferior courts, as courts baron, hundred courts, &c. were not allowed that prerogative; and even at this day the hundred court at Freibridge, in Norfolk, is held under an oak at Cey-wood; and that of Woolfry, in Herefordshire, under an oak, near Ashton in that county, called Hundred-oak.

King's BANC, or BENCH, is a sovereign tribunal where the king himself formerly presided, the judges being placed in a lower bench at his feet.—The jurisdiction of this court is very extensive, and reaches throughout all England, the law supposing the king himself to be present.

Common BANC, or common-pleas, the second court of justice in England, where common and ordinary causes are pleaded between subject and subject.—Here most civil causes are tried, whether real or personal, according to the rigour of the law. Here are usually four judges, the chief whereof is called the *lord chief justice of the common-pleas*. Formerly there were seven judges, then six, then five, &c.

BAND, in a general sense, some small, narrow ligament, wherewith a thing is tied, or fastened.

We say, a *stay-band*, a *brow-band*, a *hat-band*, &c.

BAND, in architecture, denotes any flat, low member, or moulding.

This amounts to the same with what is otherwise called *face*, from the Latin *fascia*, which Vitruvius uses for the same thing; and sometimes *fillet*, *plinth*, &c.

BAND, in surgery, denotes a fillet, swath, or piece of linen cloth, wherewith either to cover or surround certain parts that stand in need of assistance.

Bands are the same with what are otherwise called *rollers*.

A *band*, or *roller*, when applied, becomes a *bandage*. See **BANDAGE**, and **ROLLER**.

BAND also gives the denomination to a military order in Spain, instituted by Alphonius XI. king of Castile, anno 1332.

It takes its name from the *banda*, band, or red ribbon which comes a-cross over the right shoulder and under the left arm of the knight.

This order is for none but the younger sons of nobles; the eldest sons of grandes are excluded; and, before admittance, it is requisite to have served at least ten years, either in the army, or at court. They are bound to take up arms for the catholic faith against the infidels.

The king himself is grand master of the order.

BAND of soldiers, so many as fight under the same flag, or ensign.

Thus Romulus called those who fought under the same manipule, (a handful of hay being then used for a flag) *manipulus militum*. Trained-

Trained-BANDS. See the article *TRAIN-BANDS*.

BANDAGE, in surgery, the application of a band, swath, roller, or fillet to a part of the body; or the act of rolling, or tying a swath or band, round a part affected, and the parts adjacent, with compresses, plasters, and the like.

Of bandages there are two sorts; whereof one sort are remedies of themselves.—The other being intended only to keep the medicaments on the part, are called more particularly *Contentive Bandages*.

Incarnative BANDAGE. See the article *INCARNATIVE*.

BANDALEER*, or **BANDELEER**, a large leathern belt, thrown over the right shoulder, and hanging down under the left arm; wore by the ancient musketeers, both for the sustaining of their fire-arms, and for the carriage of their musket-charges; which being put up in little wooden cases, coated with leather, were hung, to the number of twelve, to each *bandaleer*.

* The word is originally French, *bandouiller*, formed apparently from *bandealter*, a kind of banditti particularly infesting the Pyreneans; who were formerly distinguished by this piece of furniture; and were themselves so denominated, *quasi ban de voliers*, a knot of robbers.

The French soldiery still retain the *bandaleer*; their horse, their musketeers, and common guards, wearing it indifferently; excepting for some difference in its garniture.

BANDELET, or **BANDET**, in architecture, any little band or flat moulding, as that which crowns the Doric architrave.—See *Tab. Archit. fig. 1. & 28. lit. a*.

It is also called *tania*, which Vitruvius uses for the same thing: sometimes, *fillet*, *diadema*, &c.

BANDEROLL, a little flag in form of a guidon, extended more in length than breadth, us'd to be hung out on the masts of vessels, &c.

BANDET. See the article *BANDELET*.

BANIAN, a religious sect in the country of the Moguls, who believe a metempsychosis; and will therefore eat no living creature, nor even kill noxious animals, but endeavour to release them if they see them in the hands of others.

The *Banians* are said to be so fearful of having communication with other nations, that they break their cups if one of a different religion have drank out of them, or even touched them; and empty the water out of a pond where he has washed himself. It is added, that if they happen to touch one another, they must wash and purify themselves before they eat, or enter their own houses. They carry, hanging at their necks, a stone called *tamberan*, as big as an egg, and perforated in the middle, through which run three strings: this stone, they say, represents their great God, and upon that account they have great respect shewn them by all the Indians.

BANISHMENT, *Exile*, among us, is of two kinds: the one voluntary, and upon oath; the other by compulsion, for some offence or crime.

The former, properly called *abjuration*, is now ceased; the latter is chiefly enjoined by judgment of parliament. Yet outlawing and transportation may also be considered as species of exile.

BANK*, in commerce, is a denomination given to certain societies, or communities, who take on them the charge of the money of private persons, to improve it, or to keep it secure.

* The word *bank* in this sense, comes from the Italian *banca*, formed of the Spanish *banco*, a bench whereon the ancient money-changers sat in the public markets; or, as others think, a table whereon they told their money: for the Spanish *banco* signifies a table, as well as a bench; as among the Greeks the word *βανκός* signified a bench, as well as a table; whence the word *βανκίτης* for a benchman. Guichard chuses to derive *bank* from the Latin *abacus*, a table, or cupboard.

There are several of these *banks* established in the several principal trading cities in Europe; as in Venice, London, Amsterdam, Hamburg, Paris, &c. But of all others that of Venice is the most considerable, as being the most ancient, and that whereon the others are modelled.

The *banco*, or bank of Venice, commonly called *banco del giro*, is properly a board of public credit and interest; or a general and perpetual purse for all merchants and traders; established by a solemn edict of the commonwealth, which enacts, That all payments of wholesale merchandise, and letters of exchange, shall be in *banco*, or *bank notes*; and that all debtors and creditors shall be obliged, the one to carry their money to the *bank*, the other to receive their payments in *banco*; so that payments are performed by a simple transfer from the one to the other: he who was before creditor on the *bank books*, becoming debtor as soon as he has resigned his right to another, who is entered down as creditor in his place; so that the parties only change name, without any effective payment being made. Indeed there are sometimes actual payments made, especially in matters of retail, and when foreigners are disposed to have ready money to carry off in specie; or when particular traders chuse to have a stock by them to negotiate in bills of exchange, &c. The necessity of these effective payments, has given occasion to the

opening a fund of ready money; which is found so far from diminishing the stock, that this liberty of withdrawing money at pleasure rather augments it. By means of this *bank*, the republic, without encroaching on the freedom of commerce, or without paying any interest, is mistress of 5000000 ducats, to which the capital of the *bank* is limited, to be in readiness on any pressing occasion; the republic being security for the capital.

Agents of BANK. } See the articles } **AGENT**.

BANK bills. } See the articles } **BILL**.

BANK, or **BENCH**, in law. See *BANC*.

Days in BANK. See the article *DAY*.

Foot-BANK. See *BANQUETTE*, and *FOOTBANK*.

BANKER, a person who *banks*, that is, negotiates and trafficks in money; or receives, and remits money from place to place, by means of bills or letters of exchange.

In Italy the employment of a *banker*, especially in republics, does not derogate from nobility; and hence it is, that most of the cadets, or younger sons of persons of condition, undertake it for the support of their family.

The Romans had two kinds of *bankers*, though their office was much more extensive than that of the *bankers* among us; theirs being public officers, in whom were united the functions of a broker, agent, *banker*, and notary; managing the exchange, taking in money, assisting in buying and selling, and drawing the writings necessary on all these occasions.

BANKRUPT*, a dealer who, having gotten other men's goods or money in his hands, absconds to defraud his creditors.

* The word is formed of the ancient Latin *bancus*, a bench, or table; and *ruptus*, broken.

Bank, we have elsewhere observed, originally signified a *bench*, which the first bankers had in the public places, in markets, fairs, &c. on which they told their money, wrote bills of exchange, &c. Hence when a banker failed they broke his bank, to advertise the public, that the person to whom the bank belonged, was no longer in a condition to continue his business. As this practice was very frequent in Italy, it is said the term *bankrupt* is derived from the Italian *banco rotto*, broken bench.

Cowel rather chuses to deduce the word from the French *banque*, table, and *route*, vestigium, trace, by a metaphor from the sign left in the ground of a table once fastened to it, and now gone. On this principle he traces the origin of *bankrupts*, from the ancient Roman *mensarii*, or *argentarii*, who had their *taberna* or *mensæ* in certain public places; and who, when they fled or made off with the money that had been trusted to them, left only the sign or shadow of their former station behind them.

BANKRUPTCY, the failure, absconding, and relinquishment of traffick in a merchant, a banker, or any other trader. The French make this difference between a *bankruptcy* and a *failure*; that the first is supposed voluntary and fraudulent, and the latter constrained and necessary, by means of accidents, &c.

A failing, breaking, or stopping of payment, diminishes the merchant's credit, but does not note him with infamy, as *bankruptcy* does.

When a merchant, &c. fails to appear at the exchange, &c. without apparent reason, it is called a *failing of presence*; the *bankruptcy* becomes open from the day he absconds, or the seal is affixed to his effects.

Commission of BANKRUPTCY. See *COMMISSION*.

BANN*, or **BAN**, **BANNUM**, or **BANNU**, in the feudal law, a solemn proclamation, or publication of any thing.

* The origin of the word is uncertain; some deduce it from the British *ban*, clamour, noise; others from the Saxon *pan*, a thing spread; whence *ban*, and *band*, used for a flag.

Bracon mentions *bannus regis*, for a proclamation of silence anciently made by the court, before the encounter of the champions in a combat.

BANNS of marriage, are certain solemn notices of matrimonial contracts, made in the parish church, before the marriage; that if there be any exceptions to either party as to prior engagements, &c. there may be an opportunity of making them.

The publication of *banns*, (popularly called *asking in the church*) was intended as an expedient, to prevent clandestine marriages; but a licence or dispensation is now so easily procured, that their use is defeated.—By the laws of the church, *banns* are to be published thrice, on three distant days, in the places where the parties live; on pain of nullity of marriage: and excommunications are threatened against those, who knowing impediments conceal them.

BANNERETS*, an ancient order of knights, or feudal lords, who possessing several large fees, led their vassals to battle, under their own flag, or banner, when summoned thereto, by the king.

* The word seems formed from *banner*, a square flag, or from *band*, which anciently also denoted a flag.—*Bannerets* are also called in ancient writers, *militus vexilliferi*, and *vexillarii*, *bannerarii*, *bannarii*, *banderisii*, *bannisii*, &c.

Anciently there were two kinds of knights, *great and little*; the first whereof were called *bannerets*, the second *bachelors*; the first composed the upper; the second, the middle nobility. See *BACHELOR*.

The *banneret* was a dignitary allowed to march under his own flag, whereas the *bachelarius equus* followed that of another. To be qualified for a *banneret*, one must be a gentleman of family, and must have a power to raise a certain number of armed men; with estate enough to subsist at least twenty-eight, or thirty men. This must have been very considerable in those days, in regard each man, besides his servant, had two horsemen to wait on him, armed, the one with a cross-bow, the other with a bow and hatchet.

As he was not allowed to be a baron who had not above thirteen knights-fees, so he was not admitted to be a *banneret*, if he had less than ten.

Banneret, according to Spelman, was a middle order between a baron, and a simple knight; called sometimes also *vexillarius minor*, to distinguish him from the greater, that is, from the baron, to whom alone properly belonged the *jus vexilli*, or privilege of the square flag.

Hence the *banneret* was also called *bannerettus*, *quasi baro minor*, a word frequently used by English writers in the same sense, as *banneret* was by the French; though neither of them occur before the time of Edward II.

Some will have *bannerets* to have originally been persons who had some portion of a barony assigned them; and enjoyed it under the title of *baro proximus*, and that with the same prerogatives as the baron himself.

Some again find the origin of *bannerets* in France; others in Brittany; others in England. These last attribute the institution of *bannerets* to Conan, lieutenant of Maximus, who commanded the Roman legions in England under the empire of Gratian, in 383. This general, say they, revolting, divided England into forty cantons, and in these cantons distributed forty knights, to whom he gave a power of assembling on occasion, under their several banners, as many of the effective men as were found in their respective districts; whence they are called *bannerets*.

However this be, it appears from Froissart, &c. that anciently such of the military men as were rich enough to raise and subsist a company of armed men, and had a right to do so, were called *bannerets*. Not, however, that these qualifications rendered them knights, but only *bannerets*; the appellation of knight being only added thereto, because they were simple knights before.

Bannerets were second to none, but knights of the garter; and they were reputed the next degree below the nobility; and were allowed to bear arms with supporters, which none else may under the degree of a baron. In France, it is said, the dignity was hereditary; but in England it died with the person that gained it. The order dwindled on the institution of *baronets* by king James I. and at length became extinct. The last person created *banneret* was Sir John Smith, made so after Edghill-fight, for rescuing the standard of king Charles I.

The form of the *banneret's* creation was this: on a day of battle, the candidate presented his flag to the king or general, who cutting off the train, or skirt thereof, and making it a square, returned it again, the proper banner of *bannerets*; who are hence sometimes called *knights of the square flag*.

BANNIMUS, the form of expulsion of any member from the university of Oxford, by affixing the sentence up in some public place, as a denunciation or promulgation of it.

BANQUETTE, in fortification, is a little foot-bank, or an elevation of earth forming a path which runs along the inside of a parapet; by which the musqueteers get up, to discover the counter-scarp, or to fire on the enemies in the moat, or in the covert-way.

The *banquette* is generally a foot and half high, and almost three foot broad: having two or three steps to mount it by. —Where the parapet is very high, they make a double *banquette* one over the other.

BAPTISM*, in theology, the ceremony of *washing*; or a sacrament whereby a person is initiated into the Christian church, and original sin is washed away in infants, and actual sins in adults who receive it.

* The word is formed from the Greek βαπτίζω, of βαπτιζω, I dip or plunge.

The Jews practised this ceremony, after circumcision, on their proselytes, long before the coming of Jesus Christ. —For the matter of *baptism*, any natural water is held sufficient, but nothing else is allowed: for this reason pope Stephen II. excommunicated a priest for baptizing a child with wine. —In the primitive times this ceremony was performed by immersion, as it is to this day in the oriental churches, according to the original signification of the word. The practice of the western churches is, to sprinkle the water on the head or face of the person to be baptized, except in the church of Milan, in whose ritual it is ordered, that the head of the infant be plunged three times into the water. —A trine immersion was first used, and continued for a long time: this was to signify either the three days that our Saviour lay in the grave, or the three persons in the trinity. But it was afterwards laid aside; because the Arians used it: it was then thought proper to plunge but once, lest the heretics should think that the catholics, like them, divided the trinity. —Some are of opinion, that sprinkling in *baptism* was begun in cold coun-

tries: It was introduced into England about the beginning of the ninth century. At the council of Celchyth, in 816, it was ordered, that the priest should not only sprinkle the holy water upon the head of the infant, but likewise plunge it in the bath. —There are abundance of ceremonies delivered by ecclesiastical writers, as used in *baptism*, which are now disused; though there are not wanting those who contend for their re-admission; as the giving milk and honey to the baptized, in the east; wine and milk in the west, &c. —It appears, that in the primitive times none were baptized but adults. —Formerly there were great disputes, whether the baptism of heretics was valid. The general opinion run for the affirmative, provided it was conferred in the name of the trinity, and therefore they allowed even that given by laymen, or even by women in case of necessity. The council of Roan in 1072, ordered, that the priest should baptize fasting.

Theological authors distinguish three kinds of *baptism*. 1^o. *Water baptism*, which is that above-mentioned. 2^o. *Baptism of fire*, which is the perfect love of God, joined with an earnest desire to be baptized; called also the *baptism of the holy ghost*: on occasion this may supply the place of *water-baptism*. 3^o. *Baptism of blood*; which is the martyrdom of a catechumen.

Baptism, in the primitive times, was only administered at Easter and Whitfuntide, except in cases of necessity. The catechumens were not forward in coming to *baptism*: St. Ambrose was not baptized before he was elected bishop of Milan; and some of the fathers not till the time of their death. Some deferred it out of a tender conscience; and others out of too much attachment to the world; it being the prevailing opinion of the primitive times, that *baptism*, whenever conferred, washed away all antecedent stains and sins.

Divers of the fathers rallied this superstitious delicacy to such a degree, that they introduced a different extreme; the ridiculous zeal of some people carrying them to baptize even the dead, by proxy.

BAPTISM, or *Chriftening*, in the sea-language, is a ceremony in long voyages aboard merchant-ships; practised both on persons and vessels which pass the tropic, or line, for the first time. The *chriftening* of vessels is simple, and consists only in the washing them throughout with sea-water: that of passengers is more mysterious; but neither the one nor the other is done without making the crew drunk; the seamen, on chriftening the ship, pretending to a right of cutting off the beak-head, unless redeemed by the master or captain.

The *chriftening* of a seaman, or passenger, is as follows: the oldest of the crew who has passed the line, or tropic, comes, whimsically dressed, his face blacked, a grotesque cap on his head, and a waggoner or other sea-book in his hand, followed by the rest of the seamen masqued like himself, each having some kitchen utensil in his hand, with drums beating: he places himself gravely on a seat prepared on the deck, at the foot of the main-mast. At the tribunal of this mock-magistrate, each passenger, not yet initiated, swears, he will take care the same ceremony be observed, whenever he is in the same circumstance: by giving a little money, by way of gratification, he is discharged with a little sprinkling of water; or otherwise, as is usually the case with the common seamen, he is heartily drenched with streams of water poured on him: the ship-boys are inclosed in a cage, and ducked at discretion; and besides, in memory of the ceremony, they are obliged to whip each other, which they never spare.

BAPTISMAL Font. See FONT and BAPTISTERY.

BAPTIST. See ANABAPTIST, CATABAPTIST, and HEMEROBAPTIST.

Hermits of St. John BAPTIST. See HERMIT.

BAPTISTERY, in ecclesiastical writers, a place or edifice where water is preserved for persons to be baptized in.

Anciently, in the churches which baptized by immersion, the *baptistry* was a kind of pond where the catechumens were plunged; though in many places the next river served for a *baptistry*.

In after times, the *baptistry* was a little building adjoining to the church, purposely appointed for the administration of this ceremony.

There were several fonts and altars in each *baptistry*, because then they baptized a number at once, all of whom received the eucharist immediately after.

At first, these *baptistries* were only in the great cities, where bishops resided, who alone had the right of baptizing; but they afterwards allowed parishes to have fonts, for the more commodious administration of baptism. This right was confined to parishes alone; and if any monasteries were found with baptismal fonts, it was because they had baptismal churches in another place: though the bishops sometimes granted them to monks, upon condition that they would have a secular priest along with them to take care of the people; but they afterwards found means to throw off the priest, and make themselves masters of the church, and attach it, with its baptismal fonts, to their own monastery.

BAR, in a court of justice, denotes an inclosure made with a strong partition of timber, three or four foot high, where the council are placed to plead causes.

This the French call *barre d'audience*, and in some places *auditoire*. It answers to what, among the Romans, was denominated *causidica*.

B A R

It is called *bar*, because inclosed with a barrier, called also in Latin *writens cancelli et caule*, by a metaphor taken from sheep-folds.

The denomination **BAR** is also given to the benches where the lawyers or advocates are seated.—The appellation arose hence, that anciently there was a *bar*, or barrier, to separate the counsellors and pleaders, from the attorneys and others. Hence our lawyers who are called to the *bar*, or licensed to plead, in other countries called *licentiati*, are termed *barri-fers*.

BAR, or **BARRE**, **BARRA**, in common law, denotes a peremptory exception, against a demand or plaint.

The author of the terms of the law defines *bar*, a plea brought by the defendant in an action, whereby the action of the plaintiff is destroyed for ever.—But the modern writers extend the use of the word farther, dividing *bars* into *perpetual* and *temporary*.

Perpetual BAR is that which overthrows the action for ever.

Temporary BAR, or *bar pro tempore*, is that which is allowed good for the present, but may fail or be set aside hereafter.

BARS, in the manage, denote the ridges or upper part of the gums, between the tusks and grinders of a horse; the under and outward sides retaining the name *gum*.

The *bars* should be sharp-ridged and lean; for since all the subjection a horse suffers proceeds from those parts, if they have not those qualities, they will be very little or not at all sensible; so that the horse can never have a good mouth; for if the *bars* be flat, round, and insensible, the bit will not have its effect; and consequently, such a horse can be no more governed by his bridle, than if one took hold of his tail.

BARS, in music, denote strokes drawn perpendicularly across the lines of a piece of music, including between each two, a certain quantity or measure of time, which is various as the time is triple or common.

In common time, between each two *bars* is included the measure of four crotchets, in triple time three crotchets. Their principal use is to regulate the beating, or measure of the musical time in a concert.

BAR, **BARR**, or **BARRE**, in heraldry, denotes an ordinary nearly resembling the *fess*; from which it only differs by its narrowness, and by this, that the *bar* may be placed in any part of the field, whereas the *fess* is confined to a single place. See **FESS**.

BAR-SHOT. See the article **SHOT**.

BARACK*, or **BARRACK**, **BARAQUE**, a hut, or little lodge for soldiers in a camp.

* The word comes from the Spanish *barracas*, little cabins which fishermen make on the sea-shore.

Those for the horse were formerly called *baracks*, and those for the foot batts; but *barack* is now used indifferently for both. *Baracks* are generally made by fixing four forked poles in the ground; and laying four others across them; afterwards they build up the walls with fods, wattles, or what the place affords; and the top is planked, thatched, or covered with turf, as they have convenience.

When the army is in winter quarters, the soldiers usually build *baracks*; in the summer they are content with their tents.

BARALIPTON, a term in logic, denoting the first indirect mode of the first figure of syllogisms.

A syllogism in *baralipson* is, when the two first propositions thereof are general, and the third particular; the middle term being the subject of the first, and the attribute of the second.—For example,

BA Every evil ought to be feared:

RA Every violent passion is an evil:

LIP. Therefore something that ought to be feared is a violent passion.

BARALLOTS, **BARALOTTI**, the name of a sect of heretics at Bologna in Italy, who had all things in common, even their wives and children.—They gave very readily into all manner of debauchery, and were also termed *compilers*.

BARANGI, officers among the Greeks of the lower empire, whose business it was to keep the keys of the city-gates where the emperor resided.

Codinus says, *barangi* were those who stood guard at the door of the emperor's bed-chamber and dining-room.

BARBACAN, or **BARBICAN**, properly denotes an outer defence, or fortification to a city, or castle; used especially as a fence to the gates, or walls.

In which sense, *barbacan* amounts to the same with what is otherwise called, *antemurale*, *promurale*, *murus exterior*, or *outer wall*.

BARBACAN is also used for a fort at the entrance of a bridge, or in the outlet of a city, having a double wall with towers. Such is that at one end of the wooden bridge at Rouen, which is still called by some *Barbacana*.

BARBACAN is also used for an aperture in the walls of a city, through which to fire with muskets on the enemy. See **EMBRASURE**.

BARBACAN, in architecture, denotes a long narrow canal, or opening, left in the walls for water to come in and go out at, when edifices are raised in places liable to be overflowed; or to drain off the water from a terrace, or the like.

B A R

BARBARA, in logic, the first mode of the first figure of syllogisms.

A syllogism in *barbara* is that whereof all the propositions are universal and affirmative; the middle term being the subject in the first proposition, and attribute in the second.—For example;

BA *Whoever suffers a man to starve, whom he ought to sustain, is a murderer:*

BA *Whoever is rich, and refuses to give alms, suffers those to starve whom he ought to sustain:*

RA. Therefore, whoever is rich, and refuses to give alms, is a murderer.

BARBARIAN*, a name given by the ancient Greeks to all those who were not of their own country, or who did not speak the Greek language.—In which sense the word signified with them no more than *foreigner*, and did not carry that odium with it, as it does now.
